in contact with the air, the preparation hardens, forming a cement. These preparations may be employed without fear of damage to the radiator; in fact, the writer has utilized them with success in a cooler which resisted the efforts of an expert to stop the leaks.

Among the well known preparations of this nature is Se-ment-ol, manufactured by the Northwestern Chemical Company, Marietta, O. It comes in a small can, the contents of which are poured into the radiator and the motor operated for a short period, after which the fluid is drained off and replaced by the usual water or anti-freezing solution. The writer has obtained the best results with these mixtures by having the water slightly warm.

Pyro Freezometer.

The International Metal Polish Company, Indianapolis, Ind., markets a similar preparation termed Blue Ribbon radiator cement, which is guaranteed to repair any ordinary leak in a few minutes. The Radico Manufacturing Company, Springfield, Mass., also makes a compound called Radico.

#### Electrolytic Action.

Relative to anti-freezing solutions, some do not approve of their use, holding that they are detrimental to the metal parts of the cooling system. There is no doubt that alkaline solutions, which are electrolytes of high potential, produce

electrolytic action whenever two metals of dissimilar potential are employed together, as the brass tubing of the radiator and solder at the joints, the aluminum or brass flanges closing the core print holes of the cast iron cylinder, etc. But where the car is exposed for any great length of time or stored in an unheated building, some solution is essential.

#### Prepared Solutions.

Among the prepared anti-freezing solutions marketed is Thermite, made by the Northwestern Chemical Company. The company holds that its product is chemically correct, that it is harmless, and that a 50 per cent. solution will withstand temperatures of 15 below zero, and a clear, 70 degrees below. It is mixed with the water and affords protection according to the proportions utilized. A freezing chart and scale accompanies each can of the liquid.

Lubro, which is made by the Lubro Oil Company, Cleveland, O., is so-called by the maker because it is stated to possess lubricating qualities in addition to being an anti-freezing mixture. It is red, and is used in the proportions of one gallon to 2.5 of water and is said to withstand temperatures as low as 20 degrees below zero. Another solution is Zero 40, marketed by the Automobile Equipment Company, Detroit. It is a natural mineral water, the freezing point of which is stated to be 40 degrees below zero and with a boiling point of 222. These preparations described are easily handled and maintained.

#### Denatured Alcohol.

Pyro (denatured alcohol) is popular with a large number of motorists, as it is easily obtained and it is a simple matter to mix it with the water of the cooling system, the proportions depending upon locality, etc. Pyro is the trade name of the U. S. Industrial Alcohol Company, 27 William street, New York City, and is the ordinary ethyl alcohol of commerce made undrinkable by an admixture. When added to the contents of the cooler, in proportions of one part to three of water, the mixture will not congeal until the temperature has dropped below zero, and even then will not solidify, only the water in the solution forming flakes or crystals, making a snow like mass.

Given the capacity of the cooling system, it is an easy matter to ascertain the proper quantity of alcohol to employ and the freezing temperatures are given in an accompanying table. These differ slightly from the chart published by the maker of Pyro, but in the main are sufficiently correct.

### Use of Freezometers.

With alcohol solutions it is advisable to purchase and use a combined hydrometer and thermometer.

**Chemical Compounds for Leaky Radiators, Including Blue Ribbon Cement, Se-ment-ol and Radico—The Miller Freezometer Illustrated Is Employed to Test Solutions Containing Alcohol.**

mometer, two types of which are shown in accompanying illustrations. They are inexpensive and comprise the indicating device, also a jar for floating the hydrometer-thermometer in the fluid. If the indicated freezing point of the solution is higher than is desired, alcohol is added. If too high, water is employed. These instruments are invaluable in that they afford opportunity of testing the solution from time to time, eliminating guess work, which may be disastrous. The instruments illustrated are marketed by Chas. E. Miller, 97-103 Reade street, New York City, and the Taylor Instrument Company, Rochester, N. Y. They come with substantial cases and, as previously pointed out, are moderately priced.

### Calcium Chloride.

Among other ingredients employed as anti-freezing solutions are calcium chloride and glycerine. Sometimes the latter is combined with alcohol. Accompanying tables present formulae for mixing the different ingredients and the freezing points of each are also given. Calcium chloride is favored by some because of its low cost and in its pure state occurs in prismatic crystals soluble in one-quarter of its weight in water, and easily so in alcohol. The commercial form contains about 50 per cent. water of crystallization, and dissolves in half its weight in water. In preparing the mixture it is well to have several strips of blue litmus paper for testing. If it changes the color of this toward a red, the mixture is slightly acid and should be corrected by adding small quantities of milk of magnesia until the color of the paper remains unchanged.

### Glycerine and Alcohol.

A combination of glycerine and alcohol is favored by some because the former does not boil until it attains a temperature of 554 degrees

Fahrenheit, and even with the addition of alcohol, it is obvious that used with equal parts of water and alcohol its boiling point is well above that of some of the other ingredients. The solution, however, "creeps", the analogy being the creeping of the electrolyte on the terminals of a storage battery. This deposit does not dry up or evaporate, but rather increases after it has been in use a time. Consequently, the connections should be tight. Glycerine also attacks rubber, but as the cost of new piping is not prohibitive, new material can be fitted in the spring.

In the preparation of anti-freezing solutions whose boiling point is well below that of water, allowance should be made for the expansion of the fluids, especially on a mild day. If the cooler is filled to the top of the filler cap, more or less fluid will be lost by expansion. In localities where the temperature varies considerably, judgment will be necessary as to the use of the fan and radiator shield.

## MAINTAINING THE MOTOR CAR.

### Willys-Overland Company Issues Complete Instructions for New Model 70.

Continuing its policy of co-operating with the owner, the Willys-Overland Company, Toledo, O., maker of the Overland automobiles, has issued its annual book containing directions for the operation, care and adjustment of the new model 70, which was fully described recently. The book is considerably larger than its predecessor, which dealt with two models, and includes instructions as to the care of the electric lighting and motor starting system. Each component of the chassis is carefully explained and illustrated, and the directions for making adjustments are complete in each detail. The brochure appears

**Prepared Anti-Freezing Solutions, Including Lubro, a Colored Fluid; Thermite, and Apex, a Radiator Cleanser.**

in a durable dark green cover and the contents are indexed. One of the valuable features of the book is the lubrication chart.

## IMPORTERS' AUTOMOBILE SALON.

### Management Decides to Open Doors to Makers of American Machines.

The Importers' Automobile Alliance of New York City, under whose auspices the annual importers' salon in the Hotel Astor will be held Jan. 2-10, announces that several high grade American made cars will be included among the exhibits this year. Already five applications have been received, but it is understood that only those of the Fiat and Simplex have been granted as yet. The Fiat is made at Poughkeepsie, N. Y., which is the American factory, the home office being in Turin, Italy.

There have been rumors for two years past that the importers were to permit such display on the part of American manufacturers, but the nearest approach to such action was that of last year, when the Keeton was shown by its Canadian concern. Other exhibits always have been from the factories of France, Germany, England, Belgium, Italy or Austria.

## AMERICAN MOTORS' OFFICERS.

### J. I. Handley Is Re-Elected President and General Manager.

The work of the board of directors of the American Motors Company, Indianapolis, Ind., appears to have received the approval of the stockholders, judging from the result of the election at the annual meeting held early in the month. The following directors were elected for the ensuing year: J. I. Handley, V. A. Longaker, D. S. Menasco, Frank E. Smith and J. E. Kepperley.

Immediately after the close of the stockholders' meeting the directors met and chose the following officers: President and general manager, J. I. Handley; vice president, F. E. Smith; chairman and treasurer, V. A. Longaker; assistant treasurer, J. D. Bright; secretary, J. E. Kepperley.

## McFARLAN INTERESTS REORGANIZE.

### New Company Will Look After Production End of the Business Hereafter.

With the announcement of the organization of the McFarlan Motor Company in Connorsville,

Ind., comes the information that this concern is to take over the manufacture of McFarlan cars, heretofore conducted by the McFarlan Carriage Company. The cars have been distributed through a selling concern known as the McFarlan Motor Car Company, and no statement is made regarding a change in this plan.

The new company is incorporated for \$100,000, the incorporators being Alfred H. McFarlan, Edward W. Cotton and Burton M. Burrows. It is understood, however, that several other men are included among the stockholders. A petition in bankruptcy recently was filed against the McFarlan Carriage Company.

## NEW OAKLAND BODY DESIGN.

### Cabriolet Provides for Coupe in Winter and Roadster in Summer.

What it claims is a distinct innovation in the way of body equipment is the new cabriolet recently brought out by the Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars. The name implies a diminutive cab, but it really is more than that, as it provides for the enclosed features of the coupe in winter and an open roadster type in summer.

A somewhat ingenious method of construction makes it possible to tilt the top backward into small compass at the rear. The side windows are hinged and fold down and inward against the doors, while the side panels drop into the walls of the car. The top and windows are operated from within and the driver has complete control without leaving the car.

The company is also producing a sedan model, the particular feature of which is the provision for one spacious compartment with ample seating space for four persons. The driver's seat slides back and forth to accommodate the stature of the occupant. All seats are arranged so that entrance may be had from either side.

Dr. Lee C. Deming, who recently drove across the continent from his home in Pasadena, Cal., to New York City, is not satisfied with this record and is to undertake the return trip. Accompanied by his wife and daughter, Dr. Deming proposes to drive his Overland car on a tour of practically all of the eastern and southern parts of the United States, winding up with another transcontinental trip, and he left New York recently for this purpose.

**VULCAN CLIMBS HOG BACK.****New Car Accomplishes Task Which Has Proved Too Much for Others.**

The testing department of the Vulcan Manufacturing Company, Painesville, O., maker of the new Vulcan car, has found a course which it believes will give the machines the necessary trial in hill climbing ability and braking efficiency. Just outside the city is a hill known locally as Hog Back, with what is said to be a 66 per cent. grade, and it long has held an interesting position among the supposedly impossible tasks set for car owners. The Vulcan not only climbed the grade with seeming ease, but completed seven round trips without difficulty.

The worst feature about the hill is the sharp hairpin turn near the foot, which prevents any attempt at getting a flying start, and necessitates a speed not exceeding seven miles an hour on the downward trip. The Vulcan tester is said to have utilized but one set of brakes at a time, in an effort to demonstrate conclusively that the design and construction of the braking system were adequate to meet every emergency.

**BUILDING NEW CLUB HOUSE.****Home of Massachusetts Automobile Club Will Provide Storage for 400 Cars.**

By the first of the new year it is expected that the new seven-story club house of the Massachusetts Automobile Club, that is now being erected at the corner of Clarendon and Stuart streets, Boston, Mass., will be ready for occupancy. The building will be modern in every particular and afford the members every convenience.

In the garage department arrangements have been made for the storage of 400 automobiles in single rank. The building also will include the executive offices of the club, lounging and smoking rooms, committee rooms and service and repairing station.

**LOS ANGELES-PHOENIX RACE.****Expected That 25 to 30 Cars Will Be Lined up at the Start.**

During the early morning hours of Nov. 3 the first car will be started and the 1913 Los Angeles-Phoenix road race will be under way. At last report 12 entries had been received and from

present indications it is expected that there will be between 20 and 25 starters.

For the first 25 miles out of Los Angeles the cars will run along boulevards, and then the country roads, good and bad in places, will be encountered, but it is believed by drivers who have been over the course that between Los Angeles and San Diego an average speed of 50 miles an hour will be made. From San Diego to the desert edge there are several mountain roads with a number of abrupt curves that will probably materially decrease the average speed for the whole distance to be covered.

**IMPORTS AND EXPORTS.****Former Shows a Decrease of 50 Per Cent. and Latter a Gain of 45.**

The report of the bureau of foreign and domestic commerce, Department of Commerce, Washington, D. C., for the month of August, shows that 31 automobiles, valued at \$61,199, were imported into this country, as compared with 66 automobiles, valued at \$155,277, during the same month in 1912. The export figures show, that 1936 pleasure cars, valued at \$1,874,312, and 68 commercial vehicles, valued at \$109,437, or a total of 2004 cars, with a valuation of \$1,983,749, were shipped abroad during August, 1913, as against 1264 pleasure cars, valued at \$1,288,354, and 57 commercial vehicles, valued at \$107,245, totalling 1321 cars, valued at \$1,395,599, shipped abroad during August, 1912. The imports this year have fallen off over 50 per cent., while the exports show an increase of a little better than 45 per cent. The tabulation, according to countries, follows:

|                                  |             | <b>Imports.</b>    |             |                    |  |
|----------------------------------|-------------|--------------------|-------------|--------------------|--|
|                                  |             | 1912               |             | 1913               |  |
| Country                          | No.         | Value              | No.         | Value              |  |

## SPLITDORF MAGNETO EQUIPMENT FOR FORD.

**A**LTHOUGH it was known that the Splitdorf Electrical Company, Newark, N. J., maker of the well known Splitdorf magnetos, was producing a true

**Fig. 1—Splitdorf True High-Tension Fixed Spark Magneto.**

high-tension magneto and a special equipment for model T Ford motors, definite details were not announced until recently for, in keeping with the policy of the concern, the system was given severe laboratory and road tests before being offered to the public.

One of the several features of the Splitdorf equipment is the simplicity of installation, it requiring no other knowledge of mechanics than the replacing of the old timing gear plate with the Splitdorf design, meshing and locking the gears, and timing the magneto, a simple operation. The new plate is machined accurately and integral with it is the base or plate supporting the instrument, the proper position of which is assured by means of dowel pins. The magneto is retained by the conventional strap arrangement. Complete instructions accompany each equipment, and it is stated by the maker that it may be installed in less than three hours by the novice.

Drive is by enclosed gears operating in lubricant, standardized practise, assuring accurate timing and noiseless operation. Crankshaft speed, necessary with four-cycle, four-cylinder motors, is obtained by utilizing an idler gear, this member meshing with a gear on the camshaft and making two revolutions to one of the last named gear.

The magneto is shown at Fig. 1 and is water and dust proof, very compact and has sufficient reserve energy for a considerably larger motor than the Ford. The base is of aluminum, to which the pole pieces are secured, and between which rotates the double wound armature, the shaft of which is mounted on two annular bearings. The operating parts are protected from foreign elements by a ribbed aluminum cover.

The circuit breaker is attached to one end of the armature shaft and revolves with it.

The break of the primary circuit is obtained by a fibre roller supported by one end of the breaker arm, the roller coming in contact with a steel cam at the predetermined instant and when the greatest number of lines of forces are cut. It is pointed out that, owing to centrifugal action, the platinum points come in contact in a positive manner at high speeds, permitting of the use of a weaker spring than usual, thus lessening wear on the cam. The fibre roller is adjustable for service. The high-tension winding of the armature is connected to a collector ring suitably mounted, and from this member the current passes through a carbon brush, etc., thence to the distributor disc. Distribution to the proper spark plugs is by cable in the conventional manner.

As will be noted, the magneto is of the fixed spark type, it being pointed out by the maker that the construction makes for maximum motor efficiency at all speeds in that the operator cannot improperly vary the time of break of the primary circuit, and that the design relieves the driver from changing the position of the usual spark lever from time to time. The timing of the magneto is such that a hot spark is obtained at a quarter-turn of the starting crank.

As is obvious, the installation of the equipment eliminates the usual timer, timer rod, primary wires, coil, etc., and as the spark lever is not required it might be put to a useful purpose, for operating some form of gas saving device manually controlled, for example.

The method of installing the Splitdorf equip-

**Fig. 2—Illustrating the Splitdorf Magneto Equipment Installed on Model T Ford Motor.**

ment is as follows: The radiator is drained and removed, but before displacing the fan and its connections it is important that the pin retain-

**Fig. 3—New Timing Gear Plate Housing Gears and Manner of Fitting.**

The cotter pins holding the fan pulley in place can be removed with a pair of pliers, and the pin can be driven out with an ordinary punch through the hole in the engine base previously alluded to. A smart blow on the pulley should free it from the crankshaft. All commutator and secondary wires are disconnected and removed.

The timing gear plate is displaced by removing eight screws, but the felt packing of the crankshaft bearing and camshaft timing gear stud housing is fitted to the new plate. The last named member is fitted easily if held at a slight angle, as shown at Fig. 3, and it is recommended that a new gasket, shellacked on both sides, be utilized between the new plate and the crankcase. All screws are replaced with the exception of the fan member.

The large, 36-tooth gear is next placed on the timer shaft with a liner washer between it and the pinion, and the assembly locked by a cotter pin through the slot in the hub of the gear and hole in the shaft, after which the original nut is replaced and set up tight. The magneto is next placed on its base and strapped in position. The magneto gear is held by a Woodruff key and locked by a nut. The fan pulley, belt, starting crank clutch, etc., are next assembled and the magneto is ready for timing.

The crankshaft is rotated until the piston of the cylinder nearest the radiator is within .3125 inch of the completion of the compression stroke, or top dead centre. By removing the cover of the cam holder of the magneto, retained by a spring, which is swung back, and using a small mirror in the operation, the proper position of the armature shaft may be located. The armature

shaft is rotated as shown until the brass distributor segment in the peep hole in the distributor block points to the upper left hand connection on the block member. The shaft is further rotated—only slightly—until the contact roller just touches the cam. The idler or intermediate gear is then placed in position or meshed. It may be changed a tooth earlier or later if necessary, but the timing described is recommended.

The wiring is simple. The Ford motor fires 1, 2, 4, 3, and as the distributor rotates anti-clockwise, looking at the circuit breaker end, the upper right hand terminal is connected by cable to the spark plug of the first cylinder, the second to the second, the terminal marked 4 to the fourth cylinder, or the third to fire, and the No. 3 terminal to the third cylinder, which is the last to fire.

The high-tension cables are supported by a special clip which is bolted to the cylinder head, as shown at Fig. 2, preventing breaking down of the insulation by exposure to the heat of the exhaust manifold. A wire is carried from the grounding stud of the magneto to the dash switch, which is included in the equipment, and another lead from the switch is secured to the metal bolt retaining the steering column bracket. Closing the switch diverts the primary current generated by the magneto from the secondary windings to ground, consequently, with the switch open, the motor will operate.

The advantages of a high-tension magneto over the usual system of ignition on Ford motors has been discussed at length in these columns. It was pointed out that it makes for greater power, economy of fuel, cooler motor, etc., and synchronization of the spark. The Splitdorf special Ford equipment may be ob-

**Fig. 4—Side View of Installation, Showing Compactness of Magneto, Method of Retention and Simplicity of Wiring.**

tained at any of the branches of the company, which are listed in the Classified Buyers' Guide, found elsewhere in this issue.

## MORE SHOW EXHIBITORS.

### Supplementary List of Concerns Which Will Display in New York.

Elsewhere in this issue is presented the list of car manufacturers who were allotted space at the New York and Chicago shows at the initial drawing, and the allotments made by the Motor & Accessory Manufacturers. Since these were made public additional concerns have secured space for the New York show, in Grand Central Palace, Jan. 3-10, as follows:

Allen Motor Co., Fostoria, O., Allen cars.  
 Asch & Co., New York City, wrenches.  
 Ajax Trunk & Sample Case Co., New York City, trunks, etc.  
 Asbestos & Rubber Wks. of Am., New York City, brake lining.  
 American Taximeter Co., New York City, recorders.  
 Automobile Journal Pub. Co., Pawtucket, R. I.  
 Brown Co., Syracuse, N. Y., pumps.  
 B. & L. Auto Lamp Co., New York City, lamps.  
 Bock Bearing Co., Toledo, O., bearings.  
 Bausch Machine Tool Co., Springfield, Mass.  
 Peteller Shock Absorber Corp., New York City, shock absorbers.  
 Northway Motor & Mfg. Co., Detroit, motors.  
 Miller Rubber Co., Akron, O., tires.  
 Crescent Motor Co., Cincinnati, O.  
 Champion Spark Plug Co., Toledo, O., spark plugs.  
 A. R. Justice Co., Philadelphia, plating material.  
 Cleveland Hardware Co., Cleveland, O., bow shifters.  
 Rushmore Dynamo Works, Plainfield, N. J., lamps.  
 Rich Tool Co., Chicago, Ill., tools, etc.  
 J. R. Ashley Co., New York City, portable garages.  
 Wm. R. Laidlaw, Jr., New York City, top materials.  
 C. A. Willey Co., New York City, paints.  
 Model Gas Engine Works, Peru, Ind., motors.  
 P. Reilley & Son, Newark, N. J., top materials.  
 Chas. E. Miller, New York City, general accessories.  
 Frazier Lubricator Co., Chicago, Ill., lubricators.  
 Peter A. Frasse & Co., New York City, chains.  
 Jones Electric Starter Co., Chicago, Ill., starters.  
 Universal Lubricating Co., Cleveland, O.  
 Fentress-Newton Mfg. Co., Detroit.  
 Howe Rubber Co., New Brunswick, N. J., inner tubes.  
 International Metal Polish Co., Indianapolis, Ind., polishes, etc.  
 Fitzgerald Mfg. Co., Torrington, Conn., horns.  
 Perkins Campbell Co., New York City, license brackets, etc.  
 Columb Tyres Import Co., New York City, tires.  
 J. Eavenson & Son, Inc., Camden, N. J., soaps.  
 Havoline Oil Co., New York City, lubricants.  
 Johns-Manville Co., New York City, general accessories.  
 Chauffeur Pub. Co., New York City.  
 Donnelly Motor Equip. Co., New York City.  
 David Kahnweiler's Sons, New York City, fire extinguishers.  
 Cox Brass Mfg. Co., Albany, N. Y., sundries.  
 Eveland Eng. & Mfg. Co., Philadelphia.  
 Motor Patents Co., Detroit.  
 Pyrene Mfg. Co., New York City, fire extinguishers.  
 Emil Grossman Co., Brooklyn, N. Y., spark plugs.  
 Rhineland Machine Works Co., New York City, bearings, etc.  
 New York Coll. Co., New York City, ignition.  
 J. Alexander Mfg. Co., New York City, bodies.  
 John T. Stanley, New York City, soaps, etc.  
 Thermoid Rubber Co., Trenton, N. J., brake linings.  
 Motor, New York City.  
 Metal Stamping Co., Long Island City, N. Y., stampings.

## TRAINS SUCCESSFUL CHAUFFEURS.

### Many Graduate from Smith Bros.' Automobile School in Hartford, Conn.

Attention is drawn to Smith Bros.' Automobile School in Hartford, Conn., by reason of the fact that a class of 14 young men has just been graduated. These students are not only qualified as chauffeurs, but are expert repair men as well, the course of instruction embracing every phase of automobile service.

During the past six months this school has sent out 315 young men who have received chauffeur's licenses. Some of them came from Boston and Worcester, and only a few are unemployed at present. The instruction is individual. There are evening classes for those who are employed during the day.

J. M. Studebaker, head of the extensive Studebaker Corporation, recently celebrated his 80th birthday by doing a big day's work at his desk in South Bend, Ind., supervising the properties there and in Detroit. The anniversary was fittingly observed throughout the organization.

# THE NEW MARION SIX HAS MANY REFINEMENTS.

**T**HE J. I. Handley Company, Indianapolis, Ind., sole distributor of the Marion line, manufactured by the Marion Motor Car Company of the same city, announces a six-cylinder chassis for the season of 1914, to which will be fitted four types of bodies, these including a five-passenger touring car, a two-passenger roadster, a four-passenger coupe and a five-passenger sedan. The new car presents several changes in mechanical design from former models, a dry disc clutch replacing the cone type, and the driver being placed at the left with centre control.

The usual breather pipes have been eliminated, the crankcase compression escaping through openings directly into the valve mechanism pockets in the cylinder castings, carrying with it an oil mist that lubricates this mechanism thoroughly. Breather holes in the valve cover plates relieve the pressure in these pockets, so that in reality this arrangement simply means the utilization of the oil that formerly was wasted by being carried off through the exit direct from the crankcase to the open air.

Among the refinements is the use of an accessible and easily adjusted coupling in the shaft between the magneto armature and the driving member. It comprises two flanges with bolt holes drilled at different intervals in the circumference, permitting of changing the timing two degrees or more without altering the position of the actuating gears.

The motor is of the L head type with the cylinders cast in threes and these have a bore of 3.75 inches and stroke of 5.25. It is rated at 50 horsepower, but it is stated that it has developed 54 on the block at 2000 revolutions a minute. The valves are large, fully enclosed, and the timing gears are spiral, but the shaft driving the pump first and then the dynamo is actuated from the crankshaft through a silent chain. The pump is of the centrifugal type, the radiator a honeycomb, and the pressed steel fan is adjustable.

One of the features of the motor is the arrangement of the manifolds. In each cylinder casting the intake ports are siamesed so that the mixture is led into the block between the last two cylinders of each casting, permitting of the use of

## DETAILS OF 1914 MARION LINE.

**Adjustable Magneto Coupling.**  
**Elimination of Breather Pipes.**  
**Turnbuckle Adjustment of Brakes.**  
**Electric Lighting and Motor Starting.**  
**Electric Horn Mounted on Steering Column.**  
**Cone Clutch Displaced by Dry Disc, 19 Plates.**  
**Self-Lubricating Shackle Bolts, Instead of Grease Cups.**  
**Left Hand Drive and Centre Control, Instead of Right.**  
**Spare Tire Carried on Auxiliary Felloe at Rear of Chassis.**  
**New Six-Cylinder Chassis, Cylinders Cast in Threes; Bore, 3¾; Stroke, 5¼; Horsepower, 33.75, S. A. E. Rating.**  
**Body Styles—Five-Passenger Touring Car, Two-Passenger Roadster, Four-Passenger Coupe and Five-Passenger Sedan.**

Illustrating Some of the Features of the New Marion Six, Involving Several Mechanical Changes from Current Marion Practice.

a simple Y shaped manifold. Individual exhaust passages are utilized, the gases passing out in a straight line to the exhaust pipe, which is a flexible metal tubing.

Ignition is by a Splitdorf magneto, carburetion by a Rayfield, while the fuel feed is by pressure maintained by a pump actuated from the camshaft. The fuel tank is suspended at the rear, is provided with a convenient gauge, and has a capacity of 20 gallons. The lubricating system is a combination force feed to the main bearings and automatic level splash. The cone clutch has been abandoned for the dry disc, comprising 10 driving and nine driven plates, and easy engagement is emphasized in the construction. The motor and clutch form a unit which is suspended at three points. Ample provision is made for the adjustment of the clutch and components of the power plant.

The Marion type of rear system is continued

eliminated on the spring shackles, the bolts of which are made hollow and carry wicking saturated with oil.

The wheelbase is 124 inches and the tires are 35 by 4.5-inch with quick detachable, quick demountable rims as standard equipment. One of the features of the new chassis is the method of carrying the spare shoe. Instead of the usual basket or strap, an auxiliary felloe is mounted at the rear of the frame and the extra tire is mounted on this and firmly bolted in place exactly the same as on the wheel, except that one lug is used. This arrangement not only makes for security, but quick service. Another refinement is the use of bumpers placed on the underside of the frame instead of the conventional practise of mounting them on the rear axle.

The operator is placed at the left with centre control, and the lighting and ignition switches, ammeter, gauges and other control members are

**Chassis View of Marion Six, Having a Dry Disc Clutch, Left Hand Control and a Motor Rated at 54 Horsepower.**

with the gearset rigidly bolted to the differential housing. The transmission provides three forward speeds and a reverse, the gear ratio of the rear axle giving a 3.75:1 on the direct drive. The gears and shafts are 3.5 per cent. nickel steel and special Hyatt bearings are utilized.

The axle is of the floating type and instead of the usual dog fitting into the hub of the rear wheels the live shafts have a deep flange which bolts onto the wheel itself, eliminating opportunity for lost motion in transmitting the power. Hyatt roller bearings are utilized throughout.

The frame is suspended on special imported Sheffield steel springs, semi-elliptic in front and three-quarter elliptic in the rear. Both sets of brakes are of the internal type and a turnbuckle on the rear end of the brake rods provides quick and easy adjustment. Grease cups have been

located on an instrument board just far enough under the cowl to protect them from the weather. The motor starter is actuated by depressing a pedal and energy is applied through silent chain directly to the motor crankshaft. The lighting and motor starting system is a Westinghouse. The electric headlights are mounted upon straight vertical rods, which carry them higher than in usual practise and the side lights are inset in the dash. A novelty is noted in the mounting of the electric horn, it being placed on a special bracket attached to the steering column. It is also under the hood.

The body lines tend toward straighter design than formerly, except for the slight bell shape at the rear, and roominess is noted in all models. Deep Turkish upholstery of high grade material is used, and the equipment is complete.

## BIG PLANT FOR MINNEAPOLIS.

**Standard Motor Company Organized with Capital of \$6,000,000.**

Announcement is made from Minneapolis that the Standard Motor Company has been organized in that city with capital of \$6,000,000, and that plans are under way for the erection of a \$3,000,000 automobile manufacturing plant. The statement includes the information that the new concern will take over the Minneapolis Motor Company and the Colby Motor Company, the latter of Mason City, Ia.

Among those said to be interested in the project are: F. E. Kenaston, president of the Minneapolis Threshing Machine Company; M. J. Scanlon of the Brooks-Scanlon Lumber Company and the Scanlon-Gipson Lumber Company, and P. M. Starnes, vice president of the American Timber Holding Company.

## TO DOUBLE ITS OUTPUT.

**C. A. Shaler Company Begins Work on Three-Story Addition to Its Factory.**

The C. A. Shaler Company, Waupun, Wis., maker of Shaler vulcanizing devices, has broken ground for the erection of a three-story addition to its present plant. It is anticipated that this will give ample floor space and other facilities for practically doubling the output of the company.

The old plant was built in 1911 and has become entirely inadequate to supply the demand for the product, although it has been operated 23 hours a day nearly all summer. The new structure will be devoted to the manufacture of the garage steam vulcanizer, which was placed in the market about a year ago.

## BUYS AUTOMOBILE SCHOOL.

**West Side Y. M. C. A. Will Absorb New York School of Automobile Engineers.**

The West Side Y. M. C. A., Eighth avenue and 57th street, New York City, has long been successful in operating an automobile school from which its graduates have found ready employment because of the thoroughness of the course adopted. It is not without some surprise, however, that it is learned that this association has acquired the New York School of Automobile Engineers, 146 West 56th street, and that the

entire equipment has been transferred to the Y. M. C. A. plant, where the students who began courses under the old management are to finish their studies.

As a result of the absorption an arrangement has been made with the International Motor Company, whereby the Y. M. C. A. school will train men for that concern. In addition, it is announced that the International company has placed a three-ton Mack truck at the disposal of the Y. M. C. A. school to be used in giving road lessons in the motor truck department. The new equipment acquired by the school includes the following: Saurer and Mack chassis, complete motors, clutches, carburetors and transmissions, and a Mack axle.

## CLAIMS PATENT INFRINGEMENT.

**Bosch Magneto Company Alleges Manufacturers Are Ignoring Its Rights.**

The Bosch Magneto Company, New York City, says that with the increased activity in the motorcycle and cyclecar branches of the industry, it has been brought to its attention that certain manufacturers of magnetos are constructing instruments which are held to be direct infringements of Bosch patents. Patent No. 974,967, issued to G. Honold, Nov. 8, 1910, which is claimed to be the basis for successful magneto ignition for gas engines of the two-cylinder V type, covers the invention in question. Special attention is directed to two of the claims, as follows:

The combination of a dynamo electric generator having means for producing a plurality of substantially equal maximum rates of change of flux at alternating longer and shorter intervals, of ignition circuits arranged to be energized by said changes of flux, and two explosive engines having igniters within the ignition circuits and arranged in intersecting planes.

The combination with two explosive engines having the axes of their cylinders inclined to each other, said engines being provided with igniters, of an electric generator having its armature driven by and at a fixed speed with relation to the engine, and having generator windings, means for producing an intermittent maximum rate of change of flux through the generator coils at alternately longer and shorter angular intervals corresponding to the angular intervals between the times of ignition and ignition circuits, including the generator windings and the respective ignition devices of the engine, whereby a maximum voltage is produced at the igniter of each engine at the time of ignition.

The Motometer Company, New York City, learns, with pleasure, that Jules Goux and Georges Boillot utilized motometers made by this company, on the radiators of their winning Peugeot cars in the recent small car race in France. It is stated that this is the first strictly American device that has ever been used by foreign racing drivers.

### SEVENTEEN YEARS AFTER.

#### Pioneer Boston Dealers Celebrate Beginning of Automobile Industry.

While there was much previous experimentation with the horseless carriage, some of it taking place in Boston and some elsewhere in the country, it hardly will be denied that the automobile industry in America really saw its beginning in that city. Seventeen years ago the first agency for cars was established in the Hub. This fact was fittingly celebrated by some of the pioneer automobile men in the Copley Square Hotel the evening of Oct. 23.

The story has often been told, but it will bear repeating again—briefly. It was 17 years ago this month when Kenneth Skinner of Boston arrived in New York from France, bringing with him a De Dion-Bouton tricycle propelled by a gasoline motor. That is, it was generally hoped that it could be propelled by its gasoline motor. The customs authorities were at a loss as to the proper classification under which to admit the vehicle, and Mr. Skinner was permitted to place his own valuation upon it. He suggested \$100, and the clerk assessed \$45 as duty. Immediately afterward he confided to a fellow clerk that he felt sorry for the importer as it would be necessary to push the contrivance all the way to the Boston train.

The other evening Mr. Skinner recounted the circumstances attending the importation of this first self-propelled road vehicle, and several of those present were able to supply some interesting sidelights. It must be remembered that success did not at all times perch upon the banner of those who sought to build other machines after this model, or to dispose of them after they were made.

At the conclusion of the dinner it was decided to form a permanent organization of the veterans of the industry, and R. R. Ross, Harry Fosdick and George G. Reed were appointed a committee to arrange the details.

### ELEVEN NEW MEMBERS.

#### Motor & Accessory Manufacturers Announces Several Additions to Its Ranks.

Announcement has been made by the Motor & Accessory Manufacturers, New York City, of the election of new members as follows: Cleveland Tanning Company, manufacturer of leather, Cleveland, O.; Racine Manufacturing Company,

automobile bodies, Racine, Wis.; Benford Manufacturing Company, spark plugs, timers, oil gauges, lighters, screw machine work, etc., Mt. Vernon, N. Y.; Gemmer-Detroit Starter Company, air pumps, garage plumbing outfits and air starters, Detroit; McGraw Tire & Rubber Company, tires and inner tubes, East Palestine, O.; J. M. Shock Absorber Company, J. M. shock absorbers, Philadelphia, Penn.; F. S. Carr Company, rubberized top and seat covering material, Boston, Mass.; Torbensen Gear & Axle Company, axles, Newark, N. J.; Taylor Instrument Company, thermometers, barometers, hydrometers, etc., Rochester, N. Y.; Reynolds-Browne Company, automobile lamps, Chicago, Ill.; Knight Tire & Rubber Company, tires and inner tubes, Canton, O.

### AT THE ELECTRIC SHOW.

#### Two New Commercial Vehicles and a Touring Car Model Are Revealed.

The Electrical Exposition and Motor Show, which opened in the Grand Central Palace, New York City, Oct. 15, served to introduce to the industry two new light delivery wagons and a touring car. Seven makes of automobiles were displayed, the new vehicles being a 1000-pound G. V., a Champion of the same capacity and a Bailey touring car.

The Champion is made by the Henry Tobin Company, New York City, and it is understood that it also will be presented with carrying capacity of 750 pounds. The touring car resembles the well known roadster produced by the Bailey concern, and except for the fact that it is slightly smaller and lower than a gasoline machine, might easily be mistaken for one. The new G. V. presents a number of changes from former practise with the General Vehicle Company.

The list of exhibitors representing the automobile and allied industries follows:

Albert & J. M. Anderson Manufacturing Company, Boston, Mass.; S. R. Bailey & Co., Amesbury, Mass.; Edison Storage Battery Company, Orange, N. J.; Electric Storage Battery Company, Philadelphia; Elizabeth Automobile Company, Elizabeth, N. J. (Standard cars); General Electric Company, Schenectady, N. Y.; General Motors Truck Company, Pontiac, Mich.; General Vehicle Company, Long Island City, N. Y.; Gould Storage Battery Company, New York City; H. W. Johns-Manville Company, New York City; Manhattan Electrical Supply Company, New York City; Philadelphia Storage Battery Company, Philadelphia; Rhineland Machine Works, New York City; Clarence L. Smith Company, New York City; Wagner Electric Manufacturing Company, St. Louis, Mo.; Henry Tobin Company, New York City; Ward Motor Vehicle Company, New York City; Westinghouse Electric & Manufacturing Company, Pittsburg, Penn.; Couple-Gear Freight-Wheel Company, Lansing, Mich.

## GENERAL NEWS OF THE INDUSTRY.

### Effect of American Locomotive Company's Annual Meeting on Alco Production— Reports Show Many Concerns Have Enjoyed a Good Year's Business.

**I**T WOULD appear that the decision of the American Locomotive Company to abandon the manufacture of Alco cars and trucks was definitely determined by the action of the stockholders at the annual meeting of the company in New York City, Oct. 21. Since announcement of this decision was made by the board of directors in August, a number of circumstances have arisen, as a result of which there has been some question as to the possibility of a reversal in policy.

Several stockholders, headed by Isaac M. Cate, were present or were represented at the annual meeting to urge the appointment of an investigating committee composed of men outside the company, which should take up the whole question of management, etc. This proposition was defeated by a substantial majority. President Marshall delivered a statement answering many of the criticisms, and promised to explain, in the near future, other points raised during the meeting.

Some of these were brought up by President Seelye of Smith College, Northampton, Mass., who represented the holdings of that institution in the company. Mr. Seelye desired particularly to learn why it had become necessary to devote a large sum from the profits of the company toward a deficit in the automobile department. Mr. Marshall promised to take up this matter in his forthcoming statement.

#### MONDEX-MAGIC CARS.

#### Chassis to Be Produced by Palmer-Singer People for Aristos Company.

Coincident with the announcement that the Aristos Company of New York City was to make display of cars at the forthcoming show in that city, comes the information that the concern is to produce the Mondex-Magic in two models, a four-cylinder and a six. The chassis will be fitted with Magic motors, for which the Motor & Gear Improvement Company, 250 West 54th street, New York City, has the American rights.

It is explained that the chassis will be built by the Palmer & Singer Manufacturing Company, Long Island City, N. Y., which also will utilize Magic motors in cars bearing the Palmer-

Singer name. This concern is understood to have the only American license thus far granted for the production of Magic motors. The Aristos company is said to be closely associated with the Motor & Gear Improvement Company, and the same thing holds true of the Palmer-Singer concern.

#### WILLYS-OVERLAND EARNINGS.

#### Preliminary Statement Shows Net Business of Over \$5,000,000.

The Willys-Overland Company, Toledo, O., has released certain figures concerning the year's business previous to the publication of the annual report, in which it is noted that the net earnings of the company were over \$5,000,000. The preliminary statement follows:

|   |                    |
|---|--------------------|
| Net earnings, from operation of all companies, after deducting all expenses, including an adequate allowance for accruing renewals and depreciation ..... | \$5,705,537        |
| Interest on notes and accounts receivable, etc..  | 176,829            |
| <b>Total income.....</b>  | <b>\$5,882,367</b> |
| Interest on floating debt.....  | 228,468            |
| <b>Surplus.....</b>   | <b>\$5,653,898</b> |
| Preferred dividend .....  | 350,000            |
| <b>Surplus.....</b>   | <b>\$5,303,898</b> |

#### PAYS STOCK DIVIDEND.

#### Packard Motor Car Company Increases Capital to \$16,000,000.

At the annual meeting of the Packard Motor Car Company, Detroit, the stockholders approved the recommendation of the directors for the distribution of a stock dividend of 40 per cent. in common stock among owners of such stock in the company. In addition, the capital of the company was increased from \$10,000,000 to \$16,000,000, by adding \$3,000,000 to the common and a like amount to the preferred, thus raising the total of each from \$5,000,000 to \$8,000,000. Practically all of the stockholders acquiesced in the plan of waiving their right to subscribe to the \$1,000,000 of new common which will remain after the stock dividend, and similar action was taken with respect to the \$3,000,000 of the new preferred stock.

President H. B. Joy explains that this action is merely the execution of a plan which has been in evolution for about two years. The stock dividend will be the first payment made to owners of common stock in about four years, during which earnings have been applied to increasing capital investment by making additions to the plant and other improvements. Mr. Joy adds that about \$1,000,000 of Packard stock is owned by Packard employees, who have availed themselves of the opportunity to acquire it at par.

### REO HAS GOOD YEAR.

**Business Is Largest in Its History and Surplus Reaches \$2,000,000.**

According to the report presented at the annual meeting of the Reo Motor Car Company,

### NEW FACTORY IS COMPLETED.

**Gray & Davis Claims It Has Largest Plant of Its Kind in the World.**

What is claimed to be the largest factory in the world devoted exclusively to the production of electric lighting and motor starting systems, has just been completed by Gray & Davis, Inc., on the bank of the Charles river in Cambridge, Mass. The new plant will afford employment for nearly 1000 men, and has a total floor space of 180,000 feet. The material is reinforced concrete with tapestry brick exterior.

The main building is 380 feet long, 60 feet wide and five stories high, while in the rear is an extension comprising 10 stories, each story being one-half the height of those in the main structure. In this extension there will be located

Recently Completed Factory of Gray & Davis, Inc., on the Bank of the Charles River in Cambridge, Mass.

Lansing, Mich., during the present month, the concern enjoyed the best business in its history, and ends the fiscal year with a surplus of over \$2,000,000. Considerable money was expended in increasing facilities, by the erection of a warehouse and various other additions, and the acquisition of machinery equipment. The management will remain the same during the coming year. The report shows the following:

| Assets.                                    |                |
|--|----------------|
| Capital assets—                            |                |
| Real estate, buildings, etc.....           | \$2,019,356.17 |
| Current assets—                            |                |
| Inventories, accounts receivable, etc..... | 1,312,734.42   |
| Cash on hand and in banks.....             | 885,383.61     |
| Total.....                                 | \$4,217,474.20 |
| Liabilities.                               |                |
| Capital stock .....                        | \$2,000,000.00 |
| Current liabilities .....                  | 155,586.80     |
| Surplus account .....                      | 2,061,887.40   |
| Total.....                                 | \$4,217,474.20 |

the lockers, wash rooms, pattern vaults, etc.

On the ground floor of the main building are the heavy duty machines, presses, stamp mills, etc., buffing and hardening rooms. The raw material comes in on this floor and will be distributed by a miniature railroad. The second floor contains the general offices, private offices of the heads of all departments, stockroom, wiring room and battery department. The assembling and light machine work will be done on the third floor, and over half of the space will be devoted to testing and inspection rooms. The manufacture of all small parts and detailed electrical work will be done on the fourth floor, with some little room left for the experimental department. The electrical engineers, the draughting rooms and the office of the chief engineer will be on the top floor, also a restaurant and rest rooms for employees.

**MORE MONEY FOR SIMPLEX.****Increased Capital to Take Care of Product of Its New Brunswick Factory.**

The Simplex Automobile Company, New York City, has been reincorporated under the laws of Delaware for \$1,500,000, which represents an increase in capital of \$500,000. It is understood that this additional money was needed to take care of the increased business made possible by the new factory in New Brunswick, N. J. The new officers of the concern are: President, Henry Lockhart, Jr.; first vice president, Otto Boessneck; second vice president, J. Hopkins Smith, Jr.; secretary and treasurer, C. T. Neubourg. The directors comprise the above officers and Hobart J. Park, C. C. Goodrich, Hugo Boessneck, Robert Behr, G. V. Lansing, John D. Dale and G. E. Franquist.

Messrs. Lockhart, Smith and Goodrich are members of the banking firm of Goodrich, Lockhart & Smith, New York City, while Mr. Goodrich also is a director in the B. F. Goodrich Company. Mr. Park formerly was president of Park & Tilford, New York City. Messrs. Boessneck are members of the firm of Boessneck, Broesel & Co.; Mr. Behr of Robert Behr & Co.; Mr. Lansing, a director of the Commercial National Bank, Albany, N. Y., and president of the Albany Garage Company. Mr. Dale has been sales manager of the Simplex company, and Mr. Franquist, its superintendent and designer. Herman A. Broesel, who has been with the company since its formation, will be manager of the service department, and Carl A. Broesel will be located at New Brunswick.

**ANOTHER DETROIT CAR.****S. & M. Motor Company, Recently Organized, Secures Necessary Plant.**

Detroit is to have still another motor car manufacturer, in the S. & M. Motor Company, which has secured a factory containing 50,000 square feet of floor space at 1900 Mt. Elliott avenue, and will begin at once the production of S. & M. cars. The following men are among those interested in the concern: Edward E. Stroebel, a furniture manufacturer in New York City, and Walter C. Martin, formerly a New York City dealer in Cadillac cars.

It is understood that Mr. Martin is largely responsible for the design of the new machine, which is to be constructed primarily to meet the

demand, which he believes exists, for a strictly high grade standardized car. Four body designs will be produced.

**MAKE KELLY TRUCKS.****Two Men Who Have Succeeded Well in the Country of Their Adoption.**

Two men who are largely responsible for the success of the Kelly-Springfield Motor Truck Company, Springfield, O., maker of Kelly trucks, are President James L. Geddes and Chief Engineer Charles Balough. The former was born on a farm near Banffshire, Scotland, March 16, 1857, and the latter in Nagy-Lak, Hungary, in 1883.

Mr. Geddes secured his education in the schools of Aberdeen, and came to this country in

At Left, President James L. Geddes; at Right, Chief Engineer Charles Balough, Kelly-Springfield Motor Truck Company.

1874. Later he became connected with the Grand Trunk railroad, and when he left that concern in 1899 he was auditor of the car department for the entire Grand Trunk system, with headquarters in Montreal. He next became general manager of the Detroit City Gas Company, with title of auditor, and later was its treasurer. This company is controlled by the Emerson McMillan Company, 40 Wall street, New York City, which has varied interests throughout the country, and Mr. Geddes represented it in several capacities. He became president of the Kelly-Springfield company in April.

Mr. Balough was educated in Budapest, and in 1902 was graduated from the Royal St. Joseph University with the degree of mechanical engineer. He came to America in 1903, since which time he has been connected with the engineering department of the following concerns: Northern Motor Car Company. Great Lake Engineer-

ing Works, Ford Motor Company, Cadillac Motor Car Company and General Motors Company. He was appointed chief engineer of the Kelly-Springfield company in July, 1910.

### WILLYS ASSUMES MANAGEMENT.

#### Promotion for Other Officials—Purchase of Connecticut Plant.

John N. Willys, president of the Willys-Overland, has announced that, owing to the death of Vice President George W. Bennett, he will resume the entire management of the business. In line with his belief in the principle of promotion, C. S. Jameson, formerly one of the sales managers, has been elected director and second vice

John N. Willys, President, Willys-Overland Company.

president, in charge of sales, of the Willys-Overland and subsidiary companies. H. B. Harper becomes sales manager and D. W. James, assistant to the president.

The company has purchased the plant and business of the Globe Ball Bearing Company of Norwich, Conn., and the machinery will be removed to Elmira, N. Y., where it will be re-established in connection with the Morrow Manufacturing Company, another subsidiary. It is announced that the purchase will enable the production of the few small parts which it has heretofore been called upon to purchase outside, so that in the future every part of Overland cars will be made by the company and its subsidiaries.

### SECURES NEW QUARTERS.

#### Red Head Spark Plugs Now Located in Bush Terminal Building.

In order to increase its manufacturing and shipping facilities, the Emil Grossman Company,

maker of Red Head spark plugs, has consolidated its Detroit and New York factories under one roof in the spacious Bush Terminal building, factory No. 20, at 41st street and Second avenue, Brooklyn, N. Y. The Detroit plant will be continued as the western branch, where ample stock will be carried for the western trade. The porcelain factory in Trenton, N. J., where several kilns recently have been built and three new buildings are now being erected, will not be disturbed.

The new Red Head spark plug headquarters will embrace 31,000 square feet of floor space, all on one floor. This increase will permit of the installation of a battery of specially designed machinery, nickel and brass plating, and enamelling equipment, which will enable the company to regulate the speed and control of workmanship on every operation in the production of its goods. Shipments, instead of being hauled for miles through New York's crowded streets to congested freight yards, will be loaded directly into cars right at the door and immediately dispatched.

### ENTERS LARGER FIELD.

#### Henry L. Hornberger Establishes Himself as Pacific Coast Distributor.

Henry L. Hornberger, who is one of the best known automobile men on the Pacific Coast, and who opened the first factory branch of the Oakland Motor Car Company in that territory, has decided to engage in business for himself, as Pacific Coast distributor for three well known lines. His resignation from the Oakland branch in July was followed by a period of speculation as to his future activities. His headquarters will be located in San Francisco, and he will cover the states of California, Oregon, Washington, Idaho, Nevada and Arizona, and British Columbia in Canada.

Mr. Hornberger is primarily a gasoline car man, and it occasions no surprise that he has decided upon the Palmer-Singer, made by the Palmer & Singer Manufacturing Company, Long Island City, N. Y., as one of the lines which he will handle. He has added the Brown internal gear driven truck, made by the Brown Commercial Car Company, Peru, Ind., to care for the commercial vehicle end of the industry.

During the past few months he has been studying the situation in this district with a view to supplying an electric pleasure car, for which he believes a large demand can be developed. On his recent eastern trip he spent a few days at

the factory of the Borland-Grannis Company, Chicago, where he examined the Borland electric line and became somewhat enthusiastic concerning its features, with the result that this make has been added as the third member of the line to be represented by him.

#### A CO-OPERATIVE PLAN.

##### Kearns Motor Truck Company Admits Employees as Stockholders.

The Kearns Motor Truck Company, Beavertown, Penn., has been incorporated under the laws of Delaware for \$100,000, \$40,000 of which is six per cent. cumulative preferred and \$60,000 common. The par value of the shares is \$10. The incorporation is on the co-operative basis, employees, from the lowest salaried up, having taken stock, these including those in the sales end.

The owners of the business have taken \$40,000 of the common stock, to reimburse them in part for the experimentation, good will, etc. The balance of \$20,000 common is to be divided among the preferred stockholders, at the rate of one share of common gratis with every two shares of preferred.

Those responsible for the business have been producing the Kearns truck during the past eight years, and have been engaged in the manufacture of carriages and wagons for 25 years. The company has succeeded in having its trade mark "Gearless" registered through the United States patent office.

#### TO LOCATE IN DAYTON?

##### Officials of Grant Motor Company Apparently Pleased with That City.

According to a dispatch from Dayton, O., President George D. Grant, General Manager George S. Waite and Treasurer H. S. Shaw of the Grant Motor Company, now of Detroit, were recent visitors in that city for the purpose of inspecting sites for the location of a factory. The company was organized recently for the production of a low priced car of the roadster type, and the capital has lately been increased to \$200,000. It is anticipated that a large number of cars will be produced during the 1914 season.

The Detroit guests were met by the local Grant representative, M. D. Thomas, and committees from the Greater Dayton Association, and they are said to have expressed their surprise and pleasure at the opportunities offered by the

Ohio city. Indeed, Mr. Thomas felt justified in saying that there was practical assurance that the plant would be removed to Dayton.

#### RETURNS TO BOSTON.

##### William B. Fewell Succeeds Fred Walsh as Manager of Oakland Branch.

Succeeding Fred Walsh, who has resigned to go to the Pacific Coast, William B. Fewell, for a long time associated with the industry in Boston, has returned to that city as manager of the Oakland branch. He has until recently been manager of the Oakland branch in New York City, going to that concern from the New England division of the Olds Motor Works in Boston.

Mr. Fewell is a native of Springfield, Mass., and gained his original automobile experience with the Locomobile Company of America, being connected with that concern for a number of years in the earlier days of the industry. For a long time he was its travelling representative, with the result that he

William B. Fewell, Manager, Boston Oakland Branch.

came in direct contact with a large number of men engaged in the trade throughout New England and the East.

Upon leaving the Locomobile people he became associated with the Oldsmobile in St. Louis, working his way to the position of manager of that branch. Naturally, this increased his circle of friends and acquaintances very materially. It was from St. Louis that he was transferred to Boston, still with the Oldsmobile interests. His many friends throughout the country will be glad to learn of his return to that city.

When the Ford Motor Company, Detroit, closed its fiscal year, Sept. 30, approximately 325,000 model T Ford cars were in use throughout the world.

# NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

## Dayton License Holder.

The Dayton Malleable Iron Company, Dayton, O., is manufacturing two new designs of license plate holders. The front style comprises two right angle arms, also a clamping construction, fitting around the filler member of the radiator. The securing device differs from conventional design in that it is made to clamp around oblong or round filler members. It is locked by a bolt and nut. The rear design is made with a combination socket, permitting of its use with either a round or flat lamp iron, and assures proper illumination of the number plate. Both styles have adjustable means, thumb nuts and lock washers.

## Pruden Auto Chair.

The W. E. Pruden Hardware Company, 260 West 52nd street, New York City, is marketing three styles of collapsible automobile chairs which may be folded very compactly and utilized when an extra passenger is to be carried. They are made in three sizes, that for a child being 12 inches, the medium 15 and the large 17. They have comfortable seats and backs, upholstered in maroon or black leather, and the entire construction is substantial as well as light.

## Masco Air Gauge.

The service obtained from tires depends largely upon the owner. One of the most important rules for the motorist to observe is proper inflation of the shoes and every manufacturer recommends the use of a tire gauge when fitting a casing and in service. The Motorcycle Accessories Company, St. Paul, Minn., is marketing the Masco air gauge, which differs from usual design in that it is permanently attached to the valve stem by a lock nut. The dial is approximately the size of a 10-cent piece, calibrated, and a watch hand denotes the pressure. It makes for convenience in that the hand may be watched while inflating the tire. The dial is protected by a hinged lid. The device is very compact and as will be noted by the accompanying illustration, is fitted with a conventional type of valve cap.

## Ten Eyck Automatic Air Pump.

The Ten Eyck Pump Company, Auburn, N. Y., is producing the Ten Eyck automatic air pump, which is designed for service with motor starting systems and for inflating tires. When utilized on the motor car the gear-shift is automatically controlled by a separate cylinder and piston, which is operated by the pressure in the storage tank or the tire. The back pressure from the air receiver slides the pump gear into mesh with the driving gear, the pump gear running idle until the two gears are partly meshed. The clutch is then engaged. Discon-

necting the pump from the air receiver allows the pressure to escape from the automatic cylinder and the gears are disengaged by means of a spring. In this operation the clutch is first disengaged, permitting the pump gear to run idle while being drawn out of mesh. This arrangement makes easy engagement and disengagement of the gears without reducing the motor speed. When the pump is utilized in connection with a storage tank for starting purposes, a special air valve and pressure gauge is inserted in the pipe between the pump and the tank, and is usually mounted on the dash. The operation of this valve is automatic. The Ten Eyck pump is 10 by 4.5 inches, weighs 10 pounds and has a capacity of two cubic feet a minute. All parts are constructed of high grade material and the workmanship is first class in every respect. The equipment includes 15 feet of rubber tubing, pressure gauge and hose fittings.

## XXX Spark Plug.

The XXX Auto Accessory Company, Springfield, Mass., is manufacturing a novel spark plug termed the XXX, which is sold under a money-back guarantee. The feature of the plug is the use of detachable electrodes, a design permitting of replacement of damaged or burned members at a very slight expense and without difficulty. The gap is double with this plug, and there are a number of interesting features which are explained in the booklet issued by the company. It will be mailed free on request.

## Auto-Queen Wrench Set.

The C. M. B. Wrench Company, Garwood, N. J., is manufacturing the Auto-Queen wrench set, which is specially designed for motor car work. The No. 11 set includes a ratchet wrench, universal joint, long extension, screw driver, spark plug socket and 15 sockets. The last named members provide for hexagon parts from .25 to .625 inches, cap screws from .25 to .5625 inch and square from .25 to .375 inch. The outfit comes in a neat, substantial hard wood box. Its weight is seven pounds. The No. 12 set is less expensive and not as complete, but includes sufficient sockets, etc., to complete ordinary work. The company also manufactures wrench equipments for factories and for machinists.

## Ka-Ha-Co Horn.

The Kales-Haskel Company, Detroit, announces the Ka-Ha-Co electric horn, with which it is stated a powerful note is obtained without harshness. The construction is simple, well known electrical engineering principles being utilized, and it is stated that its service cannot be impaired, except through injury. It comes finished in brass and black, also nickel and black, the latter type costing \$1 more. The horn is moderately priced and with

Dayton License Holder

Pruden Auto Chair

Ka-Ha-Co Horn

Auto-Queen Wrench Set

Ten Eyck Automatic Air Pump

it is furnished suitable length of cable and push button.

#### **Hans Ford Oil Gauge.**

The American Auto Supply Company, 1741 Broadway, New York, is marketing the Hans Ford oil gauge, which differs from the usual lubricator indicators, in that it is placed on the dash in plain view of the operator, and it is stated that the height of the oil in the crankcase is accurately shown. A float chamber is connected to the crankcase of the motor by a close nipple or pipe, and the float with the indicating dial, so that any change in the float chamber is instantly shown on the dial. It is supplied complete with all fittings, etc., and instructions. It is designed for attachment to 1911, 1912 and 1913 model T Ford cars.

#### **Leader Gasoline Torch.**

A torch is a valuable addition to the garage equipment, as it may be utilized for a number of useful purposes, such as heating soldering irons, starting frozen nuts, etc. The Leader Manufacturing Company, Cleveland, O., is producing a compact blow torch, which is equipped with a device for retaining the iron. Soldered joints or seams are eliminated by the construction and the torch is fitted with an Alaska wire coil handle, permitting of easy handling without danger of burning the hand.

#### **McCormick Enginetone.**

The McCormick Manufacturing Company, Dayton, O., is offering a carbon destroyer called Enginetone, which is a chemical preparation, a fluid, supplied in a bottle. It is stated that it does not contain any oil, acid or explosive, or inflammable material. It is used in proportions of a teaspoonful to a cylinder and it is said that it will break up carbon without injury to the metal. Each bottle contains six ounces.

#### **Favorite Auto Hood.**

The Favorite Knitting Mills, successor to A. J. Mandel & Co., 1388 West Sixth street, Cleveland, O., is manufacturing a practical article for women and children who motor, termed the Favorite auto hood. The design is not only neat appearing, but it protects the head of the user and the shape and material makes for decided comfort. It is made in differing sizes, in all wool worsted, fibre silk and mercerized. A wide variety of shades is offered and the price is very moderate. One of the features of the Favorite auto hood is that it keeps the hair shapely when motoring.

#### **Curry Fabric Fan Belt.**

One of the objections to belt drive is that the material will stretch in service, due to atmospheric changes, oils, etc. The C. & B. Hinson Company, Grove and Liddell streets, Cincinnati, O., is manufacturing the Curry fabric automobile fan belt, which it is stated will withstand oils, greases, heat, etc., and it is also claimed that it will not stretch after service. The belts are woven by special

machinery, of a high grade upland cotton and linen thread, then treated by a secret process which renders them proof against the troubles outlined above. The belts are made endless, to fit any design of fan pulley on the motor and are moderately priced. The company makes a specialty of belts for model T Ford cars, and is prepared to supply them in any lengths, furnishing a special belt fastener. The Curry belting is also made in rolls for the trade, and of standard dimensions.

#### **Seamless Non-Skid Tire.**

The Seamless Rubber Company of New York City, with factories at New Haven, Conn., offers the Seamless non-skid tire, which is constructed of the same high grade material and workmanship as the other products of this concern. The company lays special emphasis on the fact that it employs only the pure Brazilian Para rubber and the finest of Sea Island cotton, which is specially woven and cut diagonally to obtain the maximum amount of flexibility and tensile strength. The company employs the single cure process and each casing is covered by the usual 3500-mile guarantee. The Waite Auto Supply Company, Providence, R. I., is Rhode Island distributor.

#### **Edison Ford Starter.**

The Consolidated Gas & Electric Company, 552 West Lake street, Chicago, is marketing the 1914 model Edison starter for model T Ford automobiles. It is a mechanical motor starter, operated from the seat, and it is stated that little exertion is required to spin the engine as the leverage is compounded. Energy is applied through suitable linkage to the ratchet wheel on the crankshaft, a pawl engaging with this gear, but provided with a device to compensate for any back fire of the motor. It is stated that the system can be applied without alterations and that no tools other than a wrench and hammer are necessary. It does not interfere with the use of the usual starting crank, which is retained. The company also manufactures a model for the K-R-I-T, Regal and Studebaker cars.

#### **Arbeco Glass Lamp.**

A novelty in lamp design is noted in the Arbeco, manufactured by the Reynolds-Browne Company, 1312 Michigan avenue, Chicago. It is an all glass lamp constructed both for headlight and side light use, weighs less than the usual metal electrical units and the material should make for easy cleaning as well as for efficiency. While it would appear that a glass lamp would invite easy breakage on a motor car, the maker claims that it is as durable as a metal unit, insofar as service is concerned. Between the reflector and the shell is a vacuum space which serves to prevent heat from within or without from creating undesirable temperatures, and the construction also protects the inner plating of metal that gives the lamp its finish. Inside of the shell or main

body is plated a layer of brass, nickel or copper, of a color to match the car. The reflector is a true parabola, this being silvered on the inside, where it is protected from atmospheric changes and not affected by cleaning. The only metal used is the door frame and the jamb. A focal adjustment is included, also a wired socket. The Arbco lamp is made in different sizes to meet requirements.

#### Motophone Horn.

The Automobile Supply Manufacturing Company, 220 Taaffe Place, Brooklyn, N. Y., is introducing a new horn known as the Motophone. It is mechanically operated, a slight pressure on a conveniently located lever resulting in a loud, steady, pleasant sound. The operating mechanism has been perfected by the maker after long experimentation and it is stated that in a test 5,000,000 signals were given without any adjustment being necessary. The maker calls attention to the convenience of the signal, in that its operation does not depend upon batteries. Throughout the workmanship and material is in keeping with the high grade product for which the concern is noted.

#### A. A. S. Priming Cup.

With the approach of cool weather more or less trouble will be experienced in starting a cold motor. While the majority of manufacturers make provision for priming, a large number of cars are not equipped with

sion chamber, thence through an opening to the air intake of the carburetor. Provision is made for replenishing the supply of oil as well as draining the old lubricant.

#### Anchor Spark Plug.

The Szel Import & Export Company, 359 Broadway, New York City, is marketing the Anchor spark plug, so-called from the design of the central electrode which terminates in two arms, having much the appearance of the flukes of an anchor. Another radical departure from conventional spark plug construction in the method utilized to prevent oil being splashed onto the porcelain, thereby depositing soot and eventually creating a short circuit and faulty operation of the plug. A cap is utilized on the Anchor plug, through which extends the central electrode, but the cap is so designed and located that the high-tension current cannot jump from it to the base of the shell, owing to the high resistance encountered. It is pointed out by the maker that any oil splashing onto the cap would be consumed by the heat of combustion. The electrode is of nickel. The plug is moderately priced.

#### Pioneer Handy Rub.

In polishing brass with ordinary cloths and waste the hands are more or less soiled by the cleansing material. The Northwestern Chemical Company, Marietta, O., is marketing the Pioneer handy rub, which is a polish-

priming cups. The American Automobile Supply Company, 1741 Broadway, New York City, and 1408 Michigan avenue, Chicago, markets a number of inexpensive, high grade priming cups, one of which is shown in an accompanying illustration. The cup is constructed of the best quality brass, carefully machined and nicely finished. It is fitted with spring key and cotter pin and it is stated it will not jar loose or leak. This design is furnished nickel plated and has a fibre handle, enabling opening of the cock when the motor is hot. The priming cup is made in .125 and .25-inch threads and weighs about four ounces.

#### Lord Air Cleaner.

Analysis of deposits on the pistons and cylinder heads has disclosed the presence of more or less road dust and other foreign elements. That clean air aids in carburetion, in that a better mixture is obtained, is conceded, and the presence of dust and dirt does not improve the operation of the carburetor. Many devices have been offered for preventing the entrance of foreign elements into the carburetor, including screens, etc., but a variation is noted in the Lord air cleaner marketed by the Lord Manufacturing Company, Brooklyn, N. Y. It is screenless, oil being utilized to separate foreign elements from the air on its way to the carburetor. The air enters an umbrella shaped opening and, in passing through a chamber containing oil, the lubricant attracts the impurities by adhesion. The air then flows to an expan-

ing device composed of strips of genuine oil tanned chamois sewed to a canvas back equipped with a practical retaining band for the hand. The maker states that it lightens the work of polishing brass, cleaning glass or the woodwork, and that the material is very durable and imparts a fine polish without danger of scratching the surface treated. It is inexpensive.

#### Volcano Electric Primer.

The Volcano Electric Primer Works, Virginia, Ill., is marketing a priming device called the Volcano electric primer, which utilizes electricity for vaporizing the fuel and which is easily operated. A small container is located inside the dash and has a line connecting with a small cup like device which is inserted in the intake pipe. Gasoline is supplied to a plate over the cup by the capillary process, a wick being employed to feed the fuel. The capacity of the cup member is very small and is suitably proportioned to make an easy starting mixture. Connected to the plate are two wires from a storage battery or dry cells, and by closing the circuit with the usual push button, the plate is heated, causing the fuel to vaporize. This makes for easy starting of the motor when cold, as not only is the mixture enriched, but it is vaporized by the rise in temperature. It is stated that the dash container has a capacity for about 150 starts without replenishing the supply of fuel. The device is easily installed and the connection may be made to the battery without interfering with the usual wiring plans.

### TESTING A KISSELKAR.

#### Los Angeles Man Tells of His Recent 3500-Mile Trip in the Mountains.

D. A. Whitaker, vice president, and W. R. Letton, secretary-treasurer of the Union Stock Yards Company, Los Angeles, recently completed a 3500-mile camping trip through the mountains of California, in a 60 horsepower KisselKar, made by the Kissel Motor Car Company, Hartford, Wis. Mr. Whitaker describes the journey as follows:

We loaded our camp outfit on board my KisselKar "60," including 1200 pounds of baggage and four weeks' provisions, and started north out of Los Angeles, through the Antelope valley and across the Mojave desert, where we found an ocean of sand. After leaving Mojave we ran into a number of water spouts, which washed out much of the road and all of the bridges. We took the lead of 13 machines, and there were only three of them that went through that day.

We drove to Freeman and stayed over night. Then we went through Lone Pine, Independence and Bishop. There we struck Dead Man's grade, which I believe to be one of the roughest and steepest grades in the State of California. We proceeded on our journey up to Mono Mills, a summit of 8000 feet, then down to Mono lake, through sand and boulders. The road we travelled over down to the lake has not yet been built. There we met Wallace MacPherson, the manager of the Mono Valley Improvement Company, and received the best of camp accommodations. We bought lubricating oil, which proved to be nothing but plain crude oil just out of the well, but it was all we could get. We filled the crankcase and started for Silver Lake. I believe the KisselKar would do its work on soap grease if it could get nothing better.

We arrived at Silver Lake, about 9500 feet elevation, where we won new laurels by taking our car and dragging the biggest pine log into the camp for fire purposes. I sometimes think if I had mudhooks on the car I could climb any mountain in the Sierra Nevada range. During our stay there we made a side trip through Bridgeport, while a big 90 horsepower machine and another car failed. We made the return trip of 78 miles in 7.5 hours, over mountain and sand roads.

On the return to Los Angeles we came over Gas Pipe grade, by way of Benton. This is one of the most crooked and sandy grades I ever saw. It is nine miles of constant climbing. I made most of it on the second gear. When we struck Red Rock canyon we were in the lead and just at this point the "90" refused to move. All that was left to do was to hook it on behind the KisselKar and draw it in. One of the party wanted to bet me his ranch that we could not move it, but when we turned on steam it rolled along as though it was hooked to a traction engine. We pulled it clear through Red Rock canyon to the Mojave desert. A good demonstration in the right place tells the story.

### MOLINE UPHOLSTERY.

#### President Van Dervoort Specifies That This Shall Be of the Best Quality.

Without detracting one whit from the efforts of the designers and engineers in the production of Moline cars, made by the Moline Automobile Company, East Moline, Ill., it is possible to call special attention to the upholstery, a point concerning which President W. H. Van Dervoort is

very particular. An accompanying illustration shows one of the steer hides used in the Moline factory, and indicates its size compared with that of the workman. This skin covers an area of 86 square feet and is the outside cut, next to the hair—the only cut used by this company.

President Van Dervoort maintains that Moline cars are made for those who demand the best; for those who are accustomed to costly furniture, grand opera, art masterpieces and the costliest that the market and craftsmanship of the world offers. Therefore, the upholstery, as well as every other factor comprising the completed car, must be of the best quality.

Cushions must be stuffed hard enough to carry the load and hold their original shape, yet they must not be so hard that they are uncomfortable.

Size of the Steer Hides Used in Upholstery on Moline Cars Compared with That of Workman.

There must be enough leather to cover the body thoroughly, yet it must not sag or draw too tightly, and every seam must be sewed to remain closed no matter what the strain. "Quality is the Moline by-word", says Mr. Van Dervoort, "and it is not our intention to slight the bodies and top work any more than we would slight the making of the chassis."

Harvey Granger, president of the Savannah Automobile Club, Savannah, Ga., under whose auspices the Vanderbilt Cup and Grand Prize races were to have been held next month, has notified the Motor Cups Holding Company of New York City that it will be impossible to stage the events as planned.

## WITH THE MOTORING INTERESTS ABROAD.

### Sunbeam Car Recaptures World's 12-Hour Record, Taken from It by Argyll in May---Crespelle and Schneider Machines Are Winners in Gaillon Climb.

**T**HREE drivers, by taking turns at the wheel, established a new 12-hour world's record on the Brooklands track, Weybridge, England, early in the month. The car was a six-cylinder Sunbeam, made in England, and the distance covered was 1078 miles 460 yards. The previous record was held by an Argyll, fitted with single-sleeve valve engine, which covered 914 miles 640 yards on the same track, May 27. The Argyll replaced a Sunbeam for this world's mark.

Crespelle in a Crespelle car took the classic Gaillon hill climb at Berbe, France, driving the kilometer in 35 seconds flat. Gabriel in a Schneider won in the touring car class, his time being 0:38.3. The only American car to finish was a

tachment is connected permanently to the frame of the vehicle, instead of being hauled by the latter as a separate implement.

Two driving wheels of large diameter, fitted with deep paddles to increase their grip upon the soil, are mounted at the centre of the frame, which is supported from the main axle and practically is balanced in a horizontal position. The motor, which with the radiator is carried at the extreme forward end, is rated at 42-50 horsepower, and is equipped with Bosch ignition and a carburetor designed to operate on gasoline, benzol or other similar fuels.

Power is transmitted through a clutch and change speed mechanism, and finally by spur gears meshing with large diameter gears on the main axle. Steering is by means of a hand wheel and irreversible gearing, which controls the movements of the single wheel pivoted at the rear and on the left side of the plowboard, which is arranged to accommodate six bottoms. This rear wheel is provided with a central flange to prevent side slipping and the steering movements are communicated to it through a long diagonal rod fitted with the usual type of ball joints.

The end of the plow frame is raised or lowered by means of a rack and pinion gear operated by a long endless chain taken from a sprocket on the end of the horizontal shaft fitted with a handle in front of the driver. It thus will be seen that one man is enabled to drive the machine and attend to the six plows.

#### TEN-YEAR-OLD LANCHESTER.

**Repeats 500-Mile Run in 24 Hours, First Undertaken a Decade Ago.**

It is, of course, unnecessary to visit England in order to find machines built 10 years ago which are still capable of giving good road service daily.

**Stock Self-Contained Motor Plow, Working in Rough Land in France.**

Buick, in the touring car division, which secured sixth place, in 0:45.2.

#### STOCK MOTOR PLOW.

**Interesting Type of Agricultural Implement Produced by German Concern.**

The Stock Motorflug, Ltd., Berlin, Germany, is said to have been very successful in the production of the Stock self-contained motor plow, illustrated herewith, and it is understood that over 700 of these have been supplied by the maker for use in Germany and elsewhere. By self-contained, it is meant that the plowing at-

However, the recent performance of a 1903 Lanchester model, owned by C. W. Dixon, now of Great Roke, Witley, Surrey, England, in repeating the 500-mile, 24-hour trip first successfully undertaken in October, 10 years ago, is of interest.

The machine is a 16 horsepower, air-cooled model. In 1903, soon after it was purchased, Mr. Dixon, then living in Edgbaston, Birmingham, drove it 505 miles over a scheduled route in 24:20:00, including 1:36:00 for stops in charging lamps, sending telegrams, etc. This was considered a surprising test of endurance in those days.

Mr. Dixon has had the machine in continuous use ever since. The only change that has been made in its construction is the substitution of water-cooled cylinders for the original air-cooled members, and this took place shortly after he purchased the car. Last month Mr. Dixon drove the machine over the original route, covering the mileage in 23:54:00, with 2:02:00 out for stops, these including none for attention to the car other than filling the generator or tank. The gasoline consumption on this "repeat" performance figured out at 28.3 miles to the gallon, which must be regarded as exceptionally good, considering the character of roads encountered.

### NAPIER'S ALPINE TEST.

#### Covers Long Mileage Under Observation by the Royal Automobile Club.

British manufacturers have been searching for new and novel demonstrations of their product with a view of giving the public information as to the performance of the machines under touring conditions. Recently a 1914 model, 30 horsepower Napier, driven by Arthur McDonald, left London, England, on a trip to the Austrian Alps and return—a journey on which the car covered 2106.5 miles under observation by the Royal Automobile Club of Great Britain.

Several passes were negotiated, including Mont Cenis, the Pordoi, Falzarego, Simplon and the Stelvio. The latter ascends to a height of 9041 feet, but after the car had covered more than 8000 feet it was found impossible to continue the journey owing to the fact that the road had been rendered impassable by an avalanche. It was the first test of this character given a British made machine.

At the conclusion of the run the entire machine was dismantled and it was found that only one slight mechanical adjustment was necessary, this being the tightening of one of the nuts hold-

ing the gasoline tank. The fuel consumption worked out at 18.09 miles to the gallon. Before dismantling, the machine did a flying half-mile on the Brooklands track at a speed of 62.61 miles an hour.

### NEWS NOTES FROM FOREIGN LANDS.

The maker of the Sunbeam cars in Great Britain is at work on a 12-cylinder machine, designed especially for racing purposes.

Twenty-three cars took part in the recent road race between Odessa and Ekaterinoslaw, Russia, held under the auspices of the Odessa Automobile Club. The winner was a Benz, while a Lorraine-Dietrich finished in second place.

The Society of Motor Manufacturers & Traders has decided not to hold a commercial vehicle display at Olympia, London, next year. This means that the only truck show in England during 1914 will be that held at Manchester in January.

At the exhibition in connection with the annual convention of grocers and provision men in Islington, England, the Studebaker Corporation, Detroit, was represented by three Studebaker cars, designed for light delivery work and for the use of salesmen.

The Great Western railroad of England is operating some 33 distinct motor passenger services in the Midlands and a portion of Wales. These are in the nature of feeders to the main railway system, and it is stated that they have been found immensely profitable, financially.

The Czar of Russia has taken possession of two German made cars, fitted as a travelling kitchen and pantry. The former is provided with stove, boiler, refrigerator and cupboards for the imperial silver, while the latter is intended primarily for the storage of provisions, but may be converted into a sleeping room with little difficulty.

The Gregoire company of France has recently supplied the police authorities of Paris with a nine horsepower friction driven car, the platform of which is designed as a weighing machine. This is fitted with four collapsible legs, which, when fixed to the ground, slightly raise the scales from the chassis.

A company is said to have been organized in England for the production of motor fuel from peat. It is claimed that the concern has in prospect a plant which will be able to make 1000 tons of peat yield 22 tons of tar a week, this to be treated so as to produce from 4000 to 5000 gallons of excellent motor fuel.

According to the American consul at Shanghai, China, 116 automobiles were imported into that district during 1912, of which 97 remained in Shanghai. He states that while American cars are gaining a substantial reputation in that district it should not be considered that there is a large market for automobiles, either in Shanghai or other sections of China, at least at present.

A correspondent of the Autocar, a British motoring print, states that during a recent cross-country run with a 10-12 horsepower car, he ran out of water. Stopping at a public house in Devonshire he asked for water, but was informed that owing to the dry weather none was to be had. Instead, he utilized a gallon of beer, which, he said, seemed to be a "fairly cooling agent, except when the engine boiled on a hill, and then beer spray was not pleasant."

Heath's garage, John Bright street, Birmingham, England, has taken delivery of the first electrically driven car built by Arrol-Johnston, Ltd., Dumfries, Scotland. The machine is fitted with Edison batteries, and may be regarded as a direct result of the visit of members of the Institution of Automobile Engineers of Great Britain to this country last summer. T. C. Pullinger, one of the councillors of the association, who is connected with the Dumfries concern, was so satisfactorily impressed with the electric vehicles utilizing the Edison battery in this country that he resolved to produce machines of this type for use in Great Britain.

# MECHANICAL INSTRUCTIONS FOR NEW OWNERS.

## Valve and Magneto Timing of Model H Hupmobile---Adjusting Steering Gear of Regal Cars---Fitting Ford Fan Belt---Timing K-R-I-T Valves---Light Car Hints.

**T**O OBTAIN maximum efficiency from the motor there are several factors to be considered, and one of the most important of these is that the valves open and close properly, or in other words, the motor must be timed correctly. If there be too much space between the valve stem and the tappet, the valve does not lift as it should, consequently the mixture is restricted in its entrance and the results obtained from the gases are not as satisfactory as when the timing is correct.

While it is a simple matter with adjustable tappets to regulate the operation of the valves, and to set the space between the stems and tappets according to the instructions of the maker, many motorists do not understand how to time

should be exactly in the centre as indicated. As the operation of the valves has an important bearing in the timing, displace the valve covers. It is also a good plan to remove the spark plugs so that the flywheel may be rotated easily and the effects of compression lessened.

It will be noted that the flywheel bears a number of letters and marks, I O, E C, 1 and 4, for example. These indicate the opening and closing of the valves, I O being "intake opens", E C, "exhaust closes". The figures represent the cylinders. As it is only necessary to time one cylinder, that nearest the radiator, for example, the flywheel is rotated until the mark I O 1 4 coincides with the timing mark. Before doing this, however, it is advisable to adjust the tappets, leaving a space about the thickness of a thin business card.

With the flywheel in the position above referred to, rotate the camshaft until the intake tappet of the first cylinder just begins to lift. Hold the shaft in this position and replace the chain. If these instructions are observed, the valves should be correctly timed.

The timing of the magneto is then checked up. Retard the breaker box lever fully as in operation of the car, and rotate the flywheel until the mark 1 4 C L is two inches past the crankcase mark. Remove the breaker box cover and the contact points should just begin to separate if the break is correct. If not, loosen the nut securing the magneto sprocket to the shaft, and rotate the latter until the points begin to separate. Next examine the location of the distributor brush, by displacing the cover, and note if it makes contact with the No. 1 segment or that connection leading to the spark plug of the first cylinder. Clean the distributor with a soft, dry brush. Also examine the platinum contact points, and clean and readjust these if necessary. Play in the chain may be eliminated by using shims as indicated.

In replacing the circuit breaker cover be sure that it fits properly, else dirt will find its way into the mechanism and breed trouble. It should be borne in mind that road dust is an abrasive and that the fibre block on the movable lever must therefore be kept clean. The writer recalls an instance where this part was so badly worn from the effects of dirt that it passed the cams

Fig. 1—Illustrating Method of Retiming Valves and Magneto on Model H Hupmobile.

the engine in the event the relation of the camshaft to the crankshaft is altered. With the camshaft actuated by gears and the teeth of the driving and driven members prick punched to insure correct remeshing, the novice can displace these components without fear of incorrect reassembly.

When chain drive is utilized, as with the model H Hupmobile, a knowledge of the timing is necessary and it will be of distinct value in timing the magneto as well. Assuming that the chain has been removed and the motor must be retimed: The first step is to obtain a starting point, a mark from which to work. By referring to Fig. 1 it will be seen that a line has been scribed on the housing, and this timing mark

without touching sufficiently to separate the contact points. Remove the breaker box cover occasionally and clean the components, but do not use

Fig. 2—Showing the Location of Premier Oil Pump and Parts Displaced to Clean the Filter.

any lubricant whatsoever on the mechanism.

### TIMING K-R-I-T MOTORS.

There are two methods commonly employed in timing motors, one by the piston travel, the other marking of the degrees on the flywheel. Where very accurate work is desired, allowance must be made with old cars for the wear of the gears, lost motion in the main and connecting rod bearings, wristpins and other parts.

Owners of K-R-I-T motor cars will find the timing diagram presented at Fig. 3 of service in the overhaul of the power plant and when checking up the valve timing. With this design, irrespective of the model, the travel of the piston and its location are utilized. As will be seen from the drawing the stroke or piston travel is four inches, and that in the sketches A, B, C and D, top and bottom centres, are denoted by a horizontal line. These indicate the position of the piston at the time of the opening and closing of the valves. During the four strokes of the cycle the crankshaft makes two complete revolutions. The camshaft makes one revolution to two of the crankshaft.

To time the K-R-I-T motor the piston of the first cylinder, that nearest the radiator, is brought to the top and the flywheel rotated until the pis-

ton descends .046875 inch. This corresponds to 12 degrees on the flywheel as shown at A. With the piston in this position the cam should just begin to lift the valve tappet. The inlet valve should close when the piston has completed the second (intake) stroke and has started upward on the compression stroke a distance of .171875 inch or 28 degrees past lower dead centre as indicated at B.

The exhaust valve opens .328125 inch before lower dead centre or 39 degrees before the piston completes the down stroke as shown at C, and closes practically at top dead centre or two degrees after the piston attains this position, as shown at D. If it is borne in mind that half a revolution means a complete stroke of the piston and four strokes are made to a cycle, the work of timing will be greatly simplified.

The tappet clearance should be approximately .029 inch and with adjustable members this can be obtained. With solid tappets, the valve stem will have to be lengthened by drawing the temper, an operation best performed by one familiar with the work. Before retempering the ends of the stems it is advisable to place them in the cylinders to make sure the distance is correct. To prevent error in replacing the valves the heads can be prick punched, beginning with the exhaust of the first cylinder, marking this with one dot and the balance in order. Novices are apt to mix the valves in work of this kind. Although the diagram shows the lift of the inlet valve to be

Fig. 3—Timing Diagram of K-R-I-T Motors, Also Outlining Position of Piston During Opening and Closing of Valves.

.25 inch, and that of the exhaust .06245, unless one be familiar with fine measuring tools and their use, observe the above instructions.

### CLEANING PREMIER OIL FILTER.

With the series X Premier motors the lubricant is circulated by a gear pump and a dash sight feed indicates the operation of the system, the oil running in a steady stream through this member. Failure is generally caused by a lack of oil or because of the presence of sediment in the filter.

Fig. 4—Ford Fan Belt.

The filter should be examined and it may be inspected by displacing the screws retaining the old manifold to the pump as shown in Fig. 2; also those holding the pump to the crankcase. This will permit of drawing the pump downward and disengaging it from the distributor shaft. Next, remove the oil pump suction pipe from the crankcase and clean it thoroughly with a brush dipped in gasoline. In displacing the pipe be careful not to injure the gasket as this member preserves the alignment of the pump with the distributor shaft.

### FORD FAN BELTS.

In fitting new fan belts to the model T Ford cars it is important that they be installed so that the smooth side is on the pulleys and that the inside end of the belt rides with the pulley as shown at A, Fig. 4. The belt is a one-piece construction, and in sewing the ends in making they overlap slightly at the point A. Water should not be allowed to drip from the cooling system on the belt as it augments stretching and cracking of the material.

### ADJUSTING REGAL STEERING GEARS.

Backlash or lost motion in the steering mechanism is undesirable and should be eliminated, but in adjusting the parts it should be remembered that tightness should be avoided. The careful motorist inspects his steering gear from time to time, tightening up any loose nuts or bolts, cleaning the parts and renewing the supply of lubricant. Much of the play in steering gears is due to lack of attention.

The steering gear utilized on models N and T of the Regal car is of the worm and gear type and is adjustable for end play of the steering column and for wear of the worm and gear. The components utilized in eliminating lost motion

are lettered at Fig. 5 and it will be noted that a notched nut is fitted at the end of the steering post. This is employed to reduce end thrust of the column and adjustment is obtained by removing the dowel screw and turning the nut to the right, which movement tightens the bearing. To test the movement it is best to jack up both front wheels, preventing stresses to the steering gear and linkage, which would otherwise ensue with the wheels on the floor.

If it is found there is lost motion or too much backlash between the worm and gear it may be reduced by turning the bushing where the ball arm shaft enters the gearcase. As rotating this bushing raises or lowers the steering post, the bearing supporting the end of the shaft should be loosened from the frame and enough to allow replacing or removing shims between the bearing and the frame, also to prevent cramping of the shaft in the bearing.

If adjustment of the bushing fails to correct lost motion, the ball arm shaft will have to be removed and turned through an angle of 180 degrees, which will bring an unworn section of the gear into mesh with the worm. Before attempting this work the ball arm should be removed, which is accomplished by loosening a nut and bolt, also disconnecting the draglink. Before replacing the arm it will be necessary to file a notch through the upper corner of the squared section of the shaft, diametrically opposite from the original notch, so as to permit the bolt, which retains the assembly, to be replaced. All nuts, bolts, etc., should be gone over carefully to make sure they are tight and after operating the car for a

Fig. 5—Components Utilized in Eliminating Lost Motion in Steering Gear of Regal Cars.

few miles the parts should again be examined, as it will generally be found that they can be taken up slightly.

## IN THE COMMERCIAL VEHICLE FIELD.

### Testing New Carburetor Designed for Kerosene and Similar Fuels---Brief Details of Van Auken Electric and G. V. Mercedes Gasoline Machines.

**I**N CONNECTION with the search for a substitute fuel for gasoline, a test of "oil toppings", a refinery product which has heretofore been regarded as practically worthless, was made recently on the Pacific Coast, the carburetor utilized being of special design and an invention of Harry Miller of that city. O. W. Kern drove a 1500-pound KisselKar delivery wagon from Los Angeles to San Francisco, a distance of some 472 miles, in 24:40:00. The machine was loaded with 2000 pounds of goods, and the test was looked upon as a success in every way.

It may be stated that the carburetor in question was designed particularly to handle kerosene and other similar fuels. Aside from the experiment with oil toppings, which is rated at three cents a gallon on the Pacific Coast, other successful trials have been made with kerosene, a mixture of kerosene and distillate, distillate alone and equal parts of distillate and gasoline. The total fuel expense for the Los Angeles-San Francisco trip was \$1.40, and the consumption was one gallon to each 10.15 miles.

In this connection, it also is of interest to note that the Owen H. Fay Livery Company, Chicago, has made contract for the equipment of 50 of its machines in general passenger service in that city, with Coleman gas producers.

#### SAVES 16 CENTS A TON.

#### City of New Bedford Finds White Truck an Economical Proposition.

Officials of the street department in New Bedford, Mass., purchased a three-ton White dump-

ing truck through the local agent, the Auto Supply & Selling Company, last June. The machine is utilized in hauling road materials, and the dumping mechanism is so arranged that it is operated by the power of the motor, thus making it possible for one man to do all the work.

Superintendent C. F. Lawton reports that the truck has fulfilled all expectations in the matter of reducing the department's hauling charges. On the first job, where it was used in transporting cracked stone, the cost a ton was reduced from 21 cents to five. Since that time, and in similar work, the machine has shown a transportation cost of less than four cents a ton. Mr. Law-

White Three-Ton Dumper in Service with Street Department in New Bedford, Mass.

ton explains that these savings have been made on hauls of moderate length, and that they would have been somewhat larger on long hauls. "We find the truck is available for quite a variety of jobs and has proved its economy wherever used", he says.

#### VAN AUKEN ELECTRIC.

#### New Type of Light Delivery Wagon to Be Produced in Connersville, Ind.

The Van Auken Electric Car Company, Connersville, Ind., is producing a new type of electric delivery wagon with rated capacity of 750

**New Van Auken 750-Pound Electric Delivery Wagon.**

pounds. The designer is Charles M. Van Auken, who was for some time engaged in special work for the Ford Motor Company, Detroit. He is president of the concern, and the other officers are: Vice president and treasurer, Guilford C. Babcock; secretary, Clarence L. Millard, formerly of the Connersville Carriage Company, and chief engineer, O. C. Thompson.

The new wagon is extremely simple in design. The chassis is a steel channel section with strong end and cross frame members, mounted on two cross springs that are arched above and parallel to the axles, the springs being shackled at each end. From the centre of the middle cross frame member radius rods diverge and connect with the axles at the points where the spring shackles are located.

Back of the middle cross frame member is another cross member from which the motor is suspended transversely in the chassis. On the driving end of the armature shaft is a pinion that meshes with a reduction gear mounted on the motor case, and the latter gear meshes with a gear wheel mounted on the end of the

driving shaft. At the other end of the shaft is a second gear meshing with the crown gear of the differential set. The rear axle is a live type with a triangular housing and the forward axle is tubular.

The steering gear is a conventional linkage operated by a tiller, and the brake is a set of shoes expanding in drums on the rear wheels, actuated by a pedal. The battery is divided and is underslung, a crate carrying eight cells being suspended at either end of the chassis frame. The arrangement of the terminals is such that no mistake can be made in connecting the battery. The resistance is beneath the centre of the body. The controller is a rotary type and is carried beneath the driver's seat, being operated by a short lever at the left side.

The wheelbase is 80 inches and the tread 51. The length of the chassis from the dash to the rear end is 90 inches. Back of the seat the loading space is 56 inches, but it will be noted from the accompanying illustration that the seat is so placed that a portion of the body in front may be utilized for loading. It is maintained that with a battery of 16 cells it is possible to cover from 40 to 50 miles on a charge, and as the exchange of battery is made easily this may be doubled without difficulty.

### **G. V. MERCEDES TRUCK.**

**General Vehicle Company Is Prepared to Produce Six-Ton Model Commercially.**

Announcement has been made by the General Vehicle Company, Long Island City, N. Y., that it is now prepared to produce commer-

**Internal Gear and Driving Pinion, and the Axle Spindle on G. V. Mercedes Truck.**

cially the G. V. Mercedes truck. Early in 1912 this concern, which has heretofore been engaged solely in the manufacture of electrics, acquired the American rights for the production of machines under the Mercedes patents. The present announcement was withheld until the completion of the new plant, work on which has been under way for about a year.

Only one model will be produced at present. This will practically be in duplicate of the machines built in the German factory, and will be rated at six tons. Two sizes of motor will be offered, and either will be installed to meet the requirements of the purchaser. For conditions where the need of power is extreme an engine rated at 45 horsepower will be utilized, and where the demand for power is not so great, a 35 horsepower engine will be recommended.

The former power plant has a bore of 4.74

forgings. The wheels are of steel, the forward set being shod with 34 by five-inch single band tires, and the rear with 40 by six-inch dual band tires. The wheelbase is 169.25 inches and the tread 60.625 inches. The driver is placed at the right, with control at the right. Two sets of brakes are fitted, one on the main driving shaft and the other on the rear wheels.

### REDUCES TIRE PRICES.

#### Importer of Gaulois Product Does Not Absorb Tariff Difference at the Wharf.

During the discussion attendant upon the passage of the new tariff bill, certain members of Congress maintained that the difference in rates would be absorbed by the importer at the wharf, and that the public would benefit very

**Six-Ton G. V. Mercedes Gasoline Truck and Trailer, Both Loaded, Showing the Capacity of Machine for Haulage.**

inches and stroke of 6.29, while the latter has bore of 4.25 inches and stroke of 5.9. Both are identical save for the part dimensions. They are of the four-cycle, four-cylinder, water-cooled, L head type, with cylinders cast in pairs. Lubrication is by a combination of force feed and splash. Water is circulated by centrifugal pump. Ignition is by high-tension magneto.

The clutch is a cone of large size. The transmission is selective, giving four speeds forward and reverse. The forward ratios are 1.08, 4.09, 6.98 and 10.82 miles an hour. The complete reduction of the driving system is 14:1, of which 4.5:1 is between the pinions at the ends of the jackshaft and the internal gears on the rear wheels.

The frame is a pressed steel channel section, 21 feet five inches long, mounted on semi-elliptic springs. The front and rear axles are heavy steel

little as a result. The Gaulois Tire Corporation, 49 West 64th street, New York City, calls attention to this in making announcement of a reduction in price to meet the difference between the old duty of 35 per cent. to the new of 10 on tires.

The Gaulois Tire Corporation, which imports the Gaulois tire from France, has been operating in this country only since February, although the manufacturer has been producing this make of tires for the past 17 years. It is maintained that the high quality of the product has commanded a higher price than for most tires sold in competition therewith, but the new tariff rate is held to have removed this disparity, and the importer foresees a large increase in orders in consequence.

F. R. Robinson has been appointed comptroller of the Packard Motor Car Company, Detroit.

Postoffice at Pawtucket, R. I., under the Act of Con-  
gress of March 3rd, 1879.**NATIONAL HIGHWAY FUNDS.**

Two splendid organizations have been formed with the definite object of securing national funds for improved road construction and maintenance. One asks that Congress authorize the appointment of a special commission, composed of engineers and others qualified to give the matter careful study, which shall "investigate, collect information and report to Congress on the highways of the United States, together with recommendations as to the proper policy of the national government in respect thereto, whether by the establishment of a system of national highways or by federal aid or otherwise." The other asks Congress to authorize the appointment of a commission from civil

life "to make a thorough and exhaustive report on, and to recommend a system of federal aid."

Perhaps the use of the term federal aid in the latter instance has a broader meaning than when generally employed in connection with highway matters. Bearing in mind, however, the position which has been held heretofore by this association, it would appear to limit the activities of the proposed commission to a consideration of but one phase of the subject, whereas the bill prepared by the other organization expressly states that the recommendation as to method shall be left for the commission to determine.

It is somewhat unfortunate that the large body of citizens represented by these two national organizations have not as yet been able to agree upon the plan for securing what they, and the public generally, believe desirable. Individuals may differ as to the proper distribution of federal funds for the construction and maintenance of highways, but it is obvious that, if early success is expected, some effort must be made to secure concerted action.

**UNIFORM MOTORING LAWS.**

While in itself it does not solve all the problems which confront the touring motorist by reason of the conflicting provisions of the motoring laws in the several states, the Adamson bill, now in Congress, goes a long way toward securing that object. If automobile owners may visit any state in the Union without danger of being called upon to take out additional registration papers, then interstate touring is to receive an impetus which will mean much to the nation as a whole. The other discrepancies between the various statutes may reasonably be expected to right themselves much sooner than otherwise would be the case.

The American Automobile Association believes there is a splendid chance for this bill to be enacted by Congress. Certainly, it would appear that it was devoid of some of the features which are thought to have defeated previous attempts at similar legislation. It remains for motorists to do their part in convincing their representatives in Congress that such action is desirable.

The duty of the Pennsylvania citizen is clear. Vote "Yes" on the constitutional amendment permitting bonds for road improvement.

## PATHFINDER FEATURES NEW BODY LINES.

WITH the exception of utilizing lighter pistons and connecting rods, which is said to result in increasing the efficiency of the motor 20 per cent., and minor refinements, the 1914 Pathfinder line, made by the Motor Car Manufacturing Company, Indianapolis, Ind., is mechanically the same as last season. The same models are continued, these comprising: Five-passenger touring car, two-passenger roadster, two-passenger cruiser and Martha Washington coach. All models are fully equipped, including a Gray & Davis electric lighting and motor starting system and oversize Kelly-Springfield 35 by 4.5-inch tires.

The improvements have been made about the body and accessories, the instrument board, for instance, being brought nearer the driver and a one-piece adjustable windshield adopted. The mohair top has been replaced by a leather construction having the straps concealed between the bows, while a patent strapping device retains the bows in a rigid position, preventing wrinkling of the leather. A bumper has been added to the standard equipment, the running boards stripped clean, and the battery suspended on the frame. The chief changes in body detail are alterations in the lines, these obtaining a streamline effect, and the shape of the fenders has been altered, be-

ing more sweeping than formerly and free from ridges, etc. A new feature of the upholstery of the Pathfinder models is the utilization of a double spring construction in the cushions, the spring being divided in the centre, the top section having a slight tension, designed to make for easy riding over rough roads.

The L head type of motor is continued, a block casting, also the double lubricating system, two plunger pumps being located in the lower half of the crankcase. These pumps are operated by eccentrics. A unit power plant, clutch and transmission is employed, the clutch being a cone with spring inserts. The gearset is of the conventional selective type, providing three forward speeds and a reverse with vanadium chrome steel and Rhineland bearings.

Drive is by shaft enclosed in a torsion tube. A floating type of rear axle is utilized and provision is made for inspection and adjustment of the pinion and bevel gear, also of the differential. The brakes are of the internal expanding type, liberal in size and easily accessible for adjustment. The driver is placed at the right with right hand control. One of the features of the line is the design of the wheels, the felloe being so shaped as to give a colonial effect, and it is termed the Chariot wheel by the maker.

## THE REPAIR SHOP AND THE GARAGE.

### Grinding Attachment Which May Be Fitted to Any Lathe of Sufficient Centre Capacity---Thermostat Couple for Controlling Hot Air to Carburetor.

**T**HE benefits accruing from the use of heated and auxiliary air in carburetion are well known. When auxiliary air is admitted to the

tached to any engine lathe of sufficient centre capacity.

The grinder itself is carried by a slab and studshaft, the arm of which is about 1.75 inches in diameter, so as to insure the necessary rigidity. The slab is attached to the face plate of the lathe by means of two .75-inch bolts, of which the top one is arranged in a radial slot, to facilitate adjustment of the work in hand. Upon the arm of the studshaft is mounted a length of solid drawn hydraulic tubing, which revolves on two brass bushings forced and sweated into the ends of it, thus leaving an annular space for the lubricant.

The tube carries a driving pulley on its inner end, the grinding stone being attached to the outer end. The driving pulley is secured to the tube by means of two set screws. This pulley is fitted with a sufficiently convex face, in order to eliminate lateral slip of the belt. The outer end of the tube is threaded to receive a thimble, which is screwed and sweated into place.

Owing to the concentric path which the grinding stone spindle follows, the use of a floating countershaft is necessary. The connecting rod to the latter is shown broken off in the lower illustration, and the arrangement of the floating countershaft is depicted in the upper drawing. As previously mentioned the feed of the grinding

Automatic Control of Air Admitted to Carburetor Operating on the Thermostat Principle.

intake pipe the control is manual. An automatic device, which presents interesting features, is noted in a current number of the Commercial Motor, an English publication, and an accompanying drawing presents its construction.

The thermostat, or couple, is constructed out of strips of steel and brass, each approximately six inches long by .125 inch thick and .5 inch wide. They are sweated together throughout their length and so bent that when one end is riveted to the inside of the pipe the other end stands midway in the pipe diameter. The brass strip is fitted on the under side. The valve is constructed of aluminum, and is provided with a threaded stem over which are screwed four lock nuts, these serving to adjust the valve.

The action of the device is said to be very simple. When the temperature of the hot air rises above normal, the brass strip expands more than the steel, and causes the couple to bend up, thus opening the valve. When the temperature falls, the rod assumes its normal position and the valve closes again.

### GRINDING ATTACHMENT FOR LATHE.

In the absence of a grinding machine many repair shops complete repairs by boring and turning, when a fine degree of accuracy would be advisable. Many repairmen do not care to go to the expense of installing grinding machines, although desiring their use. In an accompanying illustration is presented a grinding attachment, the designer of which states may be at-

Grinding Attachment for Lathe—Arrangement of the Floating Countershaft Is Shown in the Top View.

stone is adjusted by the bolt situated in the radial slot, while the travel is supplied by the lathe slide rest.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**T**IRE inflators operated by electricity appeal to the motorist in that considerable labor is saved. The progressive garage proprietor and

Ten Eyck Pump Outfit.

manager of the service station installs electrical equipment to provide his customers efficient service, and there is a wide variety of apparatus manufactured to meet requirements. The portable type has many advantages, in that it may be wheeled to a car

in proximity to a lighting connection, and this saves moving the machine.

The Ten Eyck Pump Company, 10 Garden street, Auburn, N. Y., is marketing the compact, moderately priced equipment shown in an accompanying illustration, which is simple in design and sturdily constructed. It comprises a Ten Eyck model D pump, which is gear driven from a .25 horsepower Century electric motor, and both units are mounted on an iron table with wheels, so that the outfit can be moved easily as desired. The handle is so attached that it can be placed upright, minimizing space.

Included in each equipment are six feet of high grade rubber tubing, a pressure gauge and tire connections, 15 feet of best extension cord and a plug for attachment to any ordinary lamp socket. A fuse box is incorporated to prevent overload of the motor.

The entire outfit is 11 by 14 inches and weighs but 50 pounds. In the standard equipment made by the company, a .25 horsepower Century Invincible-Type, 60-cycle, single-phase, 110-volt alternating motor is fitted. The maker is prepared to install a 220-volt alternating, or 220-volt direct current motor at a slight additional cost. The standard outfit is suitable for either tire or tank service and for any pressure not exceeding 130 pounds.

The model D pump employed has a bore of 1.75 inches and stroke of 2.25, and the cylinder, piston and rings are ground accurately to size. The crankshaft is a drop forging, the connecting

rod of bronze and the bearings are of similar material. The valve is a steel ball on a bronze seat and the intake is through port holes. The company will supply complete data and prices on request.

### CARVER ELECTRIC GRINDER.

The American Electric Tool Company, West Newton, Mass., maker of Carver portable electric tools, is manufacturing a grinder operated by electricity constructed in three types, each of which may be moved around the shop if desired, although heavy enough to permit of their operation without being secured. The base is very substantial and a special feature, to which the maker calls attention, is the casting of the water pot in the base. The last named part is sufficiently wide to prevent tipping when the work of grinding is started.

Types A. G. B. L and G. B. 1 carry a grinding wheel six by .375 and .5 inch respectively and turn at 3500 revolutions a minute. The first named model is employed with an alternating current; the G. B. 1 and G. B. 2 with direct. The last named employs a .75-inch wheel, eight inches in diameter, and runs at 2500 revolutions a minute. It also is provided with two wheels, one at either end, and two tool rests and wheel guards. The company issues a catalogue illustrating and describing its equipment, which is mailed free on request.

### IDEAL OVERHEAD WASH FOUNT.

The Gaylord Sanitary Manufacturing Company, Rochester, N. Y., is marketing the Ideal overhead wash fount shown in an accompanying

Ideal Overhead Wash Fount, Having Electric Light and Counterbalance Weight to Relieve Arm of Strain.

illustration, and many practical features are claimed for the construction. All parts are sturdily constructed and as will be noted the arm is

provided with a counterbalance weight which relieves all strain when the arm is being rotated and the equipment is being used. The washer comes with or without the electric lamp, which is a 32 candlepower member, fitted with a shade to project the light upon the work.

The washer proper may be employed without a sponge if desired, the device being shown with the sponge attached and without it. The sponge supplied is the best quality Rock Island sheep wool, and the maker states that its texture is such that it will not scratch the finest finish.

### COX OXYGEN CLEANER.

During the past 12 months many devices have appeared which effect a considerable saving of time and labor for the garage, repair shop and

The Oxygen Carbon Cleaner Equipment, Marketed by the Cox Brass Manufacturing Company, and Method of Use.

service station, and the motorist is directly benefitted in that the cost of maintenance is reduced. Formerly an owner was deprived of the service of his car for a considerably longer period than is required to accomplish the same work at present. Many of the improved methods save the owner a great deal more than the difference in the cost of labor, for attention is now paid to those details which make for economy of upkeep.

It is a well known fact that many motorists delay having the carbon removed from the cylinders because of the expense involved, also because it means the loss of the service of the machine, as generally the cylinders have to be removed, to say nothing of the fittings, etc. With some types of motors this takes considerable time and often the repairman experiences trouble

with old motors in obtaining tight connections.

The introduction of the oxygen process has eliminated the tearing down of motors and not only does it accomplish the work more thoroughly, but in considerably less time. It is pointed out by the maker of the equipment that a four-cylinder engine can be cleaned in 30 minutes and a six-cylinder in 45. One of the advantages of the method is that deposits are removed from crevices, etc., not accessible with the scraper.

The Cox Brass Manufacturing Company, Albany, N. Y., is marketing the Cox oxygen carbon cleaner, which equipment is shown in an accompanying illustration. It comprises a tank of oxygen with pressure gauge, etc., and a flexible arm which is inserted through the spark plug opening of the cylinder. Means for controlling the flow of the mixture are provided, as shown in the illustration, and the oxygen consumes the carbon without affecting the metal. It is pointed out by the maker that a large number of motors may be cleaned during a week and that the cost of labor and maintenance of the equipment is slight.

The equipment is constructed of high grade material, and high class workmanship characterizes all the products of this company, and each outfit is tested carefully before being shipped from the factory. The oxygen tanks are loaned, the only charge made being for the refill. The Cox oxygen carbon cleaner equipment is moderately priced and the maker has an interesting proposition for the trade.

### NEW SMITH BODY FITTINGS.

Joseph N. Smith & Co., Detroit, is placing on the market three new specialties. One comprises a dove tail bumper for bodies, designed to take up on the cushion principle all looseness of the door, as well as to prevent rattling. Another is a sashless glass channel molding designed for use with sashless glass with closed types of bodies. The company also is making a new lever lock.

### MOVABLE LIGHT STAND.

The Muller Manufacturing Company, East New Durham, N. J., has brought out a new light stand which is mounted on casters, permitting its use about the garage. A cluster of four bulbs is employed with a suitable reflector and the latter is adjustable. Sufficient length of lamp cord and a socket are supplied with each equipment, which is moderately priced.

## WITH THE CYCLECAR MANUFACTURERS.

**Maker of Carnation Changes Name to Voiturette--Details of Fenton, De Cross and Los Angeles Models--Another New Company Is Formed.**

**H**ISTORY must repeat itself—at least, in a measure. Whether or not the industry shall eventually term the new type of vehicle a cyclecar or a small car, its development cannot help but be somewhat in the nature of a repetition of that which produced the practical automobile. Those who have engaged in this work—and their number has increased very rapidly during the past few months—find the market eager and expectant. Perhaps it is not too much to suggest that the general public is impatient.

The practicability of the automobile has long been an accepted fact. Many people feel that in the new type of vehicle they will find a machine capable of accomplishing much the same work as the regulation automobile, but at less first cost and with a corresponding reduction in the expense of upkeep and maintenance. The manufacturers have undertaken to meet these requirements.

Of course, designers have the benefit of past experimentation. While it may be a simple matter to incorporate engineering principles which have been indorsed by sound automobile practise, it must be remembered that the desired objective is a machine which can be produced not only to sell for less money, but to present an operation expense that shows an appreciable reduction. These two factors must determine the design that is finally decided upon by the manufacturer.

The task is by no means so simple as it would appear upon first thought. In fact, this is just the result toward which the automobile manufacturer has been working for some time. The new type of vehicle merely aims to accomplish a larger reduction than can reasonably be hoped for with the modern automobile, and this can be achieved only along practically new lines of endeavor.

Designers of cyclecars, or of the new small cars, believe they will be able to secure the desired results by a different application of principles which already have been accepted by automobile engineers. Subsequent tests on the road and in the factory must determine the actual ef-

ficiency of the application—always with the two important factors in mind. This may mean that minor changes will be found necessary.

After all, the public can best be served by the manufacturer who makes every effort to determine the practicability and efficiency of his product before placing it on the market. Some cyclecar producers already have made the necessary road tests, and feel able to present more or less complete mechanical details for public consideration. Others are still engaged upon the experimental work.

---

### VOITURETTE SMALL CAR.

---

It will be noted that even among manufacturers there is a wide difference of opinion as to the

**Voiturette Touring Model Is Now Listed in Small Car Class.**

proper name to be applied to their product. The American Voiturette Company, Detroit, Mich., was among the first concerns in this country to announce the production of a cyclecar, which was christened the Carnation. The original machine was a two-passenger roadster, with seats side by side, and it was forecasted that the line eventually would be increased by the addition of a tandem two-seater and a four-passenger touring model. These last two have now been added, but the name of the entire line has been changed to the Voiturette small car.

The chassis is the same with each. The motor is a four-cylinder, L head unit, cast en bloc, with bore of 3.375 inches and stroke of 3.75. Lubrication is by pump. Cooling is by water, ther-

**Fenton Roadster Type, with Luggage Compartment at the Rear.**

mo-syphon system, with V type radiator. Ignition is by Splittorf high-tension magneto. The motor, multiple disc clutch and three-speed transmission form a unit power plant. Drive is by shaft to a semi-floating rear axle, fitted with Hyatt bearings throughout. Brakes are double expanding on the rear wheels. Springs are of the cantilever type. The tires are 30 by three inches, fitted to detachable wire wheels.

In making public the specifications of the various models, the company makes no reference to any difference in seat width, although it might be expected that there was a difference between the tandem two-seater and the touring car. The roadster and touring car have seats 39 inches width. The wheelbase of each is 100 inches and the tread 44. The equipment includes oil lamps, bulb horn, jack, pump and complete set of tools. A top is fitted on the touring car.

#### FENTON CYCLECAR.

The Fenton Cyclecar Company, Fenton, Mich., is being incorporated and is engaged in the preliminary work of producing a new cyclecar which is to be known as the Fenton. So far as the plans have been made public, it would appear that the machine was to be a two-passenger roadster type, the seats being placed side by side, with a platform at the rear for luggage. The streamline effect is carried throughout, terminating with the pointed radiator.

The motor is a De Luxe special, air cooled, rated at 9-13 horsepower. The car utilizes a friction transmission and drive to the rear wheels is by V belts of imported rubber. The slippage of these belts is expected to take care of any difference in the rotative speed of wheels in rounding corners, etc., so that no

differential of any type is to be fitted, according to the present plans.

The forward springs are semi-elliptic, fastening to the frame at their ends, while the rear members are full elliptic, so arranged as to give a double cantilever action. The wheelbase is 96 inches, and the tread 36. The overall width outside the fenders is 45 inches and that of the seat 38 inches. The weight is 500 pounds. The equipment will include electric lights, supplied by a storage battery.

#### DE CROSS CY CAR.

The De Cross Cy Car Company, Cincinnati, O., brings to view an entirely new feature in American cyclecar design, by placing the driver at the rear of its two-passenger tandem De Cross Cy Car. The general effect appears to be somewhat in the nature of a combination of the British and French designs, with the latter rather more prominent. That is to say, the seating arrangement and the placing of the fuel tank over the motor follow Continental practise, while the spring suspension—quarter-elliptic springs fastened at either end of an ash frame—is very much like that utilized on several English cyclecars.

The company has been unable to make public all the details of construction as yet. The present plans are to utilize a two-cylinder V motor rated at 10-12 horsepower, friction transmission, and flat belt drive. By the accompanying sketch it will be noted that jockey pulleys are utilized for tightening the belts. The wheelbase is 98 inches, and the tread 36. The ground clearance is 10 inches. The drawing presented is that of the experimental machine and several changes may be made in the completed design.

**De Cross Cy Car, with Driver Located in the Rear Tandem Seat.**

### LOS ANGELES CYCLECAR.

L. E. French, who designed the California cyclecar, announced earlier in the year, has transferred his patent rights to a new company, the Los Angeles Cycle Car Company, incorporated for \$150,000 under the laws of Arizona. This concern is located at 612 South Olive street, Los Angeles, Cal., and has secured a factory site comprising 16 acres a short distance outside the city. Mr. French is president and general manager, and plans are said to be perfected for the production of 250 cars a month.

The Los Angeles cyclecar differs somewhat, at least in general appearance, from the machine first produced by Mr. French under the name of the California cyclecar, although the mechanical features are essentially the same. Two models are to be manufactured, one being fitted with a two-cylinder 10 horsepower motor and the other with a four-cylinder power plant rated at 12-15 horsepower. Both are designed to carry two passengers, side by side. The wheelbase with each is 102 inches and the tread, 44. The weight of the smaller car is about 450 pounds, and of the larger, 500.

The smaller motor is of the motorcycle type, although it is stated that it was designed especially for this machine. It has a bore of 3.375 inches and stroke of 3.875, giving a piston displacement of 70 cubic inches. The valves are mechanically operated. The larger engine is of the T head type, with bore of 2.5 inches and stroke of 3.5, and a two-bearing crankshaft cut from solid steel.

Both machines utilize the friction transmission, power being taken from the engine to an aluminum plate by means of a large seamless tubing fitted with a universal joint at the motor end. The countershaft, placed transverse of the frame, carries a fibre disc, and final drive to the rear wheels is by two 1.25-inch V belts on the smaller car, and by double chain on the larger. The countershaft is mounted on two Hess-Bright ball bearings. It is maintained that no differential is needed, a special friction device being utilized, and that there are no gears on the machine outside of the engine.

The friction transmission is arranged to provide four forward speeds and reverse, the different speeds being engaged by a change speed lever

at the side. Another lever at the side operates the emergency brakes on the rear wheels, and in addition works the belt tightener on the smaller machine. The service brake is on the countershaft, and is operated by a pedal, another pedal actuating the clutch. Spark and throttle levers are on the steering post.

The frame on the smaller machine is of angle iron, reinforced by hard wood sills, this being of underslung construction, giving nine inches clearance. On the larger machine the frame is of angle steel, reinforced as above, and the clearance is 9.75 inches. It is stated that the larger machine has developed a speed of 60 miles an hour and has proved itself an excellent hill climber. Even when operated on freshly watered asphalt pavement it is said that there appeared to be no possibility of the wheels skidding.

Los Angeles Cyclecar, Designer L. E. French at the Wheel.

The wheels are the same for each machine, these being 28 inches in diameter with heavy single clincher rims, extra large double swedged spokes and special cyclecar knock-out axles. The tires are 2.75 inches, with an option of three-inch shoes at the difference in cost. The equipment includes side lights, tail lamp, horn, tire repair outfit, etc.

### COMET CYCLECAR COMING.

The Comet Cyclecar Company has been organized in Indianapolis, with E. R. and St. Clair Parry of the Parry Manufacturing Company, vehicle builder, and Marshall T. Levey of the Thornton-Levey Company, as incorporators. An office has been opened in the Century building in Indianapolis.

## EVERY POSTOFFICE AND TOWN.

### Progressive Candidate for Governor Is Covering Massachusetts Thoroughly.

Not since Paul Revere covered every Middlesex village and farm, has Massachusetts witnessed such a whirlwind tour as that in which Charles Sumner Bird, Progressive candidate for governor, is now engaged. Mr. Bird is covering every postoffice and town, going into the smallest hamlets as well as the largest cities, in his campaign for votes. The party, the strength of which may be gleaned from the accompanying illustration, is making the trip in four Stevens-Duryea cars, made by the Stevens-Duryea Company, Chicopee Falls, Mass.

Mr. Bird is in the hands of his friends. That is to say that when he decided to make this tour he called upon Charles Henry Davis, South Yar-

vouched for by this party. During the first week some 590 miles were covered in the western portion of the state, which includes some of the steepest grades in the commonwealth. Weather conditions also have been far from ideal, rain and even snow being encountered almost every day for the better part of two weeks. Thus far, the machines have withstood the test remarkably, and there is every prospect that they will complete the entire schedule without difficulty.

## ON LONG TEST TRIP.

### Three Keeton Cars to Cover 2500 Miles Under Various Road Conditions.

In order to give the 1914 Keeton models a road test that shall in every respect indicate just what may be expected by the owner, H. H. Newsom, general manager of the Keeton Motor Com-

Charles Sumner Bird, Progressive Candidate for Governor in Massachusetts, and Party Touring State in Stevens-Duryea Cars.

mouth, Mass., to arrange the details and act as manager. Mr. Davis, who is president of the National Highways Association, is seen at the wheel of car No. 1, in the picture. Mr. Bird is beside him.

Car No. 1 is Mr. Davis' personal property and had been run some 12,000 miles previous to this tour. Cars Nos. 2 and 3 were engaged from the Stevens-Duryea agent, the J. W. Bowman Company, in Boston, and had been driven about 50,000 miles each. Car No. 4 also is owned by Mr. Davis, and had seen 27,000 miles in his service.

The itinerary is arranged to permit Mr. Bird to address the voters, regardless of the road conditions. Massachusetts has many miles of improved highways, but it also has some ways which are far from being improved, as can be

pany, Detroit, left that city Oct. 5, in charge of three cars for a 2500-mile trip over all sorts of roads. The route will lie from Detroit to Cincinnati, through Kentucky, Tennessee and Georgia to Atlanta, thence to Columbia, S. C.; Richmond, Va.; Washington, D. C.; Altoona and Pittsburg, Penn., and back to Detroit.

The trip has been well organized, and data will be obtained by a recording clerk who will travel in the rear car, recording every ounce of water and gasoline used, and every repair made or replacement effected. With complete records of the journey before them, the Keeton engineers will make such alterations as are necessary upon the models at the completion of the trip. The plan is a novel one, and Mr. Newsom believes it will prove a test for the machines that could be obtained in no other manner.

# IMPROVED ROADS AND MOTORING LAWS.

## Congressman Adamson's Bill Has Splendid Opportunity for Enactment--Resolutions Adopted by American Highway Association--Legislative Notes.

**M**OTOR tourists cannot help but be extremely interested in the bill introduced into Congress by William P. Adamson of Georgia, chairman of the committee on interstate and foreign commerce, providing for the regulation of "the interstate use of automobiles and all self-propelled vehicles which use the highways in interstate commerce." The bill reads in part as follows:

No person who shall have qualified by complying with the laws and regulations of the state, territory or district of his residence to use and operate such vehicle or vehicles (self-propelled), shall be required, in any other state or territory or district into which he may go for business or pleasure, to take out any additional license in order to use or operate any such machine.

It is probable that action upon the bill will be deferred until after the regular session of Congress is convened in December, but already there appears to be abundant evidence that its main provisions can be enacted into law. Motoring organizations are losing no time in bringing the matter to the attention of automobile owners with the expectation that they will use every effort to inform their representatives in Congress of their desires regarding the matter.

Touring motorists are familiar with the restrictions placed upon interstate touring, although they may not be able to quote from memory the various provisions of the several states. Several commonwealths have enacted so-called reciprocity laws covering this feature during the past two years. In most instances, these laws simply mean that the visiting motorist is allowed the same privileges as are accorded residents of the state in question when touring in the home state of the visitor.

In order to bring the situation with respect to the non-resident provisions of the various state laws more directly to mind at this time, the following resume is presented:

**Exempt**—Arkansas, Connecticut, Kentucky, Michigan, North Dakota, Ohio, Washington, Wisconsin.

**Reciprocity**—Alabama, Delaware, Idaho, Indiana, Iowa, Montana, New York, South Dakota, Vermont, West Virginia, District of Columbia.

**Exempt Temporarily**—California, Utah.

**Exempt 10 Days**—Massachusetts, \*New Hampshire, Pennsylvania, Rhode Island.

**Exempt Two Periods of Seven Days Each**—Maryland, Virginia.

**Exempt 15 Days**—New Jersey, North Carolina.

**Exempt 20 Days**—Missouri.

**Exempt 30 Days**—Colorado, Florida, Georgia, Kansas, \*Maine, Minnesota, Nebraska, Nevada, Oregon.

**Exempt 60 Days**—Illinois, New Mexico.

**Exempt Six Months**—Arizona.

**Not Exempt**—Oklahoma.

**No Provision**—South Carolina, Tennessee, Texas, Wyoming.

**No Law**—Louisiana, Mississippi.

\*Special provision for non-residents living within 15 miles of the state line.

It will be seen that there remains plenty of opportunity for changes before anything like uniformity may be expected from the states acting individually. Other attempts have been made to seek relief through federal enactment, but, heretofore, the effort has been toward the passage of a law requiring federal registration, the fees to be paid to the national government. It is suspected, not without reason, that this plan has failed because of its effect upon the doctrine of state rights.

The reason why it is felt that the present bill has much greater probability of passing lies in the fact that it does not attempt to regulate the manner in which states may provide for the registration of cars owned therein. It merely recognizes the doctrine of interstate commerce as applied to the automobile, whether used for pleasure or business, and provides that, having paid the fee required by the home state, no other shall be collected in another state.

### ASKS PRESIDENT'S AID.

#### American Highway Association Outlines Its Plan for National Road System.

While the recent road congress in Detroit was held under the auspices of the American Highway Association, other national bodies interested in good roads took part. The resolutions adopted during the closing sessions were prepared by the American Highway Association, and presumably reflect the position of that organization regarding the matters covered. Particular interest centres in the following sections:

Resolved, That the American Road Congress earnestly favors the creation of a national department of public works directed by a secretary, who shall be a member of the President's cabinet.

Resolved, That the American Road Congress favors state highway commissions and state aid for the construction and maintenance of the main roads of the several states.

Resolved, That the American Road Congress favors the establishment of a national road system, and favors

the construction by the states, counties and towns of the lateral and connecting market highways.

Resolved, That the American Road Congress respectfully requests the Congress of the United States to authorize the President to appoint a commission from civil life, with sufficient appropriation to make a thorough and exhaustive report on, and to recommend a system of federal aid.

Other resolutions called upon Congress to pass the necessary legislation so that the United States may hereafter be officially represented at the international roads congresses; indorsed the Lincoln Highway Association and its work, the compulsory use of wide tires, and the use of convict labor in the construction and maintenance of roads, and favored the long tenure in office of experienced and efficient highway officials.

### PENNSYLVANIA'S BOND ISSUE.

#### Motorists in Harrisburg Convention Launch Active Campaign in Its Favor.

The people of Pennsylvania will have opportunity next month to vote upon the constitutional amendment permitting the issuance of \$50,000,000 in bonds for the construction of highways in compliance with a state highway system laid down by the legislature two years ago. Early in this month, motorists and other interested citizens held a monster convention in Harrisburg, for the purpose of meeting objections to the proposition and formulating a campaign in favor of the passage of the amendment.

It will be understood that the favorable action on the part of the voters will mean that the legislature may issue bonds and prepare for the work. Governor Tener already has stated that he will not call a special session of the present legislature for this purpose, but, if the amendment passes, the new legislature of 1915, to be elected next year, will have charge of this work. It is presumed that the bonds will be issued as required and for such sums as seem desirable in view of the work planned.

### CAUSES FOR ACCIDENTS

#### Investigator Finds That Published Statistics Create an Erroneous Impression.

During the past year or so certain organizations have been collecting and publishing monthly statistics, with the apparent object of indicating that the motorists as a class are growing more careless. James P. Proctor has examined some of these statistics, with the result that he is convinced the accidents are due more to the

carelessness of the pedestrian than to that of the driver. He says:

Automobile owners and drivers are much concerned over this situation, as they are blamed generally for something in which the fault lies elsewhere. When accused of a lack of consideration for pedestrians, they assert that it is a poor rule that will not work both ways, and claim that pedestrians generally are so supremely reckless that were it not for the extraordinary care exercised by motor car drivers, accidents would be 100 times more frequent. It is not denied that there are some unheeding drivers, but the percentage is very small.

To take a short trip through the heart of the city in an automobile is to open one's eyes to the amazing indifference of the public. People stroll down the centre of the most crowded streets, calmly ignoring the fact that the motor cars have some rights there. Women stop to gossip directly in the path of scores of vehicles. In getting on and off street cars, not one person in 10 pays the least attention to where he jumps, but dashes wildly across the pavement, dodging here and there in absolute recklessness. Mothers allow their two and three-year-old babies to crawl and toddle into the middle of busy thoroughfares. Meanwhile the anxious and harassed automobile drivers vainly shift gears, put on brakes, blow horns and dodge back and forth among the criminally reckless populace, knowing that the slightest scratch on a pedestrian almost exposes the man in the car to lynching.

If a further proof be needed, the situation in respect to a signal may be mentioned. A few years ago the bulb horn was apparently a satisfactory means of warning. Now, so callous has the no-car owning public become, the formerly hated and obnoxious Klaxon is slowly but surely becoming so necessary that many municipalities are insisting upon its use as a minimum danger signal. This gradual change has not been brought about by the growing recklessness of motor car drivers, but by the increasing carelessness of pedestrians, insofar as automobiles and all motor driven traffic is concerned.

### LEGISLATIVE BRIEFS, ETC.

Governor Colquitt of Texas has issued a proclamation naming Nov. 5-6 as good roads days. Each man is expected to contribute either two days' labor or its equivalent in cash for improved highways. The plan is similar to that which was given expression in Kansas and Missouri recently.

The first prosecution under the new law of Wisconsin, which provides a maximum fine of \$1000, or imprisonment for five years, for using a car without the owner's permission, took place at Portage recently, when two boys, 17 and 18 years of age, pleaded guilty and were fined \$200 each. Under the old law the maximum penalty was a fine of \$50.

Motorists in Dauphin county, Pennsylvania, have instituted mandamus proceedings against Auditor-General A. W. Powell, to show cause why he withholds the income from motor car registration fees, which, under the terms of the act of 1913, should be diverted to the state highway department for the improvement of roads. The auditor-general holds that the specific appropriation act of 1909 stands in the way of his making such payment.

Secretary of State May of New York announces that 130,000 automobiles were registered in that commonwealth previous to Oct. 1, an increase of about 30,000 over the corresponding period in 1912. The gain in commercial vehicles was very notable, there being an increase of 6000, or 46 per cent., against 32 per cent. for all vehicles registered. The aggregate receipts were about \$1,235,000, or just about equal to the combined receipts in 1910 and 1911.

Maintaining that the new Ohio motor vehicle law not only increases the amount of tax to be paid by owners, in the form of a registration fee, but provides that only one-third, instead of all, the money thus raised shall be devoted to improved road construction, automobile clubs in that state have taken steps to test the matter in the courts. A new club recently was organized in Lima, having for its principal object the assistance of the state association in this work.

## CORRESPONDENCE WITH THE READER.

**New York Laws and Car Lighting.**

(1658)—Being a regular subscriber to your valuable journal, I would like to ask you a question through the Correspondence columns. Can you tell me if there is a section of the New York automobile laws which reads, "When an owner obtains a license for a new car and for each succeeding year renews the license for the same, that the fourth year and each succeeding year he renews it, he is entitled to a reissue at one-half the original tax"? That is, if a new car is registered for \$10 the first year, will the tax for the fourth and succeeding years be \$5?

Can you tell me if it is practical to obtain enough electricity from a Splitdorf magneto such as is utilized on a 30 horsepower, 1910 four-cylinder car, to light the car satisfactorily without injuring the efficiency of the spark for the motor? If so, how should it be wired and what would be the cost, labor not considered? R. E. D.  
New York City, Oct. 10.

The motoring law of New York State, as passed in 1910, was amended by the legislatures of 1911 and 1913. A careful reading of the present law fails to reveal any other mention of a reduction in fee, under the circumstances cited, than that which follows, this being a portion of article 282, section 6:

Provided that if a motor vehicle other than one used solely for commercial purposes shall have been licensed for four separate years hereunder and for which there shall have been paid the annual registration fees herein provided during said period, the annual registration fees thereafter shall be one-half the amount.

It would not be practical to endeavor to utilize the current from the magneto for lighting purposes, as the instrument is designed and intended solely for ignition work.

**Making Hot Air Device.**

(1659)—I have a car fitted with a Schebler carburetor of the old type. The air valve is located on top. It is a model much used on marine engines. Noting that the use of heated air helps the carburetor, I would appreciate any suggestion as how to make a connection between the exhaust manifold and the air intake of the carburetor. A friend of mine, who is an old subscriber of your book, states you published an article of this nature some time ago.  
APPRECIATIVE.

Portland, Me., Oct. 15.

The connections referred to can be purchased ready made, or if a special size is required it may be ordered through a dealer or supply house. The manufactured article comprises a hood for the exhaust manifold, a clamp for attaching one end of the flexible tube and the piping.

The home made device referred to is shown at Fig. 2 and was utilized by a reader of The Automobile Journal. For the hood device an empty preserve can was employed, it being cut longitudinally and the ends cut as shown at b, and two holes bored as at k. The part a was made of tin and provided with extensions as illustrated. This member was inserted in the hood as indicated at d. By making a snug fit rattling was prevented.

The tube c was of ordinary garden hose, the

member a being made to slip inside of it. The hood attached is shown at f, and it will be noted that holes are punched to admit air, the number of perforations being augmented according to the requirements of the carburetor. The manner of attaching the hood is shown at e. As previously mentioned, the ready made article would save considerable labor and time, and it is not expensive.

**Operation of Air Starters.**

(1660)—Will you explain the operation of a compressed air motor starter? What advantage has it, if any, over the electric?  
OLD SUBSCRIBER.  
Newport, R. I., Oct. 13.

The compressed air motor starting system as applied to a motor car comprises a tank containing compressed air, a pump to maintain the supply, a distributing mechanism and a valve operated by the driver. At Fig. 1 is shown the pump,

**Fig. 1—Showing the Distributor and Pump Utilized with a Compressed Air Motor Starting System, Also the Leads to the Cylinders.**

also the distributor and method of driving the first named member.

The air is led from the tank to the distributor, which has ports, one for each cylinder, and leading from the ports is a pipe or tube through which the air passes to the cylinder. The distributor is driven in much the same manner as a timer, the ports opening when the piston is at the top of the compression stroke, so that when the air is admitted it will force the piston down as on the conventional firing stroke. Check valves are utilized in the cylinder connections to prevent the air from returning to the distributor.

One of the advantages claimed for the system is that undesirable stresses are eliminated by applying the energy to the piston head.

**Faults on the Battery.**

(1661)—I have a 1910 model 19 Buick equipped with a Remy magneto. Lately I have experienced trouble when starting the car on the batteries. It misses badly when running on the batteries, although I put in a new set of cells. The wiring and spark plugs appear to be all right. The motor runs good on the magneto. Will you tell me the trouble and oblige a subscriber? J. S. G.  
Fall River, Mass., Oct. 11.

With the Remy magneto the current is transformed by a coil and the fact that the motor operates satisfactorily indicates that the fault is not in the instrument, but in the battery circuit. The current from the cells is interrupted or broken by the circuit breaker of the magneto, transformed by the coil, then carried to the distributor and thence to the plugs. There evidently is a faulty connection between the cells and the coil and these members should be examined carefully. It is possible that the battery side of the switch is

**Fig. 2—Working Plan of Home Made Hot Air Device for Schebler Carburetor.**

not making a good contact or the terminals are loose. Check up each lead and connection carefully. With the motor operating, test the switch by actuating the lever. Be sure that the wires are installed according to the maker's instruction.

**Wiring Pfanstiel Magneto.**

(1662)—I am having trouble in rewiring the magneto on my car. It is a Pfanstiel, dual system, using dry cells. Kindly publish or forward me the wiring diagram at your earliest convenience. CONSTANT READER.  
Rutland, Vt., Oct. 16.

Presuming that the magneto referred to is similar to that illustrated at Fig. 3, six cells are employed. These are wired in series-parallel and the lead from the zinc terminal is connected to the terminal marked 3. The other wire from the

batteries is carried to the switch to terminal 1. The ground is from switch terminal 6 to frame. It will be noted that the lead 3 is also connected to the magneto terminal 8, and that the terminal 9 on the instrument is connected by a lead to terminal 4 of the switch. Magneto terminal 7 and switch terminal 5 are also connected.

Connections 4 and 9 carry current from the armature to the switch, and the wire leading from 3 to 8 permits the magneto to operate as a self-contained instrument when the switch lever is in magneto position. One end of the battery is connected to point 3, the other to terminal 1, as previously stated, but as the circuit is open when the switch lever is either in the magneto or off positions, the battery is inoperative at this time. The wire connecting switch terminal 3 to contact breaker terminal 8 forms the connection whereby the armature current is intermittently connected and separated by the breaker points.

When the switch lever is thrown to the battery side, coil connection 7 is placed in circuit with 5 and 1, making it possible for the battery current to flow to the coil. A push button is provided at the side of the switch for starting, and when this is depressed the ground connection 6 is brought into electrical connection with point 3, and the battery current is grounded through a short shunt, instead of by the contact breaker points at terminal 8. With this system one taps the button instead of maintaining a continual contact as with the vibrator type of coil. When six cells are employed as shown, the voltage of but two is utilized, it being held to be sufficient, as the resistance of the primary of the transformer coil is so proportioned that the core is energized with very low potential current.

**Ford Motor Starter.**

(1663)—Would it be possible to fit an electric motor starter to a model T Ford car, and what would be the cost? Do you know of any company making an electric starter for this car? FORD OWNER.  
Nashville, Tenn., Oct. 11.

An electric motor starter could be fitted to a model T Ford car but it would involve considerable expense. With an electric system a generator would be required to maintain the storage battery in a charged condition, and as the fly-wheel generator of the Ford car develops an alternating current, it could not be employed for charging the cells, since a direct current is necessary.

It would mean the installation of a dynamo, also a motor, and while a unit system would be utilized to save space, the cost as above mentioned would be considerable. The writer cannot give figures. These could be obtained from man-

ufacturers of lighting and starting systems, who are listed in the Buyers' Guide, published in each issue of The Automobile Journal. The writer does not know of any company making an electric motor starting system designed especially for the Ford car. There are several mechanical starters made for these machines, one of which is described and illustrated in this issue.

#### Leaky Radiator.

(1664)—I have an old car with a honeycomb type of radiator which leaks badly. It has been soldered a number of times, but after a while will leak. As the cold weather is coming and there is no heat in my garage, I must use an anti-freezing solution or draw off the water when the car is not in use. This is a nuisance. I note that Se-ment-ol is advertised for stopping leaks in radiators. Is this as represented and will it do the work as they claim it will? Will alcohol affect the solution?

SKEPTICAL.

Braddock, Penn., Oct. 15.

According to a number of owners who have used the radiator solution referred to, it is efficient and maintains the claims of the maker. The writer can vouch for Se-ment-ol, made by the Northwestern Chemical Company, Marietta, O., which is inexpensive and can be procured at any supply house.

It was employed in a honeycomb radiator which leaked badly and although an anti-freezing solution was utilized, no further trouble was experienced during the winter. In the spring the radiator was cleaned out and water used. As far as the writer could ascertain the cooler was as efficient as formerly.

The principle of these radiator compounds is a self-hardening solution which hardens when exposed to the air. The writer obtained the best results with the solution by having the water warm, and, with the motor operating, small quantities of the ingredient were poured into the cooler through the filler cap. The car was then run for a short distance and the solution emptied. It was allowed to stand for some little time before replenishing the supply of water, which was later replaced by an anti-freezing solution.

The effect of alcohol upon the radiator compound is not known to the writer, who employed a chemical anti-freezing solution. It is doubtful if alcohol would have any effect on it, as this and other factors were considered by the maker.

Henry W. Nuckols, who was president of the Columbia Motor Car Company, Hartford, Conn., previous to the reorganization of the old United States Motor Company, has become general assistant to Milton J. Budlong, president of the Packard Motor Companies of New York, Chicago and Philadelphia.

#### ISSUES NEW BEARING DATA.

#### J. S. Bretz Company, Importer, Is Mailing New List to the Trade.

The J. S. Bretz Company, 250 West 54th street, New York City, sole importer of the F & S annular ball bearings, is mailing the trade a new booklet which cancels all previous lists relative to the product handled by this concern. The various types are illustrated, including the light, medium and heavy series, also the narrow types, and dimension diagrams are presented. Each bearing is listed, giving the outer diameter, bore and width, ball diameter and number of balls. The load-pounds given are the highest proper for steady loads and speeds.

The dimensions are given in millimeters, but

Fig. 3—Wiring Plan of Pfanstiehl Dual System Employing Batteries and Magneto.

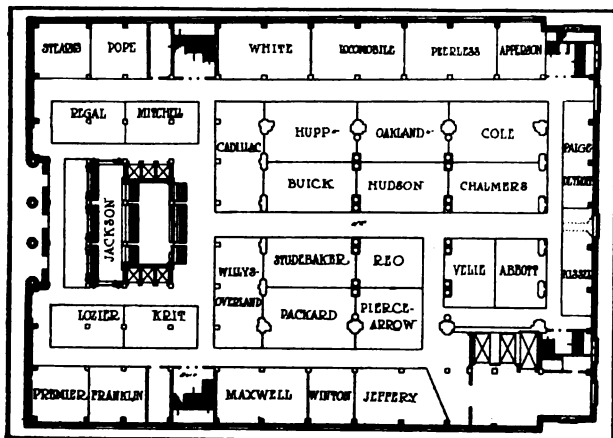

a table of inch equivalents is included, making it a simple matter to convert the measure. Special tables will be supplied on request for other speeds and loads, and for extra sizes where their use is indicated. The single annular type fitted with the narrow ribbon ball separator and the W. H. narrow width ball separator are well known to the trade and the data on these will be of service to the garage, repairman and service station, as sizes and prices have been revised to Sept. 1.

It transpires that the Reo car, driven to second place in the 102-mile race at Corona, Cal., last month, completed the entire distance without stop and without taking water, and was the only machine in the race to make this record.

## NEW YORK AND CHICAGO CAR EXHIBITORS.

**E**IGHTY makers of pleasure cars, one of whom is a producer of electric machines, have been assigned space for the 14th annual national

Main Floor, Grand Central Palace, New York City.

automobile show in the Grand Central Palace, New York City, Jan. 3-10, under the auspices of the Automobile Chamber of Commerce. Eighty-six makers, three of them makers of electrics, have been assigned space for the 14th annual show in the Coliseum, Annex and First Regiment armory in Chicago, Jan. 24-31, under the same auspices. These figures will be increased slightly when the members of the Electric Vehicle Manufacturers' Association have received their assignments, although it would appear that there are but three spaces left in New York and nine in Chicago.

For the 13th annual show, there were 85 different makes of cars represented in the two buildings, Madison Square Garden and Grand Central Palace, in New York. There were 102 different makes at the Chicago show of 1913. Several concerns represented at both shows a year ago are no longer manufacturing cars, but this does not account for all the absentees.

Among those who made display last January, but who will not be represented this season, are the following makes: Alco, Bergdoll, Chevrolet, Columbia, Cunningham, Cutting, Detroit, Edwards-Knight, Empire, Firestone-Columbus, Flanders, Inter-State, Knox, Lenox, Little, Marathon, Matheson, Michigan, Midland, Schacht, Selden, S. G. V., and R-C-H. The electric vehicles not yet heard from this year are: Argo, Baker, Borland, Broc, Buffalo, Columbus, Detroit, Hupp-Yeats, Ohio, Rauch & Lang, Waverley and Woods. Most of these are members of the Electric Vehicle Manufacturers' Association,

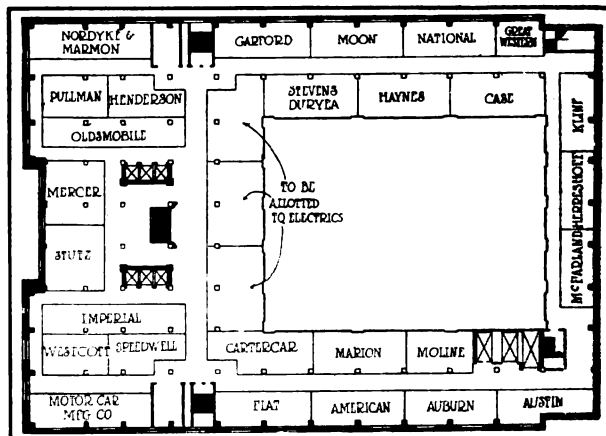

and may reasonably be expected to make application for space through that organization.

Cars showing at New York this season, which were not seen there last are: Apperson, Austin, Aristos, Chandler, Cornelian, Great Western, McFarlan, Lyons-Knight, Simplex, Partin-Palmer, Twombly, McIntyre, Howard, Palmer-Singer and Vaughn. Avery, Cricket, McCord and Vulcan are new names for Chicago. Most of these are new cars, placed in the market since the last show season.

The full list of those to whom space has been allotted, according to advices from the Automobile Chamber of Commerce, is as follows:

### New York and Chicago.

 McCord Auto Co., \_\_\_\_\_  
 Cricket Cyclecar Co., \_\_\_\_\_

It is stated in this connection that the Motor & Accessory Manufacturers has declined to sanction any other show than those to be held in New York and Chicago. This is taken to mean that members of the association, as such, will be unable to make display at the forthcoming Boston show, contrary to the plan which has been in force with that exhibition for some years. Among the makers of accessories, parts or fittings, who have previously made display at New York and Chicago, but who are quoted as not contemplating such action this season, are the following:

Republic Rubber Co., Youngstown, O.  
 Kelly-Springfield Tire Co., New York City.  
 Fisk Rubber Co., Chicopee Falls, Mass.  
 B. F. Goodrich Co., Akron, O.  
 Ajax-Grieb Rubber Co., Trenton, N. J.  
 Swinehart Tire & Rubber Co., Akron, O.  
 Firestone Tire & Rubber Co., Akron, O.  
 Goodyear Tire & Rubber Co., Akron, O.  
 Diamond Rubber Co., Akron, O.  
 Michelin Tire Co., Milltown, N. J.  
 United States Tire Co., New York City.  
 Norma Co. of America, New York City.  
 Timken Roller Bearing Co., Canton, O.  
 Hess-Bright Mfg. Co., Philadelphia.  
 Bower Roller Bearing Co., Detroit.

Chicago Car Display Spaces: From Left to Right, Colliseum, Colliseum Basement and Main Floor, First Regiment Armory—Heavy Black Lines Denote Side Walls and Buildings.

Partin-Palmer Mfg. Co., Chicago, Ill., Partin-Palmer.  
 W. A. Paterson Co., Flint, Mich., Paterson.  
 Standard Electric Car Co., Jackson, Mich., Standard electric.

American Ball Bearing Co., Cleveland, O.  
 Hyatt Roller Bearing Co., Detroit.  
 Standard Roller Bearing Co., Philadelphia.  
 J. S. Bretz Co., New York City.

### AN OLD FASHIONED FAMILY.

#### Large in Numbers but Happy in the Possession of a Six-Cylinder KisselKar.

Thomas H. Seed, a farmer of Bridgeport, Ill., is the head of an old fashioned family, insofar as numbers are concerned, for the roster totals 20 happy souls, including children and grandchildren. In every other respect the Seed household is completely up-to-date, and none the least of these modern features is the six-cylinder, 60 horsepower KisselKar, made by the Kissel Motor Car Company, Hartford, Wis.

Mr. Seed is a firm convert to the use of the automobile. In fact, he finds it of inestimable value as well as a source of much pleasure to "the women and kiddy folks." When it becomes

August and the largest of all, 292, in September.

In this connection, it also is of interest to note that the W. D. Newerf Rubber Company, Los Angeles and San Francisco, has been appointed distributor for the products of this company, Invader lubricants and I. O. C. gear oil, in California, Nevada, Utah and Arizona. The closing of this contract was one of the first duties of General Manager Scheu, who was until recently manager of the Boston branch of the company.

### OFFERS SEVEN PRIZES.

#### People of Massachusetts Have Opportunity to Tell What They Think of Horns.

The Lovell-McConnell Manufacturing Company, Newark, N. J., maker of Klaxon horns, offers seven prizes for competition among the residents of Massachusetts for the best suggestions as to how to regulate the use of warning signals on automobiles. The suggestions must be limited to 400 words, written on one side of the paper only, and mailed to the Warning Signal Committee, Drawer 2302, Boston postoffice, prior to Nov. 10, on which date the contest closes.

The first prize is to be \$150, the second \$50, and the five next \$10 each. The suggestions must be made by bona fide residents of Massachusetts and be an expression of individual opinion. The judges of the contest will be: William L. Douglas, Brockton, a former governor; James A. Gallivan, Boston, chairman of the board of street commissioners; George S. Ladd, Sturbridge, a member of the executive committee of the Massachusetts State Grange and of the bureau of highways, United States Department of Agriculture, and Daniel F. Gay, Worcester, director of the Automobile Legal Association, former president of the Worcester Automobile Club and a director of the American Automobile Association.

George F. Rein of Omaha, driving a 1914 Cadillac, recently established a new cross country record from Detroit to Omaha, covering the 911 miles in an elapsed time of 31:54:00, and an actual running time of 29:12:00.

Thomas H. Seed, Bridgeport, Ill., Some of His Family and His Six-Cylinder 60 Horsepower KisselKar.

necessary to run errands to town, it is a matter of minutes, as against hours in the old days, when Dobbin had to be "hitched" for the trip. "I don't see how I was able to putter along without one for so many years", says Mr. Seed.

### INVADER OIL NEWS.

#### Business Is Increasing Very Rapidly—New Pacific Coast Representative.

According to E. A. Scheu, general manager of the Invader Oil Company, New York City, the business of that concern has increased an average of 212 per cent. a month since the first of the year, or to be specific, there was an increase of 114 per cent. in February, 188 in March, 200 in April, 246 in May, 231 in June, 210 in July, 218 in

## 1914 OLDSMOBILE HAS A LARGER MOTOR.

**T**HE 1914 line of the Olds Motor Works, Lansing, Mich., will comprise one six-cylinder chassis, which will be constructed in two forms, one with a wheelbase of 139 inches, to which will be fitted a seven-passenger body, and the other with a wheelbase of 132 inches for four and five-passenger bodies. A reduction in price over the 1913 line is announced, and the model 54 also presents several new features.

The motor is of the L head type with the cylinders cast in pairs, having a bore of 4.25 inches and stroke of 5.25, as against 4.125 by 4.75 of this year's model, and being rated at 43.9 horsepower under the S. A. E. formula. The valves have been increased and the intake manifold, water headers and fan blades are white enamelled. Ignition is by the Delco system; the carburetor is an improved type and cooling is now by a centrifugal pump instead of a gear, it being located in the centre and the shaft extended to drive the generator. At the other end of the pump shaft is located the Taylor Noil tire pump. Lubrication is by combined force feed and splash. The new motor has no pan and the exhaust pipe is finished to be rust proof.

The cone clutch and selective type of transmission is retained, these being a unit with the motor. The drive shaft is enclosed in a torsion tube, transmitting the power to a floating axle. F. & S. bearings are utilized in the rear construction and Timken are used in front wheels.

The rear springs have been lengthened, three-quarter elliptic, and are underslung. The front members are semi-elliptic. The diameter of the

brake drums has been increased, also the face, permitting of the use of lining 2.375 inches wide, the service brake being of the contracting type and the emergency of expanding design. Both sets are faced with Raybestos and carefully equalized.

The 1913 model was equipped with 36 by 4.5-

inch tires in front and 37 by five in the rear, but these have been changed to 36 by five all around, and are mounted on Baker straight side demountable rims, the two spare members being carried on a special bracket at the rear of the chassis, where they also serve to protect the fuel tank. This tank has a capacity of 23 gallons, with a reserve of three gallons. Partitions are provided to prevent splashing of the fluid. The filler cap is ample in size, eliminating the use of a funnel.

The driver is placed at the right and the wheel is 19 inches in diameter, of Circassian walnut, corrugated on the inside and knobbed outside. The seven-passenger body is equipped with the disappearing type of extra seats, these folding into the rear of the driver's compartment and being neat in design. The running boards are clean and are covered with aluminum instead of fibre. The toeboards are also metal covered. The body lines are practically unchanged. A Circassian walnut cowl has been adopted.

### DETAILS OF MODEL 54 OLDSMOBILE.

**Taylor Noil Pump.**  
**New Type of Jiffy Curtains.**  
**Tire Size, 36 by 5, All Around.**  
**Seven, Five and Four-Passenger Bodies.**  
**Delco Lighting and Motor Starting System Adopted.**  
**Disappearing Extra Seats in Seven-Passenger Model.**  
**Larger Motor with Bore of 4¼ Inches and Stroke of 5¼.**  
**One Six-Cylinder Chassis with Wheelbase of 132 and 139 Inches.**  
**Longer Underslung Rear Springs and Slight Change in Rear Axle.**

Showing the 1914 Oldsmobile with a Larger Motor, Underslung Rear Springs, Flush Cowl Instrument Board and a Number of Other Refinements.

# CHARACTERISTICS OF HEAVY FUELS.

## Part V--Effects and Difficulties Attendant upon the Use of the Ordinary Butterfly Throttle Valve When Carbureting Kerosene--Substitutes Suggested.

**I**N THE previous installment causes of internal condensation were discussed, also factors making for a smoky exhaust when kerosene is utilized in the automobile engine. The views of two English authorities were presented and one of these, R. Owen Allsop, contends that the ordinary butterfly valve should be modified or eliminated if designers of kerosene carburetors are to meet with success. He holds that the control of the air passing the jet is important in order that the fuel disintegrating force may be effective and constant. He states:

No doubt there are frictional effects and effects relating to internal liquid stresses and surface tension that are factors, but, primarily, we must conceive that the air particle strikes the fuel particle, and that the ef-

by high velocity passes by the jet, as shown by dotted arrows, the main air being indicated by black arrows entering at holes in the sleeve.

### Varying Spray Quality.

All these designs seem to lend themselves better than the butterfly type to the attainment of a constant air blast. No doubt the position is rendered difficult in dealing with heavy fuel because that which may be workable with gasoline may be useless with kerosene. This is shown by the constant mixture aspect of carburetion problems. The invisibility of the products of imperfect combustion of gasoline permits the gasoline carburetor designer to concentrate on the gaining of a suitable mixture at all engine speeds. Little attention has been given to the effect of varying spray quality—none in fact, if we accept the atomizer jet, and devices for ready starting of the engine. And no mere atomizing jet will meet the petroleum spraying difficulty unless it has also accompanying means of proper air control.

### Air Valves and Taper Needles.

Numbers of gasoline carburetor designers have proceeded on a main principle of air control valve connected to a taper needle, generally as shown at Fig. 24, where the main air valve is connected to the taper needle inserted in the fuel jet, air entering as indicated by the arrows. And some designers have included movable choke tubes, whereby a certain measure of constancy of air flow past the jet would result, generally as shown at Fig. 25, where the main air valve carries a movable choke, which, as at A, at low speed restricts the air way round jet, and, at B, opens more way for air at full power. We say "would result" designedly, because above the carburetor mechanism there is the butterfly throttle which, constantly operated by the car driver, disorganizes the whole arrangement as respects position of highest air velocity.

In the ordinary butterfly type throttled carburetor the zone of greatest air velocity oscillates back and forth now at the jet, now at the throttle disc edges, all plainly at variance with the principles of spraying that is a necessity in kerosene carburetor design. At present our fuel spraying air is as inconsistent as the wind itself. The air blast for spraying must be controllable as to amount, duration and force, placing in the hands of the driver a real control of operating conditions.

### Substitutes for Throttle.

In looking around for a substitute for the ordinary throttle the immediate difficulty is the clashing of the interests of mixture as such and of the requirements of fuel pulverization. Correct mixture the oil engine designer must secure, but the mere arrangement of a variable shaped spindle or taper needle, and its co-ordination with a gravity or spring controlled air valve, satisfying apparently every ambition in gasoline matters, is not a solution of the kerosene problems, and, as respects spraying, becomes a farce, if there is a throttle that at irregular moments shifts the position of highest air velocity from point to point. More hopeful is the outlook if the air valve also forms the main control throttle, for in this case, while the valve is seated at low speed and no load, all air can be caused to flow past the jet as in Figs. 23 and 25, by means of suitable tubes, holes and ways in and around the air valve or along bypasses. Obviously, too, as piston speed increases, a constant air rush can be maintained, if the area of the entry for spraying air be increased in suitable proportion, so that rising venturi tubes, adjusting themselves automatically, operated by the main air valve or connected to suitable throttle device, are promising, or, at least, worthy of careful review with laying down the main lines of design for oil engine feed, but it must be noted carefully how the advantages may be lost by unsuitable throttle design. Strangely enough, many of the most promising designs are incorporated in gasoline carburetors, leading one to wonder whether their inventors have ever thought to add

Fig. 22—Flow of Air in Throttle Carburetors: A, Highest Velocity with Throttle Open; B, Velocity Removed to Edges of Valve as Indicated by Arrows.

fectiveness of the fuel spraying is a measure of the impact. In the standard designs of the butterfly throttle, when the valve is nearly closed, the high speed air current is found rushing in between the edges of the throttle and the adjoining walls of the induction pipe.

### Air Velocities.

In Fig. 22, being diagrammatic sections of a carburetor, at A, with open throttle, the highest air velocity is near the jet; at B, with nearly closed throttle, the point of highest air velocity is removed to the edges of the throttle valve, as indicated by arrows. Taking advantage of this obvious fact some gasoline carburetor designers have opened a bypass pipe connecting a flue from about the position where the edge of the throttle disc touches the wall, to a special small jet. As a consequence the engine at low speed obtains an effective supply of pulverized fuel. Some designers have arranged a throttle valve on the atmosphere side of the carburetor so that on closed throttle the full value of "negative pressure" originated by the induction stroke of the piston may be gained, more or less on the idea shown diagrammatically at Fig. 23, where a sleeve valve is utilized, having a rising air valve so that when this is sealed, spraying air

a vaporizer and test the effects of the apparatus with heavy fuel.

#### Location of Jets.

Having, say, improved the design by attention to the effect of throttle control, we may pass to the examina-

Fig. 23—Sleeve Throttle with Rising Air Valve—When Valve Is Sealed Air at High Velocity Passes Jet as Indicated by Dotted Arrows, the Main Air Entering at Holes in the Sleeve.

tion of the actual spraying device, which cannot be neglected in considering throttle control problems. We believe the flow of air, as in Figs. 22 to 25, parallel with the axis of the fuel jet, to be fundamentally incorrect. That which we desire—which indeed we must obtain—is fine spray, and we should seek intelligently to apply natural forces. If we are correct in assuming that plus frictional and tensional factors the efficiency of spray making is a measure of the kinetic energy in the air blast, then a jet crossed at right angles as at Fig. 26, must be greatly superior to the vertical jet with vertical air blast. The cause of the fuel emergence is negative pressure so-called. Neglecting frictional resistances, the greater the negative pressure the higher the liquid fuel will jump out of a nozzle when the engine piston makes its induction strokes as diagrammatically put in Fig. 27. With closed atmospheric side throttle, coarse particles of the fuel are sucked vigorously out of the jet nozzle. It is the blast of the air that effectually sprays as shown at the right in Fig. 27.

#### Negative Pressure a Factor.

Although the negative pressure may be transformed into air rush, yet the impact of the air delivers a very different blow and gives very different spray than where it meets fuel particles tending, by their velocity of emergence, to maintain their position relative to the axial direction of the jet as in Fig. 26. In this case the actual energy may be considered to approach the theoretical, while if other forces, frictional and tensional, enter into fuel pulverization, these must increase the breaking-up effect. The vertically disposed jet with parallel air flow is convenient in practical design and construction. This, no doubt, has contributed to its general adoption. A concentric choke tube fits neatly and compactly as in Fig. 23; whereas, to arrange a jet as in Fig. 26, at right angles to such a tube, is not so convenient. And it is certainly awkward when we may seek to arrange a movable tube in order that this may adjust itself automatically, or, by suitable connection to the throttle, vary the area of airway immediately next the spraying jet. On the vertical, parallel system such variable choke tubes may be arranged, but where right angled pulverization is adopted the tube apparently needs slotting for the jet and this may lead to constructional difficulties. Moreover, vertical line of movement is suited to co-ordinated air control and taper needle and not suited to horizontal arrangement.

#### Gasoline Design Favors Taper Needle.

Present practise in gasoline carburetors largely favors the taper needle in the fuel jet, as in Fig. 24. Seeing that the greater the air velocity the larger the hole for fuel emergence that can be employed effectively for

the production of fine spray, the taper needle has its merits and is certainly a very practical device, for when the needle is lowered, the annular slot formed is very narrow and so suited to the production of fine spraying with a possibly reduced air velocity. The aim, however, of the designer dealing with taper needles connected to air control valves and having venturi tubes should be to maintain a constant air velocity irrespective of engine piston speed. The general idea is plainly feasible and has indeed been adopted in gasoline carburetors, for the jet nozzle being stationary, if the rising air valve, needle and choke tube move in unison as in Fig. 25, this may be arranged so that a measure of constancy of air blast is attained opposite to the jet nozzle, but, as we have pointed out, it is waste of energy to be at pains to plan on these lines if the whole action is to be spoiled by an ordinary butterfly throttle valve between the carburetor and the engine.

#### Value of Effective Pulverization.

In matters like the present the infinitely small is of importance. Current ideas of designers as evidenced around about the spray nozzle of carburetors will bulk as a very gross expedient in view of those who have devoted much attention to the several points concerned. Nothing shows this more plainly than the design of jet nozzles, where the utmost refinement of idea based on correct theory and carried out accurately, in accordance with this in practise, should be the aim. The errors in design of such infinitesimally small matters are referable to the want of appreciation of the value of pulverization, and to the aiming solely at correct mixture for varying engine speeds, irrespective of the spray quality. The theoretically correct method must be considered to be a jet so arranged, so designed and disposed that the air sweeps unobstructedly across the fuel emergent slots as in Fig. 26. Even in the case of parallel air flow we frequently see careless design, whereby ridges or prominences of not wanted metal create whirls and eddies, and obstruct the desired arrow-like flight of air particles directly across the slots. Again, assuming our fuel pulverization theory correct—that it is the kinetic energy in the air particles that breaks up the liquid—we cannot do better than hold in mind the glass ball of a shooting gallery where obviously a clean, straight shot delivers a more effective blow than when the projectile ricochets, or—if we can imagine such a thing happening—curves around to right angles. Taking another view, we want to put the object to be battered squarely upon the anvil, directly under the hammer—all sufficiently obvious, but needing some persistence in advancing and arguing, because of the prevailing want of appreciation of the significance of fine and constant spraying for variable speed oil motors.

The end is not easy of attainment with vertical jet

Fig. 24—Showing Design with Air Control Valve Connected to Taper Needle in Fuel Jet.

and parallel air flow. In Fig. 28, being diagrams of vertical jet nozzles with parallel air flow, any fuel particle, as A, emerging from the jet within such an area as indicated by the semi-circle, must be shielded from direct air impact, and this in theory applies also to any parti-

cles within the distance C. No doubt turbulent eddies above the jet bring out particles of fuel as D D, directly subject to the pulverizing air blast, as indicated by the

Fig. 25—Design with Main Air Valve Carrying Movable Choke Tube, Restricting the Airway at Low Speed Around Jet as at A, Augmenting Supply at High.

arrows B B; but theory suggests side emergence as at E E.

The principle of the rising air valve with taper fuel control needle is that, given a butterfly throttle valve between the carburetor and the engine, as the throttle opens and negative pressure increases the air valve rises on its seat, permitting more mixture charge to pass at the same time, and adding more fuel by reason of the corresponding rise of the taper needle in the fuel jet. The main idea is mixture—its proportions—and so far the idea is useful. As petroleum engine designers we must study such devices in the light of our belief that the spraying, as far as possible, must be constant. In choosing any such device for a carburetor or oil engine feed we must study the resultant air flow and seek to arrange that, while our mixture is correctly proportioned, it is also of desirable quality.

#### Varying Air Velocity.

The obvious and gross defect we have pointed out is that the butterfly throttle valve situated between the carburetor and engine inlet valve dominates the whole resultant action and effects. If we have an open throttle valve the highest air velocity passes the jet as in Fig. 22, and the next moment, with nearly closed valve, sees the greatest air rush past its edges as at B, Fig. 22; the position of high velocity has changed, and so it ebbs to and fro. It is not what we require, and, if we can do no better, we can at least arrange a bypass from jet to throttle edge to ensure a good spray during light running.

The designers of kerosene carburetors will do well to study this point. In doing this they must for the time put aside mixture proportions and concentrate attention on air velocity, and attempt some arrangement of choke tube and the like that will enable constant speed of air to be obtained past the jet nozzle. With any given piston speed and size of opening in induction pipe, neglecting the variation with varying crank angle, the air flow is the piston speed, the effectiveness of the air flow for pulverization is related to the square of the speed, for which reason in a rough diagram in the preceding chapters on variable speed oil engines we sketched the curves for spray character greatly in excess of altitude of that for piston speed.

#### Effective Fuel Emergence.

The substitution of a throttle device on the atmospheric side of the carburetor, if applied intelligently, may be helpful. It has been adopted both for gasoline and kerosene. In the diagram Fig. 23, assuming the throttle valve well fitted and closed, the full value of negative pressure exists at the jet, causing effective fuel emergence, but we must keep distinct the notion of "negative pressure" and its effects on one hand, and a high air velocity on the other. The one "sucks out", the other sprays the fuel, and both effects may be employed bene-

ficially, but a high degree of this negative pressure is not necessarily beneficial. We desire in preference high speed of air. In experimenting with fuel vapor pump engines the distinctive effects of the two actions were well demonstrated to the writer.

#### Character of Spray.

Negative pressure—suction—is one thing as it affects fuel spraying; high velocity of air is another. The first is in reality of little service for pulverization. It causes fuel to jump energetically out of the jet nozzles (Fig. 27), and frictional and tensional forces alone act to disintegrate the fluid; but anyone who has carefully investigated the character of the spray emerging from the earlier type of gasoline carburetor, knows that "spray" is here a misnomer. Lumps, so as to speak, of fuel are torn away. The resultant supply of fuel which passed muster in old days, and still does now, may suffice, for crude carburetion with a volatile fuel. It is useless for the variable speed, variable load engines. When, therefore, we decide to put our throttle on the atmospheric side of a kerosene carburetor, we need to remember this distinction between the effects of "suction" on jets and vigorous rush of free air particles across them as in Fig. 27, and as we consider a vastly superior method in Fig. 26.

The arrangement, therefore, that we have assumed in Fig. 27, causes powerful fuel emergence on closed throttle, and from our point of view is useless. The design must be modified to convert the forces at command into kinetic energy of air. The existence of powerful suction, or negative pressure, is good so far as something potential in the hands of the designer that he may adroitly convert into air rush. We need a certain amount of suction power to cause the fuel to emerge, or perhaps to assist it to emerge, since the mere rush of air at right angles over a jet of itself acts to cause the liquid to flow.

#### Design of Fuel Ways.

The efficiency of suctional forces in spraying are related to the size of the slots or holes for fuel, the coarse hole creating a more or less solid stream of fluid; the fine holes setting up frictional resistance and reacting in surface-tensional forces give us a finer spray; so it would appear that before we can design fuel ways intelligently, that is, in the jet nozzle and the actual spraying holes or slots, we must gain some clear idea as to the relative amount of negative pressure and of actual air velocity created in the induction stroke under different conditions. A jet in an induction pipe with closed atmospheric side throttle valve as at Fig. 23, does not spray except by virtue of certain resistances to the drawing-out action excited by negative pressure upon the surface of the liquid at the jet. Gasoline designers generally ignore the point, but should the same be done with petroleum we may get an engine with good points in starting away, for example, but much smoky exhaust will result necessarily. If, therefore, we condemn the inter-engine-and-carburetor butterfly throttle and decide to substitute a control on the atmospheric side, we must see to it that the forces thus at our disposal are rightly disposed, which means, generally, the conversion of minus pressure into positive kinetic energy. Otherwise, if we completely ignore facts, we might flood the cylinder with a

Fig. 26—Jet at Right Angles to Tube.

liquid fuel each time we throttle the engine.

The problem before the designer is, therefore, to arrange choke tubes and air way details so that he may

get the full effect of his rearranged throttle position in vigorous air blast, and he must arrange the valves, either automatic or inter-connected with the throttle, so

Fig. 27—Fuel Emergence from Jets, Due to Negative Pressure: At Left, Coarse Particles as with Closed Throttle; at Right, Effect of Air Blast.

that as great a constancy as practicable is insured in this blast. Sleeve throttles may be found convenient, and generally it is to be remembered that, what with this and piston and rotary shaped blocks, ways of varying volumetric efficiency in motor cylinders exist other than the not remarkably scientific practise of fitting a sheet of oval metal into a pipe. In some designs the main air control valve may be constituted the throttle. Perforated sleeves admitting air to a mixing chamber may be a useful recourse, while piston blocks may be made to slide over openings and so form a useful main idea of throttle valve.

#### Constancy in Air Spraying.

The problem of ensuring that desirable constancy in air spraying velocity at all engine speeds seems attainable most simply by a movable choke tube, as in Fig. 25 A and B. At lowest engine speed the tube, of, say, the venturi type, closes down on the jet, or leaves but a very small air way, yet, even throwing over the old butterfly throttle and substituting some device on the atmospheric side of the carburetor, we can see we are upsetting arrangements with our supposed improved means of control. On every side we can only see compromise and give and take, while the principle of varying the cylinder charge by restraining its free entry is included as fundamental, for, if we design something that shall move up and down, as a tube around the jet, and so leave a proportionate air way that we may calculate will give us a constancy of velocity independent of piston speed, whether we restrict the intake pipe forward or aft of the carburetor, the principle governing our arrangement is set at nought.

#### Location of Throttle.

We have by putting our throttle in the new position, gained enormous power over the indraught; that is, we can control and make vigorous the air rush. Yet the act of controlling the engine by this device must, if this includes restraining free air entry, alter velocities at the jet. Viewing matters from our present standpoint we may look upon the principle of making the main auto valve the actual governing throttle as hopeful, for, if the increase of the opening of the throttle—which is here the air valve—co-ordinates with the movement of the needle, and with the needle moves the venturi tube, the opening of the throttle and increase of the potential energy supply for spraying may be modified by the rise of the tube, whereby its wider diameter comes over against the jet as in Fig. 25. In this case the area of the air passage is increased and compensation made for the increase of air flow to the cylinder, but the more we study the whole position the more evident it becomes that we must design for a compromise, and that the

statement made that this and that carburetor maintains a constant air velocity past the jet is proved, not justified, by the mere presence of ordinary throttle control, which, while shifting the point of high velocity to the throttle valve, dams up the air behind and lowers the value of the air rush through the choke tubes and past the jets.

#### Effects of Engine Side Throttle.

The diagrams at Fig. 29 show a carburetor with engine side throttle in three positions—A, nearly closed; B, half, and C, fully open. In conjunction with Fig. 22 A, it may be useful as bearing generally upon our considerations. We may assume the presence of a choke tube directing the air around the jet nozzle, but the air openings remain constant. At nearly closed throttle we get, in Fig. 29 A, little fuel badly sprayed; at B, an increase of fuel, with improvement in quality; at C, most fuel and a fine spray. The approximate air speed is assumed proportionate to the length of the arrows. At A the highest velocity is at the edges of the throttle, and under these circumstances our potential fuel disintegrating force is wasted. Air behind the throttle is penned, as water behind a dam, the rush over the weir being comparable to that past the throttle valve. The air entering the carburetor is necessarily slowed where and howsoever we make the openings, and obviously so in the diagram, where we have assumed the inlet sufficient in area for the engine at full power and high speed. Negative pressure is low, hence the pump action is small. Less fuel therefore emerges and cannot be well pulverized, as the air rush past the jet is checked. Bringing the position under review, and taking into account the several speeds of air and the relation between this and suctional forces, and assuming a constant piston speed, it is plain that more fuel better sprayed enters at B, and that these favorable conditions still further improve at C.

#### Negative Pressure vs. Air Rush.

All this is sufficiently elementary, and the position, as respects quantity of fuel, is long recognized, being made basic in constant mixture carburetor design. The neglect, as concerns petroleum motors, is failure to note (a) definite distinction between the force termed negative pressure and the actual air rush, and (b) the effect of these forces upon the quality of the spray.

In Fig. 27 we have suggested even a better spray, that would actually result in practise, for, if as indicated, we completely close an atmospheric side throttle, the engine becomes a pump purely, and would draw out a solid stream of liquid were the jet sufficiently large. As the jet area is reduced, certain forces tend to break up the fluid, the whole principle upon which drops are formed being much like that concerned when we turn off a water tap so that the solid stream is broken. Such action may pass in carburetion with a volatile fuel and is much like that which, in the early days of the gasoline carburetor, we brought about by placing an obstruction

Fig. 28—Effects of Vertical Jet Nozzles with Parallel Air Flow.

in the inlet pipe, in our endeavor to start a refractory engine. The inventor, therefore, who suddenly discovers the potential benefits of atmospheric side throttle valves,

may accomplish nothing great unless he can, by ingenious design, convert the forces he has commanded into others of suitable character. Strictly, the position indicated at Fig. 27, with air-tight induction pipe, throttle, cylinder and piston, is impossible in engine operation, because it simply indicates drawing in liquid fuel as such, without air for combustion. Nevertheless, as we have before suggested, the main principle applied intelligently, with suitable details, seems promising in kerosene carburetor design.

#### Varying Throttle.

It should again be noted that if we commence to open the throttle of Fig. 27, the highest air velocity—the most effective blows of our fuel breaking hammer—will be at C C, and remain at that position until the way opened at the throttle is at least equal to that of the ways D D, about the jet. Again, the highest velocity will then be at the openings D D, and not where we require it, until a choke tube as indicated at E is added, and there yet will remain a deficiency in practical application of these desires (powerful "atomization") for reasons suggested in discussing diagram Fig. 28. Having fully opened the throttle in Fig. 27, given equal conditions about the air inlet and choke tube, the effects of the arrangement in both sketches are identical, or practically so.

The divergence in the resultant effects in positions Fig. 27 and Fig. 29 A should be noted. Assuming both to have slightly open throttle valve, Fig. 27 results in a very rich mixture being drawn into the engine, but the

Fig. 28—Showing Spray Obtained with Carburetor on Engine Side and Throttle in Three Positions: A, Nearly Closed; B, Half; C, Fully Open—The Approximate Air Speed Is Assumed Proportionate to the Lengths of the Arrows.

object of throttling is to reduce power so the accepted method of the principle of Fig. 29 A, seems rational, as reducing fuel synchronously with reduction of compression. It is defective, as lacking power of fuel educting, but modern design meets this in gasoline carburetors with valves, etc., closing the main air way and leading air past the jet as in Fig. 25 A, where, however, the engine side throttle prejudices the value of the air rush at the nozzle. In Fig. 23, with atmospheric side throttle, the relative value of negative pressure and kinetic air energy will be according to the detail design of the air ways and choke tube area at low speed, as at A; and when as at B, at full power the main air control valve C lifts, air is shunted at D D, and a suitable velocity may possibly be obtained up the choke tube past the jet, and similarly in Fig. 25 B, the several effects, however differentiating because of the divergence in the principle of throttling. There is possibly something to be accomplished with the compound system of throttling; that is, both below and above the carburetor, co-ordinating and working harmoniously in accord with true principles.

#### Effects of Varying Throttle.

Fig. 29 is intended to represent varied throttle at constant piston speeds. If this condition ruled at all times—if, that is to say, carburetors were required only for variable load, constant speed engines, such as is the duty for all stationary engines, excepting virtual toys, we might make a fair approximation to a means of main-

taining constant quality of spray, allowing for the fact that all slow speed engines spraying by action of motor piston no doubt "dribble" at each dead centre crank position, when the value of the air flow in the induction pipe is zero.

But in automobile engines we have the complication arising from the compound action of throttle plus piston speed. The pace of the engine varies not only involuntarily from load, but designedly by the act of the car driver. If, therefore, Fig. 29 B represents a certain position of throttle valve and a certain speed, without change of throttle, varying piston speed may witness a degeneration of the spray to condition A, or an improvement to condition C. Even if we ignore the effects of varying compression temperature on the charge, the complication of load, speed and the varying demand for fuel, makes up a total of conditions to be met prompting one to believe that only in independent feed or independent air blast can we look for a complete cure of the evils attendant upon varying spray quality in automobile oil engines. The complicated factors here entering no doubt present a fine field for ingenious invention, but it seems quite certain that with auto spraying engines, subject to varying piston speed controlled by restricting the amount of the charge, a compromise only can be the end of design, and the only way which engines can be provided with absolute constancy of spraying air, is by some independent system of feed, which means apparently engines designed de novo—high speed heavy oil engines, integrally such, in lieu of carburetors attached to engines of the gasoline type.

#### Difficulties of Designers.

As some encouragement, considerable advance has been made, and more may be attained. It is commendable that so much has been effected; for when we review and endeavor to bring into harmonious correspondence all the factors bearing upon the problem, they seem too inextricably acting and counteracting, the one against the other, to look for complete success with valves either auto operated or hand controlled. The sum of the effects of variable piston speed plus throttle control presents a formidable obstacle.

Supposing we had an engine running at full volumetric efficiency, even if the speed varied we could solve the problem, nearly. This means eliminating the throttle—an impossibility in fact, but the theoretical consideration of the point indicates that, under these conditions, a very near approach to constant spraying could be made. To set out in detail the whole of the factors to be met where compression is varied and where varied speed prevails is somewhat discouraging to the inventor; but it is the correct and necessary preliminary if we would make an honest effort to meet the problem under the exigencies of accepted present day engine control.

Men interested in the manufacture of the new carburetor invented by H. O. Craven of Schenectady, N. Y., held a meeting recently to discuss plans for placing the new invention in the market. Besides Mr. Craven, those present included Joseph A. Field of Schenectady, A. H. Wynkoop of Philadelphia and Mr. Haines of Atlantic City, N. J.

The representatives of only two countries took part in the fifth international aeroplane race for the Gordon-Bennett cup, at Rheims, France, recently. As a result the trophy is retained by France, it having been won by Maurice Prevost in a Deperdussin monoplane, who covered the 124.28 miles in 59:45.6. The other contestants were: Emile Vedrines, France, Ponnier monoplane, 1:00:51.4; Eugene Gilbert, France, Deperdussin, 1:02:55.4, and Albert Crombez, Belgium, Deperdussin, 1:09:52.

## RHODE ISLAND'S MOTOR SHOW.

### Providence Dealers to Stage First Display of 1914 Models in the East.

The Rhode Island Automobile Dealers' Association has stolen a march on Boston and New York by deciding to hold its annual motor show in the state armory at Providence, R. I., Nov. 22-29, during Thanksgiving week. This early date assures the people of New England and the East an excellent opportunity to inspect the 1914 offerings well in advance of the so-called big shows. Manufacturers are not slow in appreciating this fact, and it is anticipated that several new makes of machines will be seen for the first time at any exhibition in this New England display.

Percival S. Clark has been selected by the association as general manager, and he will be assisted by a show committee. Already, arrangements have been made to include a larger number of dealers than ever before and to make the exhibition representative in every respect. L. F. Pease & Co., Providence, and the C. H. Koster Company, New York City, will have charge of the decorative treatment.

At the rear of the main floor will appear a mammoth painting in water colors on oiled silk, 37 feet high and 150 feet wide, imported from Japan at a reported cost of \$10,000. This will depict a Japanese scene and form the background for the entire decorative scheme on this floor. The side walls will be covered with green bunting, above which will run a border of wisteria, and suspended decorations of pale blue will be draped over the entire hall, underneath which will be hung Japanese lanterns and banners, branches of cherry blossoms, etc. The floor will be covered with burlap in two colors, red and green, while potted plants and palms will mark the corners of the space divisions. The spaces themselves will be designated by special emblems embodying the regulation automobile road sign. Nothing will be permitted to detract from a clear view of the entire display from the entrance, thus bringing out the size of the hall to its best advantage.

The main floor will be devoted to pleasure cars, while the basement will house the commercial vehicle and accessory exhibits, and all departments will be treated in a manner to carry out the general decorative scheme. In contrast with former practise no dealer will be permitted to occupy more than two spaces along the desirable centre aisle, with the result that instead of 12 or 13 exhibitors in this section there will be at least 24. The restriction will not apply to the side spaces, however, and one concern already has reserved 10 of these for a fitting presentation of the lines handled by it. Were it possible to secure a separate building for the trucks, the problem of assigning space would be simplified somewhat, but sufficient applications have been received to indicate that this will be by far the largest show-

The State Armory, Providence, R. I., Where the First Showing of 1914 Models in the East Will Be Held During Thanksgiving Week.

ing of motor cars that New England has ever seen, outside of Boston.

The United States government, through the War Department, has purchased a 1914 Cadillac for the use of the Chickamauga-Chattanooga national park commission. Not only is this a compliment to the maker, as it was selected in competition with numerous other makes, but it shows that the government is overcoming its reluctance to open federal parks to the automobile.

At the meeting of the New York Garage Owners' Association, New York City, means were discussed for fighting the test suit against the installation of separators ordered in all garages by the fire department.

## IN THE REALM OF THE MOTORCYCLIST.

### Fifty-Mile National Amateur Championship Race for Bosch Trophy to Be Held in Cleveland---Chicago Show Plans Completed---Contest Results and Club Notes.

**C**HAIRMAN John L. Donovan of the competition committee of the Federation of American Motorcyclists has been experiencing some little trouble in securing an opportunity to run off the 50-mile national amateur championship race, which will complete the series for the 1913 Bosch trophy award. Originally, it was expected that this event would be held in Brooklyn, N. Y., in connection with the birthday celebration, but when this plan failed to materialize an effort was made to select a suitable track under other conditions.

The lack of time, the racing season being near a close, has been an important factor. The rules provide that 30 days' notice must be given. Mr.

**Pioneer Milwaukee Woman Rider Selects Flying Merkel.**

Donovan complied with this provision in awarding the race to the North Shore Motorcycle Club of Chicago. Soon afterward that club notified him that it could not stage the event, and the sanction was transferred to the Cleveland Motorcycle Club, which will run the race at the North Randall track, Oct. 26. Under the circumstances it is believed that Mr. Donovan's actions will meet with approval. As there are but three or four riders eligible for the event, these have been notified personally, well in advance, of the change in date and place.

#### **Ready for the Show.**

Everything is in readiness for the second annual national motorcycle, bicycle and accessories

show in the Coliseum at Chicago, Nov. 3-6, and there is abundant evidence this will prove the biggest event of its kind ever held. The list of exhibitors shows a total of 104, included among which are practically all manufacturers of motorcycles, and a splendid representation of those who produce or market accessories and fittings for the two-wheel mount.

#### **She Rides a Merkel.**

The Flying Merkel agent in Milwaukee, Wis., says that the young woman shown in an accompanying illustration is one of the pioneer women riders in that city. So anxious was the agent to secure the order that he induced the Miami Cycle & Manufacturing Company, maker of this line, to produce a special machine, on which the saddle post was dropped 1.5 inches and the pedal crank was shortened so she could reach the pedals at the lowest position. Incidentally, 26-inch wheels were fitted instead of the regulation 28-inch members.

#### **On Long Distance Runs.**

I. H. Silsby, manager of the Silsby Company, Cleveland, O., riding a 1914 two-speed Yale twin, and Carl Sieler, chief mechanic, riding a self-starting Flying Merkel twin, left early in the month for a run to New Smyrna, Fla., on a vacation tour.

Ralph Piper, Corning, Ia., has recently completed a 2000-mile trip to the Cheyenne reservation in North Dakota. He made the journey in 10 days, with 290 miles the highest distance covered in one day. The feature of Piper's trip is that he covered the entire distance on an average of 80 miles to a gallon of gasoline.

When Mr. and Mrs. Leroy Snodgrass of Los Angeles, Cal., arrived in New York City a few days ago they had completed what is said to be the first coast-to-coast sidecar trip ever made in American motorcycle history.

Claude W. Baskin, Steelton, Penn., recently made a trip of 7000 miles with a cost of repairs totalling but \$1.81.

William Powell, Chicago, in a recent economy test rode his motorcycle 161 miles on one gallon and 3.5 quarts of gasoline.

Alexander M. Inderbitzin has returned to New York City after an 8000-mile motorcycle tour of England.

### New Merkel Agencies.

John Grove, Pittsburg, Penn., is to handle the Flying Merkel machines, made by the Miami Cycle & Manufacturing Company, Middletown, O., during the 1914 season, and Coleman B. Long, Louisville, Ky., has contracted to handle the Flying Merkel in Louisville and surrounding territory hereafter.

### Recent F. A. M. News.

John L. Donovan, Chicago, chairman of the Federation of American Motorcyclists' competition committee, has appointed the following state referees: Indiana, J. H. Kinney, 232 North Illinois street, Indianapolis; Illinois, Capt. Frank E. Yates, 3518 Ellis avenue, Chicago; Kansas, Erwin Keller, Topeka.

The board of directors will hold a meeting in Chicago, Nov. 5, during the progress of the Chicago motorcycle show, at which matters referred to it by the Denver convention will be taken up. The federation will maintain headquarters at the Coliseum throughout the four days of the display.

C. W. Waughop, St. Louis, Mo., one of the new directors of the F. A. M., is making an extensive motorcycle tour of the country. At the last report he had covered 11,000 miles, visiting practically all the important cities east of the Rockies. While now in Florida, Mr. Waughop will ride back to Chicago in time to attend the motorcycle show and then go to New York City.

The following local commissioners have been appointed recently: Middlesex county, N. J., Arthur LaRoe, Perth Amboy; Ashtabula county, O., J. C. Moran, 13 Spring street, Ashtabula; St. Lucie county, Fla., R. A. Saeger, Ankona.

New registered repair shops have been announced as follows: Gus Bourg & Son, Roseland, Neb.; Ravenswood Cyclery, 4501 Lincoln avenue, Chicago, Ill.

### Merkel's Bosch Magneto Contract.

The Bosch Magneto Company, New York City, has received the 1914 contract for the entire magneto requirements of the Miami Cycle & Manufacturing Company, Middletown, O. Although the exact quantity to be delivered has not been stated, it is believed that it will be a larger number than was used on the 1913 Flying Merks.

### Charles Miller, Factory Manager.

It is explained by the workmen in the motorcycle department of the Miami Cycle & Manufacturing Company, Middletown, O., that there is no more popular man at the head of any factory organization in the country than Charles R. Miller, factory manager. Perhaps the accom-

panying illustration will go far toward indicating the truth of this statement, but it may be added that last summer he thought he would resign to go into the retail business. His presence was missed so much at the factory that he has heeded the request of employer and workmen that he return to his old position.

### Club Notes, Here and There.

The Winsted Motorcycle Club has recently been organized at Winsted, Conn., with the following officers: President, Raymond Allen; vice president, James F. Ryan; secretary and treasurer, W. S. Fancher.

A. J. Preussner of the Galveston Motorcycle Club, Galveston, Tex., finds that though he has but one hand it is no handicap to him in operating his machine. In fact he is considered one of the best riders in Galveston, taking part in long runs and races of the club and frequently returning the winner.

Several members of the St. Louis Motorcycle Club will ride to Chicago to attend the show next month.

The Wanderer's Motorcycle Club, Toronto, Can., is planning a three-day endurance run during Thanksgiving

William Samuelson, Well Known Pacific Coast Rider, and His Indian Mount.

week and many new features are promised. A number of valuable prizes is offered.

Of the 44 starters in the recent reliability run of the Omaha Motorcycle Club, 22 finished on schedule time, of whom 11 secured perfect scores.

Joseph Esler, president of the Quincy Motorcycle Club, Quincy, Ill., is planning a motorcycle tour of Japan and China next year.

In the recent run of the Atlantic City Motorcycle Club, Atlantic City, N. J., to Allentown, Penn., and return, William F. Specht, Jr., and Frank Sykes, Harley-Davidson riders, had perfect scores.

Out of 35 starters in the recent two-day endurance run of the Toledo Motorcycle Club, Toledo, O., 33 finished on schedule time. The run was for 367 miles.

In the recent endurance run of the club in Tacoma, Wash., covering 204 miles to Hoquiam and return, seven of the riders secured perfect scores, as follows: H. E. Jameson, Harley-Davidson; Roy Hearne, Harley-Davidson; Elmer Bergstrom, Flying Merkel; E. Brennan, Indian; D. Oakes, Dayton; Henry Long, Excelsior; Merlfin Finch, Yale.

The Christmas Day event of the Savannah Motorcycle Club will have "Grand Prize Professional Motorcycle Road Race" for its official title. The distance will be 303.75 miles, or 27 laps of the course, open to riders of all

unported machines, singles or twins, 61 cubic inches or less in displacement. In addition to the grand prize trophy the first prize will be \$500, second \$250, third \$100. Up to Dec. 10 the entry fee will be \$10, thereafter, \$100.

After two postponements on account of inclement weather, the triangle run of the Providence Motorcycle Club, Providence, R. I., was held Oct. 19, with 40 of the original entrants starting. The riders left Providence in squads of four each minute, the first starting at 7 in the morning. The run was to Boston, to Worcester and back to Providence, and despite heavy and muddy roads good time was made. Thirty-three of the starters secured perfect scores. All who finished received medals, the trophies being awarded to those having perfect scores.

The fourth quarterly endurance run of the Cleveland Motorcycle Club was held last week with 15 entrants starting. Of the 15, five riders finished.

The annual Indian summer race of the Indianapolis Motorcycle Club was held last week at Shelbyville.

The Gadsden Motorcycle Club, Gadsden, Ala., has recently been organized and is to affiliate with the F. A. M.

The West Philadelphia Motorcycle Club has moved into its new, spacious home and is ready to welcome visitors at all times.

The Great Falls Motorcycle

Club, Great Falls, Mont., was recently organized. A membership of 42 makes the club the second largest of its kind in Montana.

### Recent Racing Results.

The following summaries indicate the results in recent race meets throughout the country:

#### Wooster, O.

Five miles, Wayne county riders only—First, Clarence Mowrey, Harley-Davidson; second, Orville Schmidt, Indian; third, Clarence Cohn, Flanders.

Ten miles, professionals—First, John Morgan, Excel-

sior; second, Paul Hale, Thor; third, Milton Long, M-M. **Norwich, Conn.**

Three miles, trial heat—First, Carroll, Indian; second, Steiner, Excelsior; third, Latham, Excelsior; time, 3:50.

Three miles, trial heat—First, Brown, Indian; second, Burdick, Excelsior; third, Pallazzo, Excelsior; time, 3:56.

Five miles, final—First, Carroll, Indian; second, Burdick, Excelsior; third, Steiner, Excelsior; time, 6:17.5.

Five miles, local riders—First, Floyd Ledger, Excelsior; second, W. N. Chapple, Indian; third, H. B. Baldwin, Excelsior; time, 7:27.

Three miles, trial heat—First, Carroll, Indian; second, Steiner, Excelsior; third, Latham, Excelsior; time, 3:46.

Three miles, trial heat—First, Burdick, Excelsior; second, Brown, Excelsior; third, Pallazzo, Excelsior; time, 3:53.5.

Five miles, final—First, Burdick, Excelsior; second, Steiner, Excelsior; third, Brown, Indian; time, 6:18.5.

Three miles, local riders, single-cylinder—First, B. P. Davis, Indian; second, T. M. Robinson, Indian; third, Cummings, Excelsior; time, 5:05.5.

Seven miles, open—First, Burdick, Excelsior; second, Brown, Indian; third, Walsh, Indian; time, 8:15.

#### Bay City, Mich.

Three miles, singles—First, James Kinsey, Jefferson; second, Young, Jefferson; third, Joseph Kinsey, Breed; time, 4:18.

Three miles, twins—First, Delzell, Indian; second, Phelps, Indian; third, Leix, Thor; time, 3:58.

Three miles, twins, exhibition—First, Hauer, Indian; second, Bell, Excelsior; third, Young, Indian; time, 3:47.

Five miles, handicap—First, Kinsey, single Jefferson; second, Phelps, twin Indian; third, Long, twin Indian; time, 7:05.

Seven miles, handicap—First, Hauer, twin Indian; second, Bell, twin Excelsior; third, Long, twin Indian; time, 10:03.

Two miles, twins, exhibition—First, Hauer, Indian; second, Bell, Excelsior; third, Young, Indian; time, 2:30.

Four miles, relay—First, Hauer, twin Indian, and Kinsey, single Jefferson; second, George Ford, twin Harley-Davidson, and Boehm, twin Indian; third, Weismiller, twin Excelsior, and Bell, twin Excelsior.

#### Los Angeles, Cal.

Three miles, trial heat—First, Johns, Excelsior; second, Bennett, Pope; third, Basso, Flying Merkel; time, 2:48.

Five miles, open—First, Sawyer, Excelsior; second, Frank, Excelsior; third, Manasco, Indian; time, 5:17.

Six miles, stock—First, Bennett, Pope; second, Walters, Indian; third, Peck, Indian; time, 5:30.2.

Five miles, final—First, Johns, Excelsior; second, Bennett, Pope; third, Basso, Flying Merkel; time, 4:45.3.

Five miles, stock, private owners—First, Heffelfinger, Pope; second, Renn, Thor; third, Bell, Thor; time, 5:25.8.

Two miles, professional—First, Manasco, Indian; second, Frank, Indian; time, 3:01.

Ten miles, professional—First, Johns, Excelsior; second, Walters, Indian; time, 9:20.

#### Winnipeg, Can.

Three miles, novices—First, Pearson, Indian; second, Janzen, Indian; time, 4:49.2.

Five miles, amateurs—First, Janzen, Indian; second, Johnson, Indian; time, 8:16.

Five miles, amateurs—First, Bush, Merkel; second, Janzen, Indian; time, 8:08.

Five miles, stripped—First, Rennick, Indian; second, Cruikshank, Indian; time, 6:05.

Five miles, amateurs—First, Janzen, Indian; second, Johnson, Indian; time, 7:54.

Five miles, handicap—First, Bush, Merkel; second, Pearson, Indian; time, 7:33.

Three miles, professionals, handicap—First, Rennick, Indian; second, Cruikshank.

Ten miles, professionals—First, Cruikshank; second, Rennick.

Five miles, singles, stripped, trade riders—First, Fabian, Pope; second, Watkins, Harley-Davidson; third, Lewis, Pope; time, 6:05.5.

Five miles, twins, trade riders—First, Russell, Excelsior; second, Smith, Indian; third, McCarthy, Harley-Davidson; time, 4:56.

Two miles, sidecars—First, Walters, Indian; second, Middlemas, Thor; time, 3:10.

Five miles, twins, stripped, trade riders—First, Smith, Indian; second, Tomkins, Jefferson; third, McCarthy, Harley-Davidson; time, 4:50.8.

Charles R. Miller, Factory Manager  
Miami Cycle & Manufacturing  
Company.

Club, Great Falls, Mont., was recently organized. A membership of 42 makes the club the second largest of its kind in Montana.

## JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcycleists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

Name .....

Address .....

**Motorcycles in Business Life.**

Charles Luder, Washington, Ind., has found the motorcycle to be very instrumental in helping him build up a paying business in his photographic work. He has frequent calls from family gatherings, picnics and various meetings, but he has never sought this class of work until recently on account of transportation expenses. This problem has been solved by the purchase of a machine which he has fitted with a box to carry his camera and incidental necessities.

The Citizen's Ice Company, Toledo, O., has a flying squadron of motorcycle riders, each one a foreman of a section of the town with about a half-dozen ice wagons under his direction. While he oversees the work of the men on the teams, the foreman also takes care of emergency deliveries, frequently carrying a small amount of ice on his machine to some customer who is in need of prompt service.

Fred W. Diehl, Piedmont, Cal., finds the use of the motorcycle to be very practical in his poultry business. Diehl handles principally eggs and dressed poultry and has attached a carrier on which he makes quick deliveries to his customers.

Louis Geyler, Chicago, Ill., with the aid of a motorcycle equipped with tools and repair kit, finds it possible to get, at a speed of 60 miles an hour, to the aid of Chicago automobilists whose cars are in distress. Mr. Geyler says that the new service is the most important factor in his garage business.

At Lafayette, Ind., the business men are finding the two-wheel mount to be the most practical investment they can make for their increasing trade. Two of the city newspapers have machines to aid the reporters in covering distant runs and for aiding the necessarily rapid work of the circulation department. Others in that city who have found the motorcycle to be a valuable aid in their business systems are four drug stores, a plumber, the telephone company and the police department.

**Mail Carriers on Tour.**

The national convention of rural mail carriers recently held at Evansville, Ind., was attended by motorcycle parties from all sections of the country.

**Whole Family on a Yale.**

Mr. and Mrs. Lewis W. Luder and two children of Caro, Mich., a small town about 100 miles north of Detroit, have been enjoying a 2800-mile trip on a Yale twin, made by the Consolidated Manufacturing Company, Toledo, O., fitted with a sidecar. Mr. Luder drove the machine, while Mrs. Luder occupied the sidecar, with the

two children in front of her on cushions. Strapped on the outside of the car was about 97 pounds of baggage. The route lay eastward to Buffalo, across New York State to Albany, thence to Pittsfield, Springfield and Boston, Mass., and finally to Portland, Me., which was made the turning point for the return journey.

**Chapple to Sell Dayton.**

A. G. Chapple, one of the riding stars of the Brighton Beach track, has returned to the trade and is now travelling in the southern states in the interests of the Dayton motorcycle, made by the Dayton Sewing Machine Company, Dayton, O.

**On Transcontinental Journey.**

W. B. Gass and Joseph Palmer of Detroit are now on a pleasure trip on motorcycles riding from Detroit to San Francisco. They started from Detroit Sept. 15 and expect to arrive in San Francisco Dec. 15.

**Crawford Plant to Move.**

Announcement is made that the Midland Manufacturing Company, Saginaw, Mich., maker of the Crawford motorcycle, will move to Morgantown, W. Va. Buildings are being constructed in the latter city and it is expected that they will be ready for occupancy in a short time.

## **ALWAYS READY FOR ANY** **EMERGENCY!**

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1918 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

Middletown, Ohio, U. S. A.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

**American Motor Transit**, Camden, N. J.; \$100,000; L. J. Bergdoll, F. R. Hansell, F. S. Garman.

**Staunton Automobile Livery & Transfer Company**, Staunton, Va.; \$25,000; president, N. C. Williams; secretary, T. M. Hoopes.

**Stewart Transportation Company**, Perth Amboy, N. J.; \$2000; Walter K. Whitaker, Raymond S. Meyers and others.

**Wilson Engineering Company**, Buffalo, N. Y.; \$20,000; C. G. Hulbert, W. F. Gagnon, W. H. Pfeiffer.

**Automobile Realization Company**, Chicago, \$90,000; to deal in automobiles and accessories; A. B. Johnston, G. B. Smith, G. F. Matthis.

**Auto Salvage Company**, Kansas City, Mo.; \$12,000; Claude S. Peck, Bessie G. Peck, W. R. Chamberlain.

**Tire Buyers**, Guilford, Me.; \$600,000; to manufacture and deal in tires; H. Hudson, J. H. Hudson.

**Cleveland Motor Lamp & Radiator Company**, Cleveland, O.; \$10,000; to deal in motor car supplies; W. H. Montie, J. L. Balash, E. E. Kiesler, H. J. Monson, W. L. Ross.

**Automatic Safety Signal Company**, New York City; \$25,000; to manufacture and deal in lamp appliances; H. Sieglar, M. M. Becker, P. R. Feign.

**DeWitt Muffler Company**, Wilmington, Del.; \$30,000; to deal in parts; C. E. DeWitt, A. L. Downey, R. B. Rupert.

"Noon Hour" at the Factory of the Electric Storage Battery Company, Philadelphia, Showing About 1000 Employees Gathered at Allegheny Avenue and 19th Street.

**Warm-Hand Steel Wheel Corporation**, Poughkeepsie, N. Y.; \$150,000; to manufacture steering wheels; G. E. Smith, W. S. Barton, J. C. Barton.

**Spokane Motor Manufacturing Company**, Spokane, Wash.; \$50,000; E. A. Torrance, R. L. Dickerson and others.

**Arthabaska Motor Car Company, Ltd.**, Victoriaville, Que.; \$19,000; F. Bastien, J. O. Bastien, A. Quesnel, Jr., W. Bergeron, L. P. Crepear.

**Whiting Motor Car Company**, Philadelphia, Penn.; \$15,000.

**Auto Motor Car Company**, Aberdeen, N. D.; \$10,000; H. A. Page, Sr.; H. A. Page, Jr.; R. J. Cochran, W. A. Blue and others.

**Sommerest Garage Company**, Boston, Mass.; \$15,000; J. J. Shea, L. L. Cambridge.

**Zip Cyclecar Company**, Davenport, Ia.; \$25,000; R. W. Phelps, G. Decker French, F. W. Skinner.

**Williams-Hasley Motor Car Company**, Pittsburg, Penn.; \$15,000; S. Hasley, S. A. Williams, W. G. Hasley.

**Burns Automobile Exchange**, New Orleans, La.; \$10,000; general automobile business and to specialize in exchange of second hand cars; W. T. Burns, William H. Byrnes, Helen McGrath.

**Taxicab Association**, New York City; \$50,000; to manufacture and deal in automobiles; L. H. Biglow, Jr., A. L. Loomis, A. Wichfeld.

**Bond Automobile Company**, St. Louis, Mo.; \$10,000; wholesale buying and selling automobiles, accessories and automobile repairing; Mark W. Bond, Caroline Bond, Charles Kist.

**John J. Roche Company**, Hartford, Conn.; \$50,000; to

deal in automobiles and supplies; John J. Roche, Carroll F. Roche, Henry W. Nichols.

**Doughty Tire Company**, Portland, Me.; \$2,000,000; T. L. Croteau, Albert A. Richards, B. M. Maxwell.

**Aurora Vulcan Company**, Bridgeport, Conn.; \$250,000; to manufacture automobile supplies.

**Frankfort Motor Car Company**, Frankfort, Ky.; \$3000; T. P. Rogers, J. G. Rogers, O. C. Kenney, J. E. Manford, A. L. Manford, A. L. Bacon.

**A. P. Mitchell Auto Company of Fort Worth**, Fort Worth, Tex.; \$15,000; F. L. Toepperwein, J. R. Walker, H. Roos.

**Dimmer Company of America**, Chicago, Ill.; \$21,000; A. A. Pantells, O. O. H. Weldner, John H. Lally.

**C. & P. Kerosene Carburetor Company**, New York City; \$100,000; H. Anderson and others.

**Buckeye Motor Trucking Company**, Cleveland, O.; \$10,000; F. E. Kulas, E. Powell and others.

## WITH THE MANUFACTURERS.

**The Firestone Tire & Rubber Company**, Akron, O., has established a separate sales and shipping department to take care of its increasing foreign business, with C. O. Brandes in charge as manager.

**The Electric Storage Battery Company**, Philadelphia, is well known to motorists because of its production of Exide, Hycap-Exide, Thin-Exide and Ironclad-Exide batteries for electric vehicles. The company has been engaged in this field since 1888, and that its factory force is sufficiently large to justify its claim as one of the leading battery makers in the country is indicated by the accompanying illustration. The company maintains branches in New York, Boston, Chicago, St. Louis, Cleveland, Atlanta, Detroit, Denver, San Francisco, Los Angeles, Seattle, Portland, Ore., and Toronto, Can. All told there are some 886 Exide battery distributors.

**The White Company**, Cleveland, O., is building an addition to its plant at East 79th street. The main building will be enlarged by the erection of a new building to be 30 by 240 feet, at a cost of \$10,000.

**The Sheffield Motor Works**, Sheffield, Eng., has closed a contract with the United States Light & Heating Company, Niagara Falls, N. Y., and hereafter will equip all its cars with the U-S-L starting and lighting system.

**The Walker Tire Chain Company** has been organized in Bridgeport, Conn., to produce a new anti-skidding device invented by Charles Smith and John Anderson. H. F. Rhorman, Zanesville, O., is vice president.

**The Grant-Lees Machine Company**, Cleveland, O., has just completed a new addition to its factory and now has production facilities almost doubling what they were a year ago.

**The Champion Spark Plug Company** has been awarded a permit for the erection of a new factory building at Avondale and Upton avenues, Toledo, O.

**The Stromberg Motor Devices Company**, Chicago, is to open a factory branch at 146 West 56th street, New York City.

**The Perfection Spring Company**, Cleveland, O., has leased a building on East 65th street and will utilize this as an addition to its plant.

**The F. L. Moore Truck Company** has moved from Los Angeles, Cal., to a new factory at Torrance. The new building is of concrete and steel, 100 feet by 500 feet, with glass sides and top.

**Henry J. Arnold** and associates have started a plant in Denver, Col., for the manufacture of a substitute motor fuel for gasoline.

# New Departure Ball Bearings

*American Made for American Trade*

## The Proof of the Bearing Is in Its Service

The garage man knows better than anybody the comparative service merit of the bearings installed in motor cars he cares for and repairs.

We recently sent out letters to garagemen throughout the country, asking them their opinion of the New Departure Ball Bearing, based on their experience with it.

The complete summary of all responses received the first week shows that 96 per cent. of the garagemen who have been using New Departures found them absolutely satisfactory. Many of them went so far as to say that it has proved superior to all others.

This remarkable evidence of the quality and efficiency of the New Departure Ball Bearing is absolutely indisputable. Users of foreign-made ball bearings, whether garagemen or manufacturers, should give this American-made bearing a thorough trial.

Every manufacturer, purchasing agent, superintendent, and designing engineer, should have the Engineering Edition of the New Departure Ball Bearing Catalog and the brochure on "Bearing Friction and Its Elimination."

Every garage proprietor and superintendent should have the new Ball Bearing Garage Manual now in its third edition. Either one, or all of these books, will be sent free on request. Drop us a line now.

**THE NEW DEPARTURE MFG. CO., BRISTOL, CONNECTICUT**

**Western Branch 1016-17 Ford Bldg., Detroit**

When Writing to Advertisers, Please Mention The Automobile Journal.

**The Jiffy Auto Curtain Company**, Detroit, has taken larger quarters in the Dodge Power building.

**The Spenny Motor Car Company**, Tucson, Ariz., has closed negotiations to take over the plant of the Dearborn Engraving Company at Holland, Mich., and remodel it into an automobile factory. The new plant will be used at first as an assembling station, but eventually cars will be manufactured there.

**The Gibson Motor Company** of Pittsburg, Penn., has taken over the plant of the Miller Planing Mill at Rochester, Penn., and will manufacture motor cars.

**The Fiat Automobile Company**, Poughkeepsie, N. Y., is erecting an addition to its plant.

**F. H. Berger**, chief engineer of the Oakland Motor Car Company, Pontiac, Mich., has resigned. He is succeeded by **N. E. Wahlberg**, engineer for the Durant-Dort Carriage Company, Flint, Mich.

**The John W. Brown Manufacturing Company**, Columbus, O., lamp manufacturer, has increased its capital from \$490,000 to \$600,000.

**The United States Light & Heating Company**, with main office in New York City, claims to operate one of the largest factories in the world devoted to the production of storage batteries, etc. An accompanying illustration indicates the extent of the plant in Niagara Falls, N. Y. The company is quite as well known to motorists as the maker of the U-S-L lighting and starting system, which is being fitted to many cars. Service stations are

trated garage and machine works to double its original size. The new addition will be used exclusively for automobiles and supplies.

**The Central Garage**, Reading, Penn., is building a new addition 30 by 40 feet.

**F. G. Diamond**, Rydal, Penn., has plans prepared for the erection of a two-story stone garage.

**F. B. Gaunt** and **E. Roberts**, Lodi, Cal., are having their garage remodelled and improved.

**Louis Stein**, Philadelphia, Penn., has purchased the large two-story garage at the corner of Broad and Huntington streets.

**L. F. Tweed** and **Murrell Ellis**, Devils Lake, N. D., have opened for business in the garage formerly operated by the State Auto Company. It will be conducted under the name of the Great Northern Auto Company.

**The Metal Welding & Brazing Works**, Columbus, O., is a new automobile repair shop opened at 75 East Mount street.

**The National Car Company**, St. Paul, Minn., has opened a garage at 124 West Fourth street.

**F. A. McCormick & Son**, Manchester, O., has opened a motor car repair shop on East Second street.

**The Des Moines Imperial Company**, Des Moines, Ia., has been organized and will handle the Imperial cars exclusively.

**Henry Vogel**, Carrington, N. D., has sold his interest in the Bull Dog garage to his partner, **L. H. McMahan**.

**The Lockwood-Luetkemeyer-Henry Company**, Cleveland, O., has taken the Cleveland agency for the Empire Tire Company.

**The Central Auto Company**, Keokuk, Ia., has been taken over by **Smith & Cox**, succeeding **Smith & Perdue** in the ownership. The new firm will operate a repair shop as well.

**J. A. Pike**, Danbury, Conn., has leased part of the Starr factory and will start business under the name of the Danbury Welding Company.

**Charles Roeder**, Coopersburg, Penn., has purchased **William M. Applegate's** garage in Bethlehem and has taken charge of the business.

**The Ford Garage & Supply House**, West Point, Neb., has been sold to **John E. Wiesner**, who will continue the business.

**J. C. Baird**, Portland, Ore., is having a new building erected at a cost of \$15,000, part of which will be used as a garage.

**The W. D. Newerf Company**, Los Angeles, Cal., is planning for new and larger quarters to be ready for occupancy about the first of the year.

**F. A. Havens & Co.**, Philadelphia, is estimating on plans and specifications for alterations and additions to the residence and garage of **W. K. Wetherill** at Wynnewood, Penn.

**The Fire Department**, Fort Worth, Tex., is erecting a garage at the central station for the use of municipal machines.

**The Ford Motor Company of Canada** is to erect a six-story building at Dupont and Christie streets, Toronto, at a cost of \$250,000.

**The Ohio Auto Sales Company**, Columbus, O., has had plans prepared for the erection of a new sales and office building near Warren street.

**William J. Payne & Co.**, Allentown, Penn., is to erect a garage on Allen avenue to cost \$5500.

**John I. Bagduina**, Chicago, is erecting a one-story garage at 2334-2336 South Oakley avenue, at a cost of \$1000.

**C. E. Meyers**, Washington, D. C., is converting a building in the alley between Third, Fourth, G and H streets into a public garage, at a cost of \$5600.

**The U-S-L Plant at Niagara Falls, N. Y., Claimed to Be the Largest Storage Battery Factory in the World.**

maintained in connection with the branches in New York, Boston, Buffalo, Cleveland, Detroit, Chicago, St. Louis and San Francisco.

#### GARAGE AND DEALER.

**The Andrew Garage Company**, New York City, is to have a new five-story garage built on East 79th street.

**Albert Snyder**, Allentown, Penn., will have a new modern garage erected.

**The Bakersfield Garage**, Bakersfield, Cal., is to be enlarged by the erection of an addition.

**The Miles B. Mank Motor Car Company**, Portland, Me., is to have its building enlarged and improved.

**The Athens Motor Company**, Athens, N. Y., is to have an addition built to its garage on South Elmira street to be used as a repair department. When finished the entire building will be 90 by 120 feet and fireproof throughout.

**L. F. Hersh & Bro.**, Elizabeth, N. J., is planning the erection of a new garage on Westfield avenue.

**Percy L. Neel**, Philadelphia, Penn., has purchased the six-story reinforced concrete garage at 142-144 North Broad street, of which he has been the occupant, for \$150,000 and mortgage of \$150,000.

**Charles F. Eggleston**, Chester, Penn., has plans for a new office and garage at Second and Main streets.

**E. L. Stanfield**, Barstow, Cal., is enlarging the Cen-

## RECENT PATENTS.

**Electric Gearshift**, Ralph W. Bradley, Fort Collins, Col., No. 1,074,599. Filed Jan. 28, 1913.

**Radiator Vent Valve**, Andrew Jackson, Chicago, No. 1,074,624. Filed March 14, 1913.

**Muffler**, Charles Hinton Kenney, New London, Conn., No. 1,074,627. Filed March 29, 1913.

**Shock Absorber**, Charles N. Sowden, Guantanamo, Cuba, No. 1,074,658. Filed Sept. 11, 1912.

**Automobile Jack**, W. Claughton Bouldin, Oakland, Tex., No. 1,074,690. Filed Aug. 29, 1912.

**Tank Gauge**, Bernard H. Camden, Washington, D. C., No. 1,074,692. Filed July 3, 1912.

**Friction Transmission**, Adolph Gazagnaire, Cannes, France, No. 1,074,710. Filed April 2, 1912.

**Lamp**, Charles E. Godley, Detroit, assignor to Edmunds & Jones Manufacturing Company, same city. No. 1,074,712. Filed May 12, 1913.

**Ignition System**, Leon J. LePontois, New Rochelle, N. Y., assignor by mesne assignments to H. W. Johns, No. 1,074,724. Filed June 15, 1909.

**Automatic Gas Lighter**, Henry Meyer, New York City, No. 1,074,728. Filed Dec. 27, 1912.

**Lubricating Apparatus**, William L. Morris, Cleveland, O., assignor to S. F. Bowser & Co., Fort Wayne, Ind., No. 1,074,730. Filed Aug. 5, 1905.

**Speedometer Drive**, Frank M. Murray, Cadyville, N. Y., No. 1,074,732. Filed Jan. 4, 1913.

**Steering Gear**, Marcus D. Satterlee, Andover, and Nellie C. Satterlee, Williamsfield, O., No. 1,074,748. Filed Oct. 3, 1912.

**Automobile Cut-Out**, Raymond T. Whipple, San Jose, Cal., No. 1,074,762. Filed July 15, 1912.

**Windshield**, Guy B. Collier, Kinderhook, N. Y., No. 1,074,774. Filed Aug. 8, 1910.

## NEW BOOKS RECEIVED.

**Baker Armored Concrete Pavement**, R. D. Baker Company, Detroit. It contains a description of pavement laid by this concern, and is well illustrated with roads which have seen various classes of service.

**Vulcan Motor Cars**, Vulcan Manufacturing Company, Painesville, O. A splendidly illustrated catalogue of the new Vulcan cars made by this concern, with complete mechanical description of the various components.

**The Bosch News**, Bosch Magneto Company, 223-225 West 46th street, New York City. October number calls special attention to new Bosch products, including the Bosch press button key switch and the Bosch-Ford attachment.

**The Lincoln Highway of Colorado**, Lincoln Highway Association of Colorado, Colorado Springs, Col. It presents a log of the new improved highway connecting Kansas and Utah through the centre of Colorado. Fully illustrated.

**Her Ladyship's Coach**, Stevens-Duryea Company, Chicopee Falls, Mass. A neat little brochure reciting the history of well appointed carriages designed to lend social distinction to the possessor, and calling especial attention to the limousine made by this company. Illustrated.

## BRITISH ENGINEER DISCUSSES FUELS.

**B** RITISH motor vehicle users are much interested in the increasing price of fuel, and it is not at all surprising that the new president of the Institution of Automobile Engineers, J. S. Critchley, should devote a large part of his inaugural address to "The Fuel Question". After citing the decrease in production of gasoline in this country and its effect upon the price in America, Mr. Critchley said:

In Great Britain, the estimated amount of petrol (gasoline) which will be consumed during the current year is 100,000,000 gallons. The total registration of vehicles in Great Britain in 1912 was 188,874, showing an increase of 28,982 over the preceding year. A considerable number of registrations are cancelled, but I think it would be safe to assume that 110,000 motor vehicles are in use. The buses and taxicabs of London number about 10,000 vehicles, and will consume approximately 20,000,000 gallons, while motor boats, motorcycles and other users will absorb at least another 10,000,000 gallons, so that for 100,000 vehicles we have some 70,000,000 gallons of petrol consumed.

Petrol as we know it today is practically the distillate of petroleum, which will completely vaporize without heat application and which has no fire test, that is, it will flash at any temperature. In the lower grades the boiling point may be over 150 degrees C. and the specific gravity over .760. There is no fixed point of demarcation between kerosene and motor fuel. Just where the one ends and the other begins in the distillation is controlled somewhat by the market price. If kerosene were the more value of the two the distiller would be careful enough to see that none of it entered into the composition of the motor fuel, and vice versa. The commercial difference between the two is that kerosene will only ignite when its temperature has been raised to a certain degree, depending on the grade, of which there are many. The lowest grade is 110 degrees fire test, the highest being 150 degrees fire test. The volatility of the lower grade is very much greater than that of the higher grades and the price again is fixed by the degree of the fire test.

The carburetor for an automobile must fulfill the following conditions: The combustion must be perfect to a degree that there shall not be any offensive odor or visible exhaust; the fuel must be regulated to respond instantaneously to changes due to varying speed and load, and the combustion of the fuel must not deposit carbon or any other substance within the cylinder. In addition to its lack of volatility, kerosene has a smaller range of combustible mixtures with air than petrol, and greater viscosity, and it is much more difficult to obtain the proper physical conditions for combustion than in the case of volatile liquids and gases. It is, indeed, difficult to fulfill the requirements with kerosene carburetors as we know them today, and I do not think we are yet able to come to a conclusive opinion as to the best method of dealing with this fuel.

Mr. Critchley then dwelt at some length upon conditions and findings by various authorities, many of which have been presented at more or less length in the article on "Heavy Fuels" now running serially in these columns. He also called attention to various processes for blending different grades of hydrocarbons, which have been introduced on the Continent of Europe, and which he suggested were the result of endeavor to revive old patents somewhat changed and reconstructed.

Since there has been some little attempt to use benzol in Great Britain, what Mr. Critchley had to say on this subject undoubtedly will prove of interest to American readers. It was in part as follows:

Benzol has the chemical formula of  $C_6H_6$ , and is a water white fluid, with a specific gravity of .880. Pure benzol freezes at 42 degrees F., and to keep it fluid in cold weather a mixture with toluol,  $C_7H_8$ , is necessary. To produce 100,000 gallons of benzol and toluol, coal to the amount of 1,625,000 tons is treated. The small amount produced per annum would only be sufficient for two days' fuel supply for the London General Omnibus Company. The cost price of benzol at the gas works is stated to be 8d per gallon in bulk. At 8d per gallon there is no profit over selling the tar at 3d per gallon.

The carburetion of benzol presents no difficulties, but it is doubtful if the best results are obtained with an engine which has been designed for petrol, and it is probable that if a type of engine were specially designed for benzol, greater efficiency would be obtained than by merely employing this fuel with an engine designed for petrol.

Some very interesting trials have been conducted by Dr. Dieterich with benzol and other fuels on an Opel car with an engine having cylinders 70 mm bore by 100 mm stroke (2.76 by 3.93 inches), with standard type of carburetor. The tests were made on a stretch of road 10 kilometers in length under equal conditions regarding temperature and weather. The results obtained with the different mixtures are as follows:

1. **Ether**—Ordinary ethyl made from alcohol and sulphuric acid, containing about 70 per cent. of carbon, eight per cent. of hydrogen, and 22 per cent. of oxygen; specific gravity, .718 to .725; calories, 9000 per kilogram; price in Germany, minus the tax, 10d per kilogram. Used as fuel, unmixed, quickly stalled motor, mainly by reason of the great cooling produced by the rapid evaporation of this highly volatile liquid.

2. **Petroleum-Ether**— $C_3H_8$ ,  $C_4H_{10}$ ,  $C_5H_{12}$  (mainly the latter, the pentane), containing 85 per cent. carbon, 15 per cent. of hydrogen; specific gravity, .650 to .680; calories, 11,000; price, 7.5d. Results poor, as under 1.

3. **Ordinary Petrol**—Hexane, heptane and octane; 85 per cent. carbon, 15 per cent. hydrogen; specific gravity, .680 to .720; calories, 9500 to 11,000; price, 7d. Produced a maximum speed of 50 kilometers per hour with a consumption of one liter for eight kilometers. The usual advantages over benzol and heavy petrol in the way of responsive acceleration and the greater power arising from rapid flame propagation.

4. **Heavy Petrol**—Octane and higher grade paraffin (kerosene); 85 per cent. carbon, 15 per cent. hydrogen; specific gravity, .730 to .760; calories, 10,500; price, 5.75d. Produced a maximum speed of 44 kilometers, and a consumption of one liter for seven kilometers. Motor sluggish and acceleration slow.

5. **Benzol**— $C_6H_6$ ; 92 per cent. carbon, eight per cent. hydrogen; specific gravity, .8997; calories, 9500 to 10,000; price, 4d. Gave nine kilometers to the liter, but a maximum speed of only 42.25 kilometers. Same drawbacks as with heavy petrol.

6. **Heavy Petrol and Ethyl Ether**—Equal weight parts, price 8d. Results poor; very little power.

7. **Same Ingredients**—Proportions 1:1.5; price 9d. Results poor, showing ether to be useless for admixture, apart from price consideration.

8. **Heavy Petrol and Petroleum-Ether**—Equal parts; specific gravity, .701; calories, 10,000; price, 6.75d. Gave eight kilometers to the liter; maximum speed, 45 kilometers. The acceleration was better than with heavy gasoline alone.

9. **Same Ingredients**—Proportions, 1:1.5. The results were almost as poor as with petroleum-ether alone.

10. **Benzol and Petroleum-Ether**—Proportions, 1:1.5; specific gravity, .705; calories, 10,750; price, 6.25d. Gave eight kilometers to the liter; maximum speed, 48 kilometers. Acceleration and results generally better than with benzol alone.

11. **Same Ingredients**—Equal parts; specific gravity,

.725; calories, 10,500; price, 5.75d. Gave eight kilometers to the liter; maximum speed, 50 kilometers. Took grades on third speed which with ordinary gasoline required second speed. An important improvement upon unmixed benzol.

12. **Same Ingredients**—Proportions, 2:1; specific gravity, .797; calories, 10,300; price, 5d. Gave a little more than eight kilometers per liter, and a maximum speed of 54 kilometers. Took all grades with higher gears than possible with other fuels. Good acceleration and lively explosions. Better than ordinary petrol of .680 to .720 gravity.

The supplies of benzol seem to vary very considerably in quality, and in view of the position that benzol seems likely to take as a motor fuel, the present time would appear to be an opportune one for some standard of composition to be decided upon. The best volatility and the permissible amount of impurities, such as sulphur, should be ascertained and fixed; there should also be some limit to the amount of toluol which it is necessary to add to keep the fluid liquid at low temperatures. The worst feature in connection with benzol is, of course, its smell, but it is a fuel which must be encouraged by all possible means.

Attention was drawn to recent tests of naphthalene in Paris with a Renault cab, fitted with a special carburetor consisting of a melting receptacle in which the melted naphthalene was maintained by the exhaust at a heat above its melting point and from which it was conveyed to a heated float feed carburetor. It was, of course, necessary to start the engine on gasoline, and it was found that the shortest time which must elapse before the naphthalene could be turned on was 13:37. A stop of 10 minutes could be made without resorting to gasoline for starting, while a stop of 16 minutes necessitated its use.

Other subjects treated briefly were: Energizing or "doping" gasoline with picric acid, ammonium nitrate, etc.; obtaining fuel from creosote, bituminous coal and shale, and the use of alcohol as fuel. Concerning the last named Mr. Critchley said in part:

In view of the repeated assurances that alcohol is the real solution, it is necessary for me to bring this matter to your notice. We must, I think, admit that as far as practical experience goes in this country, we have had very little opportunity of finding out the merits or demerits of alcohol as a motor fuel.

Before the question of suitability or otherwise of alcohol as a fuel for automobiles can be fully decided, a tremendous amount of research work is necessary. In the first place there is the question of the production of the alcohol in sufficient quantities at a price which will make its use economical. I think it is quite useless to contend that alcohol can be made at a competitive price from potatoes or beets grown in this country. According to some authorities alcohol can be manufactured in the British colonies at 4d to 6d per gallon, and from peat at even less cost.

If the motorists of this country are serious in the endeavor to provide a fuel which can be produced in unlimited quantities and not subject to market fluctuations, they should get together and devise some scheme whereby sufficient money can be provided to solve or decide the question as to the possibilities of alcohol. No doubt many of our colonies themselves would contribute to such a scheme. It seems somewhat ridiculous to pass resolutions to the effect that alcohol is the only fuel which will save the situation and to take no action to carry such resolutions into practical effect.

In conclusion, Mr. Critchley expressed himself as follows:

At the present time the petrol internal combustion engine has practically no rival, but in commercial work Providence is always on the side of low prices, and if by reason of the price of petrol other systems than those with which we are now conversant turn out more economical they will surely come to the front. We engineers have no axe to grind as regards fuel, and study all propositions with an open mind.

## DOUBLE LIGHTING SYSTEM.

### Luverne Car Is Offered with Both Electric and Acetylene Headlights.

Offering the owner an ever present option between electric and acetylene headlights, the Luverne Automobile Company, Luverne, Minn., has fitted a double lighting system on its new big brown Luverne car. It is expected that this plan will meet with decided approval, and, indeed, this seems to have been the case with those who have already secured new machines thus equipped.

The regular system consists of electric lights throughout with current furnished by a Vesta generator, which is driven through silent chain from the motor, and an LBA storage battery. The headlights are fitted with both electric bulbs and gas tips, mounted on a triangular bar, so that either the bulb or the tip may be placed in front of the reflector, with the other out of the way entirely. The change in lights can be made instantly, and a snap lock holds them securely in place. The headlights are connected up with both electric wiring and tubing to the Prest-O-Lite tank, so that in case of temporary failure of the electric system, the gas light system is instantly available. The tank is neatly mounted out of sight in the double running board which is held to be one of the exclusive features of the Luverne.

**Correction of Error**—In a special article on the National Highways Association in the issue of The Automobile Journal for Sept. 25, the address of the organization department of the association was given as 515 Hartman building, Chicago. This department is under the direction of Jesse Taylor, whose address is Jamestown, O.

C. H. Dunlop, export manager of the Hupp Motor Car Company, is now on a visit to Paris and London, and while abroad he will attend the annual shows in those cities and confer with the Hupmobile dealers on the Continent. The company reports that half of its total output for 1914 has been contracted for delivery abroad.

# FIRST ALLOTMENT OF ACCESSORY SPACES.

THE show and allotment committee of the Motor & Accessory Manufacturers at a meeting in New York City last week completed the allotment of space to the members of the association for the 14th annual national automobile shows to be held in Grand Central Palace, New York City, Jan. 3-10, and at the Coliseum Annex and First Regiment armory, Chicago, Jan. 24-31. The total number of applications acted upon was 102 for New York and 101 for Chicago, some few exhibitors making display at one show only. Last January there were 158 accessory exhibits in the two buildings at New York and 149 in Chicago. It will be understood that the list does not include all accessory exhibitors, since many concerns without membership in this body will be permitted to take any space that may be left. Those to whom allotment was made and the principal product of each, follow:

## New York and Chicago.

American Bronze Co., Berwyn, Penn., steels, etc.  
 American Hardware Corp., New Britain, Conn., speedometers.

**WHICH ROAD**—The highway at a trifling toll or the by-way with its deadly risks?

**You're not the man to hesitate!**

Nor can you debate long in choosing lubricants when the same fear, the same certainty of wear and tear attend the use of greases which save (?) a few nickels when you buy.

YOU can afford to use

at a little higher price per can when you secure the smooth, open road to long life for your car and the satisfaction of mindease about your bearings.

Silent gears, a smooth flow of power from engine to wheels, long service from the costly ball and roller bearings, cool, uncomplaining universal joints and differential—these are the NON-FLUID OIL delights, at perhaps a yearly comfort toll of one dollar—surely at a yearly saving of \$50 to \$100 in bearings and repairs.

**You're not the man to hesitate!**

Be sure you get genuine NON-FLUID OIL, packed in orange colored cans bearing the above Trade Mark.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## Lost power means worn metal

"X" indicates the motor where your power develops. But

A great deal of the power developed in combustion chambers never gets to the rear axles.

*Most of the power lost on the way is taken up by friction.*

If motorists understood better the costly results of unnecessary friction they would select their lubricating oil with the greatest care.

*Only oil of the very highest lubricating qualities can properly protect the moving parts.*

*Only oil whose "body" or thickness, is suited to your feed system can properly reach the friction points.*

Correct "body" is quite as important as correct quality. And correct "body" cannot be determined by guess.

Motor-constructions differ widely. Before the correct "body" for your feed requirements can be determined, the construction of your motor *must* be known and carefully considered.

To this end, every year we analyze the motor-construction of each of the season's models. Guided by this analysis and by practical experience we determine the correct grade of Gargoyle Mobiloil for each make of car.

The correct oil for each car we then specify in our lubricating chart, a copy of which will be mailed you on request.

The oils specified have extraordinary wearing qualities and will retain an efficient lubricating "body" under the most exacting service demands. Their "body" suits the feed requirements of each car they are recommended for.

This lubricating chart represents the professional advice of a Company whose authority on scientific lubrication is unquestioned the world over—The Vacuum Oil Company.

*If you use oil of lower lubricating quality or of less correct "body" than that specified for your car, your motor must face loss of power, unnecessary friction and ultimate serious damage.*

A booklet, containing our complete lubricating chart and points on lubrication, will be mailed you on request.

# Mobiloil

A grade for each type of motor.

The various grades, refined and filtered to remove free carbon, are:

Gargoyle Mobiloil "A"  
Gargoyle Mobiloil "B"  
Gargoyle Mobiloil "D"  
Gargoyle Mobiloil "E"  
Gargoyle Mobiloil "Arctic"

They are put up in 1 and 5 gallon *sealed cans*, in half-barrels and barrels. *All are branded with the Gargoyle, which is our mark of manufacture.* They can be secured from all reliable garages, automobile supply stores, and others who supply lubricants.

## The Miller Automobile Jack

The MILLER AUTOMOBILE JACK is a single acting, automatic-lowering jack, designed especially for automobile use and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. The MILLER JACK is constructed of the best material, no complicated or loose fitting parts to get out of order, and in material, workmanship and finish, the MILLER JACK is not exceeded, if indeed, it is equalled by any other jack. It is a high grade and one of the finest finished jacks on the market.

The short stroke makes lifting easy and rapid. Automatically locks while operating, thereby doing away with any possibility of slipping or dropping the load.

Fitted with a simple and convenient trip lever for reversing. Height, 11 inches. Raises 6 inches. Weight, 9 lbs. Capacity, 1 ton.

We guarantee this jack for 12 months, and at the price, it is the best value ever offered to the automobile trade.

We are in a position to quote a special price to manufacturers, jobbers and dealers who buy in quantities.

**CAPACITY: ONE TON.**

The List Price of the MILLER JACK,  
guaranteed for twelve months.....\$3.00 each

Weight, packed for Parcel Post, 10 lbs.

**AGENTS WANTED. ADDRESS JACK DEPARTMENT.**

**THE MILLER JACK**  
Designed for any size and style of automobile and is adapted for all purposes.

**TUBE BAG**

**25c A REAL INNER TUBE BAG FOR 25c**

MAILED TO ANYONE IN ANY PART OF THE UNITED STATES  
MADE OF HEAVY NAPPED CLOTH

Will keep your inner tube free from grit and dirt, and from scratching or chafing while in the tool box or luggage carrier. Answers the same purpose as tube bags which cost \$1.50 or more. Will hold one tube 5 inches or smaller. Protect your tubes and reduce your tire expense. In ordering, state size of tube.

Send 25c, in stamps or coin, and tube bag will be sent to you by return mail

Send your name and address NOW with 4 cents postage (to cover cost of mailing) for a free copy of our Big 256 Page Catalog

# Ask Dun's, Bradstreet's Or Your Own Banker

**NOW, MORE THAN EVER BEFORE**, it behooves the dealer and the buyer to look carefully to the financial stability of the automobile manufacturer whose car he contemplates owning.

**THERE HAVE BEEN SOME** occurrences of late that should serve as a warning in this regard. On the other hand, there hasn't been a failure that wasn't scheduled. They were fore-ordained from the first—inevitable.

**SOME WERE OVERDUE**, in fact. Thanks to the splendid demand for cars which we and other responsible concerns were unable to supply in full, some of them were accorded a longer lease of life than their product or experience or financial backing entitled them to.

**THERE WAS NO EXCUSE**, however, for any buyer being in ignorance of what impended. That was easily foreseen.

**LET US SUGGEST** that now, you who are in the market for a car, look into this matter as it deserves. You owe it to yourself—and us.

**ASK BRADSTREET'S OR DUN'S.** Or if you are not a subscriber, ask your Banker to investigate and inform you. He will do it gladly.

**ASK HIM WHICH ARE** the five financially strongest automobile manufacturers.

**YOU WILL FIND** that the Maxwell Motor Company is one of the five—and it will not be fifth in point of stability either.

**HAVE HIM ANALYZE** the latest financial statements of these five strongest and tell you which have the greatest amount of assets in proportion to liabilities—including bonded indebtedness, etc., of course. We think he'll tell you the Maxwell Motor Company is one of the leaders.

**PERHAPS YOU DIDN'T KNOW**—there's been so much confusion in this matter—that the Maxwell Motor Company has no connection whatsoever with the late Maxwell-Briscoe Company except that this concern purchased, through the U. S. Courts, all the assets, not only of that, but of several other concerns.

**WE STARTED WITH A CLEAN SLATE**—with plants worth many millions, with ample cash on hand to take care of our manufacturing operations, etc.

**WE HAVE NO BONDED INDEBTEDNESS**—no outstanding notes or debts of any kind except current open accounts not yet due.

**AND TODAY WE ARE** nine months old with orders on our books for more than thirty thousand cars.

**HAS THAT RECORD EVER been surpassed** in this industry? We submit the account of our stewardship—ask Bradstreet's, Dun's or your Banker for further particulars regarding the operations and stability of this company.

**THEN YOU'LL FEEL SECURE** on that point and, when you compare the cars as carefully, there will be only one answer, "Yours will be a Maxwell."

# COES

## THE Wrench Supreme

Strength without bulk or clumsiness.

Ease of handling without slipping or bruising.

Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

# INVADER OIL

**I**NVADER OIL is the best —not because we say so, or because it is our product, or because we are anxious to sell it, *but because the oil itself possesses certain definite concrete chemical tests which prove it to be better than any other.*

With the same range of fire tests, and the same range of viscosities that other oils have, Invader Oil is lighter in color and lighter in gravity.

*This simply means that Invader Oil is freer from carbon than other oils of equal body*

## Our Exclusive Feature

We will (at small extra cost) furnish  
our Regular Models with the

# AUSTIN Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.  
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

|   |   |   |           |
|---|---|---|-----------|
| Model "77" Six Cylinders, 4 1-2 x 7     | - | - | \$6000.00 |
| Model "66" Six Cylinders, 4 1-2 x 5 1-2 | - | - | \$5000.00 |
| Model "55" Six Cylinders, 4 x 5         | - | - | \$4000.00 |

**MORE NEW, IMPROVED and DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals.

*Write for complete description and any information you may desire in regard to our two-speed axle.*

# BOSCH DESIGN

## Why it interests you

THE design of all Bosch Products has been along those channels which assure the simplest and most satisfactory product for performing the proper functions of an unexcelled ignition system.

That is why a Bosch-Equipt car is a reliable car, insofar as the ignition is concerned. As the most vital part of the engine, ignition should be simple, accessible and fool proof—so perfect, in fact, as to be forgotten. You have these attributes in a Bosch Magneto.

There is more vim, vigor and snap in a Bosch Magneto than in any other method of ignition—it's really reliable.

# 60 "Six" KISSELKAR 60 "Six"

## The Car of Rare Comfort

With its deeply cushioned commodite seats, 142-inch wheelbase, extra large wheels and tires and big, resilient springs, the powerful, silent, smooth-running KisselKar 60 "Six" typifies solid comfort. Under all road conditions—whether over smooth city streets or country hills—the KisselKar "60" maintains its reputation as the car of rare riding comfort, and easily vindicates its title as the dominant value among the "Big Sixes."

Riding comfort is the biggest thing about any car and is the proof of well balanced construction. The final test of comfort is riding in the car. Yet it is possible to judge of comfort without this test, for the factors are known.

Every inch added to the wheelbase means a steadier riding motion and permits the car to be designed on liberal lines, with roomier tonneau, deeper seats and many comfort features impossible in cars of smaller wheelbase.

The generous KisselKar 60 "Six" wheelbase—142 in.—is the basis of its rare riding comfort. No car can equal the comfort qualities of the KisselKar without matching its liberal design and specifications. A careful comparison will prove that few cars do.

There are three KisselKar models: 60 "Six," \$3150; 48 "Six," \$2350; and 40 "Four," \$1850. All fully equipped; electric started and lighted; left hand drive, center control.

The new KisselKars are now being shown by our representatives at over 300 points. See your nearest Dealer for demonstration, or write us for illustrated catalog.

### KISSELKAR SERVICE CONTRACT

KisselKar Service is guaranteed to owners under a written contract that specifies in detail what will be done to lower running cost and retard depreciation. The unusual facilities in the way of factory-trained experts and complete stock of replacements at our Service Stations are always at your disposal.

**KISSELKAR TRUCKS**—Six sizes—1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Write for Truck Catalog.

"The Little Aristocrat"

Completely Equipped

# Now \$900

New Series Model 31 Empire, for the Season of 1914

*A larger, more beautiful car with every luxury and equipment*

Basic principles of design and construction unchanged; severest tests and hundreds of thousands of miles prove them right. *But a score of refinements and improvements* are incorporated in the new series Model "31" EMPIRE for 1914 that make it still a better car than last season's EMPIRE, and it sells for less.

*Quadrupled output and quantity buying enable us to add to the beauty, size and value of the car and yet to reduce the price by fifty dollars—the biggest value yet offered to dealers and automobile buyers.*

Dealers, there remains some open territory. Our broad, liberal sales plan offers a rare opportunity for a permanent connection. Tomorrow may be too late to secure territory.

## EMPIRE AUTOMOBILE COMPANY

448-50 N. Capitol Ave., Indianapolis, Ind., U. S. A.

## PUBLISHER'S COMMENT.

**The Annual Overhaul and Equipment Number** of The Automobile Journal, to be issued Nov. 25, will be bigger and better than originally planned. No owner or prospective owner can afford to be without a copy. It will not only be read with interest, but it will be retained throughout the year as an authoritative compendium of facts dealing with the overhaul of the chassis and the equipment making for comfort and convenience, economy and efficiency. Every motorist will want a copy. Order now—through your news dealer or direct. No advance in price. Ten cents the copy.

**Do Your Christmas Shopping Early.** Or, better still, let The Automobile Journal solve your Christmas shopping problem. What would please a motorist better than a year's subscription to a motoring magazine, every issue of which is filled with exactly the information he desires? We will enter your order now and forward a neatly prepared gift card, in colors, fittingly inscribed with the donor's name, to reach the recipient Christmas morning. Subscription price, \$1 the year.

**Our Series of Mechanical Handbooks** would be appreciated as a gift by any young man who is desirous of familiarizing himself with the mechanical details of motoring. They are written in an interesting, non-technical manner, and fully illustrated, so that the novice is able to understand the facts presented. The price for the set of 10 books is \$3.75, or with a year's subscription to The Automobile Journal, \$4.75.

**Do Not Forget to Consult** the Buyers' Guide, beginning on page 87, when considering the purchase of a new car, equipment or supplies. And remember that all new accessories, supplies and fittings are presented each issue in a special department—on pages 35, 36, 37 this issue.

# What's in A Name?

**W**HEN we stamp the name MULTIBESTOS in bold, bright letters on our brake lining we do more than make a selfish bid for your business—we do more than offer you a means of identifying MULTIBESTOS from the other linings not so good.

We say to you: Here is a brake lining we are proud of; a brake lining we are glad to have you compare with any other under any conditions of service; a brake lining which we, as manufacturers, stand back of with a most liberal guarantee.

Do you think we could afford to do this if we didn't feel sure that MULTIBESTOS is the best brake lining made?

## Grace

THE WHITE coupe is the car she has always wished for—light, beautiful, swift and far running. Here are found the safety and simple operation of the electric vehicle, combined with the flexible speed and touring possibilities which only the gasoline roadster can give. Primarily *her* car for *all* purposes, its power and convenience also make the White coupe the preferred car for *his* town and winter use.

## AMERICAN RACING RESULTS FOR 1913.

**Resume of the Work Done by Cars and Drivers in 33 Important Meets During the Season Just Closed---Road Contests Predominate Among Long Distance Events---Remarkable Record Established by Earl Cooper in a Stutz.**

**A**T NO time in the history of automobile racing has it fallen to the lot of any one man to even approach the record set by Earl Cooper of San Francisco during the racing season just closed. Driving a Stutz car, Cooper has been entered in seven long distance events, in six of which he has returned a winner. Two of these were run simultaneously, so that Cooper has driven the Stutz 1595 miles over the roads of California and Washington, and the Fresno track, in competition with many machines which were higher powered, and has failed to defeat but one car, that being a Benz.

In long distance events of whatever charac-

ter, this term being applied only to those covering a distance of 100 miles or more, the Stutz, made by the Stutz Motor Car Company of Indianapolis, Ind., has returned a winner more times than any other make of machine. Cooper

Earl Cooper and the Stutz, Winning the Santa Monica Road Race—Victorious Combination in Six Out of Seven Long Distance Events Entered.

drove it to victory six times, Gilbert Anderson once and Parsons once; eight times in all. On the face of the returns, so to speak, the Simplex might lay claim to second position in this regard, but it cannot be overlooked in this instance, that the six races credited to Galveston,

Tex., July 27, 28 and 29, really were one race, split up into three sections, each for 100 miles. The three victories won by Fiat cars in long distance events were sep-

Gilbert Anderson and the Victorious Stutz in the Race for the Elgin National Trophy.

arate contests, and give that make of car second place. The results in the long distance races of the year are presented in tabulated form elsewhere.

Thirty-three meets have been reported to The Automobile Journal during the year. In 1912 there were 40. The character of the meets this season was somewhat different from those of past years, and the tabulated list of cars entered either does not include some of the well known victors of other seasons or their names are to be found well toward the bottom. This is explained by the fact that many manufacturers, formerly prominent in the racing field, have ceased to enter cars. This also accounts for a larger percentage of what might be termed hippodrome meets, in which but two or three makes were represented.

Every effort has been made to treat each contestant, whether driver or machine, fairly in this resume. Obviously, it is impractical to set up a standard by which to govern the eligibility of a given meet to be considered in a review of this

nature. Assumedly, the contest board of the American Automobile Association has satisfied itself upon this score before granting a sanction. But, because of the varied nature of the contests, some being for short distances only, others being held on half-mile tracks, and the whole including road, beach, dirt track and specially built speedway events, it does not seem possible to arrive at a definite conclusion which would permit of naming one car or one driver as the champion of the year.

The names of William Endicott, Disbrow, Rickenbacher and Chandler stand at the head of the list of drivers, solely because they have been entered in more races than the others. It can be said, however, that, while these men have competed in some of the most important events of the year, they have gained their victories in a large number of instances while taking part in meets in which there were few entrants. The same thing holds true, in a measure, with respect to the cars. Endicott has driven the Case, Dis-

Ralph DePalma and the Mercer, at the Finish of the Race for the Chicago Automobile Club Trophy.

brow the Simplex and Rickenbacher and Chandler the Mason under these conditions.

The Mercer and Stutz have been warm contenders for premier honors, and generally, both makes have been entered in contests where competition was keen among a large number of entrants. In 1912, Mercer cars, made by the Mercer Automobile Company, Trenton, N. J., were entered 80 times, with 25 firsts, 22 seconds and 18

who support racing with the old time fervor.

Reverting to the matter of long distance events: It may be noted that the number of track events has been increased by two. Last year there was the International Sweepstakes on the Indianapolis speedway, and the 200-mile event at Columbus, O. Joseph Dawson in a National won the former, at an average speed of 78.74 miles an hour, a mark which still stands.

### HOW DRIVERS FINISHED IN 33 IMPORTANT RACE MEETS OF THE SEASON.

| Brooker .....      | 2      | 0     | 0      | 1     |                  |        |       |        |       |

thirds. This year, they have made 71 trials, with 21 firsts, 19 seconds and 13 thirds. The average appears to be a trifle better this year, although the total is not so large. Stutz cars were entered 27 times in 1912, with 10 firsts, 10 seconds and seven thirds. This year cars of this make have competed 24 times, with 10 firsts, three seconds and six thirds. These two manufacturers certainly stand at the head of the list of those

Also ran—Bancroft, Bergdoll, Beaudette, Bragg, Briscoe, Buxton, Clark, Crawford, Eldridge, Endicott, H., Evans, Faulkner, Fleming, Fritsch, Grant, Guyott, Hanshue, Henning, Hesch, Hertsch, Hertzel, Jenkins, Kern, Knight, Knipper, Leach, Leybold, Llesaw, Magonne, Mansfield, McConnors, McKelvey, Nichols, Northland, Opshal, Overmeyer, Owen, Pilette, Rhodes, Rice, Schnack, Soules, Stoley, Tobin, Toft, Tower, Trucco, True, Wallace, Waters, Welsh, Willcox, Wilson, Zucarrelli.

Jules Goux's speed this year, in a Peugeot car of French production, was only 75.92. Spencer E. Wishart created new world's class records with a Mercer at Columbus in 1912, but these were exceeded by Ralph Mulford in a Mason in the same event this year. Their respective speeds were 57.49 and 59.16. The additional track events this year were that for 100 miles at Latonia, Ky., in which Rickenbacher drove the Mason at a speed

ket.

of 58.82, and that for 200 miles at Fresno, Cal.,  
won by Cooper in a Stutz at a speed of 57.69.

Last year there were long distance beach  
races at Galveston, Tex., and Old Orchard, Me.  
No beach event was held this year by which it  
is possible to make comparison. The table shows

six races. These were in reality but one, and that  
for 300 miles, run in sections, 100 miles each day  
for three consecutive days. The event was again  
subdivided into classes, according to the rules of  
the contest board of the American Automobile  
Association. The tabulation is presented in all  
fairness to both makes of cars and drivers, but  
this explanation is necessary to a proper under-  
standing of the situation.

There were 20 long distance road races last  
year, as follows: Feb. 22, Lake View trophy,  
Bakersfield, Cal.; April 21, Fresno, Cal.; May 4,  
Ferris cup, Jepson cup and Chanslor & Lyon  
trophy, Santa Monica, Cal.; July 5, 301-450  
inches, 231-300 inches and under 231 inches, Ta-  
coma, Wash.; July 6, free-for-all, Tacoma,  
Wash.; Aug. 30, Illinois trophy, Aurora cup and  
Jencks award, Elgin, Ill.; Aug. 31, Elgin National  
trophy, Elgin, Ill.; Oct. 2, Vanderbilt cup, Mil-  
waukee, Wis.; Oct. 3, Wisconsin trophy and  
Pabst Blue Ribbon trophy, Milwaukee, Wis.;  
Oct. 5, Grand Prize, Milwaukee, Wis., and Oct.  
26-28, Los Angeles-Phoenix race.

It will be noted that it is impossible to make  
many comparisons between this list and that pre-  
sented herewith. The better to consider the va-  
rious events, it has been found desirable this  
year, to segregate those road races held over spe-  
cially guarded courses from those which were  
purely cross country in character—something  
which has not been done heretofore. Of the 19  
races of both classes, which have been held dur-  
ing 1913, 14 have been held on the Pacific Coast,  
two in the Southwest, two in the Middle West  
and one in the South. The two chief American  
classics—the Grand Prize and the Vanderbilt cup  
events—have not been held at all.

The Santa Monica race of Aug. 9, may be  
compared with the free-for-all  
over the same course in 1912.  
Last year, Teddy Tetzlaff in a  
Fiat, set a new world's road rac-  
ing record of 78.07 miles an  
hour, which has not yet been ex-  
ceeded. This year, Cooper and  
the Stutz covered 445 miles,  
against Tetzlaff's 303, at a speed  
of 74.26. The highest speed in  
any road race during the year  
was 74.39, made by Cooper and  
the Stutz in the contest for  
heavy cars at Corona, Cal.,  
Sept. 9.

Practically the only event  
run this year which was un-  
der the same conditions as

Julien Goux and the Peugeot Car with Which He Won the International  
Sweepstake Event.

those which governed the same race in 1912, was that for the Elgin National trophy. In 1912 this event was taken by Ralph DePalma in a Mercedes, his average speed being 69 miles an hour. This year the winner was Gilbert Anderson in a Stutz, with speed of 71.28.

The Illinois trophy event of 1912 was under

a speed that averaged 66.46 miles an hour.

The Tacoma races also were held under similar conditions both years. In 1912 the free-for-all for 250 miles was taken by Tetzlaff in a Fiat at a speed of 66.08. In 1913 Cooper and the Stutz finished the same distance for the Montmarathon trophy at a speed of 70.72. There was a 200-mile event for the Potlatch trophy this year, won by

## WINNERS AND PLACE CARS IN YEAR'S LONG DISTANCE RACING EVENTS.

### ROAD RACES, SPECIAL COURSE.

| Heavy Cars, Corona, Cal., Sept. 9.             |        |       |            |
|--|--------|-------|------------|
| Car  | Driver | Miles | Time       |

\*Running; †time not reported.

somewhat similar conditions to those which governed the race for the Chicago Automobile Club's cup over the same course this year, although the distance was increased from 203.5 miles to 301. In 1912 this race went to Charles Merz in a Stutz, with speed of 66.15. This year Ralph DePalma in a Mercer won the event at

Cooper in a Stutz at a speed of 70.87. Last year two classes of cars were sent over the course for 150 miles, with Cooper in a Stutz taking one of them at a speed of 66.66 and Pullen in a Mercer the other at a speed of 61.19. Evans in a Flanders (now the Studebaker) won a 100-mile event over the same course last year in 61.05.

## PROVIDENCE SHOW THANKSGIVING WEEK.

**A**RRANGEMENTS are practically completed for the third annual show of the Providence Automobile Dealers' Association, which will be held in the state armory on Cranston street, Thanksgiving week, Nov. 22-29. Inasmuch as this will prove the first opportunity for motorists and prospective owners in the East to inspect the 1914 models, the importance of this event is greatly enhanced this year. Inquiries already have been received from all parts of New England, and it is certain that the attendance will by no means be limited to places within easy access of Providence.

Realizing the importance of the event, Manager P. S. Clark has left nothing to be desired. Additional exhibition space has been provided, and the allotment has been with a view to permitting as many makes as possible to be displayed. Unlike other years, there has been no attempt to limit the exhibitors to members of the association, and as a result a much larger representation of the makers will be had.

P. S. Clark, Manager, Providence Automobile Show.

The show is to be divided into four sections. The main floor will be devoted to the presentation of pleasure cars, while commercial vehicles of all types and motorcycles will be exhibited in the basement. Accessories will be displayed along the side walls in the basement and in the large entrance end of the armory. The list of exhibitors to date follows:

### Pleasure Cars.

**Abbott-Detroit**, Whittten Motor Vehiele Company; **American**, Pugh Bros. Company; **Apperson**, Adams & Knight; **Buick**, Aetna Bottle & Stopper Company; **Cadillac**, Cadillac Auto Company; **Chalmers**, Davis Automobile Company; **Cole**, William H. Fuller; **Detroit**, E. E. Whipple; **Fiat**, Fiat Motor Sales Company; **Franklin**, Wallace L. Wilcox Company; **Herreshoff**, Whittten Motor Vehiele Company; **Hudson**, L. B. Lorimer; **Jackson**, Lister, Smith & Walsh Company; **Jeffery**, Thomas B. Jeffery Company; **King**, King Motor Car Company; **KisselKar**, Nock Auto

Company; **Knox**, Hitchcock-Banks Motor Car Company; **Locomobile**, Davis Automobile Company; **Marion**, Pugh Bros. Company; **Maxwell**, Providence Motor Car Company; **Mercer**, Adams & Knight; **McIntyre**, C. K. Setchell; **Oakland**, P. S. Clark; **Oldsmobile**, E. A. Sontag; **Overland**, Pugh Bros. Company; **Packard**, Packard Motor Car Company; **Paige**, Lister, Smith & Walsh Company; **Palmer-Singer**, Pugh Bros. Company; **Peerless**, Peerless Motor Car Company; **Pierce-Arrow**, Foss-Hughes Company; **Pilot**, Herbert E. Bradford; **Pope-Hartford**, Pope-Hartford Auto Company; **Premier**, John O'Donnell; **Regal**, Davis Automobile Company; **Reo**, William Hughes Company; **Stanley Steam**, Capitol Motor Car Company; **Stevens-Duryea**, J. E. Newton; **Studebaker**, Goodwin-Sherman Motor Car Company; **Stutz**, Kendall garage; **Veile**, Providence Motor Car Company; **White**, White Automobile Company; **Winton**, Davis Automobile Company.

### Commercial Vehicles.

**Federal**, Pugh Bros. Company; **International**, F. B. & A. W. Hopkins; **Kelly**, R. S. Longley; **KisselKar**, Nock Auto Company; **Knox**, Hitchcock-Banks Motor Car Company; **Mala**, U. S. Mill Supply Company; **Packard**, Packard Motor Car Company; **Peerless**, Peerless Motor Car Company; **Pierce-Arrow**, Foss-Hughes Company; **Pope-Hartford**, Pope-Hartford Auto Company; **Stanley Steam**, Stanley Motor Carriage Company; **White**, White Automobile Company; **Willis Utility**, Pugh Bros. Company.

### Motorcycles.

**Excelsior**, Hiram G. Baxter; **Flying Merkel**, Marceau Bros.; **Harley-Davidson**, Elmwood Cyclery; **Henderson**, Hiram G. Baxter; **Indian**, B. A. Swenson; **Yale**, Marceau Bros.

### Accessories.

Elmwood Cyclery, motorcycle sundries; William D. Goff, insurance; B. A. Swenson, general line; Vesta Providence Company, electric outfits, lamps and storage batteries; Waite Auto Supply Company, full line; Wayne Oil Tank & Pump Company, storage systems.

The decorative treatment is expected to exceed anything ever before attempted in the smaller cities. This matter is in the hands of the Koster Company, which concern has for many years taken charge of the decorations for the inaugural ball in Washington, the horse show in New York City, and which had charge of this feature during the historical Hudson-Fulton celebration. The main hall will convey the impression of a Japanese garden, which will have the appearance of being extended by an immense painting in oil on silk at the rear of the room. The other sections of the show will be treated similarly.

A special musical programme has been prepared, in charge of Fay's band, and arrangements are being completed for a particularly pleasing reception for Thanksgiving Eve, which will be known as society night. Governor Pothier, members of the legislature and the city officials have signified their intention of being present.

William R. Wilcox, formerly chairman of the public service commission in New York State, and Dr. L. Clark Seelye, president of Smith College, Northampton, Mass., have been appointed an advisory committee to assist in examining the affairs of the American Locomotive Company.

## BOSTON'S ELECTRIC AUTOMOBILE SALON.

**W**HETHER or not Boston is the Hub of the Universe, it is certain that more innovations in the automobile industry have originated in that

city than in any other centre. The first automobile salesroom in America was opened in Boston. The first exclusive display of horseless carriages in this country was held there. There is a long list of other pioneer events, but the latest innovation is an Electric Automobile Salon.

**Herbert W. Moses, Manager, Boston Electric Automobile Salon.**

The originator of this new plan is the Electric Motor Car Club of Boston, an extremely energetic organization, composed of electric vehicle salesmen, central station men and others interested in electric vehicles of all types. Since its formation in April, 1911, it has co-operated in every way with the New England Section, Electric Vehicle Association of America, in promoting the electric automobile, not only in Boston, but throughout the New England states. The Electric Automobile Salon is but another step in the general scheme of promotive publicity.

Nothing but pleasure cars will be shown. The display will be made by the Boston representatives of the manufacturers, and the latter will co-operate by sending their latest models. The salon will be held in the ball room of the Copley Plaza hotel, Nov. 17-19, being open from 10 in the morning until 11 at night each day. All the details have been arranged so as to be in keeping with the importance of the event, both from a business viewpoint and with respect to its pioneer aspect.

Among the local agencies which will be represented are the following:

S. R. Bailey & Co., 895 Boylston street, Bailey; Frank N. Phelps, 801 Boylston street, Baker; William L. Russell Company, Motor Mart, Buffalo; J. Walter Emery, 131 State street, Church-Field; Imperial Motor Car Company,

182 Columbus avenue, Columbus; Anderson Electric Car Company of Boston, 903 Boylston street, Detroit; D. C. Tiffany Company, 136 Chestnut street, Ohio; Peerless Motor Car Company, 660 Beacon street, Rauch & Lang; W. H. Stevens, 1029 Boylston street, Standard; J. W. Bowman Company, 91 Massachusetts avenue, Waverley; Whitten-Gilmore Company, 620 Commonwealth avenue, Woods;

The salon will be under the management of Herbert W. Moses, who was manager of the Boston electric show a year ago. Electric vehicles of all types were displayed at that event, in conjunction with all kinds of electric appliances, the exhibition taking place in Mechanics' building, where so many of the Boston automobile shows have been held. He will be assisted by the following special committees, consisting of members of the club:

Exhibits—John L. Snow, Albert Weatherby, J. W. Bowman, E. A. Gilmore, D. C. Tiffany.

Reception—Charles J. Hatch, Leavitt L. Edgar, L. R. Vredenburg, Frank B. Carter, Dearborn Bailey, Frank J. Stone.

Advertising—Albert Weatherby, Converse D. Marsh, D. C. Tiffany, L. D. Gibbs.

Finance—J. S. Codman, Frank J. Stone, E. S. Mansfield.

Music—J. S. Codman, Day Baker.

Signs—L. R. Walls, Albert Weatherby.

Police and parking—C. S. Smith.

It cannot be made too strong that this is the first time in the history of the automobile industry that it has been deemed expedient to hold a show devoted solely to the exploitation of electric pleasure cars. It may be admitted that the innovation is somewhat pretentious, but it is felt that the section of which Boston is the logical business centre is particularly well adapted to the use of electric vehicles of this type and that the possibilities have not hitherto been brought to the attention of the public in a manner to car-

**New Bailey Electric Touring Car, as Revealed at Recent New York Electrical Show.**

ry the conviction that should be realized.

Recent development among electric vehicle and battery manufacturers has been such as to

make direct appeal to the residents of this section. Electric pleasure automobiles have been utilized with splendid success in city and suburban service for some years, but that they present satisfactory means for intercity communication and even long distance touring is a newer phase of the situation which it is the purpose of this exhibition to bring more directly to the attention of the public. That the public is ready to receive and assimilate this information is borne out by the increased sales which have resulted from the co-operative educational campaign conducted by the two organizations already mentioned. There

can be little doubt that special emphasis will be laid upon this feature, and that the first Electric Automobile Salon will mean an increased interest in the electric pleasure car throughout the whole of New England.

Because of this fact manufacturers of this type of automobile will do well to supplement the work inaugurated at this time by energetic effort to have their product suitably represented in this field. The list of makers follows:

Anderson Electric Car Company, Detroit, Mich., Detroit; Argo Electric Vehicle Company, Saginaw, Mich., Argo; S. R. Bailey & Co., Amesbury, Mass., Bailey; Baker Motor Vehicle Company, Cleveland, O., Baker; Borland-

tiac, Mich., Tiffany; Ward Motor Vehicle Company, New York City, Ward; Waverley Company, Indianapolis, Ind., Waverley; Woods Motor Vehicle Company, Chicago, Woods.

The main details of such electric pleasure automobiles as have been made public for the 1914 season are presented in tabulated form herewith. Special attention is drawn to the new Bailey touring car, which was revealed for the first time at the recent New York electrical show, although it does not depart greatly from the standard Bailey design as exemplified in the well known roadster, except in outward appearance.

## STUDEBAKER HAS AN ATTRACTIVE LINE.

FOR the season of 1914 the Studebaker Corporation, Detroit, will produce two chassis, a four and a six, to which will be fitted three body styles, touring, landau-roadster and sedan. The four-cylinder, which is practically a new design, will be equipped with a five-passenger touring body and a two-passenger landau-roadster. A seven-passenger touring, landau-roadster and sedan will be fitted to the six-cylinder chassis.

Both motors have the same bore and stroke, 3.5 by five inches, the cylinder dimensions being the same as the model 25 and the six of 1913. With the exception of more liberal proportions, due to its greater capacity and extra cylinders, the six is similar to the four in design and details.

### Left Hand Drive.

There are several changes in detail, the most pronounced being the adoption of left hand drive with centre control. The importance of this change, in the case of a manufacturer which is said to have sold more than 120,000 cars of the right control and steering type, is especially noteworthy as an indication of the popular demand. The fuel tank is now placed under the cowl, pro-

viding a short and nearly vertical feed to the carburetor, also permitting the front seats to be made lower than with the tank located in the conventional manner.

### DETAILS OF THE NEW STUDEBAKERS.

**Fuel Tank Under Cowl.**  
**Larger Steering Wheels.**  
**Full Floating Rear Axle.**  
**Disappearing Auxiliary Seats.**  
**Two-Unit Electrical Equipment.**  
**Left Hand Drive and Centre Control.**  
**Underslung Elliptic Rear Springs on Four.**  
**Bore and Stroke of Both Motors 3½x5 Inches.**  
**Two Chassis Types, a Four and a Six-Cylinder.**  
**Tapering Hoods, Steamline Bodies, Full U Doors.**  
**Three Body Styles, Touring, Landau-Roadster and Sedan.**  
**Improved Transmission, New Clutch Transmission Ring Lubrication.**  
**Ignition from Storage Battery Through Coil and Shaft Driven Remy Distributor.**

A two-unit electrical system replaces the single member, which was driven by silent chain from the drive shaft. The generator is placed on the left of the motor and drives noiselessly by a shaft and pinion in mesh with the camshaft gear. The starting motor is placed on the right, and is connected to the drive shaft by a roller clutch chain and sprockets. A simple pinion

gear reduction encased within the unit, together with the chain sprockets, results in a gear ratio of about 20:1.

Current is supplied by a six-volt LBA battery. All wiring is enclosed in flexible steel cables. The starter is engaged through a plunger under the heel of the driver and an indicator on the dash shows the direction of current flow. The battery charges readily when the motor is revolving at a speed equal to about 10 miles an hour on the high gear and the charging current attains its maximum at 20 miles an hour.

One great advantage claimed in the system is

Some of the New Body Designs Fitted to the Studebaker 1914 Line, Including Landau-Roadster, a Convertible Type of Attractive Lines.

Illustrating Some of the Refined Mechanical Details of the New Studebaker Line, Comprising a Four and a Six-Cylinder Chassis.

its absolute silence, it being stated that there are no clashing of gears and even the hum of a chain is missing, as the electric motor and its connection become stationary upon the completion of the cranking operation.

#### System Used for Ignition.

The efficiency of the system has resulted in use being made of the current from the battery for ignition purposes, the electricity passing through a coil located at front under the hood and being timed by a Remy distributor, driven by a cross shaft opposite the pump.

The cylinders are cast en bloc. Instead of turning on the cast iron bearings of the piston bosses, the wristpins now turn on bronze bushings, making possible adjustment and replacement without renewal of the piston. The pistons themselves are flat topped, instead of crowned as in 1913; are much lighter, and are equipped with three rings, factory tests having proven that this number is ample for conservation of compression, while the change at the same time is said to reduce the friction within the cylinder fully 25 per cent.

#### Specially Designed Carburetor.

A Schebler carburetor, similar to the new model R, but changed somewhat for Studebaker requirements, is standard equipment. The location of the fuel tank permits mounting the carburetor well up alongside the motor, where warm air facilitates carburetion. The intake manifold is, consequently, much shorter than formerly. It bolts to the block casting, and the design should

make for easy starting in cold weather. Wide range of adjustment is permitted from the dash.

In the details of chassis design are noted many instances toward increased efficiency, and consistent with the policy of the company to produce a car providing maximum service with a minimum of upkeep expense. The clutch is improved in many ways and is larger in both models. Instead of a bearing on a shoulder, it now moves by engagement of two grooves and rings. Lubrication is supplied from a grease cup on the H plate, communicating with the bearing by means of a flexible steel tube.

#### Roller Bearings.

The effort toward increased efficiency is also noted in a liberal use of Timken roller bearings which, in several cases, have replaced those of other types. There are two of these bearings in each front hub, and one has been added to each side of the differential, making possible the adjustment of the ring gear and pinion to a degree of accuracy. A large Hyatt bearing has replaced the plain bronze member formerly used between the forward main driving shaft and the pinion shaft in the transmission.

Large steering wheels, 17 inches on the four and 18 on the six, are new features. The centralizing of the control levers also simplifies to a marked degree the details of the brake and gear shifting mechanism. In accordance with this change, making entrance and egress equally easy from either side, the Studebaker engineers have left both running boards entirely free of equip-

**Clutch and New Clutch Transom Lubrication System Employed on New Studebaker Chassis.**

ment, providing a rack for an extra rim at the rear and placing the battery box under the front seat. The clean design of the running boards in both cars is emphasized by the use of aluminum treads at the entrance of the doors, which are of the full U type.

#### **Features of the Six.**

The six retains many of the prominent characteristics of the former Studebaker six-cylinder car, the wheelbase remaining at 121 inches. Crowned fenders are again a feature, and the transmission system has been altered merely by the addition of several details tending to reduce friction and facilitate adjustment. The body has, however, been widened at the rear and the auxiliary tonneau seats are of the disappearing type, folding into a recess in the back of the front seat, instead of pivoting.

Although the four is a new car, it is typical of Studebaker design; has a wheelbase of 108 inches, two-unit electrical system, full floating rear axle, a change from the semi-floating type;

**The Ingenious Grouping of Speedometer, Sight Feed Lubricator and Electric Tell Tale.**

32-inch wheels and en bloc motor. There is a noticeable change in suspension, the full elliptic rear springs being attached to the lower side of the axle housing, an arrangement making possible a great deal of additional dip and permitting of the use of a far more flexible spring than is possible with the conventional equipment.

The dash features are ingenious and original in the grouping of its equipment. In the centre and mounted well up, is a bracket on which are compactly assembled the large figure Stewart speedometer, electric indicator dial and sight feed of the lubricating system. The dash lamp, attached to the top of the bracket, illuminates all.

#### **The Landau-Roadster.**

In addition to the touring bodies with which the chassis will be equipped in standard form, both the four and the six will be marketed with

**The Auxiliary Seats of the Six Are of the Disappearing Type, Folding into a Recess Back of the Front Seat.**

a convertible design, termed the landau-roadster. This body is a copy of the famous design by Salmon & Sons, a well known English body builder. With top and windows lowered, the car is a handsome roadster of the conventional type. In cold or inclement weather, however, the top can be raised and windows slipped into place, and with a few minor adjustments, readily converted into a coupe. The tapering hoods and streamline design make a very attractive appearance. The six landau-roadster is of full three-passenger capacity and is handsomely finished both inside and out. The four design is identical, with the exception of being slightly smaller. The six chassis will be furnished in limited quantities with a sedan body.

The equipment is very complete and the accessories high grade. Goodrich tires on Booth quick detachable demountable rims are standard.

## FEATURES REVEALED AT PARIS SALON.

**A**MERICAN influence was decidedly manifest at the 14th Automobile Salon in the Grand Palais, Paris, France, last month, if one may be permitted to base decision upon the reports which have reached this country. It is more or less well known that French manufacturers paid a visit to the United States something like a year ago for the express purpose of studying American production methods. Since that time, and during the last few months especially, there has been announcement by several makers in that country that they were prepared to offer the public cars built along lines heretofore laid down by American manufacturers.

Very possibly, were all the conditions to be analyzed thoroughly, other reasons might be advanced for the present trend. In many instances it will be found that French makers are offering light weight cars of the type which would be termed run-about in America. These are fitted with small motors

and it is explained by French engineers that they really are a connecting link between the cyclecar and the touring model and that the service rendered by the cyclecar is in a large measure responsible for their existence. Naturally, the cyclecar played an important part in the exhibition.

If the recent Paris Salon may be taken as a criterion, the prevailing practise of American manufacturers to fit some form of electric lighting equipment has had its effect upon foreign producers. The methods of sale in vogue in Great Britain and Continental Europe, under which the chassis is sold separately, to be fitted with such body and accessory equipment as the purchaser may desire, these being supplied by other firms, is considered as having been responsible for the lack of attention previously displayed

along this line. However, practically all of the leading makes, no matter what the country of origin, shown this year, were provided with means for the installation of a lighting dynamo, and no less than 70 different makes of dynamos were to be seen, either on the cars and chassis displayed or at the accessory stands.

As yet, very few foreign makers have decided definitely with respect to the motor starter. That the demand for this added convenience is growing abroad, is evidenced by the fact that several designers are known to be working upon devices of this sort. But, it is perhaps significant, that practically the only self-starting cars displayed

were those of American manufacture. This is a condition which it is expected will be remedied somewhat before the opening of the Olympia show in London, England, this month, since several concerns in Great Britain already have announced the production of motor starters.

There were about 1000 separate exhibitors.

One hundred and thirty-two different makes of cars were displayed. America does not appear to have been very strongly represented in this section, although there were nine makes, as follows: Hudson, Cadillac, Ford, Studebaker, Packard, Hupmobile, Buick, Mitchell and K-R-I-T. The importance of body making as a separate branch of the industry abroad is evidenced by the fact that 64 different manufacturers of bodies exclusively, exhibited 127 different designs, these being entirely apart from the body work displayed on the stands of chassis makers.

Six-cylinder motors were somewhat hard to find. The Delaunay-Belleville is practically the only make which has increased the number of such models, and several Continental manufac-

General View of the Grand Palais, Paris, France, During 14th Automobile Salon.

Some Interesting Mechanical Features Revealed at the Paris Salon: A, Hotchkiss Turnbuckle for Brake Adjustment; B, Shackle at Rear End of Schneider Front Springs; C, Schneider Pedal Adjustment; D, Flexible Joint on Palain Propeller Shaft; E, Filler Member and Twin Water Inlet Pipes on Hispano-Suiza; F, Ratchet Adjustment of Fan Belt on Piccard-Pictet.

turers have abandoned them entirely. The Rolls-Royce, an English car, displayed but one six, and for the most part this portion of the exhibition was left to America. Leaving out of consideration the British and American cars, but 12 manufacturers showed models of this type. Practically all of the Continental producers are featuring the four.

In the matter of ignition, high-tension magnetos were found on every European car shown. With high efficiency motors the tendency is to fire two sets of plugs simultaneously. In place of the fixed spark, which was decidedly prominent among the cheaper cars a year ago, the automatic advance seems to be gaining advocates very rapidly.

Block motors are still the rule, and there is

abundant evidence of a desire to make the exterior of the casting as free from fittings as possible. Perhaps the most prominent tendency in motor design is toward the long stroke and an increase in the volumetric capacity of the cylinder through the use of hemispherical combustion chambers, etc. The object is to secure greater power and less weight, and to this end some manufacturers are utilizing aluminum pistons and the number of those employing pressed steel for this purpose is growing rapidly.

Accompanying sketches present some of the newer mechanical features revealed on a number of foreign cars, but space does not permit of an extensive description of each. With the aid of the captions a little study should enable the reader to understand the various details.

Additional Mechanical Features Seen at the Paris Automobile Salon: G, Head and Side Lamps on Same Bracket on Palain; H, Vauxhall Rear Spring Shackle; I, Throttle Pedal Arrangement on Licorne; J, Charron Ring Joint Between Clutch and Gearbox; K, Compensating Bracket and Shackle at Rear End of Lion Bollee Muffler; L, Delage Brake Lever Adjustment.

**KEETON TEST TRIP ENDED.****Successful Conclusion of 2500-Mile Journey  
Made by Three 1914 Models.**

The party in charge of the three 1914 models of the Keeton car, made by the Keeton Motor Company, Detroit, which left the factory early in October, returned to Detroit, Oct. 27, after completing a test trip of 2500 miles in hard rains and over bad roads at an average speed of 18 miles an hour. Those who made the journey were: H. H. Newsom, vice president and general manager; Charles Drum, factory manager; Ralph Brown, chief engineer; C. E. Cox, factory superintendent; J. Wallabach, foreman, and Charles Piquette, chief of the electrical department.

Starting from Detroit the itinerary was to Cincinnati, thence to Louisville, Nashville, Atlanta, Augusta, Columbia, Raleigh, Richmond, Staunton, Chambersburg, Pittsburg and Cleveland. The exact mileage covered was 2559 miles, and with the exception of stopping for four days at some of the important cities on the route, the party was driving continuously for three weeks. All conditions of roads were encountered, and from Richmond to Staunton they were almost impassable, while from Pittsburg to Cleveland heavy rainfalls added to the hardships and discomforts of the party. Despite the unfavorable conditions the three cars travelled in a very satisfactory manner, the only trouble being a few side slips into ditches off the roads. At no time on the trip were the cars carried along by other than their own power.

**JONES SPEEDOMETER COMBINE.****Distribution Will Be in the Hands of the H. W.  
Johns-Manville Company.**

The Jones Speedometer Company, New York City, maker of the Jones speedometer, has placed the control of the distribution of its product in the hands of the H. W. Johns-Manville Company of that city. Within the next few months, completely equipped service stations will be established by the latter concern in all localities essential to give owners of Jones instruments speedy service and adjustments close at home.

The speedometer will continue to be manufactured under the personal supervision of the inventor, Joseph W. Jones, but will be marketed through the 49 branches of the Johns-Manville concern and will have the personal attention of

the 589 managers and travelling representatives connected with that organization.

All of these 49 branches will be equipped as service stations, each in charge of an expert mechanic, familiar with every detail of speedometer construction, for the convenience of dealers and customers. They will be ready for business early in January, and will carry a full line of spare parts, etc.

**CAMERON IN WEST HAVEN.****Well Known Beverly Concern Now Established  
in Its New Connecticut Home.**

Oct. 24 marked the completion of the removal of the plant of the Cameron Manufacturing Company, maker of Cameron cars, from Beverly, Mass., to its new home in West Haven, Conn. The concern expects to have its full quota of men at work within 90 days, and it is anticipated that the new facilities will enable the production of 1000 cars a year.

The West Haven plant is that formerly utilized by the Mathushek Piano Company and comprises practically three buildings and six acres of land. The main structure, 420 by 120 feet, will be known as the assembling and machine department. Another at right angles to this, 325 by 60 feet, will be utilized as the body building, painting and trimming department. The testing building is 150 by 50 feet. Completed cars will not undergo their road test on the public highways, but on a specially constructed track within the grounds.

The Bosch Magneto Company, New York City, maker of Bosch magnetos, through its attorney, has notified the Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, and the Splittorf Electrical Company, Newark, N. J., maker of the Splittorf magnetos used on Indian machines, to discontinue alleged infringements of patents held by the Bosch concern. It is anticipated that the Hendee and Splittorf companies will deny the Bosch claims and that an important court action will result.

The Speedwell Motor Car Company, Dayton, O., explains that the recent announcement of its Speedwell series H conveyed a wrong impression, in that wire wheels, make not stated, can be supplied at an additional charge of \$100, and that the 37 by five-inch tires are not supplied on the five-passenger models.

## GENERAL NEWS OF THE INDUSTRY.

### Col. George Pope Appointed Receiver for Pope Manufacturing Company—Willys Buys Edwards-Knight Rights and Will Produce Garford-Knight Cars.

**S**OME little interest attaches to the appointment of Col. George Pope as temporary receiver for the Pope Manufacturing Company, Hartford, Conn., maker of Pope-Hartford pleasure cars and motor trucks and Pope motorcycles, as well as bicycles. Col. Pope has qualified, furnishing a bond of \$200,000, and has been directed to continue the business.

Officials of the company declare that the concern is solvent, and that the principal reason for the present difficulty lies in the fact that the credit of the company was seriously restricted owing to the approaching maturity, April 1, 1914, of an issue of \$1,000,000 of debenture notes, which, under their terms, might shortly become

edly interesting business policy. The company will produce four and six-cylinder pleasure cars under the name of Lyons-Knight, and commercial vehicles. Complete information concerning these latter is not made public at this time.

An accompanying illustration shows the factory. It covers 65 acres and supplies 627,000 square feet of floor space. It comprises foundries, drop forge and die casting plants, and numerous other departments which make it to a great extent independent of outside supply. There are more than six miles of railroad tracks in the buildings and grounds, having direct connection with many railroad systems centring in Indianapolis, and the company has its own locomotives for switching, etc.

The president is James W. Lyons, who has had 25 years of experience in manufacturing and engineering work. The manager of the automobile department is Harry A. Knox, who is well known as one of the pioneer designers in the industry, having previously been connected with the Knox Automobile Company and the Atlas Motor Car Company, both of Springfield, Mass. Among the more recent acquisitions of the company is Frederick P. Nehrbas, who becomes factory manager. He formerly occupied a similar position

Plant of the Lyons-Atlas Company, Indianapolis, Ind.

due and payable. The capital stock of the company is fixed at \$6,500,000. Col. Pope is treasurer, and is well known in the industry through his position as treasurer of the Automobile Chamber of Commerce.

#### LYONS-ATLAS COMPANY.

#### Maker of Lyons-Knight Cars Inaugurates Enlarged Business Policy.

The Lyons-Atlas Company, Indianapolis, Ind., which was organized early in the year to take over the business previously conducted by the Atlas Engine Works of that city, and to produce a Knight engined car, is announcing a decid-

with the American Locomotive Company at its plant in Providence, R. I. Harry Tuttle has gone to the Pacific Coast to establish Lyons-Knight agencies in the Far West, and F. P. Steele, formerly of the Chalmers and Interstate sales forces, will occupy a similar position in the Middle West.

The Lyons-Atlas Company has adopted as its slogan, "The Car of Silence", and aside from the Knight sleeve valve motor, the Lyons-Knight pleasure vehicle line will also make use of a worm driven rear axle. Among the other features are the following: Fuel tank in the cowl dash, left hand drive, centre control, "one-man" top, etc. The body lines are said to present new designs, and the upholstery is very satisfactory.

## JOINS WILLIAMS & CUNNYNGHAM.

### D. Minard Shaw Severs His Connection with Mahin Advertising Company.

D. Minard Shaw, who is widely known throughout the motor car industry because of his special efforts in handling automobile accounts, has resigned from the Mahin Advertising Company, Chicago, to become associated with Williams & Cunnyngnam of that city. The latter concern is also engaged in the advertising business, and it is assumed that its automobile accounts will be increased materially through the acquisition of Mr. Shaw.

While with the Mahin company, Mr. Shaw devoted a large share of his personal attention to the exploitation of the product of the Haynes Automobile Company, Kokomo, Ind., and it is suggested that much of the recent success enjoyed by this pioneer manufacturer has been due to his efforts.

## TO SELL R-C-H PLANT.

### Receiver Advertis That Property Is Ready to Continue Production at Once.

The entire automobile plant of the R-C-H Corporation at Detroit will be sold at a receiver's sale on Nov. 11. It will be offered both in parcels and in the bulk. Subject to revision on the day of the sale the property comprises: Real estate, valued at \$201,000; plant equipment and machinery, \$213,889.75; materials, supplies and branch stocks, \$313,968.28; cars, \$14,530; accounts receivable, \$60,634.58; notes receivable, \$3174; total valuation, \$807,197.61.

The plant is equipped for the manufacture of a five-passenger touring car, is located in the heart of the industry with railroad siding, and is ready to resume business with orders for a large number of machines.

## TO ERECT NEW BUILDING.

### Cole Motor Car Company Begins Construction of Four-Story Addition.

As an indication of the outlook for the coming year, the Cole Motor Car Company, Indianapolis, Ind., maker of the Cole line, reports that it enjoyed an increase of \$1,000,000 during the first quarter of the 1914 season, which included the months of July, August and September. Work has already begun on the construction of a new

addition to the factory, which will involve the expenditure of some \$200,000.

The building will be four stories high, fire-proof and otherwise modern throughout. It is expected that it will afford ample production facilities to take care of the increase in business. Just prior to the opening of the 1914 season the Cole company increased its capital from \$500,000 to \$1,000,000 in anticipation of a decided demand for the standardized model.

## IS MANUFACTURING MANAGER.

### S. H. Humphrey Assumes Highly Important Position with Hupp Company.

Announcement has been made by C. D. Hastings, general manager of the Hupp Motor Car Company, Detroit, of the promotion of S. H. Humphrey, to become manufacturing manager. For some time past Mr. Humphrey has been factory manager, a position in which he has been highly efficient.

With the development and growth of Hupp mobile sales throughout the world there naturally arose several production problems, and it was on account of Mr. Humphrey's excellent record as a production man that he was promoted to the new position, with jurisdiction over both the American and Canadian factories. His duties will include supervision of everything from the raw material to the finished product.

The plant in Windsor, Ont., was established to look after the Canadian market and has been run under separate management, but now it will be under the guidance of Mr. Humphrey and additions and improvements will be made so that it will not only take care of the Canadian business, but will handle practically all the export production of the company.

S. H. Humphrey, Manufacturing Manager, Hupp Motor Car Company.

**WITH COMMERCE COMPANY.****W. S. Pettit Leaves Studebaker Organization to Succeed H. B. Bennett.**

The many friends of W. S. Pettit will be glad to learn of his appointment as sales manager of the Commerce Motor Car Company, Detroit, succeeding H. B. Bennett, who has been promoted to the position of general manager. Mr. Bennett is also vice president of the company, the other officers of which are: President, Walter E. Parker, and secretary and treasurer, George J. Kellogg.

Mr. Pettit is well known in the industry, through his connection with the Studebaker Corporation as advertising manager and because of

**W. S. Pettit, Sales Manager, Commerce Motor Car Company.**

his long and careful training in the automobile business before he assumed that position. His acquaintance with the trade has been acquired during a number of years in responsible positions, and his constructive policy will do much to increase the success of the Commerce company, which was organized some three years ago to produce and market a light delivery wagon.

**BUYS EDWARDS-KNIGHT RIGHTS.****John N. Willys to Produce Models Under the Name of Garford-Knight.**

John N. Willys, president of the Willys-Overland Company, Toledo, O., announces that he has purchased the plant and all license rights, stock and equipment of the Edwards Motor Car Company, New York City, which was organized something like a year ago to manufacture the Edwards-Knight car. Mr. Willys states his intention of building the new cars, which will be

known as the Garford-Knight, in the big and modernly equipped plant which he owns at Elyria, O.

The Edwards-Knight presented a number of innovations, insofar as American design was concerned, among which were the worm drive, four-speed transmission, Lanchester spring suspension, wire wheels, etc. It is not made plain whether the new Garford-Knight will include all of these features. It is stated, however, that H. J. Edwards, designer of the Edwards-Knight, has been retained by Mr. Willys and will go to Elyria as chief engineer, directing the production of the latest acquisition.

**NEW STOCKHOLDERS ADDED.****Well Known Advertising Agency Strengthens Its Facilities for Service.**

The Franklin P. Shumway Company, Boston, Mass., one of the oldest advertising agencies in that city, is increasing its field of usefulness by the addition of a number of new stockholders. The business was established some 30 years ago by Franklin P. Shumway, who celebrated his 57th birthday recently by announcing the culmination of plans which he has had under way for a number of years.

The new men, who will be associated with Mr. Shumway in conducting the business in the future, are: Charles P. Randall, D. J. MacNichol, R. D. Clinton Jordan, Willis P. Shumway, Arthur H. Merritt, Carl E. Shumway and Carl L. Fife. Each of these has had a thorough experience in the advertising field and their addition to the staff of this enterprising concern will still further establish its reputation with the automobile industry, numerous accounts in which it has handled with decided success in the past.

**ADOPTS NEW WAGE SCALE.****Ford Workmen to Be Graded Under Decidedly Interesting Plan.**

A general increase in the wages of the employees of the Ford Motor Company, Detroit, of not far from 13 per cent., has resulted from a specific grading of the operatives recently established. There is a further sub-division of the grades, which includes employees who receive higher wages on account of long service with the company. The plan fixes a wage for the different classes of workmen from which no deviation may be made.

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Parker Vaporiser.**

The Parker Manufacturing Company, Broad street and Ridge avenue, Philadelphia, is marketing the Parker vaporizer, which is inserted between the carburetor and the intake pipe, where it forms its own gasket. It is designed to break up any particles of raw fuel not vaporized by the carburetor, and convert these into a useful mixture. This is accomplished by means of a rotary motion imparted inside the conical mesh screens, and the maker states that in tests it has saved over 25 per cent. in fuel, and that it makes for a more flexible motor.

**J & B Magnet Lift.**

The J & B Manufacturing Company, Pittsfield, Mass., well known maker of ignition specialties, has brought out a useful as well as practical tool for removing parts, such as bolts, nuts, pins, etc., that are dropped into the engine pan or other places not easily accessible with the hands, etc. It comprises an electromagnet in sections, having a handle containing a switch for opening and closing the circuit between the device and the battery. These sections are so constructed as to carry the current from the handle to the magnet end without wires, and as the electromagnet is always at the end of the tool, maximum lifting power is provided at the

It is stated that the "bite" is positive, that the clip will stand straight out wherever applied and that it will not sag down and make contact with adjacent lugs or terminals. The outer members are No. 20 gauge, semi-hard, cold rolled steel with inner construction of blued spring steel, with the point of application near the jaws. The wire is secured to the heel of the clip and soldered, after which the lips are compressed, making a tight connection. A rubber nipple is fitted, preventing opportunity of shocks.

**Herz Ford Spark Plug.**

Herz & Co., 295 Lafayette street, New York City, maker of the well known Herz Bougie Mercedes spark plugs, is manufacturing a special type for model T Ford automobiles, which embodies the same characteristics of the other plugs produced by this company. The Herz plug has a double, unbreakable stone insulation, blue enamelled, and the four sparking points are of a platinum alloy. One of the several features of the new plug is that it is held to be self-cleaning. It carries a year's guarantee. It is stated by the maker that excellent results are obtained with this plug in the Ford motor.

**Burke Valve Cap.**

The Burke Valve Cap Company, Cleveland, O., is manufacturing the Burke valve cap, which differs materially

service end. The device is designed both for the repair shop and owner and with it metal chips may be removed from the transmission, etc., and the maker states that it has sufficient power to lift valves from the cylinder heads. The tool weighs complete but 12 ounces, has a lifting power of 12 pounds, consumes but half an ampere of current, and may be utilized with any six-volt battery.

**Lee License Number Holder.**

The William O. Lee Company, Port Huron, Mich., is manufacturing the Lee license number holder, which is made adjustable to fit all sizes of filler caps, it being designed to be attached to the radiator. The retaining clamps slide in a slot and are locked by means of bolts and nuts. The holder is also adjustable to plates of varying dimensions. It weighs six ounces, comes polished and is inexpensive.

**Universal Test Clips.**

R. S. Mueller & Co., 423 High avenue, Cleveland, O., is manufacturing the Universal test clip, which is designed for use with testing devices where a ready means of making a quick or test connection is desired. It is also of service in charging batteries and the maker states the clips will carry 10 to 12 amperes continuously without heating. The construction of the device is shown in an accompanying illustration and it will be noted that the nose is thin, making for convenience in tight places.

from the conventional device, in that it may be removed and replaced quickly. The cap proper, instead of screwing on to the body of the valve stem, threads into the retaining nut, the last named member having a small number of threads, but sufficient to hold the cap securely, as well as to prevent the entrance of foreign elements. The nut replaces the usual member and the cap is made hexagonal, permitting of the use of a wrench instead of pliers.

**Ad-a-man-tor.**

The Hendricks Ad-a-man-tor Company, Grand Rapids, Mich., is marketing the Ad-a-man-tor, which differs materially from other motor cleaning and priming devices, as will be noted by an accompanying illustration. In the first place the vessel containing the cleansing and priming fluids is of flint glass and resembles the preserve jar in shape and construction. It has the wire clamp for securing the top member, and the method of operation is similar to that of the fruit jar. The top part is secured on the hood side of the dash and an operating disc or button is located on the driver's side. Extending into the container is a small tube through which the fluids are drawn by the suction of the piston. Connecting with the tube is suitable piping, which is led to the intake manifold just above the carburetor. Two jars accompany each equipment, one being utilized for the cleansing material, which is said to effectually remove carbon and other deposits from the cylinders. The second jar is

utilized for carrying a priming mixture. One of the features of the system emphasized is the ease with which the containers may be changed.

#### Common Sense Spring Bolt.

Spring bolts are subjected to considerable friction and, if not provided with means for proper lubrication, wear rapidly, to say nothing of being the cause of squeaks and rattles. Many early types of machines are fitted with bolts which are so constructed as to make proper lubrication difficult, and to overcome this trouble the American Ball Company, 115 Clifford street, Providence, R. I., has brought out the Common Sense spring bolt, which is constructed of a high grade material, carefully finished and equipped with a wing cap ratchet grease cup.

#### Maburn Tester.

The Mapes & Maburn Manufacturing Company, 16 Fulton avenue, Rochester, N. Y., is marketing the Maburn tester, which is a neat and compact device for locating ignition troubles from the seat. It comprises a dash switch having buttons, these corresponding to the number of cylinders, also a key. Individual wires lead from each spark plug to terminals on the switch, and turning the key and pressing a button short circuits or cuts out the current to the cylinder. This permits the driver to locate easily a faulty cylinder and the operation obtains similar results as when holding down a vibrator of a coil. As a missing cylinder is located without lifting the hood it is obvious that considerable labor and time are saved. Another advantage of the device is that the tests may be conducted with the motor under load. The maker points out that the tester is valuable in locating knocks, etc. The Maburn tester is moderately priced, comes in polished brass or nickel plate finish and is easily installed.

#### Excelsior Adjustable Ventilator.

C. B. Wattles, 441 Butler Exchange, Providence, R. I., is manufacturing the Excelsior adjustable ventilator for model T Ford automobiles, which is an inexpensive device and easily attached to the dash in conjunction with the windshield. It provides proper ventilation of the front compartment of the machine, the air being deflected in such manner that there are no draughts. The ventilator is easily adjusted to two widths of openings or may be closed as suits the convenience of the operator, and it can be set while driving. The value of the device is obvious, as it maintains a comfortable temperature and eliminates the heat from the motor. The ventilator is finished in black enamel.

#### Nyco Power Accelerator.

The New York Coil Company, 338 Pearl street, New York City, maker of ignition specialties, has brought out a new accessory for model T Ford automobiles, called the Nyco accelerator and power adder. It consists of

a hollow chamber made of nickel steel, .25 inch thick, registering with the opening in the inlet pipe and carburetor, also the two flange bolts retaining these members. One end of the device conforms to the shape of the carburetor flange, but the other end extends a distance beyond the flange and contains a peculiarly arranged valve of approximately the same area as the inlet pipe opening. Air passages are formed in this valve in such manner that when the valve is moved from its seat, by means of a steel wire connecting with a pedal in the rear foot board, air is admitted to the inlet pipe, as no obstructed passage is provided between the valve and inlet pipe connection. The valve is supported on a rod, which is carried by a valve guide on the opposite side of the device. Two different sized springs are utilized, one a light member to keep the valve normally seated, and a heavier spring which comes into action only when the pedal is depressed, as when descending a grade. This permits fresh air to pass through the cylinders and serves as well as a brake. The main object of the device is to supply air to over rich mixtures, as when the car is speeded up. It is stated by the maker that the Nyco effects a saving of 25 per cent. in fuel, prevents carbon, keeps the motor much cooler and makes for more flexibility.

#### Ideal Magneto Cut-Out.

The Ideal Switch Company, Inc., Plainville, Conn., is manufacturing the Ideal magneto cut-out, which is a neat, well constructed switch for use with high-tension magnetos. The maker states that the switch is sturdily made and that the phosphor bronze springs will not lose their elasticity in service.

#### Kenyon Searchlight Bulb.

The Kenyon Searchlight Company, 15 Woodbridge street, East Detroit, Mich., is manufacturing the Kenyon searchlight bulb, which is designed to eliminate the side lights and to conform to the ordinances prohibiting the use of headlights. This is obtained by the use of a double filament, one being employed to project the parallel rays while the second member is diffusing and throws the reflection directly on the road. The short range light is of distinct value when traversing country roads, etc., and with the other filament provides an effective lighting arrangement.

#### Perfect Valve Spring Lifter.

Winton L. Smith, 78 Clinton street, Newark, N. J., is the inventor of the Perfect valve spring lifter, which differs from conventional design in that the valves may be ground without displacing the valve springs. It lifts and compresses two springs at once, a yoke being actuated by a nut on a screw member, the last named being secured to a bed plate. It is particularly adaptable to Winton motors and the maker states that it is possible to reach the springs of the number 4 cylinder without displacing the magneto.

**Springfield Tire Rest.**

Tire manufacturers advise relieving the shoes of all weight when the machine is not to be used for any length of time. The Shawver Company, Springfield, O., is producing the Springfield tire rest, which is constructed especially for jacking up cars, although it may be employed for a number of useful purposes. One of the features of the Springfield is that the car may be raised to a height of six inches if desired, or fractions thereof. The rest is sturdily constructed, has a lifting capacity of 8000 pounds, and can be used under cars with wheel diameters of 28 to 48 inches. The adjustments are quickly made and the lever easily operated. The Springfield tire rest comes in sets of four.

**B'Co Spark Plug.**

The Brown Company, Syracuse, N. Y., is producing a special spark plug for use with the Brown Impulse tire pump made by this concern. The Brown pump is inserted in the spark plug opening and operated by the impulse of the compression stroke. The early types produced were threaded for screwing into the cylinder opening, but with the new plug the work is greatly simplified. The B'Co spark plug has a removable core, which is displaced by a slight turn of a handle. The pump is then inserted in the base or shell member, to which it is secured by a bayonet type of lock, a slight twist fitting and releasing the components. The company makes an attractive offer to owners of the earlier types of Brown tire pumps not equipped with the quick acting device.

**Apco Ford Gaskets.**

In fitting new gaskets to the intake, exhaust and water manifolds care should be taken to employ a high grade material and one that will resist the action of heat and water. While gaskets may be made, considerable time is saved by utilizing those designed for the motor. The Auto Parts Company, Providence, R. I., maker of Apco specialties, is marketing a complete set of gaskets for the model T Ford, including the cylinder head member, inlet, exhaust, cylinder head flange, inlet and exhaust water, and transmission drain plug. These gaskets are made of the very best material and carefully constructed. They are guaranteed to fit, and the complete set is inexpensive.

**V Hot Air Valve.**

The benefits accruing from the utilization of heated air in the carbureting of gasoline are well known, and many manufacturers equip their cars with a hot air device. A different application of the principle is noted in the V hot air valve produced by the V Air Valve & Manufacturing Company, 1648 Tremont street, Denver, Col. It comprises a hood like member, which is clamped onto the exhaust manifold; flexible metallic tubing for conveying the heated air, and the V valve. The last

named member is screwed into the intake manifold above the carburetor and control of the valve is by a wire cable operated by a lever clamped to the steering column under the wheel. This permits the driver to regulate the amount of air admitted according to atmospheric conditions, etc., also to utilize the control for flushing out the cylinders with fresh air, as when coasting down a hill. The maker states that considerably more mileage is obtained to a gallon of fuel and that further economy is obtained in that at high piston speeds the emergence of fuel from the jet is restricted without affecting the output of the motor.

**Breeze Tank Valve.**

The Breeze Carburetor Company, Newark, N. J., is marketing the Breeze 4 in 1 tank valve, which obtains the reserve capacity of fuel without the auxiliary tank in the fuel container. Two outlet levels are utilized in the tank, the service member being slightly higher than the reserve, and according to requirements. Two controls are provided, one for each outlet, also two off positions, connection between the indicating plate and valve proper being made by a rod arrangement. The valve is provided with a gauze strainer, also a screw plug member for cleaning and draining. One of the features of the valve is that it may be locked, preventing use of the car by others than those intended.

**Tabor Pedal Lock.**

The large number of cars reported stolen has led to the marketing of a number of locking devices, among which is the Tabor pedal lock, manufactured by the Loveley Sales Company, Detroit. It is a mechanical arrangement, which comprises a plate member having a lock and being fitted to the toeboard. Included in the mechanism is a hook which may be swung inward and locked, thereby retaining the clutch pedal, as shown in the illustration. With the clutch out and pedal locked, it is obvious that the car cannot be operated under its own power. The equipment includes a high grade lock with removable key and the construction is very compact. It is stated that it does not interfere with the normal use of the clutch pedal.

**A. A. S. Ford Molding.**

The American Auto Supply Company, 1741 Broadway, New York City, is marketing a molding assembly for model T Ford cars, which consists of a complete set of mahogany finish moldings for placing on the top edge and doors of the body. These pieces come cut to the exact length to fit and screws and washers are supplied with each set. It is pointed out that the moldings can be fitted in about 15 minutes and that they add materially to the appearance of the car, as well as protect the body material. The A. A. S. Ford molding is made for the 1912 and 1913 runabouts and touring models.

# MECHANICAL INSTRUCTIONS FOR NEW OWNERS.

## Adjusting Abbott-Detroit Valve Mechanism--Operation of Model T Ford Carburetor --Overland Mechanical Lubricator--Velie Rear Axle Adjustment.

**I**MPROPERLY adjusted valves result in inefficiency. If the intake opens late, a maximum charge is not obtained, and with the exhaust opening late, the burned gases are not wholly expelled. Consequently after the machine has seen considerable service, the adjustment of the valves should be checked up, not by guess work, but by timing marks

Abbott-Detroit Valve Mechanism.

on the flywheel. In an accompanying illustration is presented the adjusting mechanism of the 1912 and 1913 Abbott-Detroit cars, models C 44, D 34-40 and E 44-50, the sketch showing the cylinder and crankcase cut away to depict the components.

The maker recommends that all adjustments be made when the motor is cold and this may be explained by the fact that the proper clearance between the valve stem and tappet is .004 inch when the cam is not lifting the pushrod. The valves of each cylinder must be adjusted separately and should be by the marks on the flywheel. The figures may be noted by removing the cap or plug in the top of the flywheel housing and holding a small mirror at a proper angle over the opening. If the petcocks are opened, or the spark plugs removed, the flywheel may be rotated easily.

It will be noted that the flywheel carries the figures 1 and 4, also a centre line, and the last named mark should register with a line drawn across the centre of the flywheel housing. With these lines coinciding the piston of the first cylinder (that nearest the radiator) should be at the top or dead centre (compression). Next rotate the flywheel in the normal direction 2.234375 inches. This should result in the line on the flywheel marked 1 4 registering with the centre line of the housing previously referred to.

The pushrod should be in contact with the

end of the intake valve stem. If not the lock nut is loosened and the adjusting nut turned to the left until the tappet member makes contact with the valve stem. In loosening and tightening the lock nut be careful not to exert uneven pressure on the parts. It is best to use two wrenches, holding the adjusting nut firmly and turning the locking nut with the other tool.

The closing of the intake is next checked. Turn the flywheel a trifle over half a turn and past the line marked 1 0 2 3 until that bearing the figures 1 0 1 4 approaches the housing line, and coinciding with the mark the intake should be seated. If it be found that the tappet does not engage and release with both the open and closed flywheel lines coinciding with the housing mark, the maker recommends splitting the difference, or centring the cam, as it is called. That is to say, if the valve opens correctly but closes late, move the flywheel back to the opening point and readjust the valve until it opens .0625 inch earlier.

The intake of the third cylinder is then adjusted, and after that, the fourth and the second, as the firing order is 1, 3, 4, 2. The exhaust valves are checked in a similar manner.

### MODEL T FORD CARBURETOR.

Some operators of model T Ford cars, especially beginners, utilize too rich a mixture,

Sectional View of Model T Ford Carburetor, Showing Relation of Parts to One Another.

thereby wasting gasoline, to say nothing of soot-ing up the motor, causing it to heat and miss at low speeds. In an accompanying illustration is

shown a sectional view of the carburetor with the components lettered and a little study of the parts will be of service in obtaining maximum results. A mixture, so-called,

comprises so many parts of air to fuel. The air is necessary to combustion and with too much air the charge ignites and burns slowly. Too much air is denoted by back-firing and this condition should be corrected, as it is dangerous and apt to set the fuel in the carburetor on fire. While a slightly rich mixture makes for easy starting, too much gasoline will cause difficulty in starting and missing at low speeds.

There is but one adjustment to the carburetor, that of the fuel, it being obtained by the needle valve, which is rotated to the right to decrease the supply and in the opposite direction to provide more gasoline. With this design the setting of the needle valve at low speed is important, for with the increase in the opening of the throttle, auxiliary air is supplied by a ball valve, this member operating automatically. The air enters by a duct which is fitted with a valve for starting purposes. Closing this valve by means of the wire extending through an opening in the radiator causes a rich mixture to pass to the cylinders, as the supply of air is restricted. The other lever, marked "throttle" in the drawing, controls the amount of mixture passing to the cylinders. The float maintains the proper level of fuel and the fuel valve regulates the flow from the tank to the float chamber, it opening and closing during operation of the motor.

As that part into which sets the point of the needle valve is very small when the carburetor is adjusted, it follows that any particle of dirt will clog it easily and make starting difficult. If dirt be suspected of causing the trouble, move the switch lever to neutral, screw down the needle valve, then open it several turns, and spin the motor. This will sometimes clear the spraying nozzle. Often the obstruction can be removed by opening the petcock and draining off about half a cupful of gasoline. In connection with drain-

ing, it is recommended that the petcock under the tank be opened occasionally. This should be done even when care is taken to strain all fuel used.

The best method of adjusting the carburetor is by rotating the needle valve to the right or left, cutting down or increasing the supply of fuel, and noting the effect of the alterations with the motor under a load. The odor of the exhaust should also be noted, and if it be pungent, that is, if it have an acrid smell, it denotes too rich a mixture. Cut down the gas slightly until the exhaust smells "sweet". While a light or lean mixture is advisable and makes for economy, it should not be so lean as to affect the operation of the motor. For starting, some owners open the needle valve from half to a full turn, returning it to the original setting after the motor becomes warm. Too much gasoline will prevent starting, and when this is the case, the needle valve should be fully closed and the motor spun. This will displace the rich mixture in the cylinders.

### ADJUSTING MECHANICAL OILER.

The oiler utilized on the model 69 Overland car is of the mechanical type and has six leads, one for each of the four cylinders, the timing gears and crankcase. Any of these leads may be

Overland Mechanical Oiler.

Components Utilised in Adjusting Gears and Bearings of Velle Rear Axle.

adjusted and the operation is a simple one. By referring to the sectional drawing it will be noted that the mechanism comprises a yoke to which is

secured a plunger. The last named member is raised by a cam, actuated by the camshaft. With the plunger at the top of the stroke, oil enters a passage, and upon the plunger descending, the lubricant is forced past a check member to the feed tube leading to the part to be lubricated. By shortening or lengthening the stroke of the plunger, which is accomplished by loosening the check nut and turning the adjusting member up or down, the supply is increased or decreased as desired.

Clogging of the feed tubes is generally indicated by the plungers remaining up, and usually the obstruction can be removed by working the plunger by hand. The operation of the oiler may be noted by watching the plungers rise and fall.

### VELIE REAR AXLE ADJUSTMENT.

As the rear axle of the car is adjusted properly at the factory, it will require no attention, other than replenishing the supply of lubricant as instructed by the maker. There are three conditions which may arise and which may make adjustment of the gears necessary, these being objectionable noise, back lash and looseness between the bearings on the pinion shaft of the differential.

In an accompanying illustration are shown the components utilized in making adjustments to the rear axle of the Velie car, the parts being lettered for identification. Assuming that the bevels hum unduly and one desires to eliminate the objectionable noise: The first step is to loosen the locking nut A on the pinion shaft, also the nut B. Next displace the cover, loosen the clamp bolt H, turn the slotted adjusting cap toward the left one notch and tighten up nuts B and A, taking care not to have bearings so snug that the shaft will not rotate easily. If upon trying out the car the noise is found to be diminished, but not wholly eliminated, loosen nuts A and B and rotate the adjusting cap another notch and so on until the quietest point is secured. If it is found that the noise is augmented, adjust in the opposite direction. As arrows show the direction of adjustment it should be made without trouble. Upon making the final adjustment, and there is no end play to the shaft, back off nut B a quarter turn and tighten up on nut A. Bend the washer over the flat of each nut, tighten up clamp bolt H and replace cover.

To remove back lash of the gears, back off adjusting ring at D toward the differential and turn the ring at C against the bearing cap, which will move the gear toward the pinion. These

rings have a right hand thread. Before turning the rings, however, loosen the cap screws on the bearing cap one-half turn, after removing the locking wires. The proper amount of back lash should be approximately .005 inch, or a barely perceptible looseness. After the work is completed, make sure that the locking pins are back in the slots of the rings, that the cap screws are tight and the locking wires in place. After making adjustments care should be taken to renew the supply of lubricant, and according to the directions of the maker of the car.

Looseness in bearings on the pinion shaft is eliminated by easing nut A and taking up on nut B, just enough to allow the shaft to rotate freely without end play. By backing off nut B about a quarter inch the right adjustment should be obtained. Relock nut A. If noisy gears result, the same methods should be pursued as already outlined. Play in the differential bearings is removed by the adjusting rings C and D, the position of these being changed until end play is eliminated and the differential rotates freely. The cap screws and locking wires will require attention as when removing back lash. In the case of back lash resulting from the work, it may be removed as previously explained. If it be found that the gears are too far out of mesh, or new members must be fitted, set the gears with the backs flush as a starting point and follow the directions outlined above. The position of the teeth may be ascertained by removing the peep hole cover shown the drawing.

### MOTOR CAR LIGHTING.

**Prest-O-Lite Company Issuing Free Booklet Analyzing Present Methods Employed.**

The Prest-O-Lite Company, Inc., Indianapolis, Ind., maker of the well known Prest-O-Lite gas tanks, is publishing a booklet entitled "Power and Fuel Consumed by Electric Lighting Apparatus," which contains an analysis of the cost of operation, maintenance and efficiency of electric lighting and motor starting system, also data on its own method of lighting. The company conducted a series of tests with various electric lighting equipments, the results of which are tabulated and presented in such manner as to be understood easily by the novice. The company will forward its booklet and a full report of the tests referred to upon receipt of a postal card. The address of the Prest-O-Lite Company, Inc., is 226 Speedway, Indianapolis, Ind.

## WITH THE MOTORING INTERESTS ABROAD.

### New British Electric Motor Starter Bears Name of Well Known Maker of Lighting Systems---Racing Driver Outlines Plan for Track in France.

**E**LECTRIC motor starters are being given consideration by English manufacturers of electrical equipment for motor cars, announcement being made of the C. A. V., the invention of C. A. Vandervell and A. H. Midgley, of London, England. Mr. Vandervell is of the well known C. A. Vandervell & Co., maker of lighting systems which were described in The Automobile Journal in the issue of Dec. 25, 1912.

The motor starter and the components of the system are shown in an accompanying illustration and it will be noted that the energy of the motor is imparted to the flywheel of the engine by means of a friction roller C. It is actuated by a pedal E and suitable linkage, and depressing the pedal pulls the friction roller into engagement with the periphery of the flywheel D. As the pedal is depressed it closes a double switch F, connecting the battery with the motor. The shaft B is fitted with two flexible leather universal joints. A free wheel clutch G permits the engine to overrun directly it starts under its own power. The friction clutch member is secured to the chassis frame by a special bracket, as will be noted.

#### ADOPTING NEW METHODS.

#### French Car Manufacturer Sends Fleet of Cars Throughout Russian Empire.

The success which has attended the adoption of long distance road trials by British manufacturers of automobiles, appears to have been still further reflected in the recent action of a French concern, which sent three of its latest models on a demonstration trip throughout Russia. These machines left Paris by way of Brussels, Amsterdam, Bremen, Hamburg, Copenhagen, Goteborg, Christiania, Stockholm, Riga, Revel, St. Petersburg, Moscow, Nizhni Novgorod, Samara, Aratof, Astrakhan, Petrovsk, Vladikavkaz and Tiflis to Batum, and returned by way of the Black Sea coast, the Crimea, Odessa, Kief, Vienna and Berlin.

In making report concerning this remarkable trip Consul Leslie A. Davis, at Batum, suggests that manufacturers of American automobiles, who wish to do business in this region, might find

it worth while to try some similar method of introducing their machines, as it is almost impossible to interest people there unless they can actually see the article. He adds that there are at present a few American cars in the Caucasus, but it is believed that the district offers a fair market for low priced, medium weight machines.

The roads in the vicinity of Baku are level and good, and the number of automobiles in use there is steadily increasing. It also is reported that there has been a rapid increase in the number of machines, both public and private, that are used on the Georgian military road between Tiflis and Vladikavkas, and on other roads out of Tiflis. It was in this latter city that the French firm in

The C. A. V. Electric Motor Starter, Utilizing a Friction Roller and an Overrunning Clutch.

question was successful in establishing a permanent agency. All of the roads in this particular district are mountainous and Mr. Davis advises that a high powered machine is required and one that is not too low hung.

#### POSSIBILITIES IN VENEZUELA.

#### Government Good Roads Construction Is Increasing Demand for Cars.

It appears from recent reports of conditions in Venezuela, that the activity of the government in constructing good roads has had an appreciable effect upon the demand for automobiles in

that country. More than half of the cars owned in Venezuela are said to be American manufacture, and the same proportion keeps up with the more recent importations, one steamer bringing 17 machines from New York on one voyage. The light, inexpensive car is said to have had the best sale thus far.

The government is now engaged upon the construction of a road in the western part of the country, from Uraca, the present terminus of the Tachira railroad, southward through the mountains to San Cristobal. This is expected to be of material advantage to the coffee raisers in that region. An extension of the railroad up to the town of Uraca will bring the wagon road in close connection therewith. Coffee is now brought into Maracaibo throughout the year, there to await a favorable opportunity for further transportation, but upon the completion of the road it will be possible to market the coffee immediately after harvest. The improvement of the roads out

**Bablot's Suggested Plan for Racing and Testing Track in France.**

of Caracas and about other cities has brought the automobile into much greater use, both for pleasure and commercial purposes.

### RACING TRACK FOR FRANCE.

**Bablot, Well Known Driver, Works Out an Interesting Combination Plan.**

Evidently the success of Jules Goux and the Peugeot car in the international sweepstakes race on the Indianapolis motor speedway, Memorial Day, has had its effect upon the motoring public in France. In a recent issue, *L'Aero* of Paris presented a plan for a racing and testing track as proposed by Bablot, a racing driver of some little note abroad. It is argued that this should be constructed along the lines of the Brooklands track in Weybridge, England.

An accompanying sketch indicates M. Bab-

lot's idea. The combination of an oval and a diamond offers some novel features. It is suggested that the oval track measure approximately 3.75 miles and the combination about 6.25 miles. Cars would follow the direction indicated by the arrows, and when both tracks were in use a barrier would be placed at the point indicated by the dotted line to prevent drivers short circuiting and missing out on the diamond section. Suitable provision would be made for workshops, etc., and an underground passage, underneath the entrance to the diamond shaped track.

### NEWS NOTES FROM FOREIGN LANDS.

Eighteen nations were represented at the banquet tendered by C. H. Dunlap, export manager for the Hupp Motor Car Company, to the European Hupmobile agents, during the progress of the recent Paris Salon.

At the second meeting of the Institution of Automobile Engineers of Great Britain, Nov. 12, Dr. W. R. Ormandy will read a paper entitled, "Some Experiments with Mixed Fuels, with Special Reference to Alcohol Mixtures".

The first formal automobile contest ever held in China was won by P. F. Ritcher, driving a Studebaker car. By winning the event, an economy run over a 25-mile course, Mr. Ritcher captured the cup offered by the governor-general of Kiachou.

The Royal Hungarian Automobile Club is organizing a reliability tour to cover 1500 miles and to be known as the Carpathian tour. The date has not been decided upon, but it will be held some time early next year, and probably will start and end in Budapest.

In an effort to exceed the world's hour record, held by the Sunbeam at 107 miles 1672 yards, Percy Lambert, well known in this country as a racing driver, was instantly killed on the Brooklands track, Weybridge, England, Oct. 31, while travelling at a speed said to be 114 miles an hour. Oct. 27 he succeeded in securing the 50-mile world's record, covering the distance in 27:02.4.

The report of imports into France during the first eight months of 1913 shows that America occupies second place in the matter of automobiles. Great Britain leads with a total valuation of \$929,000; America, second with \$742,300; Belgium, third with \$331,000; Germany, fourth with \$247,200; Italy, fifth with \$208,000, and Switzerland, sixth with \$119,000.

Sydney A. Friede, a former Detroit newspaper man, now residing in St. Petersburg, Russia, writes the Ford Motor Company that, as a result of a recent trip throughout the empire, he is convinced that the Ford car is decidedly popular with Russians. He declares that 32 per cent. of all the cars in the empire are Fords, and that they are being used in increasing numbers by government officials from St. Petersburg to the Black Sea.

In the recent six-day reliability trial in Morocco, the contest was divided into three classes, aside from the general classification. Paul Riviere in a *Metallurgique* was the winner in the open competition, and also in the class for vehicles selling at less than \$1800. A Delahaye secured the prize in the class for cars selling at less than \$2400, and a Ford in the smallest division, for machines selling at less than \$1200.

The Automobile Club de France has decided to abandon its tire allowance restriction for the 1914 Grand Prix, and in its stead the race will be run under two classifications. In the Grand Prix itself the only limitation will be the maximum weight of the car—1100 kilograms (2425 pounds). The second event will be known as the *Coupe de la Cylindree*, for cars with the same maximum weight limit, but with engine capacity restricted to 4.5 liters (274.6 cubic inches). The distance for each will be between 500 and 565 miles.

## ECONOMIN---A NEW MOTOR FUEL.

**A**NNOUNCEMENTS of new motor fuels have been made with decided frequency abroad, and among the latest of these is Economin, the statement concerning which was made public last month by L. R. L. Squire of Straker-Squire, Ltd., a car manufacturer, on behalf of the Economin Syndicate, Ltd., 6 Old Jewry, London, England. Comparative tests of the new product have been made by the Royal Automobile Club of Great Britain and the Cudell Motor Company of Berlin, Germany.

Mr. Squire explains that Economin has for its basis 80 per cent. of kerosene, which, together with an admixture of certain chemical ingredients, is reduced to a perfect emulsion, in which the nature of the kerosene is changed. It is then submitted to distillation and yields a very efficient motor spirit.

Of course, the identity of the chemical ingredients is not disclosed, but it is stated that the raw materials can always be procured in practically unlimited quantities. It is added that the cost of production is sufficiently low to permit of its sale at a price considerably below that of gasoline. The maker maintains that no adjustment of the carburetor is necessary after using gasoline.

The chief advantages claimed for the new fuel are three, as follows: That it can be produced at a cheaper cost than its competitors and sold cheaper to the consumer; that by its use a greater amount of power can be had from an engine of given capacity, and that the foregoing increased power can be obtained from a reduced consumption. Other advantages claimed include: Perfect combustion in the engine, practically no carbon deposit on the cylinder heads or pistons, a perfectly neutral fluid, colorless, practically odorless and absolutely free from any objectionable smell, and easy starting.

It appears that a series of tests was conducted by the Royal Automobile Club of Great Britain, between Sept. 11 and 29, some time previous to the public announcement to which reference has been made. The certificate of performance, after giving the results of distillation tests of the three casks of fuel submitted, two of which (those used in the road trials) were of specific gravity of .766 and the third .760 at 15.5 C continues:

The trial was divided into three parts: One thousand miles on the road on Economin, 1000 miles on the road on ordinary motor spirit (No. 1 Shell), and comparative tests at Brooklands.

The car used in each case was a 15 horsepower (18.8 R. A. C. rating) 1911 Straker-Squire, the engine dimen-

sions of which were 87 mm by 120 mm (3.42 by 4.72 inches). The weight of the car was 2552 pounds, the running weight (with load) being 2855 pounds.

The trial was held on the club's standard routes, and the conditions for each 1000 miles were similar, except that the weather was somewhat finer and the roads consequently slightly better during the test with Shell spirit.

The lubricating oil used in the engine was measured during each of the 1000-mile tests, and was found to be 2.9 gallons and 3.8 gallons with Economin and No. 1 Shell, respectively.

At the conclusion of each road test the engine was dismantled and examined, and the carbon deposit upon the cylinder head removed and weighed. In both cases there was practically no deposit except in the case of two of the piston heads, which had a very small amount, and which showed signs of excessive lubrication. All the valves and plugs were somewhat sooty in both tests. After both tests it was found that two of the exhaust valves had not been seating properly.

At the conclusion of the road tests comparative tests with the two fuels (without intermediate carburetor adjustment) were made on Brooklands track.

The following are the results of the tests:

|                                     | Economin | Shell    |
|-------------------------------------|----------|----------|
| Miles run .....                     | 1000.375 | 1000.375 |
| Average speed, mph.....             | 19.9     | 19.7     |
| Fuel consumed, gals.....            | 44.54    | 44.86    |
| Consumption, miles a gallon.....    | 22.53    | 22.38    |
| Ton-miles a gallon .....            | 28.72    | 28.52    |
| Weight of carbon, deposit grains... | 32.4     | 53.4     |

### Speed Test, Brooklands.

|                            |       |       |
|----------------------------|-------|-------|
| Flying half-mile, mph..... | 48.77 | 48.49 |
| Hill climbing, mph.....    | 10.83 | 10.56 |

The result of the comparative tests conducted by the Cudell Motor Company of Berlin, in which three kinds of fuel were employed, was reduced to the following:

|   | Economin | Gasoline | Benzol |
|---|----------|----------|--------|
| Efficiency in horsepower.....                 | 15.30    | 15.35    | 13.94  |
| Consumption a horsepower-hour,<br>grams ..... | 324      | 364      | 454    |

In discussing the new fuel, Mr. Squire says:

We are quite satisfied that enough has been done in the way of satisfactory and convincing tests to prove the high commercial value of our patents, and we are now engaged in laying the foundation of an important industrial enterprise. Ample capital for carrying out our programme is already secured, and we will, without delay, proceed to erect the necessary buildings for the housing of a plant capable of turning out 20,000,000 gallons of Economin a year. Good progress has already been made in perfecting the organization for an efficient and complete system of distribution.

Prof. Lewes, recognized in Great Britain as an authority on motor fuels, confirms Mr. Squire as to the commercial and chemical aspects of the new compound, laying particular stress upon the fact that the statement that 80 per cent. of kerosene goes into the compounding of Economin does not necessarily imply that it existed as kerosene in the finished product. He adds that the tests prove that the fuel is not sensitive to stalling; that is to say, it is not a mixture of kerosene and lighter spirits which give easy starting when the mixture is fresh and which evaporate when the engine is standing, but is a stable chemical compound.

## CORRESPONDENCE WITH THE READER.

**Electric Motors.**

(1665)—As I am interested in automobile electric motor starters, will you please explain how electricity by flowing in an electric motor makes it revolve?

LOUIS SAPELLY.

Bridgeport, Conn., Oct. 25.

In considering the electric motor, it is understood that the pole or field pieces represent north and south poles, between which a magnetic current will flow, or is flowing. But the field pieces are not permanent magnets and unless there is residual magnetism, or unless there is a certain amount of electricity that will excite them, there is practically no flow of energy. When energized the pole pieces create a magnetic field, and it is this field that, acting upon the conductor moving within it, exercises the propulsive effort. The principle is that a conductor carrying an electric current has a tendency to move if placed within a magnetic field.

Were there no conductor there would be an uninterrupted flow of current from the north to

force is increased, the magnetism being forced through the wire. The turns of wire intensify the current, and when they are arranged so that their effect on each other produces motion the power resultant is proportionate to the magnetic influence caused by the arrangement of the coils and poles, and, of course, the speed of rotation.

When the lines of force of two fields meet and seek to establish parallelism, the arrangement is tangential with reference to the lines of one field, and in the case of the electric motor the lines of force pass from the north to the south pole through the armature core. When the armature core is wound with wire it may have a number of positions with reference to the vertical or horizontal plane.

To illustrate this it may be well to consider several positions, the first of which may be with the coil in the horizontal plane, as shown at Fig. 1. Assuming that the coil has not influenced the magnetic field, the lines of force pass from the

Fig. 1—Magnetic Influence in Motor Action: A, Armature at 45 Degrees Angle to Lines of Force Has Greatest Effectiveness; B, Armature Horizontal to Lines of Force Has Least Power; C, Armature Vertical in Lines of Force Has Greatest Resistance.

the south poles, there being no change in the lines of force. But with the conductor interposed the lines of force passing from the segment forming the north pole to the segment forming the south pole will seek to establish parallelism with the lines of force between the poles of the field magnets. It is practical to describe an electric motor as a construction having a magnetic field, which is produced by field magnets, with conductors in the form of the armature, the armature being so suspended on bearings that it may move when it becomes influenced by the magnetic field.

The creation of a magnetic field within a loop of wire or other conductor, when influenced by an electric current, so that the loop possesses all the qualities of a magnet, is the fundamental principle of dynamos or motors. Each convolution of wire in a winding carrying a given current possesses a definite magneto-motive force, and with the increase of these convolutions the

north to the south poles of the magnet, but when the coil is energized by a current it manifests every quality of any electromagnet, despite its being within a magnetic field. The core of the armature is soft iron laminae, and the core is magnetized by the current circulating in the coil. Without the core the magnetic influence of the current would be weak, but with the core it is greatly intensified, and the lines of force of the coil are at right angles with those flowing between the poles. As the poles of the coil will seek the opposite poles of the original magnet, this causes a movement of the coil or armature in the direction governed by the location of the poles created by the ampere-turns of the horizontal coil and those of the field in which the armature core is suspended.

But, assuming that the coil is in a vertical plane, the magnetic field produced by the coil is at right angles to it, or in a horizontal plane, and these lines of force will unite with those of the field of the magnets, but, if the poles are opposed, the lines of force of the coil will be reduced proportionately to the magneto-motive force. But in this position no motion will be created, as the

lines of force will be parallel to one another.

Between these two extremes another position may be assumed, where the coil and armature are at an angle of 45 degrees with reference to the horizontal and vertical positions assumed, and the magnetic field of the coil is at right angles to the coil. Here the positions of the poles of the coil field are such that movement of the armature must follow, and a strong impulse is manifested, for it is only through moving the coil that the lines of force can establish parallelism with those of the magnetic field. From this statement it will be noted that the slightest variance from the parallel position of the lines of force will impart movement, and it follows that there is a constant tendency of the lines of force of the magnets, which have fixed relation as to influence, and those of the armature coils, to parallel when the latter are in certain positions with regard to the magnetic field.

A more simple manner of expression might be

cording to the equipment, which may include two separate units or a motor-generator.

#### Proper Location of Plugs.

(1666)—In a recent issue of your publication mention was made of the importance of proper location of spark plugs in the cylinders. I would appreciate your explaining why one position or length makes any difference.

G. A. K.

Indianapolis, Ind., Oct. 23.

The point emphasized in the article referred to was proper location of the sparking points of the plug in the combustion chamber. To obtain the greatest efficiency from the mixture the time required for the spread of the flame through it should be as brief as possible. If the gap of the plug, across which the high-tension current jumps, be located in a recess or pocket as indicated at Fig. 2 A, not only will dead gas accumulate about the points, but the combustion of the charge will be much slower than it would were the electrodes located as shown at B.

It will be noted that the construction of the

**Fig. 2—Illustrating Positions of Spark Plugs in Cylinders: A, Poor Location, Creating Pocket for Dead Gas; B, Proper Position, with Points Extending into Combustion Chamber; C, Faulty Design, Exposed to Heat; D, Showing How Same Valve Cap May Be Bored to Obtain Correct Location of Plug—Illustrations Are Reproductions from Bosch News.**

to state that there are permanent magnets that have generally a uniform influence, and a number of electromagnets that may be moved, the fields of the latter having a tendency to reach such positions that their lines of force will be parallel with and in the same direction as those of the former. Consequently, as the current is increased, there is an attraction of the movable electromagnets of the armature coils by the permanent magnets of the motor, proportionate to the current. It may be well to instance that the torque of the armature becomes simply a matter of magnetic field and the current in the armature.

Motor classification is established by the character of the windings and the form of current by which the machines are operated. Those utilized in starting systems of the automobile differ ac-

valve cap at B is such that the electrodes project into the combustion chamber, permitting the spark to come into direct contact with the fresh mixture, and that the flame will spread with maximum rapidity.

Manufacturers of spark plugs have given the matter of location considerable thought during recent years and produce a plug specially designed for the motor in which it is to be used. The shell or base is constructed to project the gap into the combustion chamber, and provision is also made for proper cooling of the material. The last named factor is important and accounts for some troubles experienced by owners who select a plug without particular reference to the valve cap, etc.

If the plug is not properly cooled, or its points

project too far into the combustion chamber, overheating results and the insulation material is more or less affected. As previously pointed out, the efficiency obtained by modern motors is largely due to the makers fitting a spark plug adapted to the cylinder, etc.

#### Fitting a Motor Starter.

(1667)—I wish to install a motor starter, but do not wish to go to a great expense. I have a Cadillac car with a Prest-O-Lite gas tank, also a Bosch dual system magneto. I have looked over several motor starters but could not decide which was the best. I therefore wish to have your opinion regarding the same. Also kindly inform me what solutions to use to make an anti-freezing solution for the radiator. WILLIAM HERZOG, JR.  
Garfield, N. J., Oct. 24.

The selection of a motor starter by the writer would be a matter of personal opinion. There is a large number of practical and successful electric motor starters made and the names and addresses of several manufacturers are given in the Classified Buyers' Guide found elsewhere in this issue. By writing the manufacturer direct, information as to cost and installing can be obtained.

The second question was fully answered in The Automobile Journal for Oct. 25.

#### Valve Timing.

(1668)—As a subscriber of The Automobile Journal I would like to have you inform me which is the best method to time a motor so as to get the most power, and if there is any difference in timing high and low speed engines?  
New York City, Nov. 1.

M. A.

The determination of the exact points at which the intake and exhaust valves of any given motor should open and close is a problem for a designer as there are many factors to be considered.

If reference is made to a motor in service, the original timing, or that of the manufacturer, should be observed, as it is doubtful if the operation of the engine could be improved by altering it. When a motor is designed in a factory, the parts constructed and assembled, it is tested to ascertain the results of the timing planned by the designer. When it leaves the factory, the opening and closing points of the valves obtaining the best results have been determined.

Regarding the second question, the same principles would apply.

#### Leaky Float.

(1669)—I have a car fitted with a Schebler L carburetor which is giving me trouble in flooding. A friend advises me to take out the float, stating that it may be heavy and leak, and shellac it. Any suggestion as to fixing the float will be appreciated. SUBSCRIBER.  
Winsted, Conn., Nov. 4.

If the float be suspected of being heavy, remove it from the carburetor, taking care in the operation not to bend the metal arm to which the cork member is secured. Dry the float very

thoroughly, making sure that any fluid in the pores evaporates. Next, lightly sandpaper it with a fine grade of paper, after which give the cork a couple of coats of thin shellac, allowing the first to dry hard before applying the second. Be sure to fill all crevices and pores of the cork with shellac.

#### Leaky Petcock.

(1670)—How can a leaky petcock in the gasoline system be cured? I have a petcock under my tank which is moved by a rod extending to the outside of the frame so that the gasoline can be shut off. The valve leaks, although I have taken up on the spring part.

CONSTANT READER.

Elkhart, Ind., Nov. 3.

Disassemble the petcock and note the condition of the seat of the valve. It is possible that it requires grinding and the work may be accomplished by taking a fine abrasive, ground glass for example, and grinding in the valve proper, much in the same manner as the valves of a motor are ground.

#### Piston Displacements.

(1671)—This is to inform you that I like The Automobile Journal very much. There is much valuable information in it, and I always look forward to the next issue. I wish you would inform me how to figure the piston displacement of a motor, also how the horsepower rating, S. A. E., is obtained. I own a Marion car, the cylinders of which are four by five. C. R. JACKSON.

Stark, Stark Co., Ill., Oct. 31.

To ascertain the piston displacement of a four-cylinder motor, the Marion, for example, square the bore and multiply the product by the stroke. Multiply the result by .7854, which will give the piston displacement of one cylinder. Multiply the product by four, which will give the piston displacement in cubic inches of the four cylinders. For example:

$$4 \times 4 = 16 \times 5 = 80 \times .7854 = 62.8320 \times 4 = 251.338.$$

The S. A. E. horsepower formula is assumed on a piston speed of 1000 feet and is as follows: Square of bore x number of cylinders ÷ 2.5. For example: The Marion motor has a four-inch bore and five-inch stroke, consequently  $4 \times 4 = 16 \times 4$  cylinders  $= 64 \div 2.5 = 25.6$ . The formula disregards the stroke entirely.

Owners of Ford cars in many of the cities and towns of this country have organized Ford societies for the purpose of establishing social relations, arranging tours and particularly for promoting Ford fellowship. The growth of these societies has been very great and there is now some talk of forming a national society with a club in every town. With every Ford owner eligible to such a society it could start with an approximate membership of 300,000.

## WITH THE CYCLECAR MANUFACTURERS.

### Recent Developments in the Newest Branch of the Industry---Imp Has Larger Motor---Detroit Speedster---Four-Cylinder Engine on Pacific Coast.

JUDGING from the statements being issued by cyclecar companies, many of these concerns have progressed so far in their manufacturing plans that the motoring public may expect to hear much concerning road tests, etc., during the next few weeks. Boston was considerably interested recently in a report that one maker was about to undertake a transcontinental tour from that city to San Francisco. Careful investigation of the rumor seemed to indicate, however, that this announcement was a trifle premature.

Several road tests of more or less length have been undertaken in the Middle West, and so far as the facts have become known, there appears to be every reason for believing that the little machines stood up well, despite the road conditions. One of these was a Zip, made by the recently organized Zip Cyclecar Company, Davenport, Ia. The run was from Davenport to Iowa City, a distance of some 57 miles, and the roads were frozen in ruts after three days of rain. Full constructional details concerning the Zip cyclecar have not been made public, but it may be stated that it is a two-passenger car, with seats side by side, belt driven and equipped with a two-cylinder V type motor.

Another new concern to announce the production of a cyclecar is the Dudley Tool Company, Menominee, Mich. The machine will be known as the Dudley, and will be fitted with a two-cylinder, air-cooled, V type motor rated at 10 horsepower. It also will have a planetary transmission with final drive by belt. The seats will be semi-tandem, the wheelbase 96 inches, tread 36 and weight about 400 pounds. It is stated that a test car already is on the road.

#### NEW MOTOR FOR IMP.

The Imp Cyclecar Company, Auburn, Ind., has been shipping machines in limited number for the past six weeks or two months, and expects to be able to increase production very materially in the near future. The little car has been given a number of road tests throughout the Middle West, one of them being a cross country run from Auburn to Milwaukee and return. As a result of these trials it was demonstrated to the satisfaction of the designer, W. H. Mc-

Intyre, who is well known throughout the industry, because of his connection with the W. H. McIntyre Company of Auburn, maker of McIntyre pleasure cars and business wagons, the desirability of changing the size of the motor somewhat.

The new power plant is shown in an accompanying illustration, and it will be noted that the two-cylinder, air-cooled design is retained. The exact dimensions of the cylinders have not been made public, but it is rated by the maker at 12-14 horsepower, as against 10 for the motor first utilized. Mr. McIntyre explains that he has found additional power advisable in ascending hills and in contending with road conditions where the latter cannot be regarded as ideal in every respect. The illustration also presents the method

The New 12-14 Horsepower Imp Motor.

of suspension, the friction transmission and the upper leaf of the front spring.

As is more or less well known, the conventional friction transmission affords an unlimited number of speed ratios, either forward or reverse, the variations being obtained by moving the periphery of the driven member across the face of the driving disc. Those who favor the friction transmission hold that the possibility of securing such variations is of decided advantage.

Consideration of the friction transmission as applied to cyclecar construction in America will reveal the fact that in nearly every instance the designer has taken steps to limit the number of speed ratios, obtaining results very much like that of the gear transmission, through the fitting of some form of stop. In explanation, it may be

stated that the several positions of the sliding disc, with reference to the driving member, have been determined after exhaustive tests as representing those in which the best service can be expected, taking into consideration the size of the motor and other equally important factors.

In the Imp, a special alloy disc is attached to the motor crankshaft, as shown, and the sliding member, or follower, as it is termed, comprises a detachable paper friction ring clamped between two metal flanges. A lever is fulcrumed above the centre line of the crankshaft and operates against a trunnion housing which contains Radio thrust bearings. Two springs anchored on a flexible arm on the motor are attached to the upper end of the lever, which is controlled by pedal, and the spring tension is increased or diminished by a cam mounted on the shifting rod and pressing against a corresponding cam on the flexible arm, while the follower is moved across the mo-

Cale; secretary and treasurer, F. L. Hall, also secretary and treasurer of the Gabriel Trussed Concrete Steel Company; chief designer, Ernest Weigold, for six years with the designing department of the Herreshoff Motor Company.

The little Detroit speedster is equipped with a four-cylinder, water-cooled motor, with bore of 2.75 inches and stroke of four, giving a rating of 12.1 horsepower under the S. A. E. formula. Cooling is by thermo-syphon, and lubrication is by splash with gravity feed. Ignition is by magneto and the carburetor is of the firm's own make.

The transmission is of the selective type, affording two speeds forward and reverse. The clutch is a disc. Drive is by shaft. The frame is of channel section suspended on long, flexible, semi-elliptic springs both front and rear. The front axle is an I beam, with patented spindle designed to make steering more efficient and easy to control. The rear axle also is of special design.

Brakes are internal expanding.

A departure from the usual cyclecar design in this country is noted in the wheels, which are of wood, artillery type, and are fitted with 28 by three-inch tires. The wheelbase is 92 inches, and the tread, 44. The weight is given as 850 pounds.

The body is of metal, of the open speedster type, with straight dash containing the fuel tank, pointed radiator, streamline fenders, etc. The two passengers are seated side by side,

with the driver at the left, with centre control levers. The sloping rear deck is portable, making this portion of the chassis available for business purposes if desired.

It is stated that factory space and a machine shop have been secured in the eastern part of the city, and that the production of the first few cars is now under way. According to the company, the demand for cyclecars is reflected in the number of agents throughout the country which have contracted for machines, and C. G. Bleasdale, for some years Maxwell agent in Cleveland, O., is said to have purchased a large block of stock in the company and to have contracted for 1000 cars to be delivered as soon as production will permit.

#### PACIFIC FOUR-CYLINDER MOTOR.

In anticipation of a demand for more power and speed, it is understood that several concerns throughout the country are considering the ad-

General View of the Little Detroit Speedster Model.

tor disc. This action decreases the pressure between the friction wheels as the speed of the follower increases and in inverse proportions exactly, or vice versa, assuming that the motor is running at a fixed speed. Each speed is locked when set by the device connecting the shifting rod with the pedal.

#### LITTLE DETROIT SPEEDSTER.

The Detroit Cyclecar Company, 504-508 Elks' Temple building, Detroit, incorporated recently under the laws of Michigan, with capital of \$250,000, is announcing the little Detroit speedster. The officers elected include the following: President, A. R. Thomas, formerly with the United States Motor Company and the Studebaker Corporation; vice president and general sales manager, B. C. Bradford, formerly with the United States Motor Company and the Hudson Motor Car Company; second vice president, Philip H.

**End View of Pacific Four-Cylinder Motor.**

visability of producing four-cylinder motors for cyclecar use. It will be admitted that much experimentation must result before designers can make definite decision with respect to the size of the power plant, and while the twin-cylinder motor has proven entirely adequate for motorcycles, there exists a feeling on the

part of some engineers that many cyclecars will eventually carry four-cylinder engines.

The Pacific Mechanical Company, 5410 Normandie avenue, Los Angeles, Cal., maker of Pacific motors, claims to be the first to produce a four-cylinder model designed especially for cyclecars. It maintains that its past experience in the production of power plants for automobiles, motor trucks and aeroplanes, places it in an enviable position, and that the new motor embodies features which will make a distinct appeal to those who are entering the new field.

The four cylinders have bore of 2.5 inches and stroke of 3.5, giving a rating of exactly 10 horsepower under the S. A. E. formula. The weight is 100 pounds. The valve diameter is 1.25

inches. The crankshaft is 1.25 inches in diameter, and is of the two-bearing construction, that at the front being three inches long and that at the rear 3.5. Each connecting rod bearing is 1.75 inches long and 1.25 inches in diameter. The flywheel is 11 inches in diameter and has a rim 2.125 inches in width.

The crankcase is of aluminum, scraped and polished; connecting rods and crankshaft of steel, and the cylinders, pistons and rings of fine grade of gray iron. Air cooling has been adopted to minimize weight and to save the expense of the radiator, hose and pump. The fan is 12 inches in diameter and is driven from the crankshaft.

Special attention is directed to the method of mounting the motor in the car, it being maintained that no matter what construction is contemplated by the designer, this method of hanging will adapt itself more readily than any other standard base construction so far designed. It is explained that it may be hung underneath two angle pieces and held by four bolts, .4375 inch in diameter at each corner of the crankcase, or, as has been done by one maker, the angle irons may be run underneath the motor and four short pieces of steel tubing used for uprights, which bear under the lugs on the crankcase. It is held that it makes no difference whether a sub-frame, main frame or underslung type of construction is adopted, the method of hanging will lend itself readily.

It is added that the flywheel can be machined for any type of drive. The magneto bracket cast on the crankcase is of standard Bosch dimensions, and a .75-inch carburetor, with standard flange, is used. The cylinder heads are tapped for the regular motorcycle spark plugs, and each cylinder is cast separately and the cost of replacement will be a very small amount.

gress of March 3rd, 1879.

**THE AUTOMOBILE INDUSTRY.**

For some time past there has been a feeling in certain quarters that the automobile industry has reached a point where there was soon to be a reaction in which those engaged in the production of pleasure cars, particularly, were to experience extreme financial and other reverses. Those who have held this view profess to see verification of their opinion in the present situation with respect to some few individual companies.

It is important to consider the position which the passenger automobile occupies in the economic life of this country. In the first place, it is an exceedingly practical vehicle, which finds a decided field of usefulness in business activities. The term pleasure car is largely a misnomer in its present application. If it were to make its

plea for existence solely on this score, the time might come when it would be superseded by some other form of transportation, although this does not now seem probable. But, since it must be acknowledged that it has a business value, entirely aside from its contribution to recreation, the motor car must be regarded as having a permanency that can be but little affected by the failure of any one or several manufacturers.

While the automobile industry ranks well toward the head of the list of American industrial activities, it is the youngest, and progress has been rapid. Careful study of the situation cannot help but indicate that the question is one of securing the necessary financial aid at the exact time it is needed, for it must be admitted that much capital is required to place an industry of such recent origin upon the footing it now enjoys in this country.

Those who are best able to judge of the possibilities, foresee greater stability in the future. The demand undoubtedly will reach a certain level, which in itself will enable the manufacturer to so regulate production as to insure the proper balancing of his business—something which manufacturers in all lines have been trying to do with more or less success during the past few years. In any event, there is no reason for suggesting that the automobile industry is on the wane, but, on the contrary, every reason for believing that it is about to enter upon a period of financial and business stability which cannot help but make for success in every respect.

That the use of motor fire fighting apparatus provides for efficiency is not doubted. The fire department budget in New York City for the coming year is over \$1,500,000 less than for 1913, although it provides for the opening and manning of 15 new fire stations. Commissioner Johnson explains that this represents the saving effected by the introduction of motorized equipment to replace horses. This would appear to leave but little room for doubting its economy as well.

The demand of modern times is for modern transportation methods. If existing bridges and roads are not able to withstand the new traffic conditions, it would appear the better part of wisdom to follow the example set by Rhode Island in constructing a new bridge capable of carrying the heaviest truck loaded to capacity.

## NEW EMPIRE HAS MANY REFINEMENTS.

**C**ONFORMING to its policy of building but one chassis and fitting to it a five-passenger touring body, the Empire Automobile Company, Indianapolis, Ind., announces but one model for the season of 1914. The new car is an enlarged edition of the former machine and while there are no radical changes in the basic principles and design, many minor improvements have been made, and the selling price has been reduced \$50. Increased production has enabled the company to manufacture a larger and a higher grade car than formerly and the fittings, equipment, etc., are in keeping with the new design.

In developing the model 31 the company has concentrated its efforts in the production of a light weight, durable vehicle, capable of being

stroke 4.5, placing it in the long stroke class. The crankshaft is a drop forging of high carbon steel, 1.75 inches in diameter and supported in three large bearings, these being three, four and five inches in length, respectively, from front to rear. Other bearings are large and white brass is utilized throughout. All components of the motor are readily accessible for inspection or adjustment.

The camshaft is of high carbon steel, mounted in four bearings, and the cams are integral. Fibre inserts are utilized on the tappets and all valve mechanism is enclosed. Large and easily removed inspection plates are a feature of the motor.

Carburetion is by a model H Holley located

**New Series Model 31 Empire Having Longer Wheelbase Than Former Design and Including Many Refinements Making for Comfort and Convenience in Operation.**

maintained at a minimum of cost and having sufficient power to meet all requirements of service. Simplicity is noticeable of the chassis, the wheelbase of which has been increased to 110 inches, and throughout the proportions of the components are well balanced.

### **Three-Point Suspension.**

The three-point suspension of the power plant, clutch and transmission is continued, it having proven highly efficient in service, particularly under the severe test accorded in the Indiana-Pacific tour. The method of suspension is made clear in an accompanying illustration and it will be noted two of the points are anchored to the frame by means of a substantial cross member.

The L head type of motor with cylinders cast in pairs is retained, the bore being 3.75 inches,

on the left hand side of the motor and a special air device, adjusted from the dash, is provided for starting in cold weather. Vaporization is aided by the conventional hot air taken from the exhaust manifold and led to the carburetor through a flexible tube.

### **Fixed Spark Ignition.**

A true high-tension Eisemann magneto with fixed spark is employed, the company holding that it is best adapted to all conditions of service, simplifying the control and making for efficiency at all motor speeds.

Lubrication is a combined splash and pressure feed, the oil being taken from the reservoir in the crankcase by a positively driven pump, forced to a sight feed on the dash, thence to the three main bearings, whence it overflows to compartments in the crankcase. The ends of the connecting rod

dip into the oil, splashing it to the working parts. A constant level is maintained, all surplus lubricant flowing to the sump, where it is filtered be-

**Showing the Simplicity and Convenience of Control Members, Comfortable Upholstery and Large Steering Wheel.**

fore again being circulated by the pump. The oil capacity is 1.5 gallons.

Cooling is by the thermo-syphon system, the cooled fluid entering the cylinders at the right of the motor, passing upward through the water jackets and around the exhaust valve, thence to the outlet manifold and to the radiator. Both manifolds are of polished aluminum and are 1.75 inches inside diameter. Cooling is further aided by a ball bearing, belt driven, adjustable fan. The radiator is large, assuring ample cooling in high altitudes. The hood is provided with ventilators.

#### **Components Accessible.**

The clutch is of the disc and ring type, with two discs faced with Raybestos and a steel member, each nine inches in diameter, these operating in oil. Provision is made for inspection and adjustment, a large hand hole being fitted to the top of the housing, which is accessible by raising the floor-board in the driver's compartment.

The transmission is of the selective type, providing the three conventional forward speeds and a reverse and the gears are large, with .875-inch faces. The supply of lubricant may be renewed easily, a large plate being fitted so as to be very accessible.

But one universal joint is employed, this being mounted at the rear of the transmission housing, and the drive is straight, by a large sized steel shaft

enclosed in a tube reinforced at the universal joint end, where provision is made for adjustment. The shaft is squared at this end, a construction facilitating the removal of the rear system, as by displacing the axle spring clips and detaching the brake rods, the axle may be taken out easily.

#### **Well Constructed Rear Axle.**

The rear construction is of the semi-floating Weston-Mott type, the axle of a high grade steel, and high duty Hyatt roller bearings are utilized throughout. A noticeable feature of the rear axle is the utilization of a 3.5-inch sleeve bearing member, which is hardened and ground. The axle carries a hardened sleeve and the rollers bear upon this member.

Special attention has been paid to the springs, each leaf being ground and polished before assembling. The rear springs are three-quarter scroll elliptic, having six and eight leaves, 1.75 inches wide. They are provided with grease cups for lubrication of the shackle bolts. The lower leaves of the upper springs are curved and carried backward to a point approximately over the rubber shock absorbing bumper, which is secured to the lower spring. The front springs are semi-elliptic, 1.75 inches wide, and the six leaves are secured to the axle by substantial clips. The front axle is a Weston-Mott, of the I beam section type, and the steering arms and knuckles are drop forgings.

The frame is very substantial. It is of pressed steel, .1562 inch thick and has a depth of channel of 3.562 inches. It has a kick-up at the rear, providing a low centre of gravity, and the rear cross member is reinforced by two large gusset plates with flanges securely riveted as illustrated.

**The Empire Chassis Is Noticeable for Simplicity and Accessibility of Components, and Throughout the Proportions Are Well Balanced.**

The size of the brakes provides a large factor of safety. The service members are of the external contracting type, operating on 12-inch drums, and

have a two-inch face. The emergency members are of the internal expanding design, operated by the conventional hand lever at the left of the driver. Both sets are fitted with equalizers mounted over the differential.

#### **Large Sized Tires.**

The wheels are of the artillery type with second growth hickory spokes and have large hubs. They are fitted with Baker demountable rims, with one extra rim as standard equipment, and provision is made for the carrying of two extra shoes at the rear, the tire holder being anchored to the rear cross member. Tires are 32 by 3.5 inches, front and rear.

The driver is placed at the right with centre control. The gearshift lever is of the cane handle type, and a feature of the control is the short movement required to effect the different changes of speed. The emergency brake lever is also mounted on the transmission housing. The right pedal actuates the clutch, the left the service brake. The accelerator is located between these members. The gasoline tank has a capacity of 15 gallons with two gallons held in reserve. Feed to the carburetor is by gravity.

The body is of aluminoid steel, with graceful flowing lines, and the cowl dash harmonizes with the design. The door ledges are upholstered, and the upholstery is deep and luxurious, a high grade hand buffed leather being utilized. The cushions are wide and the seats deep, the rear seat easily accommodating three persons. There is ample room in the tonneau between the back of the front seat and rear cushion, also between the dash and front seats.

The hood, fenders, skirt and aprons are finished in black baked enamel, and all metal trimmings are nickel plated. The running gear is a French gray with the body finished in Royal Empire blue. The finish is first class in every respect.

#### **Complete Equipment.**

The car is fully equipped. The top is a mohair with slip cover, and curtains operated from the inside are standard. The windshield is of the clear vision type. The speedometer is a Stewart, mounted on the dash with the magneto switch, carburetor control and oil sight feeds. The gas headlights and oil side and tail lamps are black enamel with nickel trimmings. The Prest-O-Lite tank is encased in a black enamelled cover. The balance of the equipment includes: Rubber bumpers, robe and foot rails, jack, pump, tire repair kit, tools, etc. The Empire model 31 is designed for a light weight family car capable of being maintained at a minimum of expense and

to give efficient service under all conditions of operation.

#### **MILLER AT ATLANTA SHOW.**

#### **Pioneer Accessory House Is the Only Jobber Exhibiting at Southern Display.**

According to advance information from Atlanta, Ga., the only accessory jobber to make display at the Atlanta automobile show, which opened Nov. 8, to continue until Nov. 15, is Chas. E. Miller. The main office of this pioneer house is at 97-103 Reade street, New York City, but for some years it has maintained an important branch in the South at 259 Peachtree street, which may be regarded as Atlanta's automobile row.

In keeping with its policy in connection with

**Ample Room Is Provided in the Driver's Compartment of the Empire Car.**

all local shows in the 13 cities, in nine different states, where the Miller branches are located, the display in Atlanta comprises a full line of goods handled by this well known manufacturer, jobber, importer and exporter. Particular attention is being drawn this year to a number of Miller specialties.

Chief among these may be mentioned the Pan-American lubricants, comprising polish, oils, transmission lubricant, tire lubricant, etc. Other goods having a prominent place in the display are: Miller tire saver, Miller cementless patches, Miller jack, Miller eight-day clock, Miller mica and Miller porcelain spark plugs, and Brampton roller chains.

It will be understood that similar exhibits will be made in all the cities where the Miller branch stores are located.

## SCHEBLER BRINGS OUT A NEW CARBURETOR.

**W**HHEELER & Schebler, Indianapolis, Ind., maker of the Schebler carburetor, has brought out a new design termed the model R, a

**Model R Schebler Carburetor.**

single jet construction of the concentric venturi type, differing from earlier models. The most pronounced variance is the lift of the needle valve actuated by the auxiliary air valve, a lever connecting the latter and the needle. The principle of former models, that of raising the needle and proportioning the fuel emerging from the jet to the air, is continued, but the well known cam and roller has been replaced by the lever arrangement, as will be noted by the sectional drawing presented herewith.

The fuel enters the float chamber at R in the conventional manner, the supply being regulated by the usual needle valve, rising to a level of about .0625 inch below the jet opening J. The gasoline passes to the central jet passage through a series of holes arranged around the bottom of the chamber. The primary air passage is through the centre of the carburetor by the way of the venturi V around the jet and the air intake pipe X is arranged for using the conventional flexible tubing conveying heated air. It is also provided with a strangling valve for enriching the mixture for starting.

The proper mixture at low speed is obtained by the usual needle valve E, which projects downward into the jet, but the method of controlling this pin differs from former practise. Adjustment is secured by means of a Bowden cable W from the steering column, the wire being connected with a bell crank lever B, which raises or lowers the needle as desired when the cable is rotated. The lever on the steering column is so attached that when in a central position the mixture is correct for low speed. The operating position is when the boss of the lever is against the stop. The lever should then register with the words "Lean" or "Air". This permits of the driver altering the position of the needle valve to meet atmospheric changes, and to enrich the mixture for starting when the motor is cold.

The proportions of fuel and air at high speeds are secured automatically as with former models,

but in the new design the raising of the needle is by the air valve as previously explained. As the speed of the motor increases the suction of the piston acts against the spring, compressing this and moving the lever L downward. The needle E is consequently raised and to a degree determined at the factory. The entire operation is automatic, and during the movement of the needle the lever controlled by the Bowden cable is inactive insofar as it affects the position of the needle.

Two adjustments are provided, the low speed needle, which is obtained by turning the air cap valve member A, and the high by regulating the tension of the auxiliary air valve spring. In setting the carburetor the lever B is connected with the Bowden cable in such manner that when the boss D of the lever B is against the stop C the lever on the steering column control will register "Lean" or "Air".

Turning the air cap A to the right augments the supply of fuel; in the opposite direction, decreases the amount or makes for a leaner mixture, in that the needle valve is lowered. For starting in cold weather, the dash lever is moved toward "Rich", which lifts the needle out of the nozzle, and with the choke valve in the air intake X closed, a rich mixture is obtained. Upon the motor becoming warm the control lever is placed at "Air" or "Lean" as best meets requirements.

The new carburetor is made in four sizes, namely: One inch, 1.25, 1.5 and 1.75. It is de-

**New Design Schebler Carburetor, the Feature of Which Is Control of Needle Valve by Auxiliary Air Valve.**

signed for service on four and six-cylinder motors and may be utilized either with pressure or gravity feed.

## IMPROVED ROADS AND MOTORING LAWS.

### United States Good Roads Association Offers Still Another Plan for Securing Federal Funds--New York State May Reorganize Highways Department.

**S**TILL another good roads organization of national proportions is making its position felt, this being the United States Good Roads Association, organized as the result of a meeting in Birmingham, Ala., April 24. The first convention has been called in St. Louis, Nov. 10-15, the announcement stating that "every advocate of good roads is invited to be present and take an active part in the work to be begun at St. Louis and continued until results are secured". In his call, President John H. Bankhead sets forth the object of the association as follows:

The controlling purpose of the association is to secure federal aid in the construction of an adequate system of highways throughout the United States. The association desires to extend its activity toward the passage of state laws in harmony with federal aid legislation. It does not hope to amalgamate all good roads organizations into one grand body, but most earnestly desires their co-operation in one great effort to accomplish the ends sought by all, namely: Appropriate legislation looking to the building and maintenance of highways throughout the United States, and to secure appropriations from the federal treasury to effectuate such legislation.

The methods by which the United States Good Roads Association hopes to attain its objects appear to be along lines indicated in a bill introduced into the United States Senate by Senator Thompson of Alabama, at the request of Mr. Bankhead, in September. Briefly summarized this bill provides for the following:

The creation of a national bureau of highways, under the joint direction of the Secretary of Agriculture and the Postmaster-General, through a commissioner of public highways appointed by the President at a salary of \$10,000 a year and travelling expenses. The commissioner shall have power to employ engineering and such other assistance as needed.

Upon application to this commissioner, made by the state legislature, or such officer as shall be designated by the legislature, governor, etc., he shall satisfy himself that the post road or rural delivery route under consideration should be improved and that the state or local authorities have available, in cash or its equivalent in labor, half of the expense exceeding \$5000. No work shall be undertaken without advertising for bids, which shall be opened in public, and contracts shall be awarded jointly by the commissioner and state or local authorities. All questions as to location, methods of construction and maintenance shall be determined by the commissioner.

The commissioner and the state or local authorities shall have joint supervision over the work of construction and maintenance, so long as the national government shall continue to expend money thereon. One-half of the cost of such work shall be paid by the treasurer of the United States, upon warrants to the commissioner, which shall be charged to the national highway fund allotted to the said state.

The sum of \$25,000,000 shall be appropriated, which, less salaries and expenses, shall be apportioned among the several states, as follows: One-half in the ratio to

which the population of each state bears to the total population of the United States, and one-half in the ratio which the mileage of star routes and rural delivery routes in each state shall bear to the total mileage of such routes in the United States—provided that the apportionment to no state shall be less than \$100,000.

It is further provided that the commissioner shall give first consideration to such highways as will form a part of a proper state system of highways, and with a view to connections for such systems into an interstate or national system of highways between principal points.

The programme for the convention is an unusually full one, it being explained that short speeches will be the rule, or, as the call expresses it: "No long paper, but general short, crisp debates will be the feature of the convention. It will be practical and not theoretical. Less rhetoric and better results is the object of the meeting".

### CHICAGO'S FENDER ORDINANCE.

#### Full Text of Regulation Which Requires Truck Owners to Equip Their Cars.

Considerable interest has developed concerning the amendment to the Chicago traffic code of 1911, which provides for the equipment of all motor trucks and delivery wagons in that city with fenders, brief particulars of which were announced recently. The full text of the new regulation follows:

Section 2650½—It shall be unlawful for any person, firm or corporation to use and operate within the city of Chicago any motor car or truck for the purpose of conveying therein bundles, parcels, baggage or wares, merchandise or other similar articles unless said motor car or truck is provided with a fender, as in the case of street cars operated and used within said city, of such design as may be approved by the board of inspectors of public vehicles.

Section 2—This ordinance shall be in full force and effect in 90 days from and after its passage, approval and publication.

### NO FURTHER CONFUSION.

#### Lincoln Highway Association of Colorado Changes Name of Its Route.

As was pointed out in a recent article in these columns concerning the Lincoln highway of Colorado, there was danger of confusion because of the similarity of this name with that of the Lincoln Highway Association, a national organization with headquarters in Detroit. The larger

body has adopted a route across the country from New York to San Francisco, a portion of which traverses Colorado, but over an altogether different course than that selected by the Lincoln Highway Association of Colorado.

At a special meeting of the Colorado association, held in Colorado Springs, Oct. 23, it was unanimously decided to continue the present organization with name unchanged, but to change the name of the section of the transcontinental route under improvement by this body to the Pikes Peak route. It is explained that there is no desire on the part of the Colorado association to conflict in any way with the plans of the Detroit organization for the promotion of the Lincoln memorial highway, as the latter's transcontinental route is known.

### SCIENTIFIC ROAD BUILDING.

#### Department of Agriculture Stands Ready to Aid Communities and Individuals.

Announcement is made by the office of public roads, Department of Agriculture, that such advancement has been made in problems connected with road construction that efforts are now being directed toward teaching the country that the expenditure of large sums of money on certain types of roads may result almost in a total waste. In other words, attention is being directed to the fact that a road built of materials which would be ideal in one locality may not serve the purpose at all elsewhere and the money expended may bring scarcely any result in reducing the cost of haulage or making it easier for the farmer to get to the shipping point with his crops.

In order to aid farmers who want to build their own roads and to assist various communities that desire to improve the highways nearby, the office of public roads has employed experts to test all materials and study their usefulness on roads subjected to certain traffic conditions. The office also is acting in an advisory capacity to many states and counties, giving what is termed a most practical form of national aid. Director Logan Waller Page, in discussing the new scientific movement in road improvement, says:

There are two ways in which the engineer may avail himself of the information necessary to a proper selection of road material. The first and only certain one is to make an actual service test of the material under observation, and under the same conditions of traffic and climate to which the proposed road will be subjected. This method, however, is impractical except in certain rare instances, due to the time which must elapse before definite results can be obtained.

The second method is, by means of short time laboratory tests, to approximate as nearly as possible the destructive agents to which the material will be subjected

on the road, supplementing the knowledge thus gained by a study of the results already obtained in practice on material of a similar nature.

The office of public roads constantly uses both methods. At Chevy Chase, near Washington, D. C., a model road has been built in sections made of different materials, while in the laboratory of the office tests are constantly being made with materials under certain traffic conditions.

### TO EFFECT LARGE SAVING.

#### Reorganization Plan for New York State to Reduce Expense Materially.

William DeHertburn Washington, George C. Diehl and Harold Parker, acting as a special board of consulting engineers, appointed to perfect a plan for the reorganization of the highways department of New York State, have reported to John N. Carlisle, commissioner of highways, a scheme by which they suggest it is possible to effect a saving of \$500,000 a year. It is further contended that the new arrangement would make for greater efficiency and would prove in every way more sensible and satisfactory. The plan may be outlined briefly as follows:

To place highway construction, maintenance and the supervision of town highways under the direction of a chief engineer, working under the commissioner as the administrative and executive head of the department. The chief engineer would have two deputies, special residences and clerks to handle the office work and any technical investigations that might be necessary. The deputies would be in charge of a specified portion of the state, the division to be made so as to place approximately the same amount of work on each.

The state would be divided into nine divisions, each in charge of a division engineer, who would have in his office a resident engineer competent to act in his absence and to have special charge of surveys, maps, designs, estimates, payments on contracts, etc. He would also have a chief clerk to care for correspondence, files, preparation of vouchers and similar work.

In the field work, each division would be divided into approximately seven sections, with an assistant engineer in charge of each. Under the direction of each division engineer for the maintenance work there would be three gangs, with automobile trucks, each gang to maintain approximately 150 miles of completed state and county highways. This would cut down the number of patrolmen to a large extent and substitute in their place a system of maintaining highway by the section gang. It is in this last named respect that it is estimated that the greatest saving would be effected.

The State of Rhode Island has just completed a new bridge in the village of Shannock, which was designed and constructed to carry the heaviest type of motor truck manufactured, loaded to its maximum capacity. The work was done under the charge of Inspector Wendell Phillips of Wyoming, and it is believed that this is the first attempt, in New England at least, to meet modern traffic conditions by the erection of a bridge of this character.

## SOLID TIRES FOR ELECTRIC TRUCKS.

The Essential Qualities Sought in Designing and Constructing Tire Equipment for All Methods of Vehicle Propulsion---How Efficiency Tests Are Made.

(By A. H. Leavitt, M. E.\*)

**I**N GAS truck practise little is required of the solid truck tire except it be of sufficient resilience to insure protection to the truck mechanism, of positive application to insure permanence, and of a quality to give maximum mileage service. The solid tire for electric truck service, however, presents a different problem to the manufacturer, as not only resilience and permanent application are required, but in addition the compound must be such as to reduce the current consumption to the minimum, at the same time increasing the speed of the truck to the maximum.

### Problem of Tire Manufacturers.

To the uninitiated this problem may appear of little consequence and the general impression of the efficient solid tire is one composed of either a very hard or very soft compound. The highest current efficiency is obtainable by equipping a truck with steel wheels and operating it upon a steel track; however, a rubber tire of excessively hard compound has been found to be efficient only under ideal road conditions such as asphalt or good hard macadam surfaces. On brick, cobble stones or rough roads generally, the vibration is extremely detrimental to the truck mechanism and the efficiency falls below that of a more resilient tire due to the slip of the wheels during the period of vibration. On the other hand, a tire built from an excessively soft compound presents such a large area of contact with the road when under load that there is a holding back or "drag", which materially reduces the speed and increases the ampere draw.

Knowing that too hard or too soft a tire will not be of the proper efficiency to meet the requirements for electric truck service, the tire manufacturer must develop a compound between these extremes, combining high current efficiency and speed. To determine the most efficient solid tire it must be taken from the laboratory and the final development made by numerous different tests, comparing various compounds and shapes.

### The Road Test.

Manufacturers of electric trucks have established methods of testing solid truck tires for ef-

ficiency and while few use the same test upon which their decision is based, a majority use what is termed the road test. In this test a chassis is loaded to normal capacity by means of accurate weights and driven over a measured course at a constant speed. The records kept in such a test consist of the time consumed in covering the course, volts, amperes, atmospheric temperature, wind velocity and direction, and road conditions. In some cases ampere-hour meters are used to

Upper View, Vibration Effect on Hard Compound; Lower, "Drag" on Soft Compound.

show the total current consumed, but as a general rule fully charged batteries are used in each individual test and total watts or ampere draw used as a basis for comparison. The tires showing the greatest efficiency are those covering the course at the greatest speed and with the lowest ampere draw or watt-hour reading.

There are many chances for inaccuracies in making this test, and unless tires of differing types and makes are tested under identical conditions a fair comparison cannot be established.

\*Assistant manager of the truck tire sales department, B. F. Goodrich Company, Akron, O.

For example, it will be observed that an accurate comparison cannot be made if two sets of tires are applied to different chassis, even though they are of the same weight and capacity. The friction and other losses of the moving parts, as well as the efficiency of motor and batteries, might vary so widely as to cause an apparent increase in power

consumption not attributable to the tires.

Differences in the atmospheric conditions during separate tests will be reflected in the final results, hence accurate comparisons may be expected only where practically identical weather conditions prevail. Since atmospheric conditions also affect road conditions, the same set of tires would not show the same results if tested on a dry course as over the same route after being wet. Temperature also plays an important part in affecting road conditions, as can best be illustrated in the case of asphalt. On a hot day the asphalt would soften, causing the tire to stick or drag and consume a greater amount of current than on a cold day when the asphalt would harden perceptibly, making a much faster course.

Wind resistance should also be constant in making comparisons, for it is obvious that more current will be required in running into a 20 mile an hour wind than one whose velocity is 10 or even 15 miles an hour.

The course over which road tests are run is usually either asphalt or good brick, and the final results show current efficiency and speed over but one type of road construction. In actual service the average electric truck meets all varieties of road and street construction and as a solid tire, most efficient on good hard asphalt, may show decreased efficiency over brick or cobble stones, and vice versa, the most satisfactory course is one including the greatest variety of paving. In this case an accurate average performance may be obtained. While the road test

is theoretically the most accurate in determining the tire or tires with highest current efficiency, in order that dependable results may be obtained, the foregoing conditions must be as nearly alike as possible and the testing course should be a fair average of actual street conditions in service.

#### Grade Test.

The grade test consists simply of noting the length of time elapsing from the instant the brakes are released on a truck standing on a 20 per cent. grade, to the instant of passing the end of the grade. In this test time only is figured, for no current is required, and as the grade is usually artificial not much dependence can be placed upon the results. Should the same complete chassis be used in testing various makes of tires the results would be fairly reliable for comparison only, but the conditions under which the test is made are theoretically too perfect for drawing accurate conclusions with respect to results in actual service.

#### Coasting Test.

This test is very similar to the grade test except that distance is the basis of comparison rather than speed. In making the coasting test the truck is run at highest speed up to a marked point, at which the down grade begins. Here the power is cut off and the truck allowed to coast until coming to a standstill. Many of the variable factors are encountered in this test, as outlined in the road test, but in the main, results are fairly accurate for comparison.

#### Impression Test.

This is a minor test used by one or two manufacturers and the results obtained are inadequate and unconvincing in comparing the efficiency of solid tires. The test is conducted by jacking a wheel from the floor, chalking the surface of the tire and removing the jack, allowing the weight of the wheel to rest upon a piece of cardboard or

Modified Form of Scleroscope.

heavy paper. Upon removing the cardboard an impression of the length and width of the arc of contact is obtained. By comparing these arcs for various tires the results are supposed to show the comparative hardness. However, even these results are inaccurate for different shapes, and the test can best be used as a check for uniformity in tires of the same make and shape. Efficiency in current consumption and speed cannot be determined by this test.

#### The Scleroscope.

The scleroscope, an instrument primarily designed for testing the hardness of metals, is sometimes used to compare solid tires for efficiency. This instrument has been accepted as a standard by different authorities for testing hardness of steel, and while a trifle intricate in its make up, consists mainly of a glass tube, graduated to scale, through which a weight is dropped

be tested, the amount of resistance to the pressure of a standard spring balance is shown on a graduated scale.

This test results in only a determination of the hardness of various tires, hence is not reliable for tire efficiency in point of current consumption, but is a fairly accurate check for compounds found to be up to requirements in this regard.

#### Conclusions.

From the foregoing it is apparent that the electric truck manufacturer should not base his decision for tire equipment upon any one single test, but should, so far as possible, make a careful comparison of results obtained from several. Far too frequently truck manufacturers are willing to sacrifice increased tire mileage in favor of reduction in weight. Tire manufacturers from long experience have established standard carrying capacities for all tire sizes, and the strict ad-

and the rebound observed on the scale.

The results from this instrument are obtained by dropping a weight upon the tire and noting the rebound, the more resilient tires showing the greater rebound. This test is not accurate for tires or rubber compounds, unless test pieces of the same dimensions are used. The difference in the shapes of tires, as well as the possibility that the tube may not be perfectly vertical for all tests, allows a great chance for inaccuracies. Again, the testing conditions are more nearly ideal than those encountered in actual tire service.

Practically everyone is familiar with the common practise of testing the resilience of rubber by biting specimens with the teeth or pressing with the fingers. Since these are very unsatisfactory methods, an instrument known as the yield gauge has been produced to take the place of the uncertain element of "feeling". By pressing the blunt end of the gauge against the tire to

herence to this standard is one of great importance in securing satisfactory tire service.

From the point of view of the truck owner, the problem is one of obtaining a tire which will reduce his cost a battery charge to the minimum, and at the same time increase his ultimate tire mileage to the maximum. Primarily the operator wants low current consumption, but it is also advisable to bear in mind the high cost of frequent tire renewals, involving also a considerable loss of time. Unfortunately, the truck operator has neither the time nor facilities for conducting the tests described above, but in view of the fact that practically all users are maintaining accurate daily records, any losses in speed or mileage a battery charge are promptly noted. When such losses occur an investigation of the tire equipment may disclose the weakness, especially if motor, batteries and transmission test up to standard.

## MECHANICAL NOTES FOR OWNERS.

### Utilizing Spark Lever for Switch with True High-Tension Magneto--Home Made Hot Air Attachment for Carburetor--Timer Hint.

**W**HEN a true high-tension magneto is utilized for ignition purposes the secondary current is prevented from flowing to the spark plugs by diverting the primary or low-tension from the secondary windings, or, in other words, when the driver desires to stop the motor the switch lever is so moved that the primary circuit is closed. It should be explained that the type of switch employed differs from conventional practise in that to permit the magneto supplying secondary current to the plugs, the circuit is open. With batteries, coil, etc., the circuit is closed, and opened to stop the motor operating.

In the Oct. 25 issue of The Automobile Journal the Splitdorf true high-tension magneto for model T Ford motors and equipment for driving

**Suggestion for Utilizing the Spark Lever of Model T Ford for Switch When True High-Tension Magneto with Fixed Spark Is Employed, as with Splitdorf Ford Equipment.**

the instrument were described and illustrated. Included in the system is a dash switch, which is wired by attaching a lead from the circuit breaker spring terminal to it and carrying another lead to the metal support of the steering column. When the switch is closed the primary current of the instrument is diverted to ground as previously explained.

In an accompanying illustration is presented a suggestion for utilizing the spark control lever of the car for a switch, as it will be remembered that the Splitdorf magneto is of the fixed spark type. As the lever is of metal and the quadrant on which it moves is of similar material, and the post of steel, these components may be used for one side of a circuit or the ground.

By taking two small pieces of fibre and constructing them to the shape shown in the sketch, they may be attached to the quadrant as illustrated. The fibre pieces are drilled to take small bolts for clamping to the quadrant, and the outside clamp is also drilled to take a metal terminal. The brass screw of a carbon post of a dry cell could be utilized, placing the screw head on the side of the quadrant facing the driver.

The wiring plan is simple. Take a piece of insulated wire, strip one end and secure it to the screw in the fibre block, locking it with the nut. The other end of the lead is attached to the magneto terminal. With the spark lever in the position shown in the drawing, the circuit would be open, allowing the high-tension current to flow to the plugs. By moving the lever so as to make contact with the screw in the fibre piece, the circuit would be closed, stopping the motor. This plan is not only simple, but it makes for convenience, in that the motor could be stopped quickly if desired and without reaching over to the dash.

#### HOME MADE HOT AIR DEVICE.

With the approach of cold weather owners are giving consideration to devices facilitating carburetion of the fuel. The modern machine is equipped with means for conveying heated air from the exhaust to the air intake of the carburetor, but many early models are not thus fitted. While attachments may be purchased, these may be made and in an accompanying illustration is presented a plan for fitting the model F Schebler carburetor with hot air connections.

The bowl A of the model referred to is retained by a hexagonal nut B, and as there is not room to attach other than a special fitting and nut, such as is marketed by a carburetor manufacturer, one can be made of sheet brass. Remove the nut B, drill and tap each side of the hex to take a small machine screw. Next take a strip of sheet brass and shape it around the nut as shown at C, fastening it by means of the screws. If shaping the brass proves troublesome any tin-smith will fit it for a few cents.

The hood member which clamps over the exhaust manifold may be made of a strip of brass and attaching to it the circular extension to

which is fitted the tube or pipe connecting with the air intake of the carburetor as shown at E. This connection piece may be flanged and riveted

Working Plan for Constructing Hot Air Attachment for Model F Schebler Carburetors.

on or soldered as convenient, but it should be remembered in constructing the hood piece D that space should be left for the entrance of air when attaching to the exhaust manifold. If fitted too close the pipe opening will be obstructed. The hood may be retained by wire or two bolts.

Flexible metallic tubing is not expensive and may be obtained at any supply house. The end attached to the hood can be soldered, while the other extremity is slipped over or inside the nut piece and retained by a cotter pin by drilling a hole through the walls of both pieces.

### SUPPORTING TIMER LEADS.

Primary wires fitted to the timer or commutator do not as a rule receive much attention until they give trouble, as the current flowing through these leads is of a low voltage. Where the timer is driven by a vertical shaft the wires are brought upward and more or less twisted together. In the event of trouble on the road the driver is obliged to trace each lead before he can locate the faulty member.

In an accompanying illustration is presented a suggestion from an owner for separating and marking the leads, and the device can be constructed from a piece of fibre and with little labor. It comprises a circular piece of material about .25 inch thick and about an inch or more in diameter. In it are drilled four holes, spaced equidistant as shown and these openings should be large enough to permit passing through the wires, yet preclude play and chafing.

The fibre is located as shown in the sketch, and to simplify matters the leads can be marked according to the firing order of the motor as indicated in the drawing, which in this instance is

1, 3, 4, 2, with the timer shaft rotating anti-clockwise or to the left. As previously mentioned, in the event of a missing cylinder, due to one of the timer leads, the wire can be located speedily and the trouble corrected. The plan could also be utilized with horizontal commutators.

### BATTERIES AND STARTING.

Owners of cars employing a dual ignition system, that is, batteries for starting, should give the cells or storage battery more attention at this season of the year than in warm weather when starting is much easier. Much of the trouble experienced in starting a cold motor is due to a weak spark. Test the cells from time to time and if not up to the specifications of the maker, install new members. If a storage battery is utilized, have it recharged. A good, hot spark is necessary for starting.

### HAVERS REPRESENTATIVES ABROAD.

Two Foreign Missions Now Under Way to Perfect Distribution of Product.

Travelling in the interest of the Havers Motor Car Company, Port Huron, Mich., Edgar A. Wilhelmi of New York City, sailed for England a short time ago, taking with him a Havers 6-60 car. After visiting England, Germany and France, Mr. Wilhelmi will sail for India and he has prospects of establishing several very desirable connections for the Havers company in each of these countries. His entire trip will keep him abroad about eight months.

While he is making the European tour one of

Easily Constructed and Fitted Fibre Disc for Retaining Timer Wires and Identifying Leads.

Mr. Wilhelmi's representatives will be in South America with the same make of car to establish agencies in that country.

## RECENTLY ANNOUNCED 1914 MODELS.

**A**N ENTIRELY new line, bearing the name of Jeffery, is the announcement made by the Thomas B. Jeffery Company, Kenosha, Wis., formerly maker of the Rambler and Cross Country models. Other new features among the latest statements from car makers include the Ohio line, to be produced by the Crescent Motor Company, Cincinnati, O., of which R. E. Northway, formerly of the Northway Motor Company, Detroit, is president, and the high powered Metropolis roadster from New York City, as follows:

**McFarlan**—McFarlan Motor Car Company, Connersville, Ind. Six-cylinder. Motor, T head, en bloc, four-inch bore, six-inch stroke. Mea magneto. Stromberg model G3 carburetor. Centrifugal water pump, electric generator and air pump on left side of motor. Multiple disc clutch. Three-speed selective transmission. Full float-

rear axle. U. S. L. electric system. Power tire pump. Four has wheelbase of 116 inches and tires, 34 by four inches; six has 128-inch wheelbase and tires, 36 by four. Four in roadster, five-passenger touring and sedan, also two-passenger coupelette. Six in five and six-passenger touring, sedan and limousine.

**Mitchell**—Mitchell-Lewis Motor Company, Racine, Wis. Three chassis, two sixes and a four. T head motor. Four and larger six have 4.25-inch bore and seven-inch stroke, while smaller six has same bore and six-inch stroke. Remy ignition. Full floating rear axle. Seven-eighths elliptic springs. Left hand drive, centre control. Additional equipment. Four in two, four and five-passenger bodies; little six in the same and a seven-passenger big six, seven-passenger only.

**Metropol**—Metropol Motors Company, 1926 Broadway, New York City. Roadster. New. Motor, four-cylinder, four-cycle, water-cooled, vertical, T head, cast en bloc, 4.25-inch bore, 7.875-inch stroke, said to develop 90 horsepower under brake test. Large valve diameter, 2.5 inches. Lubrication, combined force feed and splash. Three speed selective transmission. Semi-elliptic springs. Artillery wood wheels, fitted with 33 by four-inch tires on Stanweld rims. Wheelbase, 115 inches, tread 56.

**Ohio**—Crescent Motor Company, Cincinnati, O. Mod-

The Luverne Automobile Company's Big Brown Luverne Self-Starting Six.

ing rear axle. Underslung three-quarter elliptic rear springs. Left hand drive, centre control. Two-passenger roadster, seven-passenger touring, four-passenger coupe and seven-passenger limousine.

**Oakland**—Oakland Motor Car Company, Pontiac, Mich. Model 35 four-cylinder, model 43 four-cylinder and model 48 six-cylinder. Model 35 continued with changes largely in the nature of refinements in design and equipment. Model 43 retains the same general outward appearance of the old model 42. Larger motor, 4.25-inch bore and 5.25-inch stroke, instead of 4.125 by 4.75. Model 48 is new and is designated a little six. Motor, 3.5-inch bore and five-inch stroke, L head, cast en bloc; four main crankshaft bearings of ample size; double exhaust manifold, and inlet manifolds of special Oakland design. Delco combined ignition, lighting and starting system. Leather faced cone clutch. Three-speed selective transmission. New special control lever bolts to rear of gearbox. Semi-floating rear axle. New method of brake adjustment. Model 35 as touring car and roadster. Models 43 and 48 as touring car, cabriolet, coupe and sedan.

**Jeffery**—Thomas B. Jeffery Company, Kenosha, Wis. Formerly Rambler and Cross Country. New throughout. Two models, a four and a six. Motors the same dimensions, 3.75-inch bore, 5.25-inch stroke; L head, cast en bloc on the four and in pairs on the six. Rayfield carburetor. Bosch magneto. Inverted cone clutch, fitted with clutch brake. Four-speed gearset with centre control. Left hand drive. Floating annular ball bearing

Royal and 4-35. Former has a six-cylinder motor, four-inch bore and six-inch stroke, multiple disc clutch, four-speed transmission, full floating rear axle, left hand drive, centre control. Latter has four-cylinder motor, 4.25-inch bore and 4.75-inch stroke; multiple disc clutch, three-speed transmission, full floating rear axle, right hand drive, inside control. Both with five-passenger touring car bodies.

**Luverne**—Luverne Automobile Company, Luverne, Minn. The big brown Luverne, self-starting six. Motor rated at 50 horsepower; unit power plant. Bosch magneto. Rayfield carburetor. Multiple disc, dry plate clutch. Selective transmission. Full floating rear axle. Wheelbase 128 inches. Tires, 36 by 4.6 inches, on Bakelite demountable rims. Pneumatic starting system, four-cylinder air compressor also supplying air for tires. Double lighting system. Five and seven-passenger touring bodies.

**Dorris**—Dorris Motor Car Company, St. Louis, Mo. Model I. Five and seven-passenger touring car. Motor, four-cylinder, vertical, water-cooled, valve-in-the-head type, cast in pairs, 4.375-inch bore, five-inch stroke. Greater accessibility of camshaft gears, bearings and motor starter. Larger valve diameter, three inches instead of 2.25. Flechter carburetor. Bosch magneto. Westinghouse electric lighting and starting system. Special Dorris dry plate clutch has more plates. Larger tires, 26 by 4.5 inches, mounted on Stanweld rims. Left hand drive, centre control.

## ENGINEERS DISCUSS CYCLECAR DEMAND.

**D**EVOTING its entire time and attention for the evening to the subject of cyclecars, the Metropolitan Section, Society of Automobile Engineers, at its meeting in New York City, Oct. 29, discussed the possibilities and prospective developments in this newest branch of the industry in America. One or two of those present contended that the present low priced automobile and the motorcycle in their respective fields were all sufficient, and that there was not room between them for another type of self-propelled vehicle. It was the opinion of a majority of the speakers, however, that a distinct and very large demand for an intermediate type would develop as soon as suitable products were offered, but whether such machines would partake more of the automobile than the cycle features was a question that remained unsettled after several hours of debate, in which a large number of the 25 members and guests participated.

One of the points concerning which a difference of opinion arose was that of tread width. It was contended by two or three speakers that a vehicle of less than standard gauge cannot successfully negotiate American country highways, while others were equally insistent that the narrow tread is no bar to the service for which the cyclecar is properly suited. W. Irving Twombly, one of the several cyclecar makers present, held that while the narrow tread vehicle might prove unsuitable for touring, it was distinctly suitable for town and suburban work, where its width greatly facilitated progress through traffic. He explained that a cyclecar would be in proper proportion throughout, and borrowed a phrase from one of the papers of the evening when he said it should have the appearance of a true automobile viewed through the wrong end of a telescope. The application of bodies of streamline design he also urged as important.

#### Sounds Note of Caution.

Suggesting broadly that established makers of both small cars and motorcycles, who already have large factories and well knit sales organizations, would waste no time in turning to the cyclecar once its immediate profitability became apparent, Alden L. McMurtry, a consulting engineer, sounded a note of caution to those who may be inclined to rush into cyclecar manufacture prematurely. In a carefully prepared paper, he outlined the present commercial limitations under which the cyclecar builder must work, in part, as follows:

The cheapest motor vehicle is the motorcycle. Next to it is the cheap automobile. Most of you are aware of the characteristics of the cheap automobile, yet very few really know the modern high powered motorcycle.

The most fancied fault of the motorcycle is that it is uncomfortable. On the contrary, I was surprised at its easy riding qualities. It is true that you feel the bumps of the road, but not any more, and in most cases less, than when sitting in the rear seat of some small automobiles. The side or tilting motion of the automobile is entirely eliminated. It is possible with the motorcycle to pick the smoothest part of the road and therefore attain a higher rate of speed with more comfort than in the average small automobile.

#### The Situation Abroad.

The cylinder volume tax in some foreign countries was so heavy that the manufacturers designed cars fitted with small, high speed motors. These small cars were in most cases exact duplicates of the regular product, except on a much smaller scale. These cars proved that a small, high speed motor, with a four-speed transmission was the equal of the large, slow speed American motor with a two or three-speed transmission. It is a mistaken idea that these cars were designed solely to compete with the inexpensive American car, as some appeared on the highways abroad long before the so-called invasion of the American car.

After consideration of the motorcycle with the sidecar attachment and the miniature automobile, the following questions arise: Cannot a motorcycle be made with four wheels and arranged with a comfortable two-passenger body? Considering the design of the miniature car, is it necessary, when building a smaller car, to follow precisely accepted automobile engineering practise?

#### The Cost Consideration.

The questions would imply that the fundamental consideration was cost, since the scope of the motorcycle is to be enlarged, while that of the miniature car is restricted. Assuming that a two-passenger car containing all the essentials of the motorcycle, thereby avoiding apparently the expensive construction of the automobile, or a miniature car built on a lesser degree of refinement would answer the requirements. Manufacturers of such a car have named it a cyclecar. We have two types of cyclecar—the modified motorcycle and the small automobile.

If it is possible to build a cyclecar which embodies almost all the essential parts of the motorcycle, why are not the motorcycle builders making them? Why are so few interested?

The price of the modern motorcycle averages between \$250 and \$325, and when equipped with a sidecar between \$335 and \$400. If we take the price of a motorcycle as a basis of comparison, then a motorcycle type of cyclecar should reasonably cost over \$500. This is provided, however, the proposed cyclecar is built with the same sterling quality of workmanship and material which may be found in the modern motorcycle.

The characteristics of such a car in respect to speed, power and method of control would eliminate it from the cheap automobile class. In other words, the advantages of rapid acceleration, taking all hills on the high gear and possible overloading would be discarded in return for the presumably economical cost of upkeep with respect to fuel and tires. Substantiation of the foregoing is found in the fact that the so-called cheap price of the foreign cyclecar averages over \$600, and that the detail design and workmanship of the car is not to be compared with that of the foreign motorcycle.

#### Demand for Cyclecars.

We have in this country a car, the design of which afforded amazing manufacturing possibilities which have materialized. The success of this type of car is responsible in a great many respects for the cyclecar agitation. Almost 80 per cent. of the proposed American cyclecars are designed to compete, more or less, with this class of automobile, and as such could hardly be called cyclecars.

As the cyclecar is at present of considerable interest, it is natural to hear of a great demand for them. Has this demand been analyzed? Is it a question of what is wanted, or what can be supplied? Does the question of cost supersede mechanical construction? Does the de-

mand actually exist, or is it a question of many inquiries and few sales?

It is not my intention to appear pessimistic on the subject. However, the cyclecar has afforded questionable promoters a new excuse to organize manufacturing companies to build cyclecars at ridiculously low figures. Automobile engineers should discuss the cyclecar frankly and fearlessly in order that the public will know its limitations. Enthusiasm over the cyclecar should be limited to that which is supported only by fact.

### Manufacturing Economies Reviewed.

Joseph A. Anglada, chairman of the section, after outlining cyclecar limitations according to the European definition, briefly reviewed the manufacturing economies that the simple design of the vehicle renders possible. He said in part:

The present conventional design of a low priced American automobile comprises a pressed steel frame, a four or six-cylinder motor, a friction clutch of the cone, disc or band type, a sliding gear transmission giving two, three or four forward speeds, bevel gear or worm driven rear axle, semi-elliptic, platform or transverse rear spring. The selling price of cars designed along these conventional lines is somewhere in the neighborhood of \$1 a pound for a touring car and as low as 50 cents a pound for the later type of small runabout.

#### The Conventional Automobile.

The conventional car having these specifications contains somewhere in the neighborhood of 1000 detail parts, these not including specialties, such as starters, electric light equipment, windshield, top, etc., and such items as nuts, bolts, studs, washers and details of smaller character which are bought in stock from wholesale manufacturers. Of this large number of details there are some which are of duplicate design; that is, there are two or more parts of exactly similar form and materials, for instance, the pistons, connecting rods and bearings. Regarded in this way, the number is reduced to perhaps 400 dissimilar parts.

To manufacture these parts from raw materials requires bars of various sections and of different grades, and various castings of iron, bronze, aluminum and brass, in addition to forged and pressed and stamped parts. The proportion of these various forms of material may be taken roughly as: Castings 100, forgings 90, pressed and stamped parts about 20, and the remainder in the form of bar stock, tubing and sheet metal. If it is desired to produce such a conventional car in miniature, the number of individual parts cannot be diminished to any great extent, the main difference being in the amount or weight of material required for each part.

#### Establishing New Conventions.

A few years ago when a car to be sold for \$500 was first talked about, it was impossible to build a good car to sell at this price, because manufacturers of parts, such as axles, transmissions and engines, were not prepared to furnish parts suitable for these small cars. Since that time, however, manufacturers have begun to realize that there is a demand for a small car selling around \$500 and some of them are now prepared to furnish from stock the important units entering into the construction of such a car, and for this reason we may reasonably expect that the number of runabouts selling for about \$500 will increase.

On the other hand, simplification of design, that is, the development of a small machine and the establishment of new conventions in designs and specifications (considering that the present \$500 machine represents present day conventions) will make possible the economical manufacture and sale of small cars in accordance with the new conventions, and these small cars will probably be known as cyclecars.

#### Factors in Manufacturing Economy.

The total weight of the small car and the cyclecar can readily be brought within the European cyclecar definition, although, undoubtedly the simpler design of the cyclecar will result in less weight. Assuming, however, equal weight in the initial purchase of materials there is an important difference in the manufacturing cost of the two cars. The number of patterns is reduced. The number of dies, jigs, special tools, etc., with their attendant cost, is reduced, and with the smaller

number of parts in the cyclecar these parts will be simpler and more rugged in construction, with the resulting increase in bearing surface and a corresponding reduction in the cost of maintenance.

It is quite apparent that a reduction in the number of detail parts of dissimilar design has a direct bearing on the economy of the manufacturing department. In the first place, it lessens the expense of handling different materials and parts, and the clerical work attendant upon their receipt and inspection. In the purchase of fewer varieties of raw material and its transit through the various processes of manufacture and inspection, the cost is further reduced. The process of assembling the simpler cyclecar is also less expensive than that of the conventional small car, and likewise the expenditures for final testing, locating of faults and adjustments are also obviously reduced. Further, simplification of design is of vital importance to the owner. It lessens the amount of attention required to keep the car in first class condition and because of the greater ruggedness of the individual parts lessens the number of replacements.

Cyclecars and motorcycles were contrasted to the advantage of the former in a paper by Harry J. Stoops of the American Cyclecar Company, while the opposite view was expressed in a paper prepared by P. J. Bailey of the Consolidated Manufacturing Company. J. E. Merkel, a pioneer motorcycle designer, in a crisp and suggestive contribution, predicted a great future for the miniature car type, while a paper, prepared in behalf of W. S. Frazier & Co., expressed equal enthusiasm for a type embodying somewhat simpler forms.

Statistics drawn from British cyclecar practice, which were presented at the meeting, indicated a tendency to justify the designation of the new type by developing new characteristics bred of both cycle and automobile design.

### NEW HAYNES NAME PLATE.

#### Artistic Design Replaces Conventional Method of Displaying Maker's Trade Mark.

A handsome new name plate now adorns the radiators of the latest models of the Haynes car, made by the Haynes Automobile Company, Kokomo, Ind. It is three inches high and the same width and is reproduced in the national colors.

At the top the word Haynes stands out prominently in red against a background of white enamel. Then comes a reproduction of the first gasoline driven automobile invented and built by Elwood Haynes in 1893, which is embossed in aluminum in strong contrast with its background of blue enamel. Below is the company's slogan, "America's First Car", in red against a blue background.

The new plate itself is decidedly distinctive as well as attractive and is held by the company to be a decided improvement over the previous method of displaying the Haynes name on the radiators.

## TO BUILD CARTER PISTON VALVE MOTOR.

**A**LTHOUGH it was generally known that the Model Gas Engine Works, Peru, Ind., was developing a new piston valve type of motor, definite details were not announced until recently and until the company was ready to demonstrate the design to engineers. The first type to be marketed is a unit power plant along the general lines of the standard Model units, a four-cylinder motor having a 3.75-inch bore and 5.75-inch stroke. It will be produced at the Peru factory, but it is the intention of the company to build it in the new plant now under construction at Pittsburg, Penn.

The Model Gas Engine Works secured control of the patents to the Carter piston valve motor about a year ago and up to the present 14 claims have been allowed. While the new motor follows conventional practise in many respects, it possesses many original features and also combines principles indorsed by sound engineering practise. Among the points emphasized by the maker are a quicker valve opening than with other types, absence of noise, less vibration, 20 per cent. greater economy, 20 to 30 per cent. higher piston speed, 20 to 25 per cent. more power for piston displacements, less heat passed off through the water jackets, non-carbonizing valves, components not exposed, and a more serviceable and enduring motor under all requirements of service.

As will be noted by an accompanying drawing the cylinder bores are made much longer than required by the piston stroke and compression space, and the piston valves fit into this extension of the bore, being of the same diameter as the power pistons. Inlet and exhaust ports are provided in the walls, approximately one-third of the distance from the top, the ports being adjacent with the inlet above. The piston valve replaces the usual cylinder head, and by its movements alternately uncovers the ports.

The valve piston is fitted with three compres-

sion rings, but on its extension at the bottom are provided two expanding rings, A A, these closing the intake port C and exhaust port D, and replacing the conventional poppet valves. The valve pistons have the usual wristpin, and large rollers are mounted on the piston pin. The pistons extend upward, having a double bridge across the top of each. The camshaft extends across the top of the motor, the cylinders and valve pistons being slotted to receive these components. There are three cams for each cylinder, the central member F coming into contact with the roller H, while the two side cams are duplicates, and are so formed that when the roller follows the central cam the bridge will always be in contact with the side cams E E. These cams are so

Features of Carter Motor: At Left, End View, Showing Silent Chain Drive of Camshaft, Water Pump, Magneto and Drive of Motor-Generator; at Right, Exhaust Side.

ground that each movement of the piston valve corresponds to that of the poppet valve. The movement of the piston valve, is, therefore, positive in each direction. The intake and exhaust ports extend entirely around the cylinder, with the exception of a small space for the split of the expansion rings.

The operation of the mechanism is shown in accompanying illustrations, the piston valve being shown at the top of its travel and with the exhaust port open. In carrying out the four strokes of the cycle, the cam F moves the valve down until the intake port C is uncovered, the exhaust port being covered at the same time. When the valve is opening, the position of the point K on the valve is indicated at L on the cylinder wall. On the suction stroke the vacuum

is sufficient to draw the upper piston after it to its desired position, the cam serving as a stop or a timing of the movements of the mechanism.

**Intake Side of Carter Motor, Showing Method of Retaining Motor Starter.**

At the completion of the intake stroke and at the beginning of the compression, the valve moves upward but .25 inch, so that the rings A A assume the positions indicated by the dotted lines. During this stroke the valve remains stationary, both ports are sealed and upward movement of the valve is prevented by the contour of the cam F. Near the end of the working stroke the valve moves upward .25 inch, uncovering the exhaust port. It will be noticed that at no time does the travel of the valve exceed .25 inch and that the total is but .5 inch in the two revolutions of the cycle.

It is stated that near the end of the working stroke the pressure on the upper piston is sufficient not only to raise it for opening the exhaust without the assistance of the cams, but to exert enough energy to materially relieve the camshaft driving mechanism. On a six-cylinder motor this energy, it is stated, is sufficient to actuate the camshaft so that the driving mechanism merely synchronizes the timing.

The maker compares this engine with a poppet valve motor of the same bore and stroke, having 1.75-inch valves with .375-inch lift. The following figures are taken from its statement: The piston valves must move .09375 inch, or equal to 98 degrees,

on the flywheel before the port begins open. From the beginning to the full opening of the valve requires 62 degrees more, as compared with 102 degrees in a well designed poppet valve motor. At 23 degrees (.03125 inch lift) the poppet valve lift would be .17 square inch, while that of the piston would be 1.10 square inches. At 34 degrees (.0625 inch lift) the poppet valve would give .34 inch opening and the piston valve 1.43; 40 degrees, or .09375 inch lift of the poppet valve, gives openings of .51 and 1.53 respectively, and 58 degrees, corresponding to half the lift of the poppet valve (.375 inch), gives openings of 1.03 and 1.70 inches. The total area of the piston valve is 1.75 inches, as compared with 2.06 inches for the poppet valve. By the above it will be seen that the last item shows the poppet valve one-half opening with one-half the area of the valve, while the piston valve opening is within .05 of full opening. The number of degrees on balance wheels required to open the poppet valve .03125 inch gives the piston valve opening approximately 6.5 times the area.

Accompanying illustrations show that the overhead camshaft is driven by silent chains through an idler sprocket, this construction permitting the use of a small sprocket at the top, also serving to bring the upper chain close to the cylinder. A nearly horizontal chain drives the water pump, while another silent chain drives the magneto from the magneto and pump shaft. All chains are enclosed in the front of the motor and are very accessible.

The motor starter-generator is located on the right hand side of the power plant, the starter

**Sectional Views of Carter Motor, Illustrating Piston Valve, Cams and Actuating Mechanism.**

driving through a single worm and reduction gear, located transversely. It is clamped into a bored seat in the crankcase casting on the right.

## IN THE COMMERCIAL VEHICLE FIELD.

### Commerce Wagon to Make Novel Trip Around the World—Kelly Truck Fitted with Dumping Body—Republic Model—Lippard-Stewart with Worm Drive.

**J**OSEPH D. Wilkinson, with the Smythfield Export Company, 1216 Arch street, Philadelphia, has outlined a novel trip around the world, in which the 1000-pound Commerce truck, made by the Commerce Motor Car Company, Detroit, will play an important part. The selection of this make of vehicle was with the view of presenting a light delivery wagon which should meet with a ready sale in every section of the world, and it is expected that the arrangement will result in the ultimate shipment of 250 of these trucks to points which will be specified later.

Ten men will sail from San Francisco for Sydney, Australia, Dec. 12, and they will be gone at least two years. These 10 men will represent the export company, and Mr. Wilkinson will be one of them. Each will have charge of a separate commercial line, and the truck will be requisitioned to transport the other lines overland through the various countries visited. It is reported that the expenses of the party have been estimated at close to \$375,000.

One trip that is to be made will be from Singapore to Upper Laspur, in the Straits Settlements, and it is here that Mr. Wilkinson believes he will make his largest commercial car deal, since it is more or less well known that planters and traders in that section are anxiously awaiting the arrival of a motor vehicle which will be able to undertake the successful transportation of rubber, etc.

#### KELLY DUMPING BODY.

#### Interesting Equipment That Is Now Fitted on Three-Ton Truck Chassis.

The Kelly-Springfield Motor Truck Company, Springfield, O., is fitting its three-ton truck chassis with a power dumping mechanism that is

designed to be operated in such manner that one man can handle the machine and unload it with minimum loss of time. The hoist is the product of the Wood Hydraulic Hoist Company, St. Paul, Minn., and is operated by pumping oil into and out of an upright cylinder carried in the centre of the chassis frame behind the driver's seat. The body fittings and the power transmission by which the hoist is driven are the products of the Kelly company's engineers.

The hoist itself consists of a long steel cylinder on a base bolted to the chassis frame, and in this is a long trunk piston fitted with two rings. The piston carries a rod two inches in diameter, that extends through the upper or head plate of the cylinder, and to this is attached a cross arm on which two steel grooved pulleys are mounted. The forward ends of the two lengths of steel

wire cable are attached to an equalizer, which insures equal strain on each cable, and the rear ends are fastened to the lifting arms attached to the steel body.

At the base of the cylinder is fitted a gear driven pump, which is operated by chains and sprockets

from an extension to the countershaft of the transmission gearset. The speed of the pump is three times that of the chassis motor, the power of which is utilized in lifting the body. The driver disengages the clutch, as though he were about to shift the speed changing lever, and when the countershaft of the gearset has been brought to a standstill, a lever at his right is moved and the power connection is made. The engagement of the gear carried on the extension of the gearset countershaft is locked in the same manner as with the conventional gearset, by spring plungers.

Because of the positive lock, the driver can leave his seat with the hoist in operation. After the hoist has been started he may walk back to open the tail gate, and return to the seat at the right side of the truck, where there is a hand lever

New Kelly Power Dumping Body at Its Extreme Elevation.

Valve Side of Continental Motor Used in New Republic Delivery Wagon.

which controls the action of the hoist. By pushing this lever from him the body will lift, and by pulling it toward him the body is lowered. When in a vertical position the hoist is in neutral. When the body has been lowered, the driver can seat himself, disengage the clutch, pull the hoist lever into neutral and start the truck.

### REPUBLIC DELIVERY WAGON.

Standardized Production of the Alma Motor Truck Company, Alma, Mich.

The Republic delivery wagon, rated at 1500-2000 pounds capacity, is specialized by the Alma Motor Truck Company, Alma, Mich., but one type of chassis being produced. The machine is designed from standard productions of manufacturers who specialize in the building of motor vehicle parts, and it is maintained that the workmanship and materials have proven decidedly satisfactory from every viewpoint. It is further claimed by the maker that all of the units are from 50 to 100 per cent. over-size, and that some of them are to be found in vehicles that have twice the rated capacity of the Republic.

The motor is a Continental, four-cylinder, water-cooled, L head type, with the

cylinders cast en bloc. The bore is 3.75 inches and the stroke 5.25, giving a conservative rating of 25 horsepower. Lubrication is by combination force feed and splash, the oil being filtered as it is drawn from a reservoir in the base of the crankcase. Ignition is by Eisemann high-tension magneto, mounted on a bracket at the right side of the motor, and the spark is fixed. The carburetor is a standard float feed, automatic type. The engine is suspended in a sub-frame at four points, and the radiator is carried on trunnions that are mounted in supporting cylinders between helical springs.

The clutch is a Hartford leather faced cone of large diameter. The Covert sliding gear transmission affords three forward speeds and reverse. This is incorporated with the jackshaft, the latter being made by the Russell Motor Axle Company. Two universal joints are employed between the clutch and transmission gearset. Final drive is by detachable link chains.

The chassis frame is of large steel channel section, strongly built and with ample reinforcement. This is suspended on semi-elliptic springs. The axles are steel drop forgings. Wheels are of the artillery type, shod with 34 by 3.5-inch tires in front and 34 by four-inch tires in the rear. The service brake is of the contracting band type and operates on 10-inch drums on the ends of the jackshaft, while the emergency members are of the internal expanding type, operating within 14-inch drums on the rear wheels. The wheelbase is 116 inches, with option of 124 inches.

### ANOTHER WORM DRIVEN MODEL.

Lippard-Stewart Motor Car Company Announces a New 3000-Pound Chassis.

The list of American motor truck manufacturers producing worm driven chassis is still fur-

General View of Republic Chassis with Rated Capacity of 1500-2000 Pounds.

Rear Axle Construction on Lippard-Stewart Worm Driven Model.

ther increased by the announcement of a 3000-pound truck of this type by the Lippard-Stewart Motor Car Company, Buffalo, N. Y. Heretofore, this concern has specialized in the production of a 1500-pound delivery wagon chassis, to which have been fitted six standard types of bodies, and this will be continued. In general characteristics, aside from the rear axle construction, the two models are essentially the same.

The Continental motor is a four-cylinder, water-cooled, L head type with bore of 4.125 inches and stroke of 5.5, and with cylinders cast en bloc. The clutch is a pressed steel cone faced with leather, beneath which springs are installed to insure ease of engagement. The transmission is selective, affording three forward speeds and reverse. The main driving shaft is in two sections, the rear end of the forward half being carried on a self-adjusting ball bearing mounted on a frame cross member, this construction eliminating side pressure, and when the chassis is loaded the driving shaft is practically in a straight line. There are three universal joints, one back of the gear-set and one at each end of the rear section of the driving shaft.

The rear axle is the Timken-Brown full floating type, the housing being in three sections. The centre section contains the differential and the worm shaft and wheel, and to this the tubular sections are bolted. The housing is strongly ribbed and trussed. The worm shaft is steel and the worm wheel of bronze. Timken roller bearings are used throughout. Lubrication of the worm shaft is by

troughs in the housing, these carrying oil as it is distributed by the centrifugal movement of the wheel. By means of cleaning holes the worm, wheel and differential may be washed when necessary.

The front axle is an I section steel forging with a solid rectangular centre reinforcement. Both sets of brakes operate on the rear wheels. The wheel-base is either 145 or 158 inches, and bodies of 10 and 12 feet may be installed without overhang. The motor is mounted in front under a sloping hood, as with the smaller machine, and the driver is at the left. The company is prepared to supply this chassis with bodies of standard types.

### BELIEVES CONDITIONS GOOD.

#### President Kissel Predicts a Successful Year in the Automobile Industry.

Speaking of the automobile industry, George A. Kissel, president of the Kissel Motor Car Company, Hartford, Wis., in a recent interview, was very optimistic and predicted very successful results for the future. With reference to the condition of his own company, he said that business prospects were very bright and not only were domestic sales far in advance of any other year in its history, but everything pointed to a great increase in the foreign trade.

He said that contrary to the yearly custom the company found it imperative, on account of large business, to run to full capacity during the months of June and July, which proved to be a popular innovation, and allowed the company to deliver its 1914 models at an advanced date. Excepting the month of December, when it will be necessary to take the annual inventory, the Hartford and Milwaukee plants will be run to their full capacity during the entire 1914 season.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**M**OTOR driven air compressors are now considered standard equipment in the garage, repair shop and service station, the design vary-

**Parker Double-Cylinder Motor Driven Air Compressor.**

ing according to the service required. The Brunner Manufacturing Company, Utica, N. Y., is producing a number of different types, that shown in the accompanying illustration being adaptable to many varying classes of service. The complete outfit is self-retained and operates with so little vibration that it can be installed, if desired, without fastening to the floor.

The No. 42 Parker outfit, as it is termed, comprises, in addition to the motor, a double-cylinder vertical compressor with cylinders having a bore of 1.825 inches and stroke of 2.5. The guaranteed pressure with a standard motor is 130 pounds to the square inch, although the compressor can be fitted for higher pressures upon order.

Lubrication is by the splash system and the motor bearings are oiled by ring oilers on the shaft. The height is 16.5 inches and the floor space required is 18.5 by 11 inches. The net weight is 170 pounds; shipping weight, 200.

Energy is supplied by a .5 horsepower electric motor, and drive is by a cast iron spur gear and a rawhide pinion. The compressor is driven at a speed of 350 revolutions a minute, and has a capacity of 4480 cubic inches (2.5 cubic feet) of free air a minute. The outlet is tapped for a .25 inch iron pipe. The finish is gloss black enamel. The motor is a direct current machine or single-phase alternating current, 110 or 220 volts. Motors of any frequency on alternating current are supplied at an extra cost.

The outfit can be made automatic with an electric controller and any desired pressure can be maintained day or night without any other at-

tention than an occasional oiling. Two types of controllers are shown in an accompanying illustration, that at the left being designed for service with single or two-phase alternating current motors of two horsepower and less. The No. 91 is shown at the right and is similar to the other, but has a rheostat for all direct current motors and such alternating current motors as require starting resistance or a rheostat.

As previously stated these controllers maintain a constant air pressure at all times and are stated to be extremely accurate and reliable. They can be adjusted for operation on a wide variation of pressure, or set to start and stop the motor within a variation in the tank pressure of two to three pounds, if desired. The construction is simple, only two diaphragms being used, these presenting such a small portion of their area to the pressure that they are practically wear proof. The contact points are of the wiping variety, insuring a clean surface at all times, and eliminating sparking.

The Brunner Manufacturing Company is issuing a new catalogue illustrating and describing air compressors, which will be mailed free.

### FORD FELT WASHERS.

N. E. Booth, 644 Pacific street, Brooklyn, N. Y., maker of felt washers, gaskets and packings, is manufacturing a special felt gasket for insertion between the engine base and crankcase of

**Electric Controllers Utilized with Parker Air Compressor Outfits.**

model T Ford motors. The gasket comes in shape for immediate use and with all the bolt holes punched in it.

### HOYT FORD MAGNETO TESTER.

The Hoyt Electrical Instrument Works, Penacook, N. H., well known maker of current

testing devices, is manufacturing the Hoyt Ford magneto tester, shown in an accompanying illustration. As the name implies, it is designed to show the quality of the electricity generated by the flywheel magneto on model T Ford motors, and the dial of the instrument is calibrated. The meter is compact, being

Hoyt Ford Magneto Tester.

3.5 inches in diameter, and is constructed of the same high grade material and with the same careful workmanship for which the product of this concern is noted.

One of the most difficult troubles to locate with the Ford motor is the ignition, and many times weak magnets are the cause of the cylinders heating and lack of power. The Hoyt company conducted a series of tests with 100 cars, the experiments extending over a period of 12 months, and it was found that almost invariably a magneto which indicated below a certain point of the scale would not operate continuously without skipping, and that at another point, while operating without skipping, the gasoline consumption was higher.

For the purpose of simplifying the use of the Hoyt magneto tester these two points were indicated as "Poor" and "Medium". The lowest point of efficiency, that is, the point at which the motor would operate without skipping and with reasonable fuel consumption, was indicated on the scale as "Fair". A small percentage of cars tested showed as high as "Good", while a few tested "Extra". Very satisfactory results were obtained from motors testing between "Fair" and "Good", while rather indifferent results were obtained from those cars testing below "Medium".

The test is made easily. The device is provided with two cables, and either one may be utilized in connection to the magneto terminal. The remaining lead is grounded. The motor is started, operated as slowly as possible without skipping and the position of the needle of the tester noted. It should indicate "Poor" and "Fair" when the motor is raced for a minute. The

quality of the current at predetermined speeds is read easily on the dial, enabling the workman to tell at a glance the condition of the magneto. The Hoyt Ford magneto tester is moderately priced and should prove especially useful to Ford service stations and all repair shops catering to Ford owners.

### GENTER'S METALLIZED PAINT.

The J. H. Genter Company, Inc., Newburgh, N. Y., is marketing a metallized glass paint which is intended to withstand extreme high temperatures. It is stated that the three shades of copper will successfully survive a heat of 900 degrees Fahrenheit, and at the other end of the scale come black, brown and red, which, it is claimed, will remain unaffected under a heat of 2200 degrees.

### SURE CENTRE FINDER.

The West Haven Manufacturing Company, New Haven, Conn., is producing the Sure centre finder, a new lathe tool, shown in an accompanying illustration. It has a socket that fits on the 60-degree angle taper of centre in the tail stock of the lathe, and when held in that position and fed up to the work held and revolving in the chuck, it immediately locates the centre. The friction of the centre finder on the lathe centre is sufficient to hold for drilling and countersinking, enabling the workman to make the three operations without change or use of any other tool. The fingers need do little more than steady the tool. Each centre finder is sent out with a combination drill and countersink, which are stock sizes with many makers. The Nos. 0 and 1 have a short single-end drill and countersink about

West Haven Sure Centre Finder: A, the Finder; B, Method of Use.

half the length of the double-end ones on the market, for the sake of compactness, but the double-end ones may be used however.

## THE REPAIR SHOP AND GARAGE.

### Turning Up a Four-Throw Crankshaft in the Lathe by Means of Combination Lathe Dogs---How the Bearings Are Finished.

**I**N THE event of a broken crankshaft the usual method is to obtain a new one from the factory, but if the car is an old one and a new part

Fig. 1—Using Combination Lathe Dogs for Turning up Crankshaft.

cannot be secured it may be necessary to buy a drop forged crank in the rough and turn it up. Sometimes in the overhaul it is found that the crankpin is worn oval and will not yield to ordinary methods, and when such is the case a light cut is taken. The Strasburger Manufacturing Company, 326 Madison street, Chicago, is marketing combination lathe dogs, which are shown at Fig. 2, and these members are adjustable from two to six inches. They are designed for holding all kinds of crankshafts, such as utilized in automobile and marine engines, and other power plants, and can be employed wherever a common lathe dog can be used.

The design illustrated at C is adapted for turning heavy work, such as motor truck engine crankshafts, and is adjustable from two to eight inches. It is provided with a screw feed centre and gauge, and each type of dog is constructed of the best malleable iron with case hardened steel screws.

The company points out that the turning up of a crankshaft has always been accomplished under certain difficulties except in shops where they are made in large numbers, and where special machines are required. As crankshafts are now forged in nearly all sizes and forms, and may be procured at a reasonable cost in the rough, it is possible to turn these up in the lathe by the following process:

Assuming that a four-throw crankshaft is to be finished, although single and double ones are more common to the repairman: The first step is to centre the work, either by laying off and centring in the drill press or in the lathe with the use of a steady rest. The driving dog is fastened

at one end and the work placed between centres.

The bearings, front, centre and rear, are roughened down to within .03125 or .0625 inch of the finished size. The straight or tailless dog is then fastened on the other end and one-half of the stroke is measured from the centre of the crank to the centre hole in the adjustable screws, and the nuts securely tightened. The work is then placed between the adjustable centres and lined up parallel by running the lathe carriage back and forth.

The second and third pins should be roughened down to within .03125 or .0625 inch of the finished size. The dogs should now be loosened and the crank given half a turn, the first and fourth pins lined up parallel, and finished to exact size. After this is done the dogs are again loosened and the crank given half a turn back and lined up parallel to finish the second and third pins to exact size.

The four pins are now finished to size, so the straight dog and the counter-balance should be taken off, and the crank placed between centres. The centre bearing is then finished to size and the steady rest applied, while the front and rear bearings are being finished to size. Care should be taken not to have the tailstock centre too tight during the finishing cuts.

The large face plate should be used for this operation and a weight clamped to it for a counter-balance. If the crank should have a flange on one end, it may be chucked and a four-jaw chuck used instead of the face-plate, then only one dog will be necessary. If a heavy cut be de-

Fig. 2—A and B, Adjustable Combination Lathe Dogs; C, Design for Heavy Work.

sired or the tool should chatter, the steady rest can be used on one pin, while the other pin is being turned down.

## BAILEY ELECTRIC'S BOSTON-CHICAGO TRIP.

**D**ETAILS of the trip from Boston to Chicago, recently completed by Col. E. W. M. Bailey of S. R. Bailey & Co., Amesbury, Mass., in the Bailey electric roadster, No. 1313, indicates in no mistaken terms the availability of this type of vehicle for long distance driving. It will be remembered that this is the same car which Col. Bailey drove from Boston to Burlington, Vt., in order to attend the convention of the New England Section, National Electric Light Association, and return to Boston through New Hampshire, making a round trip of 566 miles. The car, like all Bailey cars, is equipped with the Edison storage battery, made by the Edison Storage Battery Company, Orange, N. J.

From Boston Col. Bailey drove through Worcester to Springfield, against a strong head wind. The run to New Haven, where a night stop was made by request, was at the rate of 23.5 miles an hour. The run to New York from New Haven was made on one charge, and averaged a little better than 20 miles an hour. The total distance, 239 miles, was covered in 11:08:00, running time, or at an average of 21.5 miles an hour.

At the conclusion of the stop in New York, for attendance upon the electrical exhibition, the weather conditions changed very materially. In spite of this and the heavy roads, the first day's run to Albany was made with a rather long boost at Poughkeepsie. The car was put on charge at Albany that night, or rather it was put in a garage with the intention of having it charged, but the next morning it was found that nothing had been done. It was transferred to the electric light company's plant, but as it was impossible to obtain a high rate of charge, practically a day was lost, only 18 miles being covered to Schenectady.

Oct. 21 the trip was continued up the Mohawk valley against a strong head wind, to Syracuse, with a boost at Utica. Wednesday, the weather was fair during the day, but light rain was experienced late in the afternoon. Buffalo was reached after dark. Partial charges were taken at Geneva and Rochester, and the average speed for the day figured out at 21 miles an hour.

At Buffalo, half a day was spent on special business. With the exception of the first 10 miles out of the city, the roads were very bad; mostly gravel, said to be very good in dry weather, but certainly not good under the influence of a week's rain. Erie was reached after a boost midway at Dunkirk. Friday morning it was raining harder

than ever. The start was made late on account of somewhat weak charging facilities, and the roads were the worst yet encountered. Several deep river bottoms were negotiated by means of steep descents and ascents through the clay banks. Ashtabula was reached too late to permit of securing the full charge required, though most generous service was rendered by the local service station manager. The charge had to be continued the next morning and the run to Cleveland was made during the afternoon.

In Cleveland a stop was made over Sunday for rest and to secure road information. This was not encouraging, as Col. Bailey was informed of one stretch in which a good gasoline car had been able to make but 40 miles in nine hours. Nevertheless, a run of 61 miles to Norwalk, O., was made over this route, and after a boost, a short evening run brought the electric to Fremont, still in the rain.

Tuesday, the run to Toledo was over good,

### DAILY RECORD OF THE TRIP.

| Oct.    | Boston to        | Miles | Boosts at          |
|---------|------------------|-------|--------------------|
| 14..... | New Haven, Conn. | 161.0 | Springfield, Mass. |
| 15..... | New York City    | 78.0  | none               |
| 19..... | Albany, N. Y.    | 150.3 | Poughkeepsie       |
| 20..... | Schenectady      | 18.0  | none               |
| 21..... | Syracuse         | 129.8 | Utica              |
| 22..... | Buffalo          | 173.5 | Geneva, Rochester  |
| 23..... | Erie, Penn.      | 104.3 | Dunkirk, N. Y.     |
| 24..... | Ashtabula, O.    | 45.0  | none               |
| 25..... | Cleveland, O.    | 59.6  | none               |
| 27..... | Fremont          | 85.0  | Norwalk            |

| 29..... | Kendalville      | 85.0  | Archbold           |
| 30..... | South Bend       | 60.2  | none               |
| 31..... | Chicago, Ill.    | 102.0 | Laporte, Ind.      |

but quite worn macadam. A fairly good charge was taken there. The macadam turned to clay and sand some 10 miles out of the city, and the night was spent at Wauseon. A boost was taken at Archbold and, over somewhat better roads in Indiana, Wednesday night found Col. Bailey in Kendalville, from which point he telegraphed that the worst appeared to be over. He was wrong, however, for Thursday morning the rain turned to snow, which again turned to rain. South Bend was reached quite early, but too late to charge and run through.

Friday, there was encountered, between South Bend and Laporte, nearly the heaviest road of the run, so a boost was taken at the latter point. The run to Chicago was then made over good road.

The trip was completed without accident to the car, or failure of any part. The machine was mired four times, but came out under its own power except in one instance.

# Better Service For New England

**New England Branch  
315 Dwight Street  
Springfield, - - - Mass.**

**IN CHARGE**

**C. A. VAN DOREN**

**New England District Mgr.**

We take pleasure in announcing the opening of a distributing branch at Springfield, Mass., which will enable us to give splendid service at all times to our New England friends. We will carry in stock a full assortment of Racycles, Hudson, Flying Merkel, Miami Bull Dog and Jobbing Bicycles—Musselman Automatic Coaster Brakes, Flying Merkel Motorcycles, and parts for the foregoing. A letter addressed to the factory or our branch will bring instant service.

## **The Miami Cycle & Manufacturing Co.**

\*Mechanical starter; †electric starter.

tise. New cams of smaller size are fitted, and the intake valve tappets are provided with cushion springs. The overhead rocker arms are heavier in design, and the lift rods are set in inverted sockets. Lubrication is automatic, controlled by throttle.

#### Electrically Equipped Indian.

At first glance, it would appear from the accompanying table that the Hendee Manufacturing Company, Springfield, Mass., had returned to the production of battery models, something which was dropped by the Indian maker a matter of two years ago. More extended study of the

situation reveals the fact that the battery model listed is really an advance step in motorcycle production. This machine, which is to be the leader during 1914, is termed an electrically equipped Indian, and will be known as the Hendee Special. The electric starter comprises a compact motor-generator mounted in about the same position as the Indian foot starter on the other models. The generator supplies current for charging the storage batteries, which in turn supply for ignition, starting the motor and running a headlight. Several changes are incorporated in the motor and frame, but space will not permit of an extended

description of the several models at this time.

#### Black Hawk.

There is practically no change in the single-cylinder Black Hawk, made by the Black Hawk Motor Company, Rock Island, Ill. The twin is new, and no details concerning it were made public previous to the opening of the show.

#### Harley-Davidson.

Changes in the line produced by the Harley-Davidson Motor Company, Milwaukee, Wis., include the following: Foot starter on all chain models, enclosed exhaust valve springs, priming cups and priming guns fitted, improved carburet-

or, adjustable compression relief rod, improved grip control, internal expanding band brake on chain models, contracting band brake on belt models, collapsible footboards, double clutch control, etc.

#### Dayton Models.

The Davis Sewing Machine Company, Dayton, O., presents its two twin Dayton models for the second season with a new three-stem spring fork, which is of the hinged type, the resilience being obtained by the use of leaf springs. The fork is designed to absorb both horizontal and vertical shocks. The line also is fitted with

a new band brake with double control, aluminum footboards and tubular luggage carrier.

#### **New Thor Twin.**

The Aurora Automatic Machinery Company, Aurora, Ill., is producing an entirely new Thor twin, while the changes in the other models are largely in the nature of minor refinements. The new Twin is distinctly a Thor product, however, but is fitted with a multiple disc clutch that differs somewhat from the others.

#### **Three Emblems.**

Although the table indicates that the Emblem Manufacturing Company, Angola, N. Y., is producing four models of the Emblem, this is explained by the fact that the single is fitted with either battery or magneto ignition, with a corresponding difference in price. The changes are

chine, with the pedal chain on the left, the advantage being in the placing of the clutch operating lever on the right. In other particulars the design corresponds with the twin.

#### **Henderson Four-Cylinder.**

The Henderson Motorcycle Company, Detroit, presents a new two-speed model, which is practically a duplicate of the regular model, save for the addition of a Thor two-speed gearset, which attaches to the rear axle. Mention already has been made of the hand cranking device.

#### **Minneapolis Models New.**

The Minneapolis line, produced by the Minneapolis Motor Company, Minneapolis, Minn., is new throughout. New motors of the firm's own design replace the De Luxe engines, and all models are fitted with the new kick starter. The features are the unit power plant with long stroke motor, two-speed gears on all models, multiple disc clutch operating in oil, double grip control, broad and strong mudguards.

#### **Schickel and Pope.**

There are few important changes in the Schickel line, made by the Schickel Motor Company, Stamford, Conn., which is characterized by the use of a two-cycle motor. Among the additions are: Spring mounted foot rests, hinged mudguards, a slight change in method of controlling the idler pulley on the belt driven machines, etc.

The Pope Manufacturing Company, Hartford, Conn., announces but few changes in the Pope for 1914. Practically no

changes are noted in the smaller models, but in the larger there are several minor refinements, included among which may be mentioned the following: Lighter pistons, frame strengthened by the use of fishtail reinforcements from the head, new exhaust pipe, oil tank narrower for chain clearance, and the addition of foot rests.

#### **Other Models Listed.**

The main features of all the models shown are presented in the accompanying table, and in addition to those to which special reference has been made above, the following makers are represented: Allied Motor Corporation, Chicago, A-M-C; Excelsior Motor Manufacturing & Supply Company, Chicago, Excelsior; Feilbach Mo-

Typical of the Individual Stands at the Chicago Show, with the Flying Merkel in the Foreground.

not numerous and consist mainly in the fitting of a new and heavier front spring fork, foot rests and a double brake control.

#### **Changes in Yale.**

The Consolidated Manufacturing Company, Toledo, O., presents a number of changes in the Yale, chief among which may be mentioned: New planetary countershaft two-speed gear, new exhaust valve springs, enclosed inlet valve mechanism and heavier frame.

#### **Iver Johnson.**

The chain driven Iver Johnson single, made by the Iver Johnson Arms & Cycle Works, Fitchburg, Mass., is new, but presents practically the same features as the other models of the line. The drive chain is on the right side of the ma-

tor Company, Milwaukee, Wis., Feilbach; Waverley Manufacturing Company, Jefferson, Wis., Jefferson.

#### The Show Itself.

Early reports from the show indicate that it was an even greater business success than the first display of this character held in the same city last February. Large delegations of dealers from all sections of the Middle West and Southwest began arriving two days before the show actually opened. Practically all of the manufacturers reserved presentation of their new lines until the doors were opened. As a result there followed a busy week for both manufacturers and dealers, and numerous contracts were signed. There seems little doubt that the separate motorcycle exhibition, conducted by the manufacturers themselves, is of distinctly greater benefit to the industry as a whole, insofar as Chicago is concerned, at least, than an attempt to reach the dealers and riders through a corner display in the annual automobile show.

#### Merkel in Militia Service.

Corp. H. B. Monninger, Company B, Indiana National Guard, demonstrated a new practical use for the Flying Merkel motorcycle, made by the Miami Cycle & Manufacturing Company, Middletown, O., when he received word at 3 in the morning, to round up his company to proceed at once to quell the recent strike rioting in Indianapolis. Corp. Monninger covered 62 miles in accomplishing his task and finished before 6 in the morning, in time to catch the first morning train. The machine utilized was a 1911 model, which has seen over 20,000 miles of continuous service.

#### Bosch at the Show.

A. H. Bartsch, advertising manager of the Bosch Magneto Company, New York City, writes from Chicago, that he counted the magneto equipment of the 139 motorcycles exhibited, and found that 70 per cent. were fitted with Bosch ignition, the balance being divided between three other makes. Of course, this is very gratifying to the company which he represents, and indicates the preference of the motorcycle manufacturers in this respect.

#### New Members for October.

Secretary-Treasurer G. B. Gibson of the Federation of American Motorcyclists reports 261 new members during the month of October, these being divided according to states, as follows: Ohio, 42; Indiana, 31; California, 22; New York, 21; Massachusetts, 19; Illinois, 16; Kansas, 15; South Dakota, 11; Rhode Island, nine; New Jersey, nine; Pennsylvania, nine; Oregon, nine;

Wisconsin, eight; Virginia, seven; Missouri, four; Iowa, four; Connecticut, three; New Hampshire, three; Texas, three; Michigan, three; West Virginia, three; Maryland, two; Georgia, two; Vermont, District of Columbia, South Carolina, Tennessee, Minnesota, Nebraska, one each.

#### Harley-Davidson Boston Branch.

W. J. Walker, manager of the New England branch of the Harley-Davidson Motor Company, Danvers, Mass., has sold his hardware business to Charles Orcutt and Stafford Hennigar, who will handle hardware and motorcycles, Mr. Hennigar taking care of the latter and Mr. Orcutt the former. Mr. Walker will devote his whole time to the interests of the Harley-Davidson Motor Company and is moving the branch to Boston, where wholesale and retail business offices will be opened in December at 74 Huntington avenue.

#### Big Day for Merkel.

Just by way of indicating that business is picking up at the factory of the Miami Cycle & Manufacturing Company, Middletown, O., F. L. Valiant reports that in one day recently orders were received for the following: Flying Merkel motorcycles, 451; Flying Merkel bicycles, 251; Racycles, 523; Hudsons, 102; jobbing bicycles, 1794; juvenile bicycles, 326; Miami carryalls, 17; Ramis, 239; Musselman coaster brakes, 1031; Miami Bull Dog bicycles, 37. This is said to be the biggest day in the Miami company's history, from the standpoint of number of orders received.

#### Club Notes, Here and There.

The Winsted Motorcycle Club, Winsted, Conn., has been formed and the following officers elected: President, Raymond D. Allen; vice president, James F. Ryan; secretary and treasurer, W. S. Fancher.

In the South Bend run of the South Shore Motorcycle Club, Chicago, Ill., seven of the riders finished with perfect scores.

The West Philadelphia Motorcycle Club, Philadelphia, Penn., organized in November, 1912, is to hold its first anniversary banquet this month.

The New York division of the Century Road Club Association will hold its annual reception and ball at the Plaza assembly rooms, New York City, Dec. 30.

The Twin City Motorcycle Club, Texarkana, Tex., has been formed and the following officers elected: President, Charles A. Hooks; secretary, William Watlington; captain, M. B. Chandler.

### JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

## WITH THE MANUFACTURER.

**The Harris Bros. Company**, Chicago, Ill., bid in at the receiver's sale the entire assets of the Cutting Motor Car Company, Jackson, Mich., for \$35,000. This includes property, merchandise and materials.

**The Emil Grossman Company**, maker of the Red Head spark plug, recently took possession of its new factory in building No. 20, Bush Terminal, Brooklyn, N. Y., which is shown herewith. The machinery heretofore installed in the New York and Detroit factories of the concern has been removed to this plant, in addition to new equipment of the most modern type, and the facilities for the production of Red Head spark plugs have been increased very materially in consequence.

**The Republic Rubber Company's** operatives, Youngstown, O., have elected five of their number to serve on the board of governors of the new club house which will be formally opened in December, as follows: Oscar Watkins, C. A. Miller, Daniel Evans, J. Delter and C. C. Porter. They will serve with three other members, to be appointed by President T. L. Robinson.

**The Pope-Hartford Company**, Boston, Mass., has taken the agency for the Maxwell cars, according to the announcement of Manager F. H. Lucas.

**The Bosch Magneto Company**, New York City, maker of the Bosch magneto, announces the appointment of new distributors as follows: Bertram Motor Supply Company, Salt Lake City, Utah; Schuman Carriage Company, Honolulu, T. H. The following are the new Bosch supply stations recently appointed: T. M. Caldwell, Amarillo, Tex.; Charles Arnholm, Barre, Vt.; A. R. Rettinghouse, Centalla, Ill.; Electric Service Company, Dallas, Tex.; Robert R. Ashwell, Hartford, Conn.; Bering Tire & Rubber Company, Houston, Tex.; Andrew Cowan & Co., Louisville, Ky.; Manley-Wilkins Company, Mt. Carmel, Ill.; Tire Trading Company, Newark, N. J.; J. M. Hubbard & Co., Norfolk, Va.; Tiffany Diamond garage, Poughkeepsie, N. Y.; H. G. Guenther, San Antonio, Tex.; Wyckoff-Cord Auto Company, Sioux City, Ia.; Child, Day & Churchill, Spokane, Wash.; Motor Shop, Trenton, N. J.; Tri-State Supply Company, White Plains, N. Y.; P. N. Montague garage, Winston-Salem, N. C.

**The Metz Company**, Waltham, Mass., maker of the Metz car, is to establish an athletic field for the employees of the plant, which will be equipped so that sports may be enjoyed throughout the entire year.

**The White Company**, Cleveland, O., is building an addition to its motor car paint shop and another, 240 by 30 feet, will be erected to the main building.

**The F. E. Lorts Company**, Cleveland, O., maker of fore doors and coupe bodies, has opened a Chicago distributing branch at 1547 South Michigan avenue.

**The Golden West Motors Company**, Sacramento, Cal.,

**Red Head Spark Plug's New Home in Bush Terminal, Brooklyn, N. Y.**

ton, Del.; \$250,000; W. F. Young, Perklomen, Penn.; A. H. Yocum, Reading, Penn.; S. H. Kochel, East Greenville, Penn.; T. S. Doherty, Wilmington, Del.

**The Auto-Ped Company**, New York City; \$1,000,000; to manufacture motor cars, trucks and boats; Joseph F. Curtin, Clarence E. Eaton.

**Williams Self-Starter Manufacturing Company**, Chicago, Ill.; \$5000; automobile parts.

**Woods Manufacturing Company**, Fairfield, Conn.; to manufacture automobile lamps.

**Grand Center Motor Car Company**, St. Joseph, Mo.; \$5000; W. J. Hendler, H. R. Lewis, Louis Seigel.

**Albertson Company of Philadelphia**, Dover, Del.; \$25,000; automobiles, etc.; George H. B. Martin, Camden, N. J.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

12 Issues. \$2.00 the Year.

**Let Your Motor Do The Work**

The Pump that took the "Shun" out of Inflation.

It's a **pleasure** to inflate your tires without sweating, fuming and straining.

It's an **economy** to get the exact pressure you need to make your tires give maximum service.

It's a **convenience** to attach and detach your pump without a wrench. A twist of the wrist and a few seconds of time to attach the pump, one to four minutes with your

motor at low speed to get the right pressure. The gauge tells you when to stop.

**THE BROWN IMPULSE TIRE PUMP** for 1913 is the **only** tire pump that attaches and detaches without a wrench; the **only** one that includes hose, self-opening valve connection, high grade recording gauge and Quick Detachable Spark Plug as part of its regular equipment. Your 1913 equipment is not complete without it. It sells for \$15.00. Ask your dealer today. If he can't tell you all about it, send to us for descriptive literature.

## Compare the Stutz with any car made at any price

Everybody now insists on full car value for their money—and a *past* instead of a *future* record.

### Take your time in making a selection

No car built has anything on the Stutz for style and beauty, roominess, easy operation, freedom from trouble, low cost mileage, power and convenience.

And in addition there is an "invisible something" in the Stutz that has made it a consistent, persistent winner at the races and a continued joy to every Stutz owner.

So don't take snap judgment in buying your next car—give the Stutz the thorough examination it is entitled to receive on account of its *past* and *present* performance.

Write for our new illustrated catalog

No. A-5—Series E

DEALERS: We have a little desirable territory still open and will make a profitable contract with responsible dealers. Write or wire quick.

**An Electric Lighting System at Moderate Cost**

Throw away your old-fashioned oil lamps. You can now light your car economically with electricity. No need to install a dynamo or storage battery. Simply equip it with a set of

**JM MOBILITE LAMPS**

These lamps can be operated for one-third as much as standard equipment. They give a light of remarkable brilliance. Used for dash lights, tail lights and for illuminating speedometer and interior of car. Also for motor boats, camps, etc.  
 Made of vulcanized rubber fitted with a special Tungsten bulb mounted between a powerful lens and reflector. Operate on dry batteries. Easily and quickly installed. Price \$3.00 each. Shipped prepaid from our nearest branch if not at your dealer's.

"K No 00 Special Grade"

The transmission lubricant which has set a standard of lubrication never approached by any other.

Do not mix oil and grease in your transmission when you can get this lubricant of ideal consistency. It quiets and protects gears and perfectly lubricates the ball or roller bearings in the transmission. One filling suffices for thousands of miles.

Ask your dealer. Free Sample upon request.

# Lyons-Knight

"The Car of Silence"

## Just Three Reasons—

Here are three out of hundreds of reasons that are influencing dealers in securing the Lyons-Knight agency—

(1) The makers have one of the world's greatest automobile plants—are backed by unlimited capital and are leaving nothing undone to make this proposition a success.

(2) The car itself, with finest Knight motor, worm drive and many other distinctive features, offers the greatest of values at any price. The line also includes a smaller four-cylinder Knight car, a six-cylinder Knight car and commercial cars, meeting every class of trade.

(3) The dealer's proposition is by far the most liberal offered by any reliable manufacturer. It includes

substantial profits for every Lyons-Knight dealer.

Already many of the most important cities are taken by prominent and well-established dealers. They are without exception men of years of experience, who have quickly realized the opportunities of this great proposition.

Your territory will be closed just as soon as we find the right dealer. There are going to be good profits for the Lyons-Knight dealer right in your town. If you will write us for particulars we will gladly show you hundreds of other reasons why this is true.

*Ask for our Advance Catalog and  
"Proofs of the Lyons-Knight" today*

**Lyons-Atlas Company**  
INDIANAPOLIS INDIANA

## Lyons-Knight Features

*50 horsepower silent Knight engine—the finest power plant ever made.*

*Silent, smooth, efficient worm drive.*

*130-inch wheel base with 37x5-inch tires, non-skid in rear, on quick detachable, demountable rims.*

*Full floating rear axle, strong, flexible springs, ample brakes.*

*Left-hand drive, center control.*

*Extra complete equipment, with electric starting and lighting system, patent one-man top with drop side curtains and every other refinement.*

*Price—Five Passenger Touring Car—\$2900; Seven Passenger Touring Car—\$2980. Value—unequalled.*

## HAVOLINE OIL

For Perfect

Lubrication of

Automobile

And Marine

Gasoline Engines

This OIL is NOT AN EXPERIMENT, here today and gone tomorrow, but has for many years maintained the highest reputation as a scientifically prepared lubricant which is properly filtered, so that it burns clean, without leaving carbon deposits on plugs or cylinders.

The biggest engine manufacturers in the East and in the West recommend it; thousands use it on Touring and Racing Automobiles, and Working, Cruising and Racing Motor Boats, and all are pleased to find that

# The Miller Automobile Jack

The MILLER AUTOMOBILE JACK is a single acting, automatic-lowering jack, designed especially for automobile use and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. The MILLER JACK is constructed of the best material, no complicated or loose fitting parts to get out of order, and in material, workmanship and finish, the MILLER JACK is not exceeded, if indeed, it is equalled by any other jack. It is a high grade and one of the finest finished jacks on the market.

The short stroke makes lifting easy and rapid. Automatically locks while operating, thereby doing away with any possibility of slipping or dropping the load.

Fitted with a simple and convenient trip lever for reversing. Height, 11 inches. Raises 6 inches. Weight, 9 lbs. Capacity, 1 ton.

We guarantee this jack for 12 months, and at the price, it is the best value ever offered to the automobile trade.

We are in a position to quote a special price to manufacturers, jobbers and dealers who buy in quantities.

**CAPACITY: ONE TON.**

# Use Spark Plugs That Give Real Service

**B**OSCH PLUGS, in addition to being carefully constructed, in addition to being made from the finest of materials obtainable, have 6 special features which make them the better kind of spark plug—Just the plug you want.

**\$1.00 EACH**

is the selling price.  
Shipped from nearby distributors thus reducing shipping costs.

- 1** Crescent Electrodes minimize electrical resistance, affording the maximum spark, therefore maximum power at all speeds. An easy starting motor is always assured.
- 2** Undue wear of electrodes prevented, consequently long life at a vital point is certain.
- 3** Insulator is Steatite, a stone unaffected by intense heat, carbon or oil, and unbreakable by vibration or accident.
- 4** Massive and an exclusive gastight construction—assures full power at any pressure or any speed. Compression leaks are impossible.
- 5** BOSCH PLUGS are “excessively” durable; they last as long and serve as well as you expect a “Bosch Quality Product” will.
- 6** BOSCH PLUGS are as good as Bosch Magneto, you can have every confidence in them.

*Write for “Locating the Spark Plug”  
It's educational and will be sent you free.*

## It's here—a Moline-Knight—\$2400

*For the man who THINKS before he SPENDS*

Now comes the Moline-Knight—the car that makes possible a Knight motored car at a price every motorist can afford—\$2400, fully equipped. The Moline-Knight means instantaneous getaway—less consumption of fuel—more power—no carbon troubles—no valves to clog or grind—fewer parts, simpler parts, less to get out of order.

### The old poppet valve has now outlived its usefulness

The poppet valve served its purpose well in its day—but it has its limitations as any competent engineer will tell you. The manufacturers of motors have spent fortunes and years of labor in an effort to get rid of the poppet valve. The Knight motor solves the problem. Europe took the lead in getting rid of the poppet valve—and the result is such celebrated cars as the Mercedes, Daimler, Panhard and Minerva using the Knight motor.

### Moline-Knight backed by 23 years of successful manufacturing

Charles Y. Knight—the inventor and designer of the Knight sleeve valve type of motor granted a license to the Moline Automobile Company because along with their nine years successful experience as motor car producers they had an additional fourteen years as builders of gasoline engines.

No other organization in the entire motor car industry is better equipped with brains, experience, skilled workmen, modern machinery, systematized plant or financial responsibility to build the **supreme** Knight than the Moline Automobile Company.

### Poppet valve disadvantages

To get power and speed in the poppet valve engine, high compression, large valves, strong springs and precipitous cams are necessary. These large valves and their seats will often warp. They do not cool properly and the strong springs necessary to seat them at high speed soon weaken, or actually pound the head of the valve out of shape.

### Why the Moline-Knight is supreme over the poppet valve motor

The superiority of the Moline-Knight motor over any poppet valve lies in the fact that the sleeve valve system is not affected by high pressures. The explosion does not affect nor shock it at any point because the sleeve valve is balanced against lateral pressures. The sleeve valve motor combines the silence, economy and low compression of the small poppet

valve motor with the high compression, large valves, powerful springs and long cams of the racing poppet valve motor—consequently, the Moline-Knight motor—with none of the poppet valve disadvantages—has all the advantages of both types of poppet valve motors plus all the sleeve valve advantages.

# Moline-Knight

A big, roomy five passenger car with an electric starter that starts every time

Four-cylinder, five-passenger, 50 H. P. 128-inch wheelbase, Bosch Ignition, Wagner Electric Starting and Lighting, price \$2400. Wire Wheels Extra.

## The "Four" that makes the "Six" unnecessary

**Perfect streamline body** The streamline body of the Moline-Knight is graceful and smooth—the only genuine streamline body made in America. It is an extra large five-passenger body—with ample room for two extra seats for which it is ironed. It readily meets the need for either a five or seven-passenger car.

**As flexible and as powerful as any "six"** The Moline-Knight is equipped with the Wagner Electric Starting and Lighting System. The motor is a powerful four-cylinder 50 H. P. engine that is quieter, smoother running, more flexible and develops far more power than any six-cylinder poppet valve motor of near the same piston displacement, we have ever known.

**Enclosed, dust-proof** The unit power plant is entirely enclosed and protected against dust and dirt. It is carried on three point suspension. All operating and mechanical parts are quickly accessible—simply raise the hood, remove floor board and you have everything back to the universal joint in plain view.

If you believe you are entitled from your record to a contract for the Moline-Knight act at once. Right now there is a demand in your territory for the Moline-Knight—wire, use the phone or visit us at our factories. Get our "Advance Information Folder" immediately.

If you are a user and wish to know all about the wonderful new Moline-Knight—write us at once for our "Advance Information Folder."

light green striping, nickel  
and aluminum trimmings  
Mohair top and boot  
Clear vision windshield  
Stewart speedometer  
Electric horn  
Flush U doors with concealed  
hinges

**T**HE 1914 Overland is the greatest self-seller in the industry. Few conceived, imagined or hoped that any factory could turn out for 1914 such a wonderful car at such a low cost.

And there was but one way to give the increased Overland value with decreased Overland price. Build more cars than competitors.

The 1914 Overland production is 50,000 cars—more cars of this type than is built by any other factory in the world.

That is why the value is increased and the price decreased.

# Put the car on the scales before you buy it!

If you want to know how much weight electrical equipment has added to the 1914 car, before you buy it—

## Weigh It!

You're the one who will pay the tire bill, the fuel bills, the repair bills—***Weigh it!***

See that all the car's belongings are under the seats, water in the radiator and gasoline in the tank and then—***Weigh it!***

You don't have to take anyone's word for its weight—***Weigh it!***

If you want to know why the new car is sluggish, feeble on the hills, sudden death to tires and thirsty for gasoline—***Weigh it!***

Then compare the weight with a 1910 or 1911 model of the same car.

Electrical equipment adds a dead weight of 150 to 250 pounds and in addition (by actual tests) consumes 8% to 12% of the engine power.

This calls for larger engine, heavier frames, axles, springs, tires—added weight all the way through.

Either you'll find this or you'll find something worse—for if the manufacturer has not enlarged the engine and other parts to carry excess weight, the result is a weak, under-powered, overloaded car.

## If you want a real automobile

Full powered, simple, easier on tires, less troublesome, less expensive in every way—see that it is Prest-O-Lited.

Even if the car was designed to carry electrical equipment, the removal of the electric apparatus and the substitution of Prest-O-Lite will make a decided reduction in the weight, stop the power loss, and increase the safety, reliability and economy

If you want to know why—send for this book.

It shows why electric lighting costs five times more than Prest-O-Lite—how you risk the safety of yourself and family by an unreliable lighting system

It tells why thousands of motorists are keeping their old cars and refusing to buy the new ones with electric equipment.

**The Prest-O-Lite Company, Inc.,** 226 Speedway, Indianapolis, Ind.

(Contributor to Lincoln Highway)

Prest-O-Lite can be lit, dimmed and extinguished from the driver's seat. It is the natural solution of your lighting troubles.

EXCHANGE AGENCIES EVERYWHERE.

Please send full information on ALL lighting systems to

When Writing to Advertisers, Please Mention The Automobile Journal.

## So Much Depends Upon the Starting-Lighting System

Have you ever considered that the actual performance of any modern car depends upon the ability of the starting-lighting system?

If the starting device will not crank the engine under all weather conditions, if it is not efficient, reliable, and consistent in operation—the actual value of your car is reduced at least one-half.

If the lighting dynamo does not offer every convenience, if it does not provide maximum illumination—no matter how you operate your car or when—the conveniences you are entitled to are not available.

When purchasing an automobile, bear in mind the well-known efficiency of the

## Gray & Davis Starting-Lighting System

In this system you obtain great power—power sufficient to meet every cranking requirement. You have at your disposal maximum illumination. You are not restricted by conditions and you have the satisfaction and assurance of operating a time-tried and service-tested system which has successfully met the public demand for starting-lighting efficiency.

An inspection of the many cars carrying this equipment is invited. Cars ranging in price from \$1075 to \$7000 are so equipped.

# EMPIRE

*"The Little Aristocrat"*

Completely Equipped

## Now \$900

New Series Model 31 Empire, for the Season of 1914

*A larger, more beautiful car with every luxury and equipment*

Basic principles of design and construction unchanged; severest tests and hundreds of thousands of miles prove them right. *But a score of refinements and improvements* are incorporated in the new series Model "31" EMPIRE for 1914 that make it still a better car than last season's EMPIRE, and it sells for less.

*Quadrupled output and quantity buying enable us to add to the beauty, size and value of the car and yet to reduce the price by fifty dollars—the biggest value yet offered to dealers and automobile buyers.*

Dealers, there remains some open territory. Our broad, liberal sales plan offers a rare opportunity for a permanent connection. Tomorrow may be too late to secure territory.

# Cut This Out and Save It

Paste it on tin or card-board and hang it in your garage.

## WHERE TO USE

### Dixon's Graphite Automobile Lubricants

**TRANSMISSION.** Use No. 677 for all transmissions that use grease. Use No. 675 for all transmissions that are intended for oil lubrication. Use No. 688 only in gears that are noisy or in housings that leak. Must be thinned at least 50% with No. 677.

**DIFFERENTIAL.** Use No. 677 in all differentials with shaft drive, also in chain driven cars that use grease in the differential. Use No. 675 in the differential of chain driven cars that are intended for oil lubrication. Use No. 688 for noisy gears and leaky housings. Must be thinned at least 50% with No. 677.

**TIMING GEARS.** If there is no connection with crank case, use No. 677; otherwise use oil with a little Motor Graphite added. If grease can be used and gears are noisy, use 50% No. 677 and 50% 688.

**UNIVERSAL JOINTS.** Use No. 676 or Cup Grease No. 5. Will not throw out.

**PUMP CUPS.** Use No. 676. Will not melt and run into the radiator.

**OVERHEAD VALVE CUPS.** Use No. 676. Is not affected by the heat.

**THRUST COLLARS.** Use No. 676. Is not affected by heat.

**CUPS elsewhere than on engine.** Use Cup Grease No. 3 in Winter. Use Cup Grease No. 5 in Summer. In warm climates use No. 5 all the time.

**WHEEL SPINDLES.** Use Graphitoleo, but Cup Grease No. 3 or No. 5 may be used if Graphitoleo is not obtainable.

**ENGINE.** Use Motor Graphite in splash systems only. Add an even tea-spoonful of Motor Graphite to each quart of oil contained in the crank case. Add another tea-spoonful of Motor Graphite to each third quart of oil put in crank case thereafter.

**CHAINS.** Use Motor Chain Compound. Clean the chain—melt the brick of Motor Chain Compound—boil the chain in the Compound for 20 minutes or  $\frac{1}{2}$  hour—let chain cool. You then have on every pin in the chain a graphite bushing that will not squeeze out—the outside of the chain is well lubricated, but is dry and hard, and will not pick up grit.

# Kemco

## Fan Type Electric Generator      Built on Scientific Principles

**The Kemco is a Generator and Fan Combined**—One that can be installed in an hour without tearing down the car. Waterproof and dustproof. Can be put on any make of car at less cost than other generators. Your old fan comes out. A **Kemco** generator, with fan attached, goes in its place. The **Kemco** generator weighs only 4 pounds more than the standard fan. It charges batteries and gives ample current for electric lights.

**The Kemco Is Easily Installed**—No place to attach a generator has kept thousands of car owners from enjoying the convenience of electric lighting, starting, etc.

In some cars every moving part is covered by housing; making it impossible to attach a generator in place of the ordinary type.

The **Kemco** is installed in the one practical location—"just the place for a generator."

In connection with its cooling features a dependable source of current supply is furnished.

Power which operates the fan does double duty, and charging current is obtained at little or no cost.

Installation requires no changes in the car—you simply substitute a **Kemco** fan-type generator in place of the fan you are now using.

On many cars the **Kemco** can be installed upon the original fan supports, but when any additional fittings or a bracket are necessary, we can furnish them.

**The Kemco Is Inexpensive and Easily Attached to Any Make of Car**—It does not carry with it a big bill for labor of installing. Your car is not "tied up" to make the change. First cost means all the cost. A **Kemco** adds more than its cost to the value of a car. A car equipped with **Kemco** and storage battery can have lights whether running or standing.

**What the Kemco Does**—It furnishes current for charging your battery—ample to operate any combination of lights, an electric starter, gear-shaft, horn, ignition or other electrical devices. It is admirably suited for battery charging, because it gives an ample supply with no danger of overcharging at high speeds.

**Kemco Equipment and Guarantee**—Few parts and no complications, electrical or mechanical, make the **Kemco** especially suitable for automobile service. We furnish the following material for equipping the average car: **Kemco** fan-type generator complete. Automatic cutout and ampere meter. Fan-bracket when required. Every generator is thoroughly tested, and all **Kemco** products are guaranteed against electrical or mechanical defects for one year.

**The Kemco Electrically**—The armature is ring-shaped and rotates outside the fields. This construction produces rapid radiation of any heat through the fan blades and outside casing.

The practical result is high current output and a compact, strong machine of light weight.

The **Kemco** generates its normal output at low and medium speeds—at high speed the output rapidly decreases. This regulation is accomplished by the generator's construction, making the **Kemco** ideal for battery charging.

The **Kemco** is the only generator, the output of which is not affected by heat conditions.

**The Kemco Mechanically**—Every part of the generator is strong and substantial. Brush construction provides more contact surface than is found in any automobile generator, and gives brushes an average life of 50,000 miles running.

Accessibility is a most important quality. The entire fan and generator can be dismounted in 10 minutes. No changes in the fan-belt are required.

**Kemco Representatives Wanted in All Centres**—Ours is a money-making proposition. Write today.

# THE KEMCO ELECTRIC MFG. CO.

## PUBLISHER'S COMMENT.

The Fourteenth Annual Automobile Show will be held in the Grand Central Palace, New York City, under the auspices of the Automobile Chamber of Commerce, Jan. 3-10. There are only two national exhibitions held each year by the manufacturers of pleasure cars and their accessories. The importance of the East as a market for motor vehicles is indicated by the fact that the industry awaits the opportunity afforded by the annual New York display to reveal the new features in the various lines. The issue of The Automobile Journal for Dec. 25 will be known as the advance New York Show Number and will be replete with information concerning what may be seen at that exhibition. The issue for Jan. 10 will be the Review Number, in which special reference will be made to the new cars and accessories shown for the first time. The two numbers combined will constitute a buyer's reference and guide for the 1914 season. Make certain that you do not miss them by entering your subscription at once. Order direct, or through your news dealer.

**Make Your Motoring Friends Happy** with a Christmas gift that will last all the year. The Automobile Journal is an owner's magazine, and as such, every issue is filled with exactly the information that the automobile owner is seeking. A year's subscription costs but \$1, and with each order received to be filed as a Christmas present we will forward a neatly prepared gift card, fittingly inscribed with the donor's name, to reach the recipient Christmas morning.

**Our Series of Mechanical Handbooks** would be particularly appreciated by any young man who is desirous of familiarizing himself with the mechanical details of motoring. They are written in an interesting, non-technical manner, and fully illustrated, so that the novice is able to understand the facts presented. The price for the set of 10 books is \$3.75, or with a year's subscription to The Automobile Journal, \$4.75.

**The Buyers' Guide on Pages 103-112**, contains the names and addresses of reliable concerns engaged in the manufacture and sale of pleasure and commercial cars, and their accessories, supplies and fittings. Always consult it when in need of anything new.

# For Purchasers of Motor Cars— and for Dealers—Here are Certain Economic Facts of Vital Interest and Importance.

**IT** is quite generally known that the Paige Car is a car of extra value for the money.

Many men—thousands of them doubtless—who **realize** this is so, do not understand **how** it can be so.

Many who admit that the Paige **seems** to be the greatest car in the world at its price are skeptical because they don't see **how** the Paige Company can possibly have such advantages over competing manufacturers as to **permit** the production of so much better cars.

So here, then, is a simple, brief statement of five fundamental facts which tell you why this **can be and is so**.

**FIRST FACT**—Small capitalization. Only \$250,000. And the Paige Company seeks nothing more than moderate dividends on this small capitalization. Every dollar earned above these moderate dividends *goes back into the car*. You can prove this yourself. Compare the 1914 Paige with the 1913 Paige. Compare the 1913 model with the 1912. The proof is clear.

**SECOND FACT**—No preferred stock and no "water." The Paige Company's capital is all *genuine*. No "patents, good will and valuable trade names" to pay dividends on. The stock is all *common* stock. No deferred dividends accumulating if it does not seem advisable to pay dividends.

**THIRD FACT**—Not a dollar's worth of bonded indebtedness to add a 6 per cent or 7 per cent load that the *car purchaser* must pay. The Paige Company carries *no* financial load. It is *financially free and independent*.

**FOURTH FACT**—Our investigations show that we operate at the *lowest "overhead" expense*. How? By simplicity and economy in management. By good old-fashioned Hard Work. No branches. Absolutely mod-

ern factory equipment. Our great new factory is the very last word in automobile plants.

**FIFTH FACT**—By sufficiently large production—13,500 cars for 1914—coupled with financial strength and highest credit, to earn lowest prices on all materials and parts, and to *command* the best.

The famous Paige "36" for 1914 is even *further* ahead of its competitors than the "36" of a year ago was.

## Features of Design, Construction and Equipment

A really big, roomy car; 116-inch wheel base; left side drive and center control; powerful, quiet, long stroke 4x5-inch Paige motor, unit power plant; silent chain drive for cam shaft, pump and generator; perfect and smokeless lubrication; gasoline supply carried under a shroud dash, with short straight feed from tank to carburetor; multiple disc cork insert clutch; aluminum castings for strength and light weight; extra-deep cellular radiator and extra-large fan and water jackets; crowned fenders; deep tilted 10-inch cushions and a score of other features of design and construction.

Paige "36" equipment, in every detail, from starter to tail lamp, is all of the highest class. It includes the Gray & Davis large unit electric starting and lighting system; ventilating windshield built into body; silk mohair top, tan lined; jiffy curtains; Stewart revolving dial speedometer; 12-inch electric head lights; electric side lights flush in dash; 5 demountable rims; Goodyear, Goodrich or Diamond tires, with non-skid in rear; Bosch magneto; adjustable foot rail; nickel robe rail; extra tire irons; license brackets; electric horn; pump, jack, tools, tire repair outfit, etc., complete.

Touring car \$1275, 3-passenger roadster \$1275, 2-passenger speedster \$1275, 4-passenger coupe \$1850, 5-passenger Sedan \$1950, limousine \$2250.

See the Paige at the Shows. There is some desirable territory open. For further information, write or wire,

## NEW ENGLAND BUSINESS OUTLOOK GOOD.

**An Analysis of the Conditions Governing the Sale of Cars in This Territory—  
How the Boston Dealers View the Prospects for the 1914 Season.**

**F**ROM the very inception of the automobile industry in this country, Boston has played a prominent part in its history. Particular reference is made at this time to that history dating from the establishment of the industry upon any-

thing even approaching a commercial basis. Undoubtedly, experimentation with the horseless carriage covered a longer period than has ever been acknowledged by those who were able to bring their experiments to a successful issue. It also is probable that such vehicles

were publicly exhibited before George H. Morrill of Norwood, Mass., appeared on the streets of Boston driving one of the original models produced by Charles E. Duryea, which was preceded by a flagman to warn other high-

way users, some time in the latter part of 1893.

That Mr. Morrill was able to travel from place to place in his horseless carriage was a feat which occupied the minds and attention of many Boston people. In 1895, Kenneth Skinner of

Boston imported the first gasoline vehicle, a De Dion tricycle, and soon afterward interested Thomas McCullough, who had a small shop on Massachusetts avenue, near the corner of Boylston street, in the production of machines utilizing motors of this type. Several other ex-

**The First Salesroom in America Devoted Exclusively to the Exploitation of Automobiles—The Mobile Factory Branch, Opened at 346 Boylston Street, Boston, in the Fall of 1898.**

perimenters were inclined to meet and discuss the horseless carriage in McCullough's shop, and as a result this soon came to be known as "Automobile Headquarters".

It thus will be understood that this term origi-

inated before its application in a corporate way to a garage opened by P. A. Lewis on Stanhope street in 1900. And, by the way, George Reed and A. P. Underhill, under the firm name of Reed & Underhill, opened an agency for Knox cars in this structure in 1901. Undoubtedly, there were still other "Automobile Headquarters" in Boston during the intervening period.

#### America's First Salesroom.

But to return to McCullough's shop: One of the enthusiasts foresaw a splendid future for the new industry and rented a building on Boylston street in which to conduct an automobile salesroom. This was in 1898. Among those whom he sought to represent was the maker of the Mobile steamer, then being produced at Tarrytown, N. Y. When the matter was brought to

racycles maintained by Kenneth Skinner. There does not seem to be any doubt, however, that it was the first factory branch and the first salesroom devoted solely to the exploitation of the automobile. The photograph from which the accompanying illustration is reproduced, probably was taken early in 1900, and the view shown is the rear of the store, because the traffic rules of the City of Boston forbade entrance to the building by automobile from the front. The salesroom was opened during the fall of 1898.

#### Prominence of Boylston Street.

This bit of automobile history is of exceptional interest in the light of recent events in Boston. The location of this store on Boylston street did not exactly establish that thorough-

Glimpses of Boston's New Automobile Row on Commonwealth Avenue: Upper Left, Packard Plant; Upper Centre, Group of Buildings Near Allston Line; Upper Right, Square at Beacon Street; Lower Views Present Both Ends of the Long Block of Buildings Near the Beacon Street Corner.

the attention of John Brisbane Walker, who was interested financially in the manufacture of these cars, it was decided that if the proposition looked good enough for others, the company could well afford to operate its own sales agency, and Harry Fosdick was sent to Boston to open a store.

It is expected that the claim that this was the first automobile salesroom opened in this country will be questioned. John Wanamaker was displaying Mobile steam cars in his New York store about this time, and there is some dispute, apparently, as to whether his agency antedated that opened in the store at what was then 346 Boylston street, in Boston. And, of course, there was the agency for De Dion tricycles and quad-

fare as the Automobile Row of that city, but the fact remains that until within the past year that portion of Boylston street between Copley square and Massachusetts avenue has been given over very largely to cars and accessories.

It already has been pointed out that some of the earlier agencies were on Stanhope street, and others were on Columbus avenue. Mention should be made of the creation of an automobile centre in the Motor Mart, at the foot of Columbus avenue facing Park square. The overflow from Boylston street has extended onto Massachusetts avenue, on both sides of Boylston, and on Huntington avenue, between Massachusetts avenue and Copley square. Still other agencies

Upper Row, Left to Right: Baker Electric and Cadillac, Boylston Street, and Speedwell, Columbus Avenue—Lower Row, Abbott-Detroit, Huntington Avenue; National, Boylston Street, and Buick and Stevens-Duryea on Massachusetts Avenue.

and branches were located at various points about the city.

Some two or three years ago the Autocar Sales & Service Company, a factory branch of the concern making Autocar business wagons, opened its salesroom and service station on Beacon street, near the corner of Commonwealth avenue, and the Packard Motor Car Company of

Boston (Alvan T. Fuller) erected a large service station at Brighton and Commonwealth avenues, over the Allston line. Fuller retained his salesroom in the Motor Mart until the present year. The Peerless Motor Car Company of New England, factory branch, also located at Beacon street and Commonwealth avenue about the same time as the two others already mentioned above.

Upper Row, Left, Detroit Electric, Boylston Street; Centre, Cole, Stearns and Oakland, Massachusetts Avenue; Right, Metz, Boylston Street—Lower Row, King, Pope-Hartford and Maxwell, and Jackson and Marathon, Boylston Street.

**Upper Row, Left, Overland, Massachusetts Avenue; Centre, Reo, Columbus Avenue; Right, Mitchell, Massachusetts Avenue—Lower Row, Studebaker and Knox, Cameron and Cartecar, and Stutz, Bailey Electric and Hudson, All on Boylston Street.**

These buildings formed the nucleus of a new Automobile Row, which now extends from the Autocar to the Packard plants—a distance of practically two miles. It should not be understood that there is a solid block of automobile buildings throughout the entire distance. Four motor car and two tire concerns are located on the square at the corner of Beacon street and Commonwealth avenue. Then there is a gap of something like a city block, after which 10 automobile companies are housed in a row of buildings over a quarter of a mile long. Half a mile further up the street is a third section, in which are to be found six car agencies and several other concerns intimately associated with the automobile industry, such as body and top makers, etc. It is still some little distance to the Packard plant, and ground already has been broken for other buildings of a similar character.

#### **Unlike Anything Else.**

In some respects Boston's new Automobile Row is unlike any other in the world. Each of the buildings was designed and constructed solely for automobile purposes. Many of them are small factories in themselves. This feature is sufficient indication of the wonderful growth of the industry in New England's business centre, but there are other phases of the situation which will interest the motorist.

With but three exceptions the concerns which have removed to Commonwealth avenue have discontinued their salesrooms further down town. One of these exceptions is the Cadillac agency,

the salesroom of which has been located at 372 Boylston street, near the Public Gardens, for years. The others are the Studebaker agency and the Buick branch. It will be understood that the Commonwealth avenue buildings for these cars are service stations only, but with all the others, the salesroom and service station are combined under one roof.

#### **Reasons Which Compelled Change.**

Why did these concerns abandon their locations in what has been looked upon as at least a portion of the business section of Boston and create a new business section on one of the finest boulevards in the city, famed hitherto for its handsome residences, and so far out of the city proper that many of the buildings are taxed in towns which go to make up Greater Boston? There were several reasons.

The advantage of being on a trunk line thoroughfare was considered, and there is no place in Boston where so many automobiles pass a given point during a single day, unless it be that section of Commonwealth avenue lying below Beacon street, which is devoted to residential properties and hotels. The item of rent also was of importance, and the advisability of having the service station in close connection with the salesroom.

#### **New Business Methods Adopted.**

It must be conceded that many of the business methods of the industry have undergone decided change. This applies to both manufacturer and dealer. Many of the pioneer dealers in

Boston, and therefore in America, are still in business in that city. They are not only well informed as to local conditions, but they have learned from actual experience the methods which make for individual success. This does not mean that there are no differences of opinion, a fact which is substantiated by the erection of large service stations in the vicinity of the old Automobile Row on Boylston street. A specific instance is the four-story Overland station now in process of construction at West Newton, Falmouth and Belvidere streets.

#### Owners Sell Cars.

The older dealers, at least, bear in mind that the day is gone by when the public was so eager to possess automobiles, that the prospective purchaser paid frequent visits to the salesroom to gain information concerning the various models and to urge more rapid delivery. Insofar as Boston is concerned, and undoubtedly the same conditions apply elsewhere, the selling of motor vehicles has become very largely a matter of soliciting business. That is to say, the salesman must canvass prospects and seek to interest them sufficiently in his car to make a demonstration possible.

This creates a situation as a result of which it is contended by many that it matters little where the salesroom is located, since customers must be brought to the dealer. On the other hand, some maintain that more prospects visit the new places on Commonwealth avenue than was true when the salesrooms were further down

town. Of course these opinions are not held by those who still remain in the older locations.

Even among those who feel that it is necessary to solicit business today, there is a suggestion that the buying public is still sufficiently interested in automobiles to visit the dealer were it possible to secure limited display space in the heart of the business district—room for one car, for instance—say at the lower end of Washington street. Busy men find little time to consider extraneous matters during business hours, and it is at such times that the solicitor must do his work. Even very busy men usually take opportunity to secure a respite from business cares during the lunch hour, for instance, and it is thought that they would gladly avail themselves of the opportunity to inspect the models on display in a down town showroom of the character suggested. However, this plan involves additional rent expense, and with the business methods in vogue among Boston automobile dealers today, innovations are not attempted until the conditions warrant.

#### Used Car Problem.

The matter of used cars causes more or less discussion in every community. Boston dealers have not solved this difficulty, although some of them state that they have, insofar as they are concerned individually. Several agents sell only for cash. That is to say, they will not trade, although they may be induced to take part of the payment in stocks or bonds of good standing. If the prospective purchaser has a car which he de-

Upper Row, Mercer, Columbus Avenue; Flat, Boylston Street; Imperial, Columbus Avenue—Lower Row, Garford, Boylston Street; Henderson, Brookline Avenue; Pierce-Arrow, Boylston Street.

sires to sell, the dealer will secure the best possible price for him, but in each instance of this nature the full purchase price of the new machine is paid, and the amount realized on the old car is turned over when that sale has been consummated.

Other dealers maintain that it is absolutely necessary to make trades, and in many instances the competition is very keen. Whether or not there is any evidence to substantiate the claim, it is held by some agencies that it is possible for a factory branch to take advantage of the dealer by offering larger discounts in a trade, the factory being in a position to balance the sales in Boston against those in other sections.

With the situation as outlined above, it is

propositions over to a disinterested party. Still another reason for considering this move is found in the difficulty attendant upon disposing of used cars. To the necessity for making two sales instead of one must be added a still more important factor. The dealer who disposes of a second hand car of a make other than that which he represents must see that the machine gives satisfaction or run the risk of losing a business friend, and if it does give satisfaction the chances are very much in favor of his having created additional customers for a make of car represented by a competitor.

#### The Electric Situation.

No attempt has been made herein to differentiate between passenger and commercial vehi-

Upper Row, Palmer-Singer, Boylston Street, and McIntyre and Imp Cyclecar Agency in Taylor-Palmer Garage on Huntington Avenue; Lower Row, Fenway Garage, Ipswich Street, Home of Chandler and Paige Agencies, and the Motor Mart.

conceded without question that many times it is the owner who makes the sale rather than the dealer or his salesman. The prospective purchaser makes inquiry among his friends and is guided very largely by their opinions in making his selection, particularly if it is his first machine. This is cited as a very potent reason why manufacturers are anxious to place as many cars as possible in a given territory.

#### A Possible Solution.

Undoubtedly, this has played its part in creating a condition, insofar as trading is concerned, both with respect to the factory branch and agency, that raises the question as to whether it would not be possible to turn all second hand

cles, although there is little doubt that the situation cannot be made to apply to both in exactly the same manner. Each line might be subdivided between gasoline and electric machines, and again the conditions would not be identical. It has seemed more desirable to consider the subject in a general way.

However, the electric pleasure car market in this field has been given particular attention during the past year, with the result that the number of such vehicles in use in metropolitan Boston has been increased practically 92 per cent. Those who are directly interested in this exploitation have just concluded a most successful exhibition, as set forth elsewhere in this issue,

# DIRECTORY OF PROMINENT BOSTON AUTOMOBILE DEALERS.

**Anderson Electric Car Company**, 903 Boylston street; Detroit electric; factory branch. Manager, Albert Weatherby; salesmen, Russell Bennett, J. Leslie Brown, E. R. Harris, N. M. Hammond.

**S. R. Bailey & Co., Inc.**, 895 Boylston street; Bailey electric; Boston sales office. Vice president and sales manager, John S. Codman; salesmen, P. E. Whiting, G. W. Langdon.

**E. P. Blake**, 169 Huntington avenue; McIntyre and Imp cyclecar; agency.

**J. W. Bowman Company**, 91 Massachusetts avenue; Stevens-Duryea, S. G. V. and Waverley electric; agency. President, A. W. Klein; treasurer, J. W. Bowman; secretary, M. H. Harper; salesmen, G. A. Canterbury, B. A. Robey, J. A. Davis.

**Buick Motor Company**, 97 Massachusetts avenue; Buick; factory branch. Manager, H. L. Johnson.

**Cadillac Automobile Company of Boston**, 372 Boylston street; service station, 660 Commonwealth avenue; Cadillac; agency. Proprietor, Alfred Measure; sales manager, G. M. Leghorn; manager service department, J. J. McGregor; superintendent service department, Louis F. Russell.

and they foresee an especially good year.

The automobile industry, although young in years and the result of a rapid growth, is gradually assuming standard business proportions. Not every automobile dealer in Boston is making money. Some, very probably, have not yet been able to appreciate the changed character of the industry as a whole. Several have stated the opinion to the writer within the past week that it takes at least five years to place an agency on a satisfactory business footing. Of course there are many agencies in Boston that are not five years old. It does not follow, necessarily, that these newer concerns are not meeting with success.

## Outlook for the Future.

Boston is the commercial centre for conservative New England. It might almost be characterized as the financial barometer of the country. Five states—Maine, New Hampshire, Vermont, Massachusetts and Rhode Island—and a portion of Connecticut are served by the factory branches and distributors in that city. The men in charge of these have exceptional opportunities for judging of business conditions in this section.

It will be admitted that the month of November is not a particularly auspicious period in which to interview automobile dealers concerning the prospects for the coming year. Experience has indicated that at this time agents are

usually much more actively engaged in closing up affairs for the past season than in laying plans for the future. What the Boston dealers have to say with reference to the outlook for 1914 is of particular interest in consequence. The situation as seen by some of the representative men in the industry in that city is as follows:

### J. L. Snow—Peerless.

Motor car buyers are more careful than ever before, and when they select a high grade car today they expect it to run for a long time. I do not believe this has created an unfavorable condition, but on the contrary it has placed the industry on a strictly business basis. There has been a tendency toward over production and the production of too many types. The result has been a perfectly natural one. I can foresee no lessening of the demand for high grade cars in this territory. Our sales for this year show an appreciable gain over those for 1912, and I see every reason to expect a decidedly better year during 1914.

### F. P. Allen—Chalmers.

It is a question of the survival of the fittest. Manufacturers must learn to study the problem of over production. What you can't have, you always want. In 1910 the public was paying bonuses. Now that it is possible to get a car any time he wants it, the prospective buyer takes more time to look the situation over, and buying is not quite as brisk in consequence. However, the situation, insofar as we are concerned, is giving us no cause for uneasiness.

### C. E. Fay—Ford.

Conditions are exceptionally good with us. The demand in Maine is particularly strong, the people in Aroostook county, for instance, absorbing all the Fords they can get, and our dealers report that the demand for other lines is growing rapidly. The reports from New Hampshire and Vermont are better than ever, and, of course, Massachusetts and Rhode Island are at all times to be relied upon.

### R. I. Eads—Premier.

If money is higher, and I am told it is, it ought to buy more. Insofar as the automobile is concerned it

does. There never was a time when it was possible to secure a better car for \$2000, and in my opinion the medium priced automobile is to be the ultimate car. There is plenty of money in New England, and I have yet to learn of any tendency on the part of its people to deny themselves personal gratification. It would seem to me that there was to be a constant and steady demand.

**Alvan T. Fuller—Packard.**

Business is good—business is always good with Tiffany, John Wanamaker and the Packard car. I could have sold 25 per cent. more cars the last two months had the factory been able to make prompt deliveries. Less political talk and agitation, and more sawing wood will get the result we want. Saw wood. There's plenty of it hereabouts.

**E. A. Travis—Locomobile.**

Our business in Boston for the past year has been just triple what it has ever been before. The prospects are equally as good for the year to come. There is no reason to fear any lessening of the demand for cars. When the American manufacturers have fully supplied the needs of the American people there is plenty of export business to fall back upon. South America offers a market that has never been seriously considered by the American manufacturer, although European concerns seem to find it profitable.

**J. J. McGregor—Cadillac.**

All conditions point to the best business ever. We have delivered more of next year's models to date than in any previous year at this time, and we have more orders on file for future delivery. There is a particularly fine demand for enclosed cars this season. This applies to the metropolitan district of Boston.

**F. A. Hinchliffe—Winton.**

Our business is right up to last year's record, and that was the best we have ever had. I have every reason to believe we will sell the same amount next year. I mean just that. The industry will see a general readjustment, which will be the best thing for all concerned. There is going to be good business for any manufacturer or dealer who does business in a proper business way.

**J. S. Hathaway—White.**

We have more orders on the books for spring delivery than we had a year ago. Our deliveries to date are about on a par with those for 1912. I think we are going to do an even better business next year.

**H. A. Clapp—Simplex.**

There is always a demand for a good, high grade car. There are certain people who will buy them anyway. We expect a good year's business. Some manufacturers have not been as conservative as they should have been, and it would have been better for the industry if they had started in a small way and built up a business gradually. But, in the main, the outlook for 1914 is bright.

**A. H. Sowers—Jackson.**

The outlook is good—remarkably so. Agents throughout Massachusetts and Vermont report that things are looking splendid. The demand is going to be for medium priced cars in the future.

**R. G. Houston—Marathon.**

We are practically a new concern in this territory, but the outlook is very good. We are getting our share of the business, and I see no reason why we should not continue to get it throughout the coming year. Cars are selling at a price where people can afford to buy, and many people are buying who have not thought they could own a car before.

**Frank Crockett—Knox.**

There is a big field for the medium priced, six-cylinder car, and there are a great many users of high grade automobiles—the class of people who ride in Pullman trains. In the future, changes will not be so many or so marked, although there always will be improvements. There is every indication that the industry is being put on a strictly business basis.

**J. S. Donovan—Studebaker.**

The public is going to buy cars if nothing else. All factories are taking care not to have an over production, and good cars will be as scarce next spring as ever. There never will be as many cars made in one season as were made during 1913, but that does not mean poor business. The whole industry is getting down to a legitimate business basis.

**A. B. Henley—Hudson.**

It will be our best year. We are now way ahead of last year's business at this time, and we are selling cars every day. In the future there will be three classes of cars. Dealers in high priced machines will be able to sell

all they can get. There will be an ever increasing demand for medium priced and low priced models. Perhaps we will have to add a fourth class—those which shall be termed very low priced.

**M. F. Chase—Stutz.**

Men are getting motor wise, and the manufacturer must give them what they want. We will do more business next year than last. Already we have received nearly five times as many orders for cars as at the same time in 1912.

**C. B. Spiegelberg—Metz.**

Conditions are looking very good. We are going to sell a lot of cars next year. I don't know anything about the other lines, but I do know that a lot of people have heard about this line this year, and lots of folks want them.

**G. M. Wetherby—Cartercar.**

I understand that every farmer in Maine either owns a car or is going to buy one. I know that we are doing a big business among the country people. I think you will see less factory branches in the future and agents will be better able to conduct business in competition with each other.

**J. L. McKone—Overland.**

Business with us never looked better. You had to be a sport to sell as well as own a car 10 or 15 years ago, but that day has gone by. The manufacturer or agent who does business today must do it on a business basis, and I find that a great deal of the selling is done by the owner.

**J. W. Bowman—Stevens-Duryea.**

You can eat just as much porridge out of a dish purchased in the 10-cent store as from the best piece of Haviland china made. Selling automobiles is just like selling anything else. There always will be a demand for a high grade article, whether it be a car or a shirt. People have confidence in the man who makes and the man who sells, and they are always going to have. We sell more of this make of cars than any other agency in the country and we expect to be able to say the same thing a year from now.

**J. H. MacAlman—Stearns-Knight.**

This is going to be our best year. The situation is no different now than it ever has been. There always have been men in the manufacturing end who thought that when they sold a car they could spend the money without considering the overhead. Profit is not always what it seems on the face. There always will be a demand for high grade cars and there is no reason for suggesting that there is anything wrong with the automobile industry.

**W. C. Sills—Chevrolet.**

I look for a shortage of cars next season in February or March. We are already about 100 behind on deliveries throughout New England. The big demand in the future will be for medium priced cars.

**William Blanchard—Lenox.**

Conditions look good. People know what they want and don't mind paying the money for a good car. The day of big output is over, and the industry will be on a better paying basis in consequence.

**W. L. Russell—Haynes.**

It is a good time to put in a lot of hard work, and the sales will take care of themselves. The tendency is toward the car of medium price on the part of the man who used to pay more. The demand below \$2000 is good, going right down the line.

**George E. Curtin—Speedwell.**

We expect good business, judging from the number of inquiries we have had concerning the new rotary valve motor. I would say that the demand is for cars of medium price. Many men who formerly felt it was necessary to purchase a high priced machine have come to learn that good cars are produced for less money.

**J. M. Linscott—Reo.**

The demand is for low priced cars. We are about 100 behind on our orders and my partner is in Lansing, Mich., trying to get the machines. We see no cause for complaint, except on that score.

**J. W. Maguire—Pierce-Arrow.**

The situation looks good to us. We find that the man who can afford to pay \$3000 will pay the long price and get the best.

**R. R. Ross—Flat.**

We are looking forward to a big year. Our growth has been steady and healthy each season. High grade cars always will be sold and we feel that we shall get our share of the business.

## BOSTON'S ELECTRIC AUTOMOBILE SALON.

**C**ONFIDENCE is a basic principle upon which all successful business is conducted. The people of Boston and New England, while comprising perhaps the most conservative element in this country, have supreme confidence in the automobile dealers in that territory. Thus is explained the fact that Boston may attempt innovations with every assurance that the result will be equal to anticipations.

**Day Baker, General Director Electric Automobile Salon.**

which came to a successful conclusion in the ballroom of the Copley Plaza hotel, Boston, Nov. 19, was a distinct innovation. Nothing like it ever had been attempted before anywhere in the world. It was a social success in that it became one of the important events of the season on the social calendar. The commercial side was kept well in the background, but the statement is made, unofficially, that something like \$40,000 worth of business was secured during the three days of the display. It is understood that the Electric Motor Car Club of Boston, under whose auspices the show was held, has engaged the Copley Plaza ballroom and all of the adjoining rooms for a similar exhibit next year, during the month of November.

It must not be understood that this result was attained upon the spur of the moment, although it is true that less than two weeks elapsed between the final decision to hold the display and the actual opening of the doors. The electric pleasure automobile has had its adherents in Boston and vicinity for many years. In fact, experimentation in electric vehicles was quite as prominent in this field in the earlier days of the industry's history as anywhere else in this country. However, it is not denied that the use of such

cars has been somewhat larger in some other sections. This has been due to a number of causes, but it rapidly is being made evident that there are at present no reasons which cannot be overcome by careful presentation of the facts.

Soon after the organization of the Electric Motor Car Club of Boston in April, 1911, there was begun an active campaign to secure a more general application of the electric machine both for business and pleasure. Reference might be had in this connection to both freight and passenger vehicles, but the statement should be made to apply in this instance to the latter type. It is conceded that the electric passenger automobile is quite as well adapted to business purposes as to social uses.

Within the past year the number of electrics of this type in service in Boston and its immediate vicinity has increased some 42 per cent. This, in itself, is sufficient indication of their increasing popularity, and explains, in a large measure, the success enjoyed by this first Electric Automobile Salon. It also suggests the wisdom of the dealers in deciding upon an innovation of this character.

The decorations were strictly in keeping with the simplicity of the vehicles displayed. The treatment of the ballroom by its designers is such as to leave little to be desired in this respect. The appointments of the cars themselves are quite sufficient to set off their beauty without additional adornment. It seemed to the committee in charge of this feature that the simplest arrangement would prove most effective, and the special decorations consisted solely in the artistic placing of large bouquets of yellow chrysanthemums at various points about the hall. The

**W. H. Blood, Jr., Who Formally Opened the Salon.**

color selected was a particularly appropriate one, inasmuch as it blended well with the electric lighting of the building and of the cars.

Because of the historical importance of the event it was deemed consistent to depart somewhat from the conventional, and the opening of the salon was rather more formal than is usual with automobile shows in this country. Abroad, it always has been the custom to ask men of prominence to strike a keynote of the exhibition in the presentation of opening addresses. This plan was followed in this instance. The speakers were Day Baker, president of the Electric Motor Car Club of Boston, and William H. Blood, Jr., first president of the Electric Vehicle Association of America.

Mr. Baker spoke in part as follows:

It is with great pleasure that as president of the Electric Motor Car Club of Boston, I welcome you here

the first president of the national association, and it gives me great pleasure to introduce to you this evening the first president of that association, W. H. Blood, Jr., who will now formally open this salon.

The following is an abstract from Mr. Blood's address:

I fully appreciate the honor, which has been thrust upon me, of making the official announcement of the opening of "Le Salon de l'Automobile Electrique". In France, the president of the Republic opens "Le Salon de l'Automobile", while in this country you have selected the humble ex-president of the Electric Vehicle Association of America. I am greatly honored to be put in a class with M. Poincare.

The first Electric Automobile Salon to be held in the United States, and, so far as I am able to determine, in the world, is now open. The Electric Motor Car Club of Boston, under whose auspices this salon will be given, is to be congratulated upon this achievement. The electric vehicle fraternity presents to the public the last word in motor car design and the public embraces this unusual opportunity of seeing, under one roof, the comparative merits of all that is best in electric motor cars. The electric automobile, through this salon at the Copley Plaza, has, like many another "debutante", made its initial bow and is now being received into Boston so-

General View of the Copley Plaza Ballroom During the Progress of the World's First Electric Automobile Salon.

this evening to view the first Electric Automobile Salon of this country. This evening marks an epoch in the advance of the electric vehicle. It is one of the milestones to which we will look back in years to come as one of the important events in the electric passenger automobile industry in the United States.

Ex-President Taft recently remarked that whenever it was necessary to find anything new, you should come to Boston. With this in mind, I would like to call your attention to the fact that only a few short years ago, in one of the offices of a battery company on State street, the idea of an Electric Vehicle & Central Station Association was conceived, and in March, 1909, a number of electric vehicle enthusiasts and central station men met at the Hotel Tuilleries and inaugurated a small organization, which has since grown to mammoth proportions, until the combined capital of the companies interested in this Electric Vehicle Association of America is now well over \$600,000,000.

The Electric Automobile Salon has long been the dream of a few members of the Electric Motor Car Club of Boston, and tonight we see realized, in a beautiful manner, in this exquisite room, our vision, which we so fondly treasured.

Not only was the idea of the Electric Vehicle Association born in Boston, but from Boston was elected

ciety. This is the coming-out party of the electric pleasure car.

It was just about 20 years ago that the first electric vehicles appeared in Boston, but they were of little value from a practical standpoint; they were hardly more than experimental forerunners of what was to come. The underlying principles employed were correct, but the way that those fundamental ideas were worked out was crude. The designs were clumsy, the motors inefficient, and the batteries were unnecessarily heavy. A few venturesome individuals purchased these experiments, only to be rewarded by high cost of upkeep and unsatisfactory operation. Even these early cars ran. Electrics always run. This is one of the salient features of the electric automobile—it runs.

For a number of years the electric vehicle has been going through a period of development and of improvement, and it now appears before the public as a perfected article. It possesses at least three points of superiority which must appeal to everyone—simplicity, beauty, durability.

**Simplicity**—You press a button, or move a handle, and off you go. There is no cranking, no spark adjustment, no shifting of gears or adjustment of carburetor—a single motion and the car is under way. A child can operate it and many a woman who knows nothing of me-

chanics finds pleasure in going and coming in her own car, when and as she pleases. The modern electric car is simplicity itself; it has very few parts and these are usually understood and adjustments are quickly made.

**Beauty**—I need say but little on this score, for I am sure that you have already noticed the artistic lines of the cars on exhibition. The coach builder's art has reached its climax in the design and construction of the modern electric coupe. The appointments and the upholstery are rich, yet simple, and even the most fastidious critics are satisfied with the beautiful creations which are on exhibition in this room tonight. The most exquisitely gowned and gloved lady is as much in keeping with her surroundings in one of these palatial cars as in the glittering ballroom. The modern electric is properly named the "car de luxe".

**Durability**—It is a common saying in the South that "No one ever saw a dead mule". In the North we say: "No one ever saw a worn out electric car". Styles may change from year to year, but cars that were made 10 years ago are still to be found in daily service, giving satisfactory results. Electric motors are practically indestructible. The storage battery of today lasts twice as long as those of a few years ago.

The electric automobile is fast coming into its own; its popularity is increasing from day to day. We are a little slow here in the East in adopting it, but during the past two years the increases have been remarkable. While in Chicago a few months ago, on returning from the theatre to my hotel, I was interested to count the automobiles in waiting. There were 107, counting all kinds. Of these, 81 were electric—a very creditable proportion. Chicago now boasts of a total of nearly 3000 electrically propelled vehicles. In Washington one hardly sees anything else in the shopping district. Even Kansas City, with its steep hills, boasts of many, and the women of that city enjoy to the utmost the independence which their electric gives them. During the past 12 months the number of electric in Boston has increased 42 per cent., yet as far as the total number in use is concerned, Boston is a long way from the top of the list.

The electric pleasure car is not a competitor of the gas car. It rather supplements it. As a town car the electric is the car "par excellence". For calling, for shopping, for the theatre and the club, the electric car cannot be equalled. This salon is for you to become acquainted with the electric pleasure car and to convince you that you cannot do without it. The low cost of operation will surprise you. The cost of electric current, due to the far-sightedness of the Edison Electric Illuminating Company of Boston, has been periodically reduced to a minimum and in this respect shows a sharp contrast to the ever increasing price of gasoline. Other costs, due to operating at comparatively low speeds, and complete emancipation from the chauffeur, are a satisfactory surprise to those who have operated other cars.

The salon is for the public to become acquainted with the facts to which I have referred and many others which I have not mentioned. The "Salon de l'Automobile" of Paris was discontinued for a few years and the entire French automobile industry suffered in consequence. It has been revived again with most satisfactory results to both the manufacturers and the public. I feel sure that this "Salon de l'Automobile Electrique de Boston" will prove to be both of pleasure to the public and of profit to the exhibitors. As an institution I believe that it has come to stay. The manufacturers have in it an unusual opportunity to meet face to face the appreciative members of Boston's society, who have abundant means with which to purchase the most up-to-date transportation machines. The purchasers likewise may take advantage of the facilities offered by means of this salon to select from the many beautiful models the car which appeals to them as "a thing of beauty". In the full assurance that it will prove to be "a joy forever".

"Vive le salon de l'automobile electrique de Boston".

The list of exhibitors and the models shown by each follow:

**S. R. Bailey & Co.**, 895 Boylston street; Bailey. Two-passenger roadster, four-passenger roadster or touring car and victoria phaeton.

**Frank N. Phelps**, 801 Boylston street; Baker. Five-passenger brougham, two-passenger roadster and two four-passenger coupes. With the exception of the road-

ster the bodies were with special upholstery designs by Paul Polret.

**W. L. Russell Company**, Motor Mart, Buffalo-Babcock. Roadster and two coupes.

**Anderson Electric Car Company**, 903 Boylston street; Detroit. Two four-passenger broughams, five-passenger brougham and roadster.

**D. C. Tiffany Company**, 136 Chestnut street; Ohio. Four-passenger brougham and five-passenger straight line brougham.

**Peerless Motor Car Company**, J. L. Snow, 660 Beacon street; Rauch & Lang. Five-passenger brougham, seven-passenger town car (five inside and two outside), three or four-passenger demi-brougham and roadster.

**W. H. Stevens**, 1020 Boylston street; Standard. Four-passenger coupe.

**J. W. Bowman Company**, 91 Massachusetts avenue; Waverley. Victoria, Colonial brougham, four-passenger limousine, five-passenger limousine and roadster.

**Whitten-Gilmore Company**, 620 Commonwealth avenue; Woods. Three-passenger roadster, five-passenger extension brougham and four-passenger pony limousine.

The accessory department, if such it may be termed, was limited to the appearance of four makes of storage batteries, these being displayed as follows: Herbert S. Potter Company, 24 Commerce street, Edison; Electric Storage Battery Company, 60 State street, Exide; American Storage Battery Company, Albion street, Cambridge, Harvard, and Philadelphia Storage Battery Company, Ferdinand and Piedmont streets, Philadelphia.

The attendance throughout the three days was uniformly satisfactory. Regarded in many ways as a society event, people of social prominence lent the salon every approval, and the handsome gowns of the women, with the dignified electric equipages for a background, made a picture that will long be remembered.

Particular mention should be made of the musical programme, and in this respect the Electric Automobile Salon was again somewhat distinctive. The music was of the highest character, and of such quality as easily to permit conversation by the members of the reception committee and their guests. One of the features of the closing evening was the extinguishing of all the electric lights of the building and the illumination of the ballroom by means of the lights on the cars exclusively.

It is impossible to give personal credit to all who co-operated so admirably in making this initial Electric Automobile Salon a splendid success. The remarkably smooth and artistic working out of the details was due largely to the executive ability of President Day Baker, who acted as general director. He was ably assisted in their respective fields by Albert Weatherby, chairman of the executive committee; Herbert Moses, supervisor of committees; Charles H. Hatch, chairman of the reception committee; W. H. Atkins and F. S. Mansfield of the Boston Edison Company, and O. G. Draper, business secretary of the Electric Motor Car Club of Boston.

## PROVIDENCE SHOW IN JAPANESE GARDEN.

PAST achievements offer the best inducement to strive for still more marked success. Percival S. Clark, chairman of the show committee of the Rhode Island Automobile Dealers' Association, Providence, R. I., had before him the example set by two previous motor car exhibitions, in which every effort was expended to make the display one to be long remembered for its beauty and completeness. With the help of the other members of his committee, he has set a new standard for local shows in New England.

Thousands of people from Rhode Island and the neighboring sections of Massachusetts and Connecticut visited the state armory in Providence, the evening of Nov. 22, to witness the opening of the third annual automobile show of this association, which will continue until Nov. 29. Upon entering the building the attention was first drawn to the artistic decorative treatment. An immense painting, representing a garden scene in Japan, with Mount Fujiyama's snow capped peak in the background, was suspended at the rear of the building. This had the apparent effect of increasing the size of the main hall, where the pleasure vehicles were displayed, although it is one of the largest exhibition floors in New England. The entire treatment of this floor was in keeping with the central piece, and the judicious use of Japanese lanterns and banners created the impression of displaying the cars in the garden itself, amid its realistic surroundings.

But attention was drawn from the cars only for the moment. Along the side walls and in the centre of the main hall the latest models were arranged so as to permit of ready inspection, and in most instances the machines on display were direct from the factory, some of them arriving in Providence but a few hours before the doors were opened. A feature of the pleasure car section was the prominence given to electric machines, and the interest in them was sufficient indication of the importance in which they may be regarded in this field in the future.

Another feature of particular interest was the

Imp cyclecar. This was the first time that the people of New England have had opportunity to inspect these little machines. In fact, the Boston agency for this make has had a model in its show-rooms but a comparatively short time. During the opening night at the Providence show the space occupied by the Imp was crowded all of the time, and the attendants were kept exceedingly busy answering questions.

Trucks, motorcycles and accessories were exhibited in the basement, as in past years, but, as was true of the pleasure vehicle section, the number of individual displays was much larger than

1914 Models in Japanese Setting at Rhode Island Automobile Show.

heretofore. One of the anterooms near the entrance to the building was utilized for an overflow, both of cars and accessories.

The list of exhibitors and the product displayed by each follows:

**Pleasure Cars**—Adams & Knight, Mercer, Apperson; Aetna Bottle & Stopper Company, Buick; Charles Barre Company, Lehigh; Herbert E. Bradford, Pilot; Cadillac Automobile Company of Rhode Island, Cadillac; Capitol Motor Car Company, Hupmobile; Percival S. Clark, Oakland, Jeffery, Mitchell; Davis Automobile Company, Chalmers, Locomobile, Regal, Winton; Elmwood Motor Car Company, Imperial, Standard electric; Flat Motor Sales Company, Flat; Foss-Hughes Company, Pierce-Arrow; William H. Fuller, Cole; Goodwin-Sherman Motor Car Company, Studebaker; Hitchcock-Banks Motor Car Company, Knox; Williams Hughes Company, Reo; Kendall garage, Stutz; King Motor Car Company, King; Lister, Smith & Walsh Company, Paige, Jackson; L. B. Lorimer,

Hudson; J. E. Newton, Stevens-Duryea, Detroit electric; Nock Automobile Company, Kissel-Kar; North End garage, Case; John O'Donnell, Premier; Packard Motor Car Company, Packard; Peerless Motor Car Company, Peerless; Pope-Hartford Automobile Company, Pope-Hartford; Providence Motor Car Company, Velle, Maxwell; Pugh Bros Company, Overland, Marlon, American; C. K. Setchell, McIntyre, Imp cyclecar; E. A. Sontag, Oldsmobile; Speedwell Company, Speedwell; E. E. Whipple, Chevrolet, Detrolter; White Automobile Company, White; Whitten Motor Vehicle Company, Abbott-Detroit, Marathon, K-R-I-T; Wallace L. Wilcox, Franklin.

**Commercial Cars**—Aetna Bottle & Stopper Company, Bulck Autocar Sales & Service Company, Autocar; H. E. Bradford, Selden; Capitol Motor Car Company, Koehler; Percival S. Clark, Jeffery; Foss-Hughes Company, Pierce-Arrow; Hitchcock-Banks Motor Car Company, Knox-Martin tractor; B. F. & A. W. Hopkins, I. H. C.; R. S. Longley, Kelly; Nock Automobile Company, Commerce; Packard Motor Car Company, Packard; Peerless Motor Car Company, Peerless; Pope-Hartford Automobile Company, Pope-Hartford, Stewart; Pugh Bros. Company, Federal, Willys Utility; Stanley Motor Carriage Com-

pany, Stanley steam; U. S. Mill Supply Company, Mais, Brown; White Automobile Company, White.

**Motorcycles**—Hirah G. Baxter, Excelsior, Henderson; Elmwood Cyclery, Harley-Davidson; Marceau Bros., Yale; B. A. Swenson, Indian.

**Accessories**—Waite Auto Supply Company, Waite Success batteries, Four-in-One auto heater, Warner speedometer, Vacuum Mobiloil lubricants, Arnold Hough whistles, Thermite, Weed chains, Empire and Seamless tires and a full line of other goods; Belcher & Loomis Hardware Company, United States, Federal, Firestone, Goodyear and Goodrich tires; A. C. C. Oil Company, Acco lubricants; Russell Manufacturing Company, brake lining; Fryer-Auster Company, tonneau windshield; Winsor Manufacturing Company, Winsor valve remover; Ernst Flentje, shock absorber; Auburn Wheel & Manufacturing Company, E-Z Ford rim, wheels and bodies; Providence Auto Equipment Company, Hood tires, etc.; William D. Goff, insurance; Wayne Oil Tank & Pump Company, gasoline and oil storage systems; Aetna Life Insurance Company, insurance; Providence Petroleum Products Company, oils, greases, etc.; Cherry & Webb, wearing apparel for automobilists.

## ATLANTA'S "MILLION DOLLAR" DISPLAY.

THE importance of the Southland as a market for motor vehicles was never better demonstrated than during the progress of the

R. N. Reed, Chairman Atlanta Show Committee.

third Great Southern automobile show in the Auditorium-Armory, Atlanta, Ga., Nov. 8-15. The exhibition was heralded throughout the states below the Mason-Dixon line as a "Million Dollar" display, the inference being that cars valued at that sum were to be on view during the week. This portion of the programme was fully realized

and there is much reason for suggesting that the term might have been made to apply to the amount of business resulting from the display. Certain it is that the crowds in attendance and the interest taken in the various new models shown were such as to justify the assumption that 1914 is to see a splendid year's business in the district of which Atlanta is the commercial and social metropolis.

For a number of years—ever since the national automobile display in Atlanta in November, 1909—the demand for cars in the South has been increasing. Good roads agitation has played its part in bringing the advantages of the motor vehicle to the attention of the public. In 1911 the Atlanta dealers decided to stimulate business activity by holding a local show, and

their efforts were crowned with such success that the Atlanta Automobile & Accessory Association was formed to take charge of the annual display in November. Last year the show was such a business producer that the association determined to eclipse all previous records in the "Million Dollar" exhibition just closed.

The committee in charge of the arrangements was composed of R. N. Reed as chairman, George W. Hanson, K. T. McKinstry, C. H. Johnson, J. K. Gewinner, H. D. McCutcheon and John F. Poole. All interests were represented in the personnel and each worked in harmony with all the others to make the event a splendid success. Taking advantage of the climatic conditions, it was deemed wise to adopt measures not hitherto tried in the holding of shows of this character. Atlanta business men were encouraged to enter into the spirit of the occasion, and the entire week was

George W. Hanson, President, and C. H. Johnson, Vice President of the Atlanta Automobile & Accessory Association.

given over to the exploitation of the automobile and to calling attention to Atlanta as a commercial centre.

Members of Atlanta Show Committee: Left to Right, J. K. Gewinner, H. D. McCutcheon, K. C. McKinstry, J. F. Toole.

One of these extraneous features, if such it may be termed, was a floral parade, Tuesday morning, for which fully 2000 cars lined up on either side of Whitehall and Peachtree streets. There was a long list of prizes. Mrs. P. T. Heath, driving a Studebaker covered with 7000 pink and white roses, won the first award for the most beautifully decorated machine, while second place went to Mrs. George Hanson, with an Oakland hidden by yellow and white chrysanthemums over which a flight of milk white doves was suspended. The car winning the prize for originality was driven by Lon J. Daniels. It was decorated with autumn leaves, and at the front a bevy of partridges peeped out from the crimson foliage.

Inside the hall the treatment was simple, the committee deciding upon the use of bunting and flowers in such manner as not to detract from the beauty of the cars on display. The plan was one which was calculated to confine the commercial features of the show to the interior of the Auditorium-Armory, although business was by no means the only attraction even there. Sousa's famous band furnished the musical programme, and many of the younger set found opportunity for dancing in the aisles. This was particularly true Thursday evening—Society night.

The show was made more notable by the formal presentation of the Lyons-Knight pleasure car, made in Indianapolis, to the people of the South, and by the first appearance of the Imp cyclecar in that section. Both

attracted unusual attention throughout the week. The department devoted to commercial vehicles was of particular interest to business men, and in this the Van Winkle truck, an Atlanta product, was a feature. The exhibitors were:

### BUYS ABBOTT COMPANY.

#### Pittsburg Concern Takes Over Business of Well Known Detroit Company.

Announcement is made from Detroit that the Edward F. Gerber Company, Pittsburg, Penn., has purchased outright the plant and business of the Abbott Motor Company of the former city, the sale having been ratified by about 90 per cent. of the stockholders. The name of the latter concern will not be changed, and the production of Abbott-Detroit cars will be continued under the new management, with the same factory organization and managing officials.

The Gerber company has been somewhat well known in the industry as a distributor in western Pennsylvania, and at one time made an offer to take over the production of Michigan cars, soon after the recent failure of the Michigan Motor Car Company in Kalamazoo, Mich. With its acquisition of the Abbott-Detroit business, sufficient working capital is promised to produce cars on a large scale.

### EISEMANN MAGNETO REMOVES.

#### Sales and General Offices Now Located with Factory in Bush Terminal.

Announcement is made by the Eisemann Magneto Company that its sales and general offices have been removed from 225-227 West 57th street, New York City, to the same building in which the factory is located, Bush Terminal building No. 8, 32 33rd street, Brooklyn, N. Y. The change was made because it was felt that it was more advantageous to have these offices in closer relation with the factory, and the fact that the old location was largely outgrown had its full weight in influencing the decision.

It is added that the company will maintain a service station at the West 57th street address, where the many users of Eisemann magnetos throughout that district will be able to receive the same courteous treatment that has been accorded in the past.

### AN INTERESTING BOOKLET.

#### Electric Vehicle Association of America Publishing Novel Treatise.

"The Story of the Electric Pleasure Vehicle" is the title of an interesting and attractive booklet just issued by the Electric Vehicle Association

of America, with headquarters at 124 West 42nd street, New York City. The text matter treats of the early history of this type of automobile, supplemented by descriptions of the latest models of electric pleasure cars. The booklet is fully illustrated with views of ancient and modern machines, and the typographical work is particularly attractive.

The booklets have been prepared for general distribution in an educational campaign recently inaugurated by this organization, in which makers of electric pleasure cars and accessories and equipment therefor are interested. Copies may be secured by making request of the association at the above address.

### MILLER'S ADVANCE CATALOGUE.

#### Pioneer Accessory House to Distribute 100,000 Copies at the Shows.

Chas. E. Miller, 97-103 Reade street, New York City, is issuing the 1914 advance catalogue No. 27. Special reference should be made to the cover treatment, which is quite in keeping with the varied lines handled by this pioneer accessory house. Automobiles, motorcycles, aeroplanes and motor boats are worked into the design in a particularly pleasing manner.

The catalogue contains a number of new lines recently added by this well known manufacturer, jobber, exporter and importer, and 100,000 copies have been prepared for distribution at the various automobile shows throughout the country. Beside the headquarters at the above address, branch stores are maintained in the following cities: New York, Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.; Detroit, Mich.; Cleveland, O.; Philadelphia, Penn.; Atlanta, Ga.; New Orleans, La., and Newark, N. J. In addition, the parcel post policy of the concern is such that every motorist is able to purchase direct from any of these branches with immediate delivery at the home address anywhere in the United States.

E. G. Bennet, vice president of the General Motors Export Company, who has charge of the foreign business for the Oakland car, made by the Oakland Motor Car Company, Pontiac, Mich., reports that shipments of this make of machine are being made to a large number of foreign countries. Recently Oaklands were shipped to China, Java and Australia. Mr. Bennet leaves shortly on a business trip to Russia, going to Vladivostok, by way of St. Petersburg.

# ELECTRIC LIGHTING AND MOTOR STARTING.

## Practicability of Equipping the Used Car Demonstrated by Installation of Various Systems on Standard Models—Factors Considered in Selecting Dynamo, Etc.

(By C. P. Shattuck.)

OF THE equipment added to the motor car by the maker none has created more interest among the owners of used automobiles than the electric lighting and motor starting systems. That their convenience appeals to the motorist is demonstrated by the large number of inquiries received by The Automobile Journal from its readers as to the practicability of installing a lighting dynamo and a motor starter.

In order to compile authentic information the writer invited each manufacturer to present his views upon the subject, and in a majority of instances the data were supplemented with sketches showing installations on used machines of standard makes. Lack of space prevents utilizing all of the plans submitted, but a sufficient number

and motor starting was adopted by practically every manufacturer, or made optional with the purchaser, have been equipped and at a moderate cost, because the owners made a thorough examination of every system and selected one that could be fitted to give practical results and at a reasonable expense.

Every owner desiring to equip his machine with electric lighting or motor starting should investigate every system, selecting that which is best suited to the design of car, if he would obtain satisfactory results, for the most perfect equipment will lack efficiency if improperly installed. The large number of systems fitted to standard makes of cars should be sufficient guarantee as to their practicability and efficiency, and with the data issued by the manufacturer one should be able to select and install an equipment which will obtain the desired results without an excessive expenditure of money.

On the other hand, if one favors a particular equipment without reference to its adaptability to the car, the price and expense of installation will doubtless be prohibitive. This contention is borne out by the statement of a prominent manufacturer, who says that when the majority of owners seeking information as to the cost of his

Aplico Dynamo Installed on the White Car.

Dimensions of Aplico Model A 2 1/2 Generator and Data as to Drive, Output, Etc.

is presented to demonstrate the practicability of equipping the used motor vehicle with lighting dynamos and motor starters.

Many owners of popular and moderately priced machines desiring electrical equipment have vague ideas as to its construction and operation; the steps necessary to install it and the cost of the completed work. Several cases have come to the attention of the writer where motorists decided upon a certain type of dynamo or motor starter without investigating its adaptability to their cars and, upon being advised by the manufacturer as to the probable cost of installation, decided to retain the oil and gas lighting systems. On the other hand, many cars made previous to 1913, at which date electric lighting

Method of Mounting the Electric Auto-Lite.

Fisher Generator on Hupmobile.

equipments for the used car, but in most every instance the design of the machine was such as to present no great difficulty in installing and the cost was reasonable.

Instances are recorded where the maker has advised the prospective purchaser that lighting and motor starting is a manufacturer's proposition. In explanation of the statement it may be said that there are certain models of cars which would require considerable alteration and mechanical ingenuity to install the equipment so as to give satisfactory service, and it is obvious that under these conditions the amount involved would not warrant the expenditure. Then again, a unit system, a motor and a generator combined, which is favored by some makers, does not lend itself to installation so readily as individual units.

There are makers whose product, although designed particularly for the car manufacturer, is also adaptable to the used machine. And there are some makers who have designed a moderately priced equipment for the used vehicle, and have in stock, brackets, pulleys, sprockets, chains, belts, etc., which enable the owner to equip his machine with electricity, and the majority of these may be fitted without any alterations.

Fisher Generator on R-C-H.

system are informed as to the expense they drop the idea entirely and satisfy themselves with the old lamps until the purchase of another machine. This manufacturer, however, has marketed a number of

to, as the drive of the former need not be so positive; that is, there is no timing to be observed. It is simply a question of finding room enough under the hood for the installation of a small generator; fitting a bracket for its suspension and making provision for the drive. In 99 cases out of 100 the last named may be accomplished by means of chain, belt, shaft or gears. The average motor presents many opportunities for obtaining the drive, from the pump or magneto shaft, for example, as is demonstrated in accompanying illustrations showing a wide variety of installations.

When it is considered that approximately half a million cars were manufactured previous to the adoption of electric lighting, and that many of these give efficient service, the number of manufacturers making a specialty of electrical equipment for the used car is very limited. It is doubtless true that many owners are deterred from purchasing and installing the convenient

Showing Mounting and Method of Drive of Fisher Generator on Cadillac and Overland.

system because of the reasons previously explained, but during the present season a number of makers have brought out equipment for used vehicles. Several of these come complete for installation and the work may be performed by the owner, as not only are the instructions accompanying each outfit very complete, but the directions are easily followed.

In investigating lighting dynamos, their dimensions will have to be given consideration, and probable locations under the hood must be carefully measured to make sure there is ample space for the bracket or retaining member. The dimensions of several makes are given herewith and it will be noted that they include those of the side, bottom and end views, also the distances between the bolt holes, etc. In some instances a manufacturer produces several models, these having different capacity, as well as varying in size.

There are a number of possible locations on

Showing Method of Mounting Da-Lite Dynamo on Model C and T Regal Motors.

the power plant for the dynamo, and in considering these the drive is most important. The methods will differ with the design of the engine, but the almost universal arrangement is to mount a sprocket or pulley on some convenient shaft and drive from this by a silent chain or a belt.

An example of utilizing the magneto shaft is shown in the installation of an Aplco dynamo, made by the Apple Electric Company, Dayton, O., to a White car. It will be noted that a bracket is placed over the magneto and is secured to the frame and crankcase by bolts. By fitting a sprocket to the magneto shaft and aligning the driven sprocket of the dynamo, an ideal drive was obtained. Sometimes it is possible to fit a sprocket on the crankshaft or pumpshaft, and installations have been made where the fanshaft was utilized for the driving member. The Apple Electric Company issues a book showing a large number of installations and containing suggestions for selecting the proper equipment.

The cost of the lighting dynamo will vary from \$37.50 upward, and it may be purchased without the equipment. In addition to the dynamo and fittings necessary to drive it, there generally will be required: A storage battery, wiring, switch, ammeter, connectors and lamps. With some systems a regulator or cut-out device is required. The equipment will vary according to the system. Some manufacturers include all attachments and fittings with the exception of the lamps, while others believe that the choice of the equipment is best left to the purchaser, although suggestions are made as to its selection.

For the benefit of those who desire a moderately priced outfit, the figures presented in an accompanying table will be of interest. They are approximations only, and refer to a particular system. It may be assumed that they will be exceeded with some types of machines or cost less with others. The generator, ammeter and switch are listed at \$37.50, and the storage battery, a six-volt, 80 ampere-hour unit, as \$15.50. By fitting the gas headlights with nine-inch reflectors, for example, and at a cost of \$6, economy would be effected. The oil side and tail lights could be equipped with adapters at an expense of \$1.80

|   |                |
|---|----------------|
| Generator, ammeter and switch.....              | \$37.50        |
| Two 9-inch reflectors.....                      | 6.00           |
| Three adapters, two side, one tail.....         | 1.80           |
| Six-volt, 80 ampere-hour battery.....           | 15.50          |
| Two 6-volt, 15 candlepower headlight bulbs..... | 1.00           |
| Two 6 candlepower side light bulbs.....         | 1.00           |
| One 2 candlepower tail light bulb.....          | .50            |
| Bracket, pulleys and belt.....                  | 3.30           |
| <b>Total.....</b>                               | <b>\$66.60</b> |

and the five bulbs for \$2.50. The pulley, brackets and belt for the installation in mind, are listed at \$3.30, which brings the total cost of the equipment to \$66.60. No figures have been given on the wiring, but this would not be expensive. It is assumed that the motorist will install the dynamo himself, and as the attachments come complete and are designed particularly for the make of car utilized as an example, there is no reason why the work should not be entirely satisfactory.

As previously stated, the figures are approximations only, especially those pertaining to the lamps, battery, bulbs, etc., and as these are pro-

Front, Top and Side View of Installation of Wells Generator to E-M-F Motor and Side View of System Applied to Detroit.

duced by a large number of concerns it is very likely that they can be purchased for less money. It should be borne in mind, however, that inferior equipment is dear at any price.

**Kemco, Which Replaces the Fan.**

In the matter of reflectors and wires, one should be careful to select only those marketed by a reliable concern, for poor lamps and wiring will handicap the most efficient generator.

In selecting the battery, the capacity recommended by the maker of the dynamo must be observed, as his knowledge is founded on experience. Elsewhere in this issue will be found directions for properly installing and caring for the battery, also suggestions for its proper maintenance in and out of service. Specific data as to the size of bulbs to employ with each system will be supplied by the maker of the dynamo, who will also furnish a wiring plan for any number of lights, and for including the ignition and electric horn in the system, if desired.

One of the concerns making a specialty of lighting equipment is the Fisher Electrical Works, Detroit, a number of installations on used and standard makes of machines being illustrated. That for the Hupmobile "32" requires only the drilling of two holes at A for securing the support E. The mounting includes the hanger F, which is bolted to the cylinder head at H, and the supporting member referred to. Drive is by belt, a special pulley being supplied with the equipment, and the driving member is depicted at L.

A special pulley H is also utilized in the equipment produced for R-C-H motors. The dynamo is supported by a bronze bracket A, which is bolted on the side of the cylinder at L and secured to the crankcase at E by the bolts T,

an installation requiring the drilling of two holes in the bracket. Drive is taken from a large pulley, the belt passing over and contacting with the fan pulley.

The method of mounting the Fisher dynamo on Cadillac models of 1910 and 1911 is also illustrated. The equipment includes a brass base plate A and support B, these being supplied with all holes drilled and ready for fitting, also a special grooved pulley on the generator. It will be noticed that the belt utilized is employed for driving the fan as well. The illustration drawn to scale in the same drawing and at the right, depicts the Fisher generator installed on Overland models and the maker states that it has given satisfaction, is easily attached and without alterations. The company manufactures a number of pulleys and brackets for standard makes of machines.

The Dayton-Dick Company, Quincy, Ill., maker of the Da-Lite generator, states that it has made a large number of installations on used cars, and an accompanying illustration presents front elevations of model T and C Regal motors, showing the manner of fitting and driving the dynamo. The company has also installed its system on the following makes of cars: Mitchell, Oldsmobile, Amplex, Glide, Colby, Knox, R-C-H, Packard, Tribune, Abbott-Detroit and Pierce-Arrow.

It will be noted that the fan drive pulley is replaced by one designed to carry both the fan belt and silent chain driving the generator, energy being supplied by a sprocket on the crankshaft. On the Regal car the dynamo is driven at twice the crankshaft speed. It is not essential to drive at this ratio as the company winds armatures for engine speed drive. The brackets em-

**Showing Method of Mounting and Driving Ward Leonard Systems: Upper Row, Left to Right, Application of Motor Starter to 1911 Peerless; Dynamo on Ford and Renault—Lower Row, Renault, Cole and Palmer-Singer.**

ployed in mounting are aluminum in the majority of installations, well braced and are bolted to the engine, as well as the chassis frame. Slight deviations are made in fitting the generator, according to the model of car, etc.

The Dayton-Dick Company will supply blue prints showing the method of mounting and driving its product on any car and after Dec. 1 it will be in a position to furnish complete details. The Da-Lite is similar in appearance to a magneto, has an overall length of 11.40625 inches, 4.3125-inch width and height of housing 7.625. Its weight is about 35 pounds. In commenting upon fitting the used car with electric lighting, the company states that no one desiring the equipment need have any hesitancy, as it can be installed so as to give efficient service.

The R. C. Wells Manufacturing Company, Fond Du Lac, Wis., is making the Wells lighting system, adapted to used cars, also a motor

space prevents giving details of each installation, but the illustrations demonstrate the practicality of fitting dynamos to the used vehicle.

A lighting dynamo which differs from those described, in that it replaces the fan, is the Kemco system, which was fully described and illustrated in the Sept. 25 issue of The Automobile

Disco Motor Starter on Peerless.

Journal. An accompanying illustration shows its installation on a Packard car and the simplicity of the design is apparent.

The selection of a motor starter requires even more careful consideration than the lighting generator, and while it is not always as easy to fit it as the dynamo, there are several makers who produce a system adaptable to the used machine. Manufacturers of the electric motor starter differ on the subject, some stating that it is as easy to install as a dynamo, while others contend that it is a manufacturer's proposition exclusively. Two illustrations presented herewith show the application of two different makes to used cars, also a view of the Universal starter made by the Disco Company, Detroit, which concern is to establish agencies throughout the country.

The Disco starter is installed by removing from the crankshaft the member with which the starting crank engages. Drive is by worm gear.

The Rushmore Dynamo Works, Plainfield, N.

J., manufactures the Rushmore motor starter, which is adapted to used cars and, through utilization of a patented end throw of the armature, the maker states it can be installed easily on any motor and

Application of Rushmore Starter to Simplex Motor.

without alterations. The armature of the starter carries a pinion which meshes with the flywheel, the periphery of which is fitted with teeth.

Disco Universal Electric Motor Starter Designed Especially for Application to Used Automobiles.

starter. The dynamo was designed especially for the used vehicle; is driven at 2.5 times engine speed and the automatic switch cutting in or out the current to the battery is incorporated in the dynamo. This system has been fitted to a number of used machines and side, front and top views of mounting the dynamo on an E-M-F are shown. Drive is taken from a pulley on the camshaft. An installation on a Detroit is also depicted and the dimensions of the generator are given.

Five methods of mounting and driving the Ward Leonard automatic dynamo lighting system are illustrated, these giving some idea of how energy may be supplied through a silent chain. It will be noted that in two instances the pumpshaft was fitted with the driving sprocket. Another view presents the location and manner of driving an Auto-Lite dynamo, made by the Electric Auto-Lite Company of Toledo, O. Lack of

## MOLINE FEATURES KNIGHT MOTOR FOR 1914.

**F**OR some time it has been known that the Moline Automobile Company, East Moline, Ill., the officials of which are identical with those of the Root & Van Dervoort Engineering Company, was to incorporate changes in its 1914 design. The most pronounced is the adoption of the Knight sleeve valve motor, presenting a number of interesting features, the most noticeable of which is the utilization of a block casting, stated to be the first of its type produced in this country. Many refinements making for comfort, convenience and efficiency have been incorporated in the new chassis, which provides a longer wheelbase than the 1913 model, larger tires, wire wheels, new lighting and motor starting equipment, power tire pump, one-man top, etc. But one body is fitted, a streamline design, much lighter and roomier than this season's, and hav-

the entire length of the cylinder barrel, are completely surrounded with an unusually large water jacket. The cooling system presents a number of individual features of design and should insure efficient cooling. The cylinder heads are covered by a removable plate over the four cylinders, providing ample water space between the cover and head. Circulation is by thermo-siphon, a radical departure in the Knight motor. An equal flow of cooled fluid from the radiator is assured by the use of an intake manifold having two branches, one leading to the forward end and the other to the rear end of the lower edge of the cylinder block. The cooled fluid passes upward along the cylinder barrel, then around the intake and exhaust manifold, thence to the cylinder head and through the upper manifold or cover plate. The water headers are exceptionally

large in diameter. The cylinder covers are retained upon the cylinder by bronze nuts, eliminating opportunity for sticking.

As will be noted by an accompanying illustration, the cylinder head is a cone shaped cap with the spark plug located in its centre, extending into the combustion chamber to a depth of several inches. The space between the centre and sides of the cap are in the water circuit, so that the upper portions of the two reciprocating sleeves have water circulation on both sides

**New Moline-Knight, a Five and Seven-Passenger Touring Car, Fitted with Knight Sleeve Valve Motor, Wire Wheels, Electric Lighting and Starting.**

ing a capacity for seven persons, the tonneau being ironed for two extra seats.

The output of the Moline-Knight motor is ample to meet all requirements of service, the company guaranteeing it will develop 50 brake horsepower. It has developed 65 horsepower at 1800 revolutions a minute, at which point the tests were stopped on account of the limitations of the hydraulic dynamometer, although no indications were observable that the maximum power point was being approached. The rating appears to be conservative when it is considered that the Laurens-Klement car, made abroad, equipped with a Knight motor of the same dimensions, developed 74 horsepower at 2220 revolutions under test.

### Features of Cooling System.

Both the intake and exhaust manifolds are integral with the cylinders and they, as well as

of them, and the upper half of the spherical combustion chamber is also surrounded by cooling fluid. With the exception of the ports and their extreme lower ends, the sleeves are water-jacketed. It will be noted from the cross sectional view that the spark plugs are located in little wells, which extend through the water jacket. This, with the conical cylinder cap and concave piston head, provides a combustion chamber very nearly approaching the ideal.

### Adjustment of Magneto Drive.

Another noticeable feature is the design of the sleeves. These are provided with a skirt or shelf. The sleeve valves are actuated by connecting rods from the eccentric shaft, which is driven by silent chain from the crankshaft. The chain also passes over the sprocket driving the magneto and lighting dynamo, the former being mounted on top and the latter on the underside of a base plate

on the left hand side of the motor. This base is carried on a long pin which acts as a pivot, allowing the magneto and generator to swing about it as a centre. Any elongation of the chain is compensated for by moving the shaft carrying the magneto sprocket in or out. Movement is provided by a bolt and nut arrangement on the timing gear housing, and the dynamo chain cover has slots instead of bolt holes to permit of movement between this member and timing chain housing.

Sectional View of Moline-Knight Cylinder.

The Moline Automobile Company has taken advantage of the opportunities offered by the sleeve valve motor for large valve openings, and those of the new motor are twice as great in area as those in the present poppet type of engine, even with the latter having slightly larger cylinder dimensions. Both the inlet and exhaust slots of the Moline-Knight are 3.875 inches in length, while the height of the inlet is .5 inch and that of the exhaust .625 inch.

Special attention has been given to the bearing design. The crankshaft is two inches in diameter, with the front and middle bearings 2.5 inches long and the rear member four in length. The eccentric bearings are 2.3125 inches in diameter and the eccentric pins 1.125 by 1.25 inches.

#### Efficient Lubricating System.

The connecting rods are hollow, true tubular sections, having a .875-inch hole, which plays an important role in the lubricating system. The oil is forced at pressure varying from 0 to 20 pounds through drilled crankshafts and hollow connecting rods to each motor bearing. Pressure and circulation are maintained by a gear pump which takes the lubricant from the sump in the bottom of the crankcase through a screen, forcing it through a manifold, which extends along the crankshaft bearing plate the entire length of the motor and parallel with the crankshaft. At the three main bearings leads conduct the oil to the crankshaft bearings.

Oil slots are not utilized, all motor bearings being floated on a film of lubricant, a practise in vogue abroad. At the main bearings, holes drilled in the crankshaft lead the oil to the connecting rod bearings, which are floated in the same manner. Here the drilled hole in the crankshaft registers once every revolution with a hole in the upper portion of the connecting rod bearings, which communicates with the hollow connecting rod. The last named is filled with oil, which is released in the same way to the wrist-pin. The latter is not locked in place. It comprises a tube riding freely in the piston and retained only by the lower half of the bottom ring of the three piston rings utilized.

A lead is provided to the idler of the chain drive, it also supplying lubricant to the bearings of the magneto shaft. The maximum oil pressure, 20 pounds to the square inch, is obtained only with the throttle wide open. The supply, therefore, is automatic, being proportional to the speed of the motor. Regulation of the pressure is obtained by means of a three-way cock connected with the throttle control mechanism and through which the lubricant is forced after it leaves the pump. The top openings are graduated so that with the throttle closed, the cock discharges oil directly into the sump, allowing but little to enter the leads to the bearings. With the opening of the throttle, the supply to the sump is decreased and that to the bearings increased, and at maximum opening the entire output of the pump is forced to the bearings. This provides a proper supply of lubricant at all motor speeds and eliminates smoking.

The suspension of the fan is very novel, as will be noted by one of the accompanying draw-

Intake Side of Moline-Knight Engine, Illustrating Location and Operation of Motor Starter—The Small Lever Is Utilized for Starting.

ings. It is a combination breather pipe and oil filler serving as a base for the fan bracket. The fan is belt driven from a small pulley on the

crankshaft. A two-cylinder gear driven tire pump is mounted at the forward end of the motor. Immediately behind the fan pulley there is a small

**Front View of Moline-Knight Motor.**

spur gear, and an idler gear always in mesh with the gear on the pump crankshaft. This idler gear is so pivoted that, by means of a lever, which projects to the front of the car under the radiator, it may be swung into mesh with the gear on the engine crankshaft. This arrangement permits of utilizing the pump without lifting the hood. These gears are not in mesh except when tires are to be inflated.

A specially designed Wagner two-unit lighting and motor starting system is utilized. The generator is inverted on the magneto plates and driven by enclosed chain from the magneto shaft. The energy of the motor starter is applied to a steel ring gearing cut on the periphery of the flywheel, rotating it at a speed of 120 revolutions a minute. The system is a 12-volt, and the use of a three-wire lighting system permits use of six-volt lamps. The battery is a 12-volt LBA, 80 ampere-hour capacity, and is located under the front seat. The method employed for operating the cranking switch differs from conventional practise. Instead of a pedal closing the circuit and sliding the driving gear into mesh, a lever, similar to the usual gearshift member, but slightly shorter, is located beside the latter. Ignition is by a Bosch magneto, carburetion by a Schebler.

The Moline-Knight motor is noticeable for its cleanliness of exterior and this practise has been carried further than ordinarily. The power plant is a unit, the motor, cone clutch and three speed gearset being combined and supported at three points, a suspension early advocated by the Moline Automobile Company. The motor will be finished in gray enamel baked on above the crankcase, the latter being of aluminum.

The chassis details are similar to those of 1913, refinements being made. The rear springs are now half-elliptic, instead of elliptic; are of the underslung type and are shackled at the rear of

the frame. The axle is of the full floating type with wheels carried on double annular ball bearings. The rear construction is such that the axle shafts may be removed without disturbing or jacking up the wheels. The differential is suspended on roller bearings and adjustment is possible through the loosening of four bolts.

#### **Ample Braking Capacity.**

A pressed steel frame is utilized, with a drop over the rear wheels, bringing the body four inches nearer the ground than formerly and adding to the appearance of the car. The wheelbase has been increased four inches, being 128, while larger tires are fitted, these being 36 by 4.5 inches. The brake drums have a diameter of 16 inches and face of 2.5 and the emergency are of the expanding type fitted with a special lining applied to the inside of the drum. The service brakes are of the external contracting type. The fuel tank is now located at the rear of the chassis instead of under the cowl.

The new Moline-Knight body is very attractive in appearance. It is of the streamline design, fashioned after European practise, much roomier and lighter than the 1913 type. Viewed from the front it presents a continuous, unbroken curving line extending from the rear of the body to the radiator. The body line is not broken at the dash, and the rear part of the hood is flush with the cowl, so that there is no inset where the body and hood meet. The sides are high, being almost flush with the top of the back seats. The carrying capacity is ample for seven passengers and all of the five-passenger types are ironed for two extra seats.

The body is unusually well constructed and special attention has been given to prevent sagging and springing in service, which generally

**Exhaust Side of Moline-Knight Motor, Showing Method of Driving Magneto and Lighting Dynamo.**

result in sticking or ill fitting doors. Crowned fenders without rivets are employed. The Moline-Knight is fully equipped.

## HEATING THE GARAGE IN COLD WEATHER.

THE convenience of a heated garage appeals to all motorists. It not only prevents freezing of the cooling fluid and insures comfort when washing the car, but it makes possible easy starting of the motor. Storing a car in a cold, damp building results in deterioration. The finish is affected, the metal parts will tarnish and rust, and in low temperatures the lubricant will congeal, inviting mechanical troubles.

The Scientific Heater Company, 1125 Power avenue, Cleveland, O., has perfected a heater that will appeal to the motorist owning or leasing an unheated building. One of its qualities is that it requires no alteration of the garage building, such as installing boilers, etc., the fuel utilized being artificial or natural gas.

Owing to the fact that there is more or less gasoline vapor present in the garage, it is not practical to utilize any heating arrangement having an exposed or naked flame, as it is well known that the fumes of the fuel, being heavier than air, are present in clouds of vapor near the floor. The Scientific design embodies the same safety principles as the miner's lamp. It heats by the principle of air circulation; that is, it causes the air in the garage to circulate through the heater, up one side of the building, down the other, across the floor and again through the heater.

The maker states that the system is installed easily, the only expense being that of piping to the city mains, and that meter tests have shown that it is possible to operate it at a cost of a few cents a day. As will be noted by the accompanying illustration, which depicts the single type, a pilot light is incorporated, this being lighted at the beginning of the cold season and requiring no further attention.

Control is by a gas valve, it being a simple matter to regulate this to obtain the desired degree of heat. One of the features of the heater is the fire door, which may be locked to prevent its being tampered with. It is stated that the action of the system is very rapid, it being possible to raise the temperature from zero to a high degree in a very short time.

The design is very attractive, and, when mounted on brackets against the wall, that illustrated projects but 13.5 inches. It is 41 inches high and its body is 36 long—dimensions permitting of installation in garages where the space is limited. The front and back castings, and top and bottom reinforcing bars at the sides, are enamelled black. The sides are of extra quality

galvanized steel and all parts exposed to the gas fumes are of special acid proof iron. The company issues, free of charge, data on heating buildings of various dimensions, and both the single and double heaters are moderately priced.

The subject before the November meeting of the Detroit Section, Society of Automobile Engineers, was, "Shifting Gears by Electricity". Three papers were presented as follows: "A Specific Type of Electric Gear Shifter", W. A. McCarrell, chief engineer, Vulcan Motor Devices

Company, Philadelphia; "Electro-Magnets and Their Application to Gear Shifting", C. R. Underhill, chief electrical engineer, Acme Wire Company, New Haven, Conn., and "The Application of the Electric Gear Shift to the Haynes Car", Frank N. Nutt, chief engineer, Haynes Automobile Company, Kokomo, Ind.

S. D. Waldon, vice president of the Packard Motor Car Company, Detroit, accompanied by M. J. Budlong, president of the Packard Motor Car Company of New York, is enjoying an European trip.

## CONVERTIBLE BODIES AND ONE-PERSON TOPS.

**W**ITH the automobile being utilized for more extended travel during the entire year the manufacturer is providing comforts and conven-

The Springfield Metal Body Company, Springfield, Mass., has been specializing on the convertible type for years and its product is well known to the industry. The details have been carefully worked out and by standardizing the parts, the company is able to build quickly bodies to suit the different types of chassis. The Springfield is rattle, dust, water and weather proof; its sides have large openings without posts or framing to obstruct the view other than the framing around the glass, and the occupants of the rear seat have a clear view at all times. The doors are wide, making for easy entrance and exit, and the same space and conveniences are provided as are

**Springfield Convertible Body, Providing the Motorist with Open Touring or Fully Enclosed Type, an All-the-Year Design, Presenting Interesting and Practical Advantages.**

iences obtainable with other forms of modern transportation. The present body designs are in decided contrast with those of former years, when the occupants were subjected to draughts and many other inconveniences. One of the most interesting possibilities of body work is the convertible type, in that it provides the owner with an open touring body with top neatly folded out of the way, an ordinary canopy top, and a completely enclosed car with glass sides and door panels for winter use. It can also be made into a two-compartment design by the utilization of glass or curtains at the rear of the front seat.

In addition to the convertible idea, it has all of the advantages of the touring body and can be changed in a few minutes to the enclosed type, the placing of the glass frames taking less than three minutes, while two persons can lower the top without previous experience, other than that of knowing the method of procedure.

obtained with the limousine or enclosed types.

All bodies are made from sheet aluminum, with ash framing and steel forgings for body braces. The body top line is horizontal from the windshield post to the back upright. This top line is finished with a metal plate having a half-round rib extending lengthwise on the plate, and over this the rubber channel of the glass frames are guided and held in position.

The top structure is very light and the folding process is performed more easily than with conventional tops. As will be noted by an accompanying illustration, there are four windows on each side, or eight to a body, and four of these are permanently fastened to the doors by hinges. These hinges allow the frames to be revolved from the open to the closed position, and a spring tension constantly bears on the lever arm that locks the hinge in the two positions by engaging in a notch provided in the side of the hinge.

**Sharrer Patent One-Hand Top, Showing Method of Putting the Top Up—It is Retained in Position by Two Cables, and Straps Fasten the Front to the Dash.**

**New Scott Curtains: At Left, Fixtures Attached and Curtains Open; at Right, Curtains Drawn.**

All joints are screw retained, eliminating opportunity for rattling and the upholstery is in keeping with the comfortable design. The bodies are constructed both for touring and roadster cars and can be made to fit any standard chassis of modern manufacture.

#### **One-Person Tops.**

Tops quickly operated by one person make for convenience, and an accompanying illustration depicts the Sharrer patent one-hand top, made by the Sharrer Patent Top Company, New York City. It is attached to the body at only one point on each side of the rear seat, and in extending the top, the rear half is carried by two principal bows, which are supported by steel tubing, frames projecting forward and backward from the point of attachment at an angle, and by an intermediate bow secured to the rear main frame. The intermediate bow can be run from either the rear or auxiliary bows. Around the forward edge of the front extension is a frame with a hinge about the middle of its length. The forward fabric is supported by a bow hinged to the forward frame work and is braced by four short rods. It is, however, the flexible cable attached to the intermediate bow of the rear half of the top and running over two pulleys on the forward main bow, thence to the bow of the forward extension, which makes this construction possible. This invisible cable provides the top with support when extended and relieves the fabric of all strain.

When the forward straps are loosened, the top can be pushed back with one hand, as there is no weight to sustain, and the maker states that it is as easily put up. The Sharrer has a frame work of steel tubing and straight grained ash, and is finished as desired. The fabric is cravenette, pantasote or water proof mohair, and celluloid windows are fitted

in the sides and back. The maker claims it can be raised or lowered by one person inside the car and in less than 10 seconds.

The Simplex Specialties Company, Detroit, is marketing the Simplex top lifter, which has telescopic features and is adaptable to any top and car. It is made of seamless brass tubing, and castings are made to fit the socket on the front upright of the back bow, into which is inserted the front bow when the top is down. On account of the telescopic features the Simplex may be fitted to any car by drawing out the inner tube and inserting it into the body iron opposite the front seat. The lifter has a carriage with a tongue in which is a hole for inserting the front bow, and the operator after placing the lifter on the right hand side of the car, goes to the other side and operates the top much in the same manner as if he had a person on the other side. After the lifter has been used it can be removed and stored in the car. It is moderately priced and very compact.

Views are shown of the New Scott automobile curtains manufactured by the Star Storm Front Company, Troy, O. The fixtures are attached and removed instantly without leaving the car and all curtains are operated from inside.

**Simplex Auto Top Lifter, Attachment Permitting of Raising and Lowering the Top Easily by One Person, and Adaptable to Any Size Car.**

## MOTOR CAR HEATING SYSTEMS.

**B**Y UTILIZING some method of heating the motor car the discomforts attendant upon long rides in cold weather may be eliminated. Of

**Clark Indestructible Steel Heater with Drawer Removed to Show Brick of Fuel, Which Is Consumed Slowly.**

the systems marketed, the majority utilize either the heat of the exhaust or that of the motor, employing coils, registers, etc., for radiation. Generally the system can be installed easily and at a moderate cost.

### Clark Steel Heaters.

The Clark heater, made by the Chicago Flexible Shaft Company, Chicago, is well known to the carriage owner, having been on the market for a number of years. An accompanying illustration makes clear its construction, it being shown with the drawer removed and containing the brick of Clark carbon fuel. These heaters are constructed in various forms for motor cars and have indestructible steel bodies with ends nickel plated. The ends and sides are fitted with adjustable ventilators, permitting of regulating the heat. Brussels carpet, mohair and velvet plush are utilized for upholstering and in colors to match the finish of the car. The fuel is carbon, specially prepared and compressed into bricks, which are stated to yield a much higher percentage of heat than any other fuel. The maker claims that one brick will supply a strong and steady heat for a period of from 12 to 16 hours. The bricks come in cartons, each containing 12, and are inexpensive.

The Reynolds heater, manufactured by the Reynolds Dull Flasher Company, Chicago, is practically a register which is located in the foot-board of the car and which permits heat from the motor to pass to the front compartment. The maker states that a certain amount of fresh air is drawn in with the heat and that the system not only maintains a comfortable body temperature, but the feet are kept warm. The Reynolds is attached by a few screws and control of the heat is by a hinged shutter, which is reversible for convenience in installation and operation.

The Garrison heater, made by H. Garrison, Philadelphia, is adaptable to any type of body, although it is designed particularly for the enclosed car. It is constructed in three styles, for the right, left or the floor of the machine at the front.

When located in the front compartment it does not prevent access to the transmission, etc. The heater is easily installed, the register being fitted in the floorboard and connected to the exhaust by tubing. Regulation of the supply is by a two-way valve.

### Four-In-One.

The Auto Heater Company of America, 1148 Bedford avenue, Brooklyn, N. Y., is producing the Four-In-One heater, which is a complete equipment, and the maker claims it can be installed in 30 minutes. It comprises a register, to which the exhaust is conveyed by a flexible pipe, and a valve attached to the other end of the tube. The latter has an inlet and exhaust nipple, into which are set the ends of the exhaust pipe, a section of which is removed to fit the valve.

The heater valve contains a rotor, the blades of which are revolved by the energy of the exhaust, causing a port in the valve disc to register at regular intervals with the pipe leading to the radiator or register in the body of the car. This arrangement, the maker points out, allows a predetermined amount of heat to flow through the register, the lighter gases being utilized. The heavier pass on to the muffler.

Control of the valve is by a rod which may be carried to any convenient place for operation. The maker claims that back pressure is considerably reduced by the increased space provided for the expansion of the gases, and that the rotor muffles the sound of the exhaust. The radiators are constructed of a light metal and it is maintained that the car will be warmed within a few minutes after the motor is started. The Four-In-One may be installed in either the front or rear compartment, or both.

### American.

The exhaust is also utilized in the American, manufactured by the American Auto-Heater Company, Buffalo, N. Y. A special valve, controlled by a cable with a regulating member convenient to the driver, is placed in the exhaust line between the engine and the muffler. The exhaust passes through coils of radiating tubes, heating an aluminum register, thence to a separate miniature muffler, which is utilized to carry off all odor, etc., and as a silencer much in the same manner as the conventional muffler. The register is fitted in the floor, is 10 inches square and three deep, highly polished and perforated to allow the heat to enter the car. The temperature may be controlled by the driver or the heat shut off as desired.

### Detroit.

The Detroit, manufactured by the Detroit Auto Heater Company, Detroit, is another which employs the exhaust, but the installation includes a heater for the front compartment or driver, as well as the tonneau. A regulating valve is located in the exhaust line between the engine and muffler, and the heat passes to the forward radiator, thence to the rear member and back to the exhaust line. Flexible steel hose is utilized and all parts are aluminum or nickel plated. The radiator is neat in appearance, and the system may be installed easily. It is adapted to roadsters, as well as to the enclosed types of cars.

## TYPES OF PRIMING SPARK PLUGS.

ONE of the best known methods of starting cold motors is to prime cylinders by injecting a small quantity of gasoline or other highly volatile fluid into the combustion chamber through the petcocks. This pro-

The AC, manufactured by the Champion Ignition Company, Flint, Mich., differs from those above described in that a thumb nut is utilized, and the maker claims that a gas tight construction is obtained by a valve placed in such manner that the compression of the cylinder has a tendency to keep it shut. It is also stated that the plug has been tested with the thumb nut loose and the effect of the compression was sufficient to keep it gas tight.

A form of needle valve construction threaded into an extension of the shell, and controlling a passage communicating with an opening in the wall of the base, is the feature of the Champion priming plug, manufactured by the Champion Spark Plug Company, Toledo, O. The knurled head of the controlling valve is provided with a cup shaped recess, which communicates with the shell passage, permitting the fuel to flow to the cylinder.

The manufacturers of these plugs construct them in .5 inch standard, .875 A. L. A. M., and metric. They are also made with the hexagonal or threaded section, long or short, to conform to the various types of valve caps and motors. Special designs adapted particularly to the model T Ford motor are described and illustrated in the Ford section of this issue.

### J. H. S. SHOCK ABSORBER.

The J. H. Sager Company, Rochester, N. Y., well known maker of the Sager equalizing springs, bumpers and motor car specialties, has brought out a new shock absorber named the J. H. S., which is distinctly different from conventional designs. As will be noted by the accompanying illustrations showing the J. H. S. attached to the full and three-quarter elliptic types of springs, it comprises a pair of cylinders constructed similarly to those of the hydrocarbon motor in that a piston is employed. This piston acts in harmony with the coiled springs to destroy all shocks, automatically taking up all jars and jolts, regardless of whether the car be loaded or empty. All parts are substantial, fully protected from road dust and foreign elements, and emphasis is laid upon their durability.

The guarantee is unusually liberal, the J. H. Sager Company offering to replace free of charge any broken spring or its attachment within one year from the date of purchase. A special free trial offer is also made.

vides a rich mixture, one that will ignite easily, provided, however, too much fuel is not utilized. While the modern motor is fitted with priming cocks, there are a number of old cars, and a few new models, not thus equipped, necessitating the removal of the spark plugs.

The priming spark plug differs from the standard types in that means are provided for injecting fuel, and in some designs the hexagonal and threaded sections are made longer. Those of the petcock type permit the fuel to flow through a passage in the shell and to the sparking points, while in others the fuel is introduced by means of a passage in the shell itself.

One of the best known priming spark plugs is the All-In-One, made by the Frontier Specialty Company, Buffalo, N. Y. It comprises a priming cup with a lever, and one of its features is that it is perfectly gas tight when the lever is placed in a vertical position. It is utilized in the same manner as a conventional petcock in priming, and the capacity of the cup is such as to provide the amount of fuel necessary to insure an easily ignited mixture. In addition to being useful for priming purposes, the All-In-One may be employed for introducing a decarbonizer, and for locating a missing cylinder. It is produced in vertical and horizontal types and for every make of motor.

The Frontier Specialty Company also manufactures the Czar priming plug, the priming passage of which is controlled by the regular style of priming cup, which embodies in its construction a brass key ground to a perfect seat in the cup body. A heavy spring maintains tension and eliminates opportunity of leakage. The slip collar, which is threaded on the lower end of the cup, permits the use of ordinary spring connections, also wire or flat terminals, and can be screwed either up or down to conform to the thickness of the wire or terminal. The cup is made to fit the end of the ordinary gasoline can, so that the fuel may be injected directly through the hollow electrode into the combustion chamber. It is made in various threads.

The Red Head, made by Emil Grossman, New York City, and the Sharp, manufactured by the Sharp Spark Plug Company, Cleveland, O., utilize priming cups and in the latter the fuel flows down the inner wall of the secondary combustion chamber directly over firing points.

New J. H. S. Shock Absorbers Fitted to Three-Quarter and Full Elliptic Springs.

## CARE OF STORAGE BATTERIES.

Attention Cells Should Receive When in and out of Service, and Practical Tests That Will Insure Efficiency Without Deterioration.

**E**FFICIENCY with electric lighting or motor starting systems, as applied to the automobile depends upon the storage battery, and when it is considered that the electricity derived is due to chemical action and reaction, it follows that the cells must be given proper attention if satisfactory results are to be secured.

With the lighting and motor starting systems the charging of the cells is accomplished by the generator, and, as the battery is not removed except for repairs or in the event of an accident, the care of the cells must be assumed by the motorist or by the battery expert. It is not the purpose of the writer to discuss the construction of batteries,

other than to state that the lead type consists, briefly, of positive and negative plates, separators, sulphuric acid and hard rubber containing jars. The positive plates comprise supporting and current conducting grids, and active material in the form of red-brown lead peroxide, while the negative plates are similar grids and a peculiar amorphous form of metallic lead known as sponge lead.

During the discharge a reaction takes place, the plates absorbing sulphuric acid from the electrolyte and part of the lead sponge changes to lead sulphate. To secure maximum efficiency from the cells both of the elements must be maintained in good condition with the same charging treatment, because, apparently, treat-

ments which are beneficial to the positive are harmful to the negative, and vice versa. Conditions may be so adjusted, however, as to keep both positive and negative in perfect shape.

LBA Storage Battery.

One of the most important rules to observe in the care and maintenance of batteries is to keep the electrolyte at the proper height indicated by the maker. This

lever is indicated for an LBA battery, made by the Willard Storage Battery, Cleveland, O., in an accompanying illustration. Distilled water is vastly preferable, although clean rain water or melted artificial ice may be utilized. Distilled water is not expensive and the motorist is assured of a fluid free from all impurities. Inspect the battery once in two weeks in cold weather, adding the water as needed, and never allow the solution to get below the top of the plates. It is equally important to use clean vessels in replenishing the supply.

The best method to use in ascertaining the condition of the cells is to test the specific gravity of each with a hydrometer, and the readings should be taken before adding water. The instrument utilized is shown in an accompanying illustration, the electrolyte being drawn into it by compressing and releasing the bulb, thus drawing up the electrolyte until the hydrometer floats. The reading on the graduated stem of the hydrometer at the point where it emerges from the solution is the specific gravity of the electrolyte. An enlarged section is depicted, showing the float resting at 1.280, and denoting that the battery is fully charged. After testing, return the electrolyte to the cell.

The gravity reading is expressed in points. Thus, the difference between 1.275 and 1.300 is 25 points. When all cells are in good condition the gravity will test about the same (within 25 points) in all. Gravity above 1.200 indicates that the battery is more than half charged. Below 1.200, but above 1.150, indicates less than

Charging from Direct Current with Lamps for Resistance.

half charged. Gravity below 1.150 indicates that the cells are completely discharged or run down and that they should be recharged.

Never put acid or electrolyte into the cells to bring up the specific gravity, as harm may result. Acid should not be supplied except by a battery expert. A battery charge is complete when, with charging current flowing at the finish rate given on the instruction plate on the battery, all cells are gassing (bubbling) freely and evenly, and the gravity of the cells has shown no further rise during one hour. The gravity of the solution on cells fully charged is 1.275 to 1.300.

This recharging can preferably be done by running the engine until the specific gravity shows that the cells are fully charged. If this be not convenient it may be accomplished by means of a rectifier with an alternating current or by lamp resistance where direct current is available. The better method is to displace the battery and have it charged by the expert.

When charging from 110-volt direct current with bulbs for resistance, use the finish charging rate given on the name plate of the battery. This rate determines the number of lamps to be used

ing it a freshening charge at least once a month, but in addition it should preferably be given a thorough charge after a period of inactivity before it is replaced in service. This may be accomplished by operating the engine as previously explained. When not in service it is recommended that the leads be disconnected, avoiding any opportunity of leakage through short circuits due to chafed or defective leads of the wiring system.

Method of Locating Positive Wire of Charging Circuit.

Hydrometer Syringe for Testing Specific Gravity of Electrolyte.

as follows: One 32 candlepower lamp for resistance gives one ampere; one 16 candlepower, .5 ampere. For example: For an 80 ampere-hour LBA battery, the finish rate is five amperes and the cells will require five 32 candlepower lamps or 10 16 candlepower bulbs. To fully charge an empty battery by this method, leave it connected to the circuit for one period of 24 hours or two periods of 12, or until each cell gasses freely and shows a specific gravity ranging between 1.275 and 1.300.

In charging, care must be taken to connect the positive wire of the circuit with the positive of the battery. To ascertain the positive wire from the charging current, draw a little solution from a cell and place it in a clean tumbler with a strip of lead attached to each wire. Turn on the current for a few minutes. The strip of metal that turns brown is the positive wire and is connected to the positive post of the battery. Before charging, the cells must be filled with distilled water as previously explained.

A battery which is to stand idle, as during the winter months, should first be fully charged. It may be kept in condition for service by giv-

In storing a battery for the winter the maker of the LBA advises placing it where the temperature does not fall below 20 degrees above zero Fahrenheit, or maintaining the cells in a fully charged condition. For the benefit of users of lighting and motor starting batteries it may be stated that the electrolyte will not freeze with the cells fully charged in temperatures ordinarily met.

In caring for the battery in service it is im-

Cells Should Be Filled with Distilled Water to Line Indicated in Section View of LBA Battery.

portant that its exterior and the interior of the battery box be kept clean and dry. Keep the terminals and connectors coated with vaseline and remove any spilled electrolyte with waste moistened with ammonia. Metal articles should not be carried in the battery box. Do not bring a naked flame in proximity to the battery as during the gassing a very inflammable vapor is given off and some of it may be present in the box when chemical action is not taking place.

### PREPARES FOR BIG BUSINESS.

#### Haynes Automobile Company to Increase Production to 5000 Cars.

Announcement is made by the Haynes Automobile Company, Kokomo, Ind., that it is preparing to increase its production to 5000 cars.

**R. C. Hoffman, Chief Draughtsman,  
Haynes Automobile Company.**

The demand for the product of this pioneer concern is said to have been exceptionally large this season, and the company suggests that the adoption of the Vulcan electric gearshift has been one of the features which has been a deciding factor with the general public.

although it hardly will be contended that the popularity of the Haynes product is dependent entirely upon any one feature.

In order to prepare for increased business, President Elwood Haynes is adding to the sales and technical forces, and among the latest acquisitions is R. C. Hoffman, who until recently was identified with the J. I. Case Threshing Machine Company, Racine, Wis. Mr. Hoffman becomes chief draughtsman for the Haynes organization.

Other recent appointments include: L. C. Burnett, district sales manager in the Northwest, with headquarters in Minneapolis, who comes from the Peckham Motor Car Company, Dayton,

Batteries must be fastened securely, be accessible for inspection and for adding water, and the battery compartment should be well ventilated and drained. Free air space should be provided on all sides. The battery should rest on cleats, rather than on a solid bottom, and the holding devices should grip the handles. Covers, cleats or bars must not be utilized on the tops of the battery to retain it in position. All dirt, water and foreign elements should be excluded.

O., of which concern he was secretary and general manager; F. A. Fisher, at one time identified with the eastern Canadian distributor for the Stutz, who becomes Haynes district sales manager in the same territory with headquarters at Toronto, and J. S. Stark, a recruit from the Michigan Buggy Company's force, who represents the Haynes in Indiana, with headquarters in Elkhart.

### THE NATIONAL'S POLICY.

#### General Manager George M. Dickson Explains Its Essential Features.

Believing that the purchaser of motor cars, as well as the dealer, is vitally interested in the character of the company with whom he is doing business, General Manager George M. Dickson of the National Motor Vehicle Company, Indianapolis, Ind., invites investigation of the concern producing National cars. He adds that it is possible to purchase these machines as a complete, reliable unit, in which every mechanical part operates harmoniously to produce satisfactory results. He says:

The National is built on the series basis, every day beginning a new year. Improvements do not wait upon the calendar. Nor do we make changes for the mere sake of changing. We do not upset our manufacturing efficiency by forcing yearly models. We have no fundamental faults to disguise by changing body style, no more than we try to divert attention from quality by pointing to mere specifications.

Test the National for all you demand of a car. Buy it then, without the trouble of attempting to be an expert on every mechanical reason incorporated into the car's unit of construction. A single feature is good only in its relative position to all the rest of the car. We put the right material in the right place. Our experts devote their lives to this duty. We take that responsibility. You enjoy the results.

Representatives of more than 20 per cent. of the largest creditors of the Dean Electric Company, Elyria, O., whose claims amount to over 80 per cent. of the full indebtedness of the company, met in Cleveland, O., early in the month and appointed a creditor's protective committee, consisting of A. L. Garford, C. H. Gale, J. M. Lenz, C. E. Lozier and W. M. Pattison.

## PREPARATIONS FOR WINTER SERVICE.

The Attention Necessary to Insure That the Chassis Is in Condition for Continued Use, and Suggestions for Inspecting, Adjusting and Restoration.

THE preparation of the motor car for winter service involves, in addition to equipment making for comfort and convenience in operation, a partial or complete overhaul of the chassis, the extent of which will depend upon its condition, service expected, etc. The machine purchased in the spring may not require other than a general inspection and adjustment of parts, the removal of carbon and the grinding in of the valves. On the other hand, an old model may need considerable attention, including machine work and the replacement of worn parts with new. It should be borne in mind that certain components of the chassis are subjected to more severe stresses in cold weather than in the sum-

mer, and a set of automobile mechanical handbooks (published by The Automobile Journal Publishing Company) may be procured for a small sum, there is no reason why the new owner should not become thoroughly acquainted with the components of the motor vehicle and their relation to one another.

### Tools and Supplies.

Lack of space prevents enumerating the tools and supplies required. If the usual equipment is fairly complete, the addition of a wrench set or a set of S wrenches will suffice, but if larger and heavier tools are needed they may be obtained from a neighboring motorist or purchased. The supplies may be secured as required. The

Fig. 1.—Suggested Inspection of Chassis and Parts That May Require Attention in Preparing Car for the Road.

mer because of the condition of the thoroughfares traversed.

It is not presumed that the novice will be able to successfully complete a thorough overhaul of the chassis, but much of the work may be accomplished and those components requiring experience in adjustment may be left to the expert. In this connection it may be stated that it is possible to secure the services of a thoroughly competent workman who makes a specialty of repairing in the garage of the owner. With labor costing from 60 cents an hour upward, to say nothing of the helper, it is obvious that the owner can considerably reduce the cost of the overhaul by undertaking certain work. Inasmuch as the manufacturer generally supplies an instruction

necessary material, including new parts, may be listed during the disassembling and it is suggested that these be set down as the work progresses. It will save time, in that the new part may be ordered and received before needed.

### Removing the Body.

Before beginning the work it is advised that a thorough study be made of the various groups of the chassis and the instruction book will be of value in this respect. Assuming that the overhaul is to be very thorough, the first step is to wash the car, then strip it of all accessories, including those stored in the body compartments. Care for the top and curtains as outlined on page 56.

Before attempting to remove the body ex-

**Fig. 2—Components of Motor Lettered in Alphabetical Order to Simplify Work of Disassembling—To Reassemble, Reverse the Order.**

amine all ignition, lubrication, lighting, fuel, etc., connections located on the dash or body, marking them with tags for identification, and make sure that the body is free before lifting it from the chassis. With the fuel tank under the seat it will be necessary to disconnect at the unions and it is well to drain the container. The body may be lifted by a falls and tackle, or by several persons, and placed on stands, etc. Previous to this work, it is advisable to flush out the radiator with a soda solution or a marketed preparation. The work was described in detail in the Oct. 25 issue of *The Automobile Journal* and the preparation of anti-freezing solutions was also outlined.

After displacing the body roll the chassis out of doors for the cleaning process, if the garage be not equipped with a washstand. Grease and foreign deposits may be removed with a brush dipped in gasoline or a compressed air type of cleaner may be utilized, employing a fluid. These are not expensive and one can be made by taking a gallon can, fitting a tire valve, and attaching a tube and a nozzle having a

fine opening. Pressure is secured by using a pump and control is possible by fitting a petcock in the line. In cleaning the motor, cover the magneto, carburetor, lighting generator and motor starter.

### Removing the Power Plant.

It is assumed that the radiator has been drained. Next study the cooling system thoroughly before attempting to detach the pipes or separate connections. The illustrations at Figs. 1, 2 and 3 will be of value in this work, outlining as they do the components of the thermo-syphon and pump methods of circulation. If the equipment includes a dynamo and motor starter, the instruction book should be consulted, the wiring plan studied, and all leads tagged. It is well to be very thorough in the work, as it will save trouble in the assembly.

Next remove the radiator, and if it has been leaking, send it to an expert for repairs. Handle the cooler carefully as it is damaged easily. Examine all tubing, and if the layers of fabric are loose, make a note to purchase new piping. It may be secured at any rubber house and the old tube will be useful to obtain correct lengths, etc. If careful, the old clamps or wire may be utilized.

It is difficult to give other than general directions for removing the power plant as the construction varies. Some motors may be removed easily, while other designs will require a study of the method of retention. The unit type—the motor, clutch and transmission—is handled fairly

**Fig. 3—Components of the Power Plant Lettered to Simplify the Work of the Overhaul and to Show Their Relation to One Another.**

easily, especially when the gear shifting and emergency brake levers are incorporated with it. A careful inspection of the drive from the motor when the transmission is a separate unit, should enable one, with the aid of the instruction book, to free the engine from all driven mechanism. The object of removing the power plant to the motor stand is to facilitate the work of adjusting bearings, etc., but in the majority of overhauls the motor may be left in the frame.

For the benefit of those not familiar with the components of a motor and clutch, the chart presented at Fig. 3 will be of value. The illustration at Fig. 2 presents the exterior of a motor and it will be noted that the parts are alphabetically lettered to show the order of disassembly. Clean the work bench and its shelves and have a number of wooden boxes for the nuts and bolts removed from the motor, etc. Where possible, replace these members after disassembling the

Fig. 4—Unit Clutch of Multiple Disc Type and Transmission, with Components Lettered.

part as it not only will insure using the proper nut, but will save considerable time.

#### Disassembling the Motor.

To strip the motor of exterior components use the chart at Fig. 2. First, remove the spark plugs a, placing them to one side for inspection and cleaning, then take out the priming cocks b. The valve caps c may be removed with a special wrench and placed in order on the shelf of the bench for cleaning. Next, disconnect the pipe leading to the muffler. The water manifold f is retained by bolts d and by displacing the former carefully the gaskets may be saved. The exhaust manifold h is secured by nuts, one of which is shown at g, and in loosening these, slack each off a little at a time. Steady the manifold when removing and preserve the gaskets if possible.

The intake manifold i is similarly retained, but before loosening the nuts take out the bolts k, being careful not to exert undue strain upon

Fig. 5—Components of Leather Faced Cone Type of Clutch, Actuating and Adjusting Mechanism.

the pipe, and remove the carburetor. The manifold may now be displaced in the same manner as was the exhaust. The inlet water manifold m is now accessible and as it is retained by four bolts these can be taken out easily. To prevent injury to the fan o and to reach the timing gears this and the belt p are displaced by taking out the bolts n. The starting crank s having its bearing in the housing r, the bolts of the latter will have to be removed before the lower crankcase x can be separated from the upper member. By disconnecting the unions t and z the motor is ready for the removal of the cylinders.

#### Bearings, Etc.

Separate cylinders, those cast in pairs and triplets of the multitype should be marked to insure proper replacement before removal. This may be accomplished with a prick punch, and this tool will be found to be handy for other purposes. Individual cylinders may be removed easily by one person if careful, but pairs and triplet castings may require two, depending upon the strength and experience of the workman. Place the cylinders to one side for cleaning. Next remove the pan and drain the crankcase of old lubricant before removing the lower half. If the camshaft and crankshaft are to be removed, mark the bearing caps so that these will be replaced

Fig. 6—Illustrating Utilization of Flywheel Marks and Timing Diagram for Resetting the Valves.

Fig. 7—Conventional Internal Expanding and External Contracting Brakes and Components Requiring Attention.

properly. Note if the timing gears and crankshaft gear are marked; that is, prick punched. This insures correct replacement. If not, mark one tooth of the driving gear and two teeth of the driven member between which the first named tooth meshes. The adjusting of bearings may be accomplished by removing one or more shims, or it is possible they will require scraping. This is best determined by the expert. The large and small ends of the connecting rod and the wristpins will require attention and the method of adjusting will depend to a certain extent upon the bearing material employed and the construction.

#### Removing Piston Rings.

The removal and replacement of piston rings may bother the novice. Being fragile the rings must be handled carefully. By slipping three strips of tin or hacksaw blades between the rings and piston, and at points equidistant, the top ring may be removed easily and the others in order. To replace, reverse the order. In cleaning the cylinders, plugs, valves, piston and rings, an old

Fig. 8—Showing Parts Employed in Eliminating Back Lash of Steering Gear and Lost Motion.

knife may be employed to advantage. Smearing the parts with a mixture of graphite is recommended, as carbon will not stick as easily as to a rough surface.

With the cylinders on the bench or floor, it is an easy task to compress the valve springs, remove the retaining member and displace the valves. It is best to grind in the valves of one cylinder at a time. Do not take out all the valves at a time unless they are marked, as they are easily mixed. If not familiar with grinding, it is best to utilize a screw driver and a fine abrasive, which may be purchased or made. The finest of carborundum mixed with oil is a rapid cutter, but care should be exercised by the novice, and it is well to employ plenty of oil. Wash thoroughly with gasoline before assembling the valve mechanism.

#### Replacing the Cylinders.

Replacing the cylinders will bother the novice and it is advisable to have assistance. The rings must be so spaced that their slots do not register, and it will

be necessary to compress them before the cylinder can be slipped on. By using a clamp constructed of sheet metal, or winding the ring with stout string, the desired compression may be obtained and the cylinder slipped over the top ring, and the balance in order. Before replacing the cylinder lubricate well the rings, piston and cylinder walls. All bearings should receive similar attention. The writer obtains excellent results by smearing the valve caps, valve stems and tappets with a mixture of oil and graphite before replacing these members. The replacement of the exterior components is accomplished by reversing the alphabetical chart at Fig. 2.

Fig. 9—Stuffing Box for Leaky Valve Tappets.

Before replacing the cylinder lubricate well the rings, piston and cylinder walls. All bearings should receive similar attention. The writer obtains excellent results by smearing the valve caps, valve stems and tappets with a mixture of oil and graphite before replacing these members. The replacement of the exterior components is accomplished by reversing the alphabetical chart at Fig. 2.

#### Lubricating System.

All components of the lubricating system should be thoroughly cleaned and special attention given to the screens or filters, as these are likely to be more or less clogged if the oil has not been strained. All unions and connections ought to be inspected as the cause of former leakage may be discovered. The lower crankcase will require a thorough washing with gasoline before replacement, and if a gasket is employed it

may be necessary to make or purchase a new one to insure an oil tight crankcase. In replacing gaskets, especially those employed with the intake and exhaust manifold, care must be taken to prevent leaks, for auxiliary air will affect the operation of the motor with the intake and cause a hissing noise with the exhaust. In setting up the nuts or stirrups retaining these pipes, tighten gradually, and make sure the manifolds are aligned. They may be tested, as can the fit of the spark plugs, by using oil or, better still, a solution of soap and water, as bubbles will be given off if the parts are not tight.

#### Timing the Motor.

If the gears are, or were, marked as previously explained, the timing or opening and closing of the valves will be a simple matter to check. The marks on the flywheel are generally utilized, and these are denoted by figures and letters, which may be as shown in the table herewith.

An arrow or indicator is generally provided,

**Fig. 10—Components of the Steering Linkage Should Be Thoroughly Inspected and Lost Motion Eliminated.**

or the centre mark may be on the last cylinder, as shown at Fig. 6. To check the timing, rotate the flywheel until the mark I O 1 2, for example, coincides with the mark or arrow and the intake valve of the first cylinder (that nearest the radiator) begins to lift. It may be late or early, which can be determined by rocking the flywheel back

E O, exhaust valve opens.  
E C, exhaust valve closes.  
I O, intake valve opens.  
I C, intake valve closes.  
1, 2, 3, 4, 5 or 6, number of valve.  
C, centre.

or forth. If out of time, loosen the check or locking nut and screw the tappet in or out until the valve starts to lift with the marks coinciding as explained. If correct, rotate the flywheel until the mark I C appears and adjust the tappet if necessary. The exhaust valves are checked in a similar manner. If the camshaft has been removed and the gears are not marked for identi-

fication, the degrees will have to be marked off and the factory timing plan utilized. The camshaft is replaced so that the intake cam of the first cylinder starts to lift the tappet and valve, and in accordance with the timing plan. Instructions for timing the magneto and adjusting the carburetor are given elsewhere in this issue.

**Fig. 11—Adjusting Members of Roller Bearings.**

#### Clutch and Transmission.

With some types of power plants, dismantling the clutch is an easy matter, while with others more experience is required. With cone members it is essential that the spring be compressed and secured or allowed to expand fully. With the internal type, and after the spring is compressed, the clutch ring or female member can be removed and the spring gradually released. Those who have never taken down a clutch should treat the spring cautiously, especially if it be a strong one. With a multiple disc, flat plate or internal expanding clutch, a study of its construction will best determine how to proceed. Although the planetary type is not prevalent, a word will not be amiss. If fitted to the four-cylinder motor it is secured to the flywheel by bolts and nuts. On some types of two-cylinder cars it is attached to the engine shaft and will have to be removed with this member when dismantling the motor.

#### Types of Clutches.

A conventional type of cone clutch is shown at Fig. 5 with the components utilized in adjustment, etc., lettered. The multiple disc should be cleaned by washing the plates, etc., with kerosene, and if adjustment has failed to correct the trouble, the plates may be burred and need attention. The transmission requires the services of an expert, but the novice can remove all lubricant and inspect the gears, bearings, shifting forks, etc. If only slight adjustments are necessary, these may be made by observing the directions of the maker. If gear shifting troubles have been experienced, a thorough examination of the bearings, gears, etc., should reveal the cause of trouble. Sometimes, with the cone type of clutch, failure to effect a gear shift is due to the bearing being worn and allowing the cone to touch the flywheel. Shifting collars and all

**Fig. 12—Shimming Ball Bearings.**

## CARE AND MAINTENANCE OF TIRES AND TUBES.

**E**VERY motorist desires to obtain at least the guaranteed mileage from his tires, but, despite the fact that the manufacturer conducts an

Illustrating Steps in Folding Inner Tubes for Carrying in the Car or for Storing.

educational campaign, many owners fail to secure maximum service because of lack of attention to the small details making for efficiency. It is important that the instructions of the maker be followed as carefully in the winter as in warm weather, because the casings are subjected to severe service when traversing over rough, frozen roads. Ice and snow invite more or less skidding, subjecting the walls of the shoe to sudden stresses, and moisture, a resultant of friction in cold weather, causes deterioration of the fabric if cuts are not vulcanized.

### Inspecting the Equipment.

The inspection of the tire equipment should be very thorough. By this is meant that each shoe ought to be removed from its rim, carefully examined inside and out, and all cuts vulcanized, as well as weak places backed up. The low cost of vulcanizers and their simplicity of operation has led many owners to perform this work, thereby effecting a considerable saving in tire upkeep expense.

Inner tubes should be overhauled, those with punctured walls repaired and any having faulty valves fitted with new. The tube bag or container should be cleaned and in repacking the tubes they should be sprinkled well with talc or soapstone. In an accompanying illustration are shown, in alphabetical order, the steps necessary in folding the tubes, the valve being removed during the operation depicted at A and B to permit displacing of the air.

### Cleaning the Rims.

Much of the trouble experienced in changing shoes is due to neglecting the rims. As it is not a pleasant task to change a shoe in freezing tem-

perature or in the snow, it is best to clean the rims and their components thoroughly, then coat the parts with a mixture of graphite and oil. Smooth all rough parts with a file if necessary, then use sandpaper or emery cloth to remove all deposits. Next, prepare the graphite, using the powder grade mixed with enough oil to give a consistency of paste. Smear the rims and their components liberally, then wipe off with a piece of waste. This will leave a glass like surface, filling all pores of the metal, and make the changing of tires a simple matter. Thomas' anti-rust paint, the base of which is graphite, may also be used. Either mixture will resist the action of moisture.

### Putting Tires Away.

If the car is not to be used, it is best to remove the tires, having all cuts repaired before cleaning them. Use a good grade of soap and warm water, washing the exterior carefully, and dry thoroughly before covering. Tire covers may be employed or the casings wrapped with paper, which may be obtained from any tire dealer. The object of covering the shoe is to prevent the air reaching the compound. In storing the casings they should be placed where the temperature is fairly even. It should not be too cold or too warm. Inner tubes can be stored in the tube bag or wrapped in paper.

### Use of Tire Chains.

If tire chains are employed they should be properly adjusted. If they are fitted too snugly

Casings to Be Stored Should Be Cleaned Before Wrapping to Remove Oil and Foreign Deposits.

the tread is apt to be damaged. They should have a certain amount of movement to obtain best results.

## WITH THE CYCLECAR MANUFACTURERS.

### American Cyclecar Company Makes Public Constructional Details Concerning Its New Trumbull Model--Still Another Design Announced from Detroit.

**F**OLLOWING the announcement that the American Cyclecar Company, originally formed in Detroit, had passed into the control of the Connecticut Electric Manufacturing Company, Bridgeport, Conn., and that the new vehicles would be produced in the latter city, those interested in the cyclecar branch of the industry have anxiously awaited detailed particulars of the machine itself. It is to be known as the Trumbull, and it is described briefly by its maker as a completely equipped four-wheel light car. Accompanying illustrations reveal the features of design and construction.

It will be noted that the body is designed

ter-cooled, en bloc, L head unit, with mechanically operated valves and with bore of 2.875 inches and stroke of four inches. This gives a rating of 13.25 horsepower under the S. A. E. formula, and the maker's rating is 14-18 at nominal speed. Lubrication is by pump and splash. Ignition is by Unisparker with automatic spark advance, current being supplied from a storage battery.

Power is transmitted through a propeller shaft to a friction disc located under the seat. The driven friction wheel is carried on a jackshaft, fitted with sprockets carrying roller chains which deliver the power to the rear wheels. Four speeds forward and reverse are provided, as is customary with cyclecar practise in this country, the several speeds being controlled by the one hand lever at the left.

Standard contracting friction brakes operate on the rear wheel drums, these being actuated by pedal, and the friction transmission may be utilized as an emergency brake. Springs are of specially heat treated steel, transverse semi-elliptic both front and rear. The axles are of special forged steel and dropped steel forgings are used for the knuckles and steering arms. The frame is of pressed steel, channel section.

Wheels are of wire, special design and quick demountable. They are equipped with 28 by three-inch clincher tires, and any wheel will fit all hubs,

front and rear, and on either side. When an extra member is supplied, this is carried on the left running board. The hubs are of special pressed steel, and the wheel may be removed without disturbing the bearings. Patents are pending on the design throughout.

The electric lights at the front are carried at the forward end of the fenders, and are provided with a special arrangement for dimming, this being controlled by a switch from the seat. The rear lamp also is electrically lighted. The mechanical motor starter is operated from the seat. The electric horn is operated from the storage

**Plan and Side Views of Trumbull Cyclecar Chassis, Also General View of the Completed Vehicle.**

along Continental automobile lines, and seats two passengers side by side, the driver being located at the left with the one hand lever conveniently placed at his left. The wheelbase is 80 inches and the tread 44. The weight is approximately 650 pounds. The car comes completely equipped with top, side curtains, windshield, electric lights, motor starter, electric horn, oil gauge, jack, tire pump and tool kit. At a slight additional cost a spare wheel with hub cap and tire, 60-mile speedometer and dash automobile clock are supplied as well.

The motor is a four-cylinder, four-cycle, wa-

**Mercury Cyclecar with Engineer C. E. Barton at the Wheel and His Assistant, H. J. Woodall, as Passenger.**

battery. The speed of the car is given as 45 miles an hour and the fuel consumption, 35 miles to the gallon.

### MERCURY FROM DETROIT.

The Mercury Cyclecar Company, Detroit, reports that it has leased the factory formerly occupied by the Tribune Motor Car Company, at 807-815 Scotten avenue, and that contracts are being let for material which will permit the construction of 3000 Mercury cyclecars during the 1914 season. It is stated that experimentation has continued throughout a long period and that the new machine is offered as a thoroughly practical vehicle in every respect.

Accompanying illustrations reveal the general appearance of the car, and it will be noted that the two passengers are seated tandem. The body lines are distinctly new, as applying to American cyclecar design. The wheelbase is 100 inches and the tread 36. The weight is not given in the preliminary announcement.

The motor is a DeLuxe, twin-cylinder, air-cooled V type unit, with bore and stroke of 3.5 inches, rated by the maker at 9.8 horsepower. The cylinders are cast singly and the piston displacement is 70.1 cubic inches. This is located crosswise of the chassis under the hood. Ignition is by Bosch magneto, carburetion by a Schebler, and lubrication by splash with gravity feed.

Power is transmitted by shaft and friction disc to a friction wheel on the countershaft under the driver's seat, from which point it is conveyed to the rear wheels by two V belts. Underslung springs are utilized

both front and rear, the former being transverse semi-elliptic and the latter of the cantilever type. Crowned fenders are provided on both the front and rear wheels, these being attached to the wheel hubs instead of the body. The wheels are of wire with ball bearing hubs. Tires are 28 by 2.5 inches, with non-skid tread.

The body is of metal, with wood frame, and the equipment includes three lamps, tire tools, pump and tire kit. The gasoline tank, with capacity of five gallons, is carried in the cowl of the dash.

The Mercury Cycle Car Company has been incorporated under the laws of Michigan with a capitalization of \$50,000. The following are the proposed officers: President, W. J. Marshall; vice president, R. C. Albertus; secretary, C. E. Barton; director, H. J. Woodall.

Sales Manager Redden of the Maxwell Motor Company, Detroit, is unable to foresee any difficulty in placing the product of that concern during the 1914 season. He returned from a trip throughout the Middle West recently, the main object of which was to satisfy the dealers in that section without materially changing the production plans of the company.

His first stop was in Minneapolis, where he supervised the equitable distribution of a train load of Maxwell cars consigned to the dealers in the Northwest. He declares that every man in the party wanted twice as many machines as the company was prepared to deliver to them, and the same conditions are reported elsewhere.

**Three-Quarter View of the Mercury Cyclecar, Presenting Front Spring Suspension, Etc.**

## CONTROLLING GAS LIGHTING.

THE convenience of controlling the lights from the seat is appreciated by motorists. Not only is considerable time saved when it is

Fig. 1—Components of Prest-O-Liter, Gas Lighting System Controlled from the Seat: A, Automatic Reducing Valve, Maintaining Proper Pressure; B and D, Controller for Headlights and Five Lamps; C, Adapter for Converting Oil into Gas Units; E, Insulated Burner.

possible to light and extinguish the lamps by pressing a button, etc., but when the control of the groups includes a dimming device, economy is effected.

The Prest-O-Lite Company, Inc., Indianapolis, Ind., is manufacturing a lighting system that fulfills the above requirements and a feature is that it may be installed by the owner at a moderate cost. With this system the headlights can be lighted, extinguished, dimmed, etc., from the seat by simply turning a knurled knob and pressing a button on the controller member, which is compact and located on the dash. One of the advantages of the equipment is that the different groups of lights may be used as desired; for example, the head and tail for country driving, and the side and tail for city work.

### Components of System.

The Prest-O-Lite equipment is made in three styles, the No. 2 being for the headlights only, the No. 3 for the head and tail lamps, and the No. 5 for all lamps. The equipment is very complete, including as it does the controller, vibrating coil, automatic reducing valve, burners, seamless brass tubing, insulated wire, lamp cord, rubber hose and unions for connecting the tubing. The length of the tubing, wire and cord varies according to the number of lights utilized.

The reducing valve, Fig. 1, automatically reduces the pressure of the gas in the Prest-O-Lite tank to two ounces. It is fitted as shown, requires no attention after being attached, and in-

sures the flame being at the proper height regardless of whether the tank is full or nearly empty. This saves walking to and from the lamps after lighting, and the gas valve may be opened as many turns as desired without affecting the pressure at the burners.

### Operation of Controller.

The controller, which comprises a push button and distributing valve, is mounted on the dash or in any other convenient place. It is made in three styles, that shown at Fig. 1 D, being for headlights only, while that depicted at B is for controlling the head, side and tail members. It is also made for head and tail.

The operation of the controller is very simple. When use of the lights is desired the valve is turned and the button pressed. This causes a spark to occur at the burner, igniting the gas. The headlights may be dimmed by a slight turn of the controller to a notch provided for that purpose. With this arrangement, the headlights may be used in cities where the ordinances prohibit the use of glaring headlights. The side lamps could be dispensed with.

### Lighting Device.

The lighting device is shown at Fig. 1 E. It consists of an insulated burner tip, to which is connected a lead from dry cells and the usual ignition battery may be utilized if desired. The system is simple and practical, being similar to that for house gas lighting, which has been in vogue for years. The low-tension current of the cells is intensified by a small vibrating coil.

When the side and tail lamps are to be converted into gas units, an adapter is supplied, this

Fig. 2—Showing Simplicity of Installation, Method of Piping and Location of Controller.

being shown at Fig. 1 C. A small hole is drilled in the side of the lamp and the adapter inserted and locked by nuts. The work may be accom-

plished without difficulty by the owner.

The simplicity of the installation is shown at Fig. 2, which depicts the Prest-O-Liter for head-

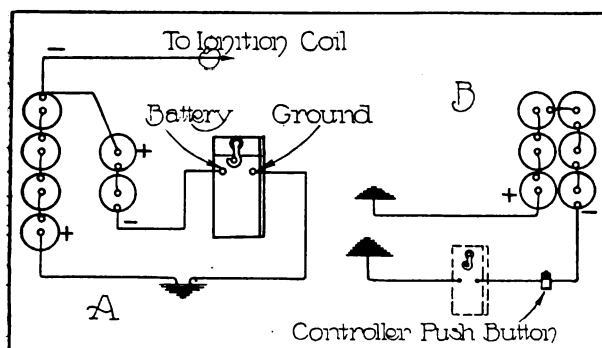

Fig. 3—Wiring Plan of Prest-O-Liter System: A, Diagram for Adding Two Cells to Four-Cell Ignition; B, Primary Side of Spark Coil.

lights only. One tube is led from the reducing valve to the controller, thence from another connection to the lights. When the car is piped for the headlights it would only be necessary to pipe to the controller and to the main line.

#### Wiring Plans.

The wiring plans are shown at Fig. 3. That at A is a diagram for adding two cells to the ordinary four-cell ignition system, and it will be noted that the wiring is in series and that two grounds are made, the usual from the four cells and the second from the coil. The positive of the larger set is connected to the ignition coil and the negative to ground, and the positive of the auxiliary cells to the negative of the other set. The diagram at B depicts the primary side of the spark coil with six cells employed and with the push button of the controller in circuit. The wiring plan of the secondary circuit with a group of five lights is shown at Fig. 4, and it will be observed that it is very simple.

#### Burners.

The Prest-O-Lite Company recommends the use of .125-foot burners for the side and tail lights and gives option of different sizes for the headlights. The equipment comes complete with detailed instructions for installation and the different styles are carried in stock at the numerous branches maintained by the company.

### THE LINCOLN HIGHWAY.

#### Decided Activity Indicates Enthusiastic Support of the Project.

The Lincoln Highway Association, Detroit, reports that special celebrations were held in over 2000 cities, towns and villages along the pro-

posed route of the Lincoln memorial highway between New York and San Francisco, Oct. 31, the date selected for the formal ratification and dedication of the plan. It is also stated that the proposition was brought directly to the attention of the people by several hundred clergymen during sermons on the life of Abraham Lincoln, Nov. 2.

Special effort has been directed toward increasing the amount of subscriptions to the fund of \$10,000,000, held to be needed for the proper construction of the cement highway, in several sections of the country, and contributions are being received from many sources well removed from the actual route selected. Among these latter may be mentioned one from A. H. Stanley, managing director of the London General Omnibus Company, Ltd., London, England. It is proper to state, in this connection, that Mr. Stanley formerly was a resident of Detroit and served on the U. S. S. Yosemite during the Spanish-American war.

One result of the dedicatory celebrations is that a large proportion of the route has been marked by the official copyrighted marker of the association, which comprises a strip of red three inches wide, a band of white 16 inches wide and a strip of blue three inches wide. On the white band is a large letter L with the word Lincoln above and Highway below.

The Stewart-Warner Speedometer Corporation, Chicago, announces the establishment of nine new direct factory branches, in charge of the company's own district sales managers and a corps of expert, factory trained mechanics, for Stewart and Warner speedometers, in the follow-

Fig. 4—Wiring Plan of Secondary Side of Prest-O-Liter System, Showing Connections of Coil and Leads to Lamps.

ing cities: Philadelphia, Pittsburg, Atlanta, Portland, Los Angeles, Kansas City, Minneapolis, Cincinnati and St. Paul.

## STARTING MOTORS WHEN COLD.

### Systems Supplying Additional Fuel Direct to the Cylinders or Increasing Carburetion from Exhaust or by Electric Current.

**E**LECTRIC, mechanical and compressed air types of motor starters have not wholly solved the starting problem in cold weather, for under certain conditions, extreme low temperatures for example, the mixture must be enriched to obtain the explosions necessary to warm the cylinders. While it is possible to augment the fuel supply or decrease the air with the modern carburetor, and from the seat, accessory makers have brought out a number of devices for this work and particularly adapted to motors not fitted with priming attachments, etc. The majority provide means for introducing fuel into the intake pipe, either plain gasoline or a vapor; others vaporize the liquid by electricity or hot air, and some combine both priming and fuel saving features. In the majority of installations the control unit is mounted on the dash, convenient to the operator.

#### Ideal.

The Ideal, manufactured by the Auto Accessory Company, 2124 East Washington street, Indianapolis, Ind., is a primer, the container being located on the dash and having a petcock and plunger. The last named is utilized for forcing the fuel to the intake manifold and for breaking it up into a spray. To use, the petcock is opened, allowing the fuel to flow through a tube, and the plunger employed as stated.

#### Gilson.

The Gilson, made by the Gilson Motor Starting Company, 1409 North Illinois street, Indianapolis, Ind., is a primer and fuel saver, comprising a fuel container mounted on the driver's side of the dash and having a controlling handle. The

priming fuel is fed by gravity to the intake pipe through a tubing and is vaporized by the heat, another pipe being coiled about the exhaust manifold. The suction of the piston draws the hot air directly into the intake manifold, the heat not only augmenting the flammability of the mixture, but converting into vapor any particles of raw fuel. The dash vessel holds sufficient fuel to make a large number of starts, and control of the priming fluid is by a needle valve.

#### Nelson.

The A. Nelson Manufacturing Company, Chicago, is marketing a primer which is of the dash type, but differs from those described in that a sight feed device is incorporated, enabling the operator to note the amount of priming fluid fed to the intake pipe. Control of the supply is provided and the equipment includes tubing, etc.

#### Indiana.

The Indiana primer, manufactured by the Indiana Equipment Company, 1201 State Life building, Indianapolis, Ind., comprises a nickel plated half-pint reservoir for mounting on the dash, suitable length of tubing and connection for the intake manifold. A needle valve is provided to control or regulate the mixture obtained with the primer, and the maker states it can be installed in 15 minutes.

#### Brown-Maddock.

The Brown-Maddock starter is the product of the Brown-Maddock Company, West Newbury, Mass., and varies from the usual intake pipe primer in that it is operated from the front of the car, much in the same manner as the carburetor is flooded by depressing the float. The

primer and container are mounted as a unit on the dash under the hood, and actuating the connection primes the intake pipe. Lack of space prevents giving other than an outline of the starter.

#### Auto Dashboard Primer.

The Auto dashboard primer marketed by the Ideal Brass Works, Indianapolis, Ind., is six inches high, weighs one pound and comes with 26 inches of .125-inch copper tubing and connections. The device is mounted on the dash and the flow of fluid to the intake pipe is regulated by a needle valve. It comes in nickel, polished brass or gun metal finish.

#### Savegas.

The Savegas, marketed by the Housel Manufacturing Company, 207 Livingston building, Rochester, N. Y., is made in two models. That illustrated is the model A and comprises two separate chambers, one for storing a priming fluid and the other a decarbonizer. In addition to its priming feature it is claimed that it will save 15 per cent. of the fuel and that starting is made easy in cold weather.

#### McVey Start-O-Speed.

The Start-O-Speed, produced by the McVey Manufacturing Company, 16 Canal street, Dayton, O., utilizes the exhaust for forcing the fuel to the intake pipe. The priming fluid is controlled by a lever member which is connected to the hot air cock and after the initial explosion the heat vaporizes the fuel, and a rich mixture is fed to the cylinders until they become warm. The device is provided with a charge indicator, a gasoline chamber and a reserve charge compartment.

#### Volcano.

The Volcano, made by the Volcano Electric Primer Works, Virginia, Ill., not only feeds the fuel to the intake pipe above the carburetor, but vaporizes the fluid by electricity. The font containing the priming material is located under the hood, and the valve member, incorporated with

the container, extends through the dash to the driver's side. The construction of the primer is such that one teaspoonful will supply a mixture sufficient to turn the motor over 150 times, it is claimed, and the font is said to have a capacity of 150 primings. The pressing of the valve button permits the proper amount of fuel to pass to a plate in the intake member, where it is vaporized by the heat of the current supplied by dry cells or a storage battery. Control of the current is by a special switch. The maker points out that it is a simple matter to repeat the primings in very low temperatures until the motor is warm.

#### Weld Extra Jet.

The Weld extra jet was illustrated and described in detail in the Oct. 10 issue of The Automobile Journal. The priming operation is consummated from the seat and differs from the usual methods, in that the fuel is taken from the float chamber of the carburetor, mixed with air, and supplied to intake pipe in proximity to the cylinders. The size of the jet is approximately .75 by 3.5 inches, and connection from it to the control member is by a small brass chain. It can be attached without soldering, only two small holes being required for an .125-inch pipe. In addition to making for easy starting it is pointed out that the adjustment of the carburetor will not require changing to enrich the mixture.

A meeting was held in the Hotel Ten Eyck, Albany, N. Y., Nov. 20, for the purpose of organizing the New York State Automobile Dealers' Association. Representatives were present from a large number of the local dealers' associations in the state. The objects of the new association include the preparation and introduction of bills for the better protection of motorists, and to assist in any way possible to establish good roads, etc.

# ADJUSTING AND TIMING THE MAGNETO.

MANY owners who are capable of overhauling the power plant hesitate to disturb the magneto, regarding the construction and operation of the instrument as mysterious and requiring the services of an expert. It is a simple matter to clean, adjust and retim after displacement from the

Fig. 1—Wiring Diagram of Four-Cylinder Magneto.

motor, and if the car has been in service for some time, it is advisable to give the magneto attention. For the benefit of those not familiar with the work, the accompanying illustrations and suggestions will be of value:

## Components of Breaker Box.

One of the most important components of a magneto is the breaker box, the mechanism of which interrupts the primary current, and in this connection it should be stated that with the majority of instruments the mechanism serves for both the magneto and battery current. As the spark is supposed to occur at the same instant the break takes place it is obvious that faulty operation of the parts will result in inefficiency in that the spark will be too late, making starting difficult, or it will not completely burn the charge in the cylinders.

Conventional circuit breaker mechanism is shown at Figs. 2 and 3, the latter presenting that utilized with a Bosch Instrument. The cover is removed by pushing the spring member to one side as indicated in the drawing. With this type of magneto the circuit breaking mechanism is secured to the armature shaft revolving with it. The break is obtained by two platinum points, one a fixed member, the other secured to a pivotally mounted lever. At one end of the lever will be noted a fibre block member, upon coming in contact with the steel segments, depresses the lever, causing the movable platinum point to separate from the fixed point.

The breaker box of the Splittorf shown at Fig. 2 differs in that the breaker mechanism is practically fixed, being secured to the breaker box proper. The principle is similar to the one just explained, differing in that a cam secured to the armature shaft lifts the lever or bar carrying the movable platinum point. The Remy also employs a cam for separating the contact points, but the

Fig. 2—Components of Breaker Boxes of Conventional Magneton, Showing Contact Points and Adjusting Mechanism.

arrangement of the components differs, as will be noted by a little study of the drawing. The Mea breaker box, also shown at Fig. 2, employs a fibre roller and cams for breaking the low-tension current generated by the instrument.

## Adjusting Break of Points.

With these types of magnetos, and with many others, provision is made for the adjustment of the break; that is, for setting the gap between the points. Usually the fixed point is set, the screw carrying it having a hexagonal head and locking nut. Loosening the latter with the wrench provided by the maker will permit of decreasing or increasing the break as may be necessary. The break varies, according to the instrument, but the correct space may be obtained by using the wrench, one end of which is calibrated for this work.

The points may be pitted, burned or contact unevenly through careless adjustment. When these conditions exist considerable resistance to the passage of the current is set up and the points should be smoothed with a very fine jeweller's file, taking care not to remove too much of the metal. Make sure that the points meet squarely. Upon completing the work, clean the breaker box, but lubricate only in accordance with the instructions of the maker. Where fibre is employed oil should not be utilized.

The components of the distributor are accessible

Fig. 3—Bosch Breaker Box Mechanism with Parts Lettered to Illustrate Operation.

through removing a cover or plate, according to the design of the magneto. The function of the distributor is to connect the high-tension current with the wires leading to the spark plug, when the charge should be fired. The operation is simple, an arm rotating at half engine speed making contact by means of brushes, etc., with the segment to which is attached the wire leading to a spark plug. There is little to be done with the distributor, other than cleaning it with a soft brush, displacing any foreign elements. It should not be lubricated.

## Timing Magneto.

If the magneto be removed in the overhaul and the gears, coupling or shaft not marked, it will be necessary to retim the instrument. With a four-cylinder motor, for example: Have the piston of the No. 1 on compression (top centre), rotate the armature shaft until the points start to break, then mesh the gears or secure the coupling. Without moving the armature, note the position of the distributor arm. The segment with which it makes contact or to which it is opposite is that which should be wired to the first cylinder. The wiring plan is shown at Fig. 1 with the firing order of the motor 1, 3, 4, 2. It will be noted that the armature shaft rotates clockwise (looking at the driving end) and that the distributor arm moves in the opposite direction. By observing the direction of rotation of the armature and distributor, and connecting the leads according to the firing order of the motor, no trouble should be experienced in retiming the magneto.

## ADVANTAGES OF POWER TIRE PUMPS.

**P**OWER tire pumps not only save considerable labor, but are good tire insurance, in that it is a simple matter to keep the shoes inflated properly, a precaution often neglected because of the work involved with the usual hand pump. The car manufacturer now recognizes the importance of the power pump and several makers are fitting it as standard equipment with the 1914 models.

These pumps are generally constructed in two forms, those fitted permanently to the motor and the removable type. The latter are moderately priced; are as efficient as the permanent members and the majority of makes are so compact that they occupy but little room in the tool box. They are constructed so as to be screwed into

National at Left, Dewey at Right.

the spark plug opening, secured by special connections, or come equipped with a special type of plug permitting of quick insertion.

The National, made by the National Motor Supply Company, Cleveland,

O., is utilized by screwing it into the spark plug opening, and comes complete with 12 feet of high grade rubber cloth tubing, pressure gauge and connections. It has patented leak proof piston and rings, pure air being drawn into the cylinder through an intake port. An outlet valve opens at the proper instant, permitting the compressed air to flow gradually through the tubing, etc., to the tire. The pump is highly polished and nickel plated, is constructed to fit any spark plug opening and weighs but five pounds.

The Dewey, made by the Dewey-Anderson Company, Toledo, O., is a very light and compact pump, 12 inches in length, and may be installed permanently or carried in the tool box. When fitted to the motor, a special connection made by the company is utilized, several methods of installation being available. The Dewey

is accurately made, does not require lubrication, and efficiency at low motor speeds is emphasized by the maker. Ample length of woven cloth covered hose, pressure gauge and special connections are supplied with each equipment.

The Brown Impulse tire pump, manufactured by the Brown Company, Syracuse, N. Y., like those previously described, is operated by the compression of the motor. It is made like a motor, with two cast iron pistons and rings, and a connecting rod of high grade steel between the larger piston, on which the compression acts, and the smaller one which forces the air to the tire. The early types were constructed to be screwed into the spark plug opening or to be permanently attached, but the company is now marketing the pump with a special connection and a quick detachable spark plug as shown in the accompanying illustration. Owners of the early models may obtain this connection and the fittings for a small sum. With the new equipment it is possible to remove the spark plug core and insert the pump quickly and easily, the operation involving a slight turning movement of the pump after insertion in the opening. The Brown comes with ample length of tubing, gauge and connections.

Brown Impulse and New Connections.

Stewart Four-Cylinder, Made in Two Models.

## IN THE COMMERCIAL VEHICLE FIELD.

### General Vehicle Company Announces a 1000-Pound Delivery Wagon Chassis with Worm Drive--United States Government Studying Mine Rescue Work.

THE latest model of the well known G. V. electric line, produced by the General Vehicle Company, Long Island City, N. Y., is a 1000-pound worm driven wagon that differs materially in appearance from anything the company has previously manufactured. Instead of being suspended in a cradle under the body, the battery is installed in front under a sloping hood.

The wagon is driven by a General Electric series wound motor, and the power is transmitted by a shaft with a universal joint at either end, to the worm and worm wheel in the steel rear axle housing. The worm shaft is steel and the wheel, with which is assembled the differential, of

way running switch is under the seat, and the handle of the controller can be removed only when it is in neutral position. Extreme provision is made to protect the machine against interference when left unattended.

#### SAVING THE CITY'S MONEY.

#### Detroit Police Department Purchases Commerce Wagon in Interests of Economy.

The police department in Detroit has a number of patrol wagons which cost the city in the neighborhood of \$5000 each. Until recently it

was the custom of the precinct officers to send these machines to headquarters twice a day with the reports and any property that might have been taken from prisoners upon arrest. This mileage, when added to that covered in making arrests, brought the total for 1911 to 80,000 and for 1912 to 115,000.

The attention of the police commissioner was directed to this matter one day, when a policeman stepped from

one of these \$5000 automobile patrols into his office for a pad of report blanks for a precinct some distance out. The patrol carried its usual equipment, driver and two officers. The commissioner also took into consideration the fact that when the big car was thus engaged it was absent from duty at the precinct station for which it had been purchased.

The result of this incident was a reorganization of the police patrol system. A 1000-pound Commerce wagon, made by the Commerce Motor Car Company, Detroit, was selected for the errand work. This smaller car, which is presented in an accompanying illustration, is manned by

**New 1000-Pound, Worm Driven G. V. Electric Wagon Fitted with Panel Body.**

bronze. The differential assembly and the wheels are mounted on Timken roller bearings.

The frame is a pressed steel channel, mounted on semi-elliptic springs. The front axle is a drop forged I section, and the rear axle of the full floating type. The service brake is operated within and the emergency brake without drums bolted to the rear wheels.

The battery and motor will give 45 to 65 miles on a single charge at a speed of 12 miles an hour, and 40 to 50 at 15. The controller is of the continuous torque type, affording four forward speeds and two in reverse. This is installed in a metal box under the driver's seat. The three-

**Commerce 1000-Pound Chassis, Fitted with Police Patrol Body for Department in Detroit.**

one policeman, who acts as driver, and it is maintained that it will be but a short time before it has saved its purchase price, in reduced wear and tear on the larger machines, and in time wasted by salaried policemen.

### **SPECIAL RESCUE WAGON.**

#### **United States Bureau of Mines Stations White Vehicle at Pittsburg, Penn.**

For some time past the government of Great Britain has made it compulsory to have installed in mining centres motor vehicles equipped with special life saving apparatus. So far as is known the first attempt to follow this example on the part of the United States government is the installation of a specially designed vehicle at Pittsburg, Penn. The car utilizes a White chassis, made by the White Company, Cleveland, O., and is under the jurisdiction of the United States Bureau of Mines.

As will be noted from the accompanying illustration, the body has been designed with extreme care, and it was built to specifications supplied by the government. Beneath the driver's seat are two Draeger reviving outfits, and under the body on a sub-frame are six oxygen tanks,

stored transversely of the frame so as to be withdrawn readily. The oxygen pump is at the left side of the chassis and is driven by the motor. At the back of the seat is a five-foot crowbar and tent poles.

At either side of the body are compartments opened from the outside, in which are carried a tent, 22 feet of rope, three miner's picks, three miner's shovels, a four-pound sledge and two axes. Between these are two longitudinal seats with folding lazybacks, protected by a brass rail. Beneath the seats are compartments and there is another under the rear steps with side and end doors. There are also shallow drawers that contain saws, hose couplings, reducers, spanners and 200 feet of half-inch rope. In central compartments at the side are a lifeline reel, a telephone system, compasses, bits, braces, chisels, hacksaws and blades, snatch blocks, etc. Suspended outside of the body are two stretchers, fire extinguishers, lanterns, axes and other tools. On the running boards are two special boxes that contain mine lanterns, and in addition the equipment includes a pump, first aid boxes, 50 regenerators, two pulmotors, a box of explosives, a full telephone outfit and even a caged bird, the last mentioned being taken into mines to detect the presence of poisonous gases.

It will be noted that the machine carries everything that might be used in entering a mine where there is fire or gas, and that when necessary a field hospital can be extemporized.

The machine is intended as a demonstration of what is desirable in this respect, and the Bureau of Mines proposes that mine owners shall establish stations at suitable points and provide them with equipment of a similar description.

**White Chassis with Specially Equipped Body for Mine Rescue Work.**

gress of March 3rd, 1879.

## THE OUTLOOK FOR 1914.

It will not be denied that New England represents that section which is regarded as most conservative in its business dealings. It ought also to be conceded that the automobile dealers in Boston are in a position to judge the conditions of the market in this part of the country.

The dealers and branch managers in Boston, as is set forth in greater detail elsewhere in this issue, are uniform in the opinion that the opportunities for satisfactory business during the 1914 season are quite as bright as at any time in the history of the industry. There is ample reason for believing that this can be taken as fairly representative of the situation elsewhere.

Conditions undoubtedly have changed since the earlier days, when the demand so far ex-

ceeded the supply that the public was eager to make substantial deposits in order to insure priority in deliveries. But the automobile has become a practical institution with an economic value that is still only partially realized. The stability of the industry is assured, and the present consistent demand on the part of prospective new owners has created a healthful business policy that can produce no other result than permanency.

## FAILURE OF SPEED TRAPS.

Slowly but surely those upon whom devolves the duty of enforcing traffic regulations are beginning to realize the impotency of the speed trap, so-called. Chairman Luther of the police commission in Providence, R. I., in announcing the abolition of this system in that city, explains the decision of the board in terms exactly parallel with the opinions of those who have given this matter careful study elsewhere.

Motorists who appreciate the importance of extreme care at all times—and these comprise a large majority of automobile owners and users—have always maintained that the speed trap catches only the more careful drivers. The reckless operator has little regard for others, and either quickly detects the trap and avoids it altogether or rushes through it at a speed so fast that the officers are usually powerless to act.

Automobile owners and users are deeply interested in this subject. The reckless driver is an even greater menace to the occupants of other cars than to pedestrians, if this be possible. The objection to the speed trap has been due not so much to the fact that it is felt that it has been the means of inflicting punishment upon those who were only technically guilty of violating the law, but because it is the honest belief of those who have the best interests of the public at heart that it does not, and cannot, reach the real offenders.

Chairman Luther apparently coincides with this viewpoint. The commission of which he is the head is to procure a high powered automobile, which will be manned by police officers in citizen's dress with instructions to work in all sections of the city and apprehend those who are manifestly operating in a reckless manner. The plan is believed to be new and to be worthy of extended trial.

# CARBURETING THE FUEL IN COLD WEATHER.

**W**HILE it is admitted that the present grade of motor fuel is more difficult to vaporize in cold weather than the gasoline utilized several years ago, the owner of a modern car experiences less difficulty in starting than did the operators of early models because the carburetor manufacturer has incorporated devices for enriching the mixture, these being controlled from the seat. Control of both air and fuel is now possible and with the carburetor set properly the motorist should not experience trouble, providing he is careful to strain all fuel and empty the filter.

While it is recommended that the mixture be not changed if the results have been satisfactory, a knowledge of the carburetor is important in the event it becomes clogged with foreign elements, or has been disassembled in the overhaul, for example. In tuning up the motor after the overhaul it is possible that the original adjustment of the carburetor may have been altered and resetting will be necessary. Lack of space prevents discussing each type of carburetor, but views of three standard makes with their components lettered are presented herewith, and will prove of service in making adjustments, etc.

Components of Stromberg Carburetor.

than one-quarter in starting in cold weather, stating that a greater opening will create difficulty. This instrument is provided with a dash adjustment, making possible a rich mixture, as it lifts the needle out of the nozzle. Operating the priming attachment aids, in that a puddle of gasoline is formed in a dam. After the motor becomes warm the dash lever should be set to running position.

The carburetor is set by turning the low speed screw to the left until the arm member above it and slightly to the right just breaks contact with the cam above that. Next, turn the low speed screw 1.5 turns to the right, open throttle about one-quarter turn, and start the motor. Close the throttle until the motor runs slowly without stopping, then turn the low speed screw to the left, cutting down the fuel, and do this one notch at a time until the engine idles smoothly. Open the throttle slowly until wide open. If the motor backfires, turn the high speed adjusting screw to the right, a half turn at a time, until each cylinder fires evenly. Should the motor not backfire, turn the high speed screw to the left until it does, then to the right until it runs smoothly. The low speed should not be touched in setting the high, but should the motor backfire with the throttle about one-quarter open, the automatic air valve should be turned to the right a turn or two, decreasing the amount of air slightly. The automatic valve should be seated when motor is idling.

The adjustment of the Schebler carburetors is similar, with the exception of the new model R, announced recently. That shown herewith is the L, and like the F, has a single jet. Model O has two needles, a low and a

Three Adjustments Are Provided on the Schebler L—Low, Intermediate and High.

high. The model F has one numbered dial; the L two. To adjust the L retard the spark, open the needle valve about 1.5 turns and start the motor. The throttle should be about two-thirds way open. Screw the low speed needle valve in or out until the motor runs smoothly, but if it operates too fast, move out the adjusting screw which controls the butterfly valve closing point. If the motor stops increase the opening.

The high speed is obtained by setting the arms or pointers on the dials, of which there are two. These are numbered 1, 2, 3. Adjust the intermediate speed first, moving the arm midway between 1 and 3. Next, advance the spark and open the throttle so that the roller moving on the track like member beneath the dials is in line with the intermediate speed dial. The auxiliary air valve should seat lightly. If the motor backfires, move the arm toward the figure 3. If too rich, move toward the figure 1. The high speed adjustment is made with the other dial and with the throttle wide open.

The operation of the Stromberg carburetor is made clear by the sectional view, and it will be noted that there are two adjustments, a low and a high. The low speed member N is turned up or down until the spring seats lightly, then turned three additional notches. The air valve should not move until the motor attains approximately 500 revolutions a minute. The high speed is obtained by means of the nut L N, which is turned down to increase the supply of fuel and up to decrease the amount. There should be at least .03125 or .09375 inch between the nut and the lever L. The spraying nozzle P N is accessible by removing the plug member P.

In setting any carburetor it should be remembered that cold weather has the effect of too much air.

The Rayfield Has Two Fuel Adjustments, Also Automatic Air Setting.

## FUEL CONTROLLING DEVICES.

**W**HEN it is considered that with the average motor only approximately 17 per cent. of the heat realized from a gallon of fuel is converted into useful work, and that the balance is lost through the water jackets, radiation and exhaust, the cost of gasoline is indeed an important factor in the operation of a motor vehicle.

To obtain maximum efficiency from the fuel, three factors must be considered, namely: Proper proportions of fuel and air, inflammability of the mixture, and the spark. Economy of fuel, in which practically every motorist is interested, is obtained by utilizing as lean a mixture as possible without sacrificing efficiency. With the modern car, control of the air is provided by dash adjustments, the carburetor maker incorporating the device in his endeavor to increase the mileage obtained from a gallon of fuel.

### Over Rich Mixtures.

Owing to the fact that a slightly rich mixture makes for easier starting, many motorists increase the ratio of fuel to air, generally resulting in too rich a mixture at higher motor speeds, an adjustment not only making for a waste of fuel, but one affecting efficiency to a greater or lesser extent. Obviously, the remedy would be to increase the supply of air or decrease the amount of fuel, suitably proportioning the two elements so as to compensate for varying speed, atmospheric conditions, altitude, etc.

### Correct Mixtures.

As previously stated, the perfect mixture is one having so many parts fuel and air—a quick burning one—the resultant of properly vaporized fuel intermingled with the atmosphere. And the more air that can be utilized, with the vapor,

without sacrificing efficiency, the greater the economy.

Fuel economizers may be divided into two general classes, one breaking up or pulverizing any molecules of fuel not vaporized and mixing the atoms with air. The other method consists of introducing auxiliary air into the intake manifold between the carburetor and the cylinders, and includes means for controlling the amount of atmosphere admitted. The impact of the air also breaks up any particles of fuel not vaporized. The advantages claimed in these fuel savers are: Economy of fuel, greater efficiency, cooler motor, less carbon, priming features and flexibility.

### Mixing Devices.

Three types of mechanical mixing devices are shown herewith, these being fitted between the carburetor and intake manifold by simply removing the bolts retaining the carburetor pipe, slipping in the mixer and replacing the bolts. Both the Stanley, made by W. P. Deppe, 127 Duane street, New York City, and the Automizer, manufactured by the Automizer Company, Canton, O., make use of a rotary device imparting a whirling motion to the mixture. The Gasosava, made by the Gasosava Company, Inc., 1270 Broadway, New York City, utilizes a wick like screen, so proportioned and constructed as to screen as well as break up the fuel.

### Bowden Auxiliary Air Inlet.

The Bowden auxiliary air inlet, marketed by the J. S. Bretz Company, 250 West 54th street, New York City, comprises a cylindrical body, curved at the base to conform to the shape of the intake pipe, and having a number of apertures. Within the body is a plunger which, in its nor-

mal position, completely closes the openings. When more air is required the plunger is moved upward by means of Bowden wire mechanism, gradually uncovering the ports and allowing air to be drawn in. Control is by lever as shown.

#### **Michener.**

The fuel saver manufactured by E. S. Michener, New Castle, Penn., is made for both dash and steering post control and has a priming feature. It is very compact, is screwed into the intake manifold and has a cone shaped screen projecting across the bore of the intake pipe at right angles. Control of the air is by a rod having universal joints. The primer comprises a bowl shaped member and the air valve is held in an adjusted position by means of a spring catch which engages a ratchet on the valve stem.

#### **M. & M. Controller and Economizer.**

The M. & M. controller and economizer has been described and illustrated in these columns. It differs from usual fuel savers in that its valve may be adjusted for either a low or high-tension magneto; that is, the ignition may be cut out as desired, as when descending grades for example. The opening of the ports, admitting air, is controlled from the steering post. The controller is fitted to the intake manifold as shown by an accompanying illustration, which also outlines the valve construction. It is manufactured by the M. & M. Sales Company, Inc., Lewistown, Penn.

#### **Saunders.**

The Saunders, marketed by the Powers Sales Company, 122 South Michigan avenue, Chicago, is fitted to the intake pipe above the carburetor, by drilling and tapping a .375-inch hole. The air enters through four large holes and the passage leading to the interior of the intake pipe has a cone shaped plunger which is controlled by a

flexible wire connected with a lever on the steering column. The plunger is made cone shaped to increase the velocity of the air, which the maker states enters at such angle as to effect complete vaporization of fuel.

#### **Crary Auto-Valve.**

The Auto-Valve, manufactured by the Crary Company, 652 Woodward avenue, Detroit, combines fuel saving and priming features. It comprises two parts, a lever control located on the dash, which closes and opens an automatic air valve under the hood, and a connection to the intake manifold just above the carburetor. The priming device comprises a petcock in the line. The automatic valve is adjustable, lock nuts being provided on the top of the spring.

#### **Lydon Speedler.**

The Lydon Speedler, made by the Lydon Manufacturing Company, 1146 Michigan avenue, Chicago, was described and illustrated in the June 10 issue of The Automobile Journal. It is inserted in the intake pipe, operated from the seat and the amount of air admitted is varied according to conditions.

#### **V Hot Air Valve.**

The V hot air valve, made by the V Air Valve & Manufacturing Company, 1648 Tremont street, Denver, Col., differs from the devices above described in that hot air is conveyed to the intake manifold through a flexible tubing, one end of which has a hood for clamping to the exhaust pipe. Control of the amount of the heated air is by the usual steering column lever.

#### **Gasolette.**

Gasolette, made by the United Products Manufacturing Company, 1463 Michigan avenue, Chicago, is a preparation which is mixed with the fuel in proportions of half an ounce to a gallon. It comes in quarts and gallons.

## SELECTING ELECTRIC LIGHT EQUIPMENT.

**W**HILE it is possible to secure a complete electric lighting equipment, the majority of the makers of dynamos leave the choice of

**Hoyt Ammeter.**

lamps, switches, meters, cable, etc., to the purchaser, although suggestions are made as to the material to be employed. It is poor economy to buy cheap equipment, especially lamps, for the most efficient lighting dynamo is severely handicapped by poorly designed lamps, inferior wiring, etc.

The lamp manufacturer has made considerable improvement in his product during the past year, and not only are the designs attractive, but greater efficiency is obtained with the new types, the majority of which are provided with means for securing proper focal adjustment, an important factor in lighting systems.

### Lamp Specifications.

The size of the lights is determined to a great extent by the size of the car, and the owner will have to be guided by the recommendation of the maker of the dynamo. A list of lamp manufacturers will be found in the Buyers' Guide, elsewhere in this issue, and the concerns listed will forward complete data on request.

As previously mentioned, the lamp equipment will depend upon the car and the owner. Side lights may be eliminated, as there is a growing

tendency to equip the headlights with double bulbs, as indicated by the Guide design, made by the Guide Lamp Manufacturing Company, Cleveland, O., shown in an accompanying illustration. The smaller light is

**Guide Double-Bulb Headlight.**

employed in the city, etc., and where the ordinances prohibit the use of powerful headlights. Dimming devices also serve the same purpose.

All-glass lamps are now marketed, these including head and tail members.

### Proper Cable to Use.

Too much emphasis cannot be laid upon the importance of utilizing a high grade lighting cable and employing caution in wiring so as to avoid the possibilities of short circuits, due to abrasion, vibration, action of water, etc. The product of the Packard Electric Company, Warren, O., is shown herewith, the No. 10 and 12, both in single and double-conductor form, being illustrated. The construction is the same as characterizes the Packard ignition cable made by this concern. The No. 14, made in one and two-strand, is recommended for wiring tail lights, and the No. 12 single and double for side and headlights. The larger size, the No. 10, is used for wiring from the generator to the battery, thence to the switches, also for large headlights. Single

**Showing Construction and Exterior View of One and Two-Strand Packard Lighting Cable.**

or double strand is employed, according to the installation. The maker of the Packard cable guarantees its product.

### Switches.

There is a wide variety of switches manufactured and in the selection one will have to be guided by the lighting system. If a group of lights is to be controlled, such as side, head, tail and speedometer, a multiple unit will be required. These are also constructed to control each side or headlight; in fact, a number of combinations is afforded.

A form of rotary switch made by the Hartman Electrical Manufacturing Company, Mansfield, O., is shown in an accompanying illustration and it is made in several types. As will be noted in the drawing at the left, it is possible to obtain any combination of or all lights. A junction ring, a separate unit, is a feature of the switch, the maker stating that it provides ready

means of attaching the wires and eliminates splicing and soldering. As shown, it provides for 16 wires, these including, in addition to the lights, connections for the battery, ignition, etc. A dimmer device, comprising a centre push and pull switch, is supplied with the junction ring when desired, it changing from a parallel to a series connection. This permits of eliminating side lamps and utilizing head members. It is stated that the current consumption on the basis of 16 candlepower bulbs will be a little over one ampere in excess of that taken by the usual four candlepower side lights. The Hartman switch may also be employed where double-bulb head-lights are utilized.

#### Voltmeters and Ammeters.

Accurate reading instruments are essential with the lighting system and these may be voltmeters, ammeters or a combination of the two, according to the equipment. The ammeter is mounted on the dash in plain view of the driver, and indicates at all times the amount of current

**Hartman Rotary Switch, a Multiple Unit—Also Made with Junction Ring and Dimming Attachment.**

produced by the generator or discharged by the battery. When the indicating needle points to the left of the zero point, for example, it denotes that the battery is supplying current to the lights or discharging. With the needle pointing to the right of zero it means that the generator is charging the battery. The amount or rate of charge and discharge in amperes is denoted by the needle moving over a calibrated dial. The ammeter does not show the amount of current in the battery. There is no instrument made which will show this.

#### Hoyt Instruments.

The Hoyt Electrical Instrument Works, Penacook, N. H., manufactures a wide variety of indicating instruments, one of which, an ammeter, is shown herewith. This instrument is very compact and is constructed with the same care and high grade material as characterizes the product of this concern, which has made a specialty of current indicating and reading devices

for years. The Hoyt company also manufactures voltmeters in several forms, these being utilized to test the cells of a storage battery.

As the battery is one of the most important components of the lighting system, a high grade make should be utilized. The voltage and capacity will depend upon the system selected. Representative makes are listed in the Buyers' Guide, and elsewhere in this issue will be found a discussion on the care and maintenance of the cells of the storage battery.

**Cutler-Hammer Automatic Door Switch.**

Relative to the lamp equipment it is not absolutely essential to purchase new members as the acetylene head, oil side and tail lights may be converted into electrical units. No attempt has been made to describe these, but they may be obtained readily, a large number of different types being marketed. The matter of connectors, junction boxes, fuses, etc., may be referred to the maker of the dynamo, who will supply complete information, including wiring plans of the system.

The Empire Automobile Company, Indianapolis, Ind., has prepared an interesting booklet, entitled, "The Transcontinental Empire", which comprises an interesting, illustrated account of the Empire car, which took part in the recent Indianapolis-Pacific tour of the Indiana Automobile Manufacturers' Association. The text was written and the photographs taken by Harlow Hyde, advertising manager of the company, and the booklet should prove of decided interest to motorists, who may secure a copy by making request of the company.

**Wiring Plan of Volt and Ammeter.**

## STORING THE CAR AND OCCASIONAL USE.

**A**LTHOUGH the motor car is an all-around-the-year vehicle, some owners store their machines upon the arrival of cold weather. In

Weaver Twin Jacks Marketed by Ralph Walcott, New York City.

putting the car away for the winter it should be borne in mind that its condition and appearance will be important factors in the event it is to be sold or traded in the spring.

First of all, it should be carefully washed and dried, and if it is to be stored in an unheated building, the tires ought to be removed and treated according to the instructions contained elsewhere in this issue. The top and upholstery should be cleaned and there are a number of preparations for treating leather and other materials. It is advisable to fit the curtains in place and keep the top up, thereby eliminating creases. Clean and polish the metal trimmings and coat with vaseline or polish.

### Care of Power Plant.

All water must be drained from the circulation system, and it is a good plan to clean the radiator with a soda solution or a prepared mixture. In connection with this work it is important that all fluid be drained from the cooler, pump, hot water connections, etc., especially if the car is to be stored in a cold building. It is poor practise to allow the motor to stand all winter with the tension of the valve springs unrelaxed, as the elasticity is impaired. Remove the spark plugs and pour about half a pint of kerosene into

Tire Rests and Jacks; A, Springfield Combination; B, Storage Stand of Same Make.

each cylinder and then replace the plugs.

It is an excellent plan to jack up the frame so that the springs will be relieved of all weight. Wooden supports are made easily and by placing them under the frame the tension of the springs will be relaxed. It will also enable one to clean and lubricate the springs if desired, by using a thin bladed tool or one marketed for the work. If a storage battery is utilized it should be removed and treated according to the instructions published elsewhere in this issue.

### Covering the Car.

After cleaning, etc., the car should be completely covered and care taken not to expose it to the rays of the sun. If near a window, pull down the shade or cover the window with some material that will not admit sunlight.

When the car is to be used occasionally, as on mild, pleasant days, for example, it should be jacked up to relieve the tires of all weight. Although it is best to deflate the casings, unless the equipment includes a power tire pump, this method will require repump-

Springfield Tire Rest.

ing the shoes by hand. It is advisable to cover the car when not in service and to wash it if needed.

In accompanying illustrations are presented several forms of storage stands, quickly operated jacks, etc., making for convenience when the car is to be used occasionally. These come in sets of two and four and are moderately priced.

The Moon Motor Car Company, St. Louis, Mo., maker of the Moon car, has installed an axle testing machine, by means of which it is maintained that it is possible to obtain the same results as from at least 500 miles of road travel. The chief object of the device is to indicate the proper adjustment of differential and brakes under all conditions of service.

## TIRE, TUBE AND LAMP PROTECTORS.

**M**OISTURE is one of the enemies of tires in that it causes deterioration of the fabric, and if for no other reason the spare casings should be enclosed in a tire cover when carried on the car. The practise of some motorists to carry the shoes without a protective covering is not to be recommended, for during the washing of the machine much water is likely to find its way inside of the casing. Tire makers advise covering the new spare shoes, for the action of sunlight and air upon the compound develops tiny cracks and in time the life of the rubber is impaired.

Tire cases are not expensive and two well known makes are presented in an accompanying illustration, these being the product of the Gilbert Manufacturing Company, New Haven,

The Hopewell case, also in sectional view, is shown at A. This is a continuous casing, being wrapped around the tire and retained by two endless spiral springs, eliminating the use of fastenings. The adjustment of the springs is such as to permit the cover to be used on old or new tires. The construction is not only easily and quickly applied, but prevents wrinkling. The cover is made of fabric leather, all colors, black enamel duck, etc., for different sizes and types of tires and rims, and each cover comes in an enamel duck bag suitable for an inner tube bag. The company also makes the Russell and Go-On cases.

Radiator covers of the adjustable type not only protect the cooler in cold weather, but permit of maintaining the water at a proper work-

**Covers and Protectors:** A, Hopewell Design for Tires and a Sectional View; B, Gilbert for Electric Lamps; C, F and I, Hopewell for Tail, Side and Headlights; E, Gilbert Magneto Cover; D and G, Gilbert End Thrust and Universal Joint Boots; J, Autocape Top Company's Radiator Cover; H, Miller Tube Bag; K, Sectional View of Gilbert Tire Cover.

Conn., and Hopewell Bros., Newton, Mass. A sectional view of the Gilbert is shown at K and it is made with either snap button or wire edge fasteners. The case has the Teel patented water-shed construction extending over one-half of the circumference, and when it is fitted to a tire the latter is so mounted that the water-shed section is at the highest point with the shoe in an upright position. Additional water proof features are provided by the strip holding the caps of the fasteners overlapping the lower section. The company manufactures a wide variety of cases, including members for all types of rims, and in various colors. The material includes black enamelled duck, fabric leather (any color), mohair (any color), black patent leather and any color of grain leather.

ing temperature. With the fluid too cold, maximum efficiency is not obtained from the motor. The Autocape Top Company, 2334 Michigan avenue, Chicago, is marketing the design shown at J, and it will be noted that an adjustable curtain is provided and retained by snap buttons.

Lamp covers not only preserve the finish of the lights, but save considerable labor in cleaning. Designs for electric, oil and gas are shown herewith, the product of the Gilbert Manufacturing Company and Hopewell Bros., who will forward illustrated catalogues on request.

Extra inner tubes should be carried in a tube bag and a serviceable member is being marketed by Chas. E. Miller, 97-103 Reade street, New York City, with branch houses in 13 cities, for a very small sum.

## IN THE REALM OF THE MOTORCYCLIST.

### Additional Exhibits at the Chicago Show--Long Distance Cross Country Trip on Kerosene--Recent Racing Results--Other News and Notes.

**I**N THE preliminary report concerning the Chicago motorcycle show held early in the month, specifications and details were given of 18 makes of machines on display there. Information concerning five other makes shown was not available at that time. These machines are considered briefly below.

#### De Luxe Two-Speed New.

Practically the only change in the De Luxe line presented by the Excelsior Cycle Company, Chicago, is the addition of an Aurora two-speed gear. The line comprises four models, two seven horsepower twins and two nine horsepower twins, one in each horsepower classification being equipped with the two-speed gear. Equipment

**Flying Merkel in Service with Trouble Man of Middletown Telephone Company, Middletown, O.**

includes Bosch magneto, Eclipse countershaft clutch, Musselman coaster brake, Corbin front axle, Troxel saddle and any make of three-inch tires.

#### New R-S Twin.

The Reading-Standard Company, Reading, Penn., displayed a five horsepower chain drive single, five horsepower two-speed single, seven horsepower undergeared belt drive twin and 10 horsepower two-speed twin. The last named is new. The features of the motor include: Long stroke, mechanically operated valves, cylinders removable without taking motor from the frame, unit power plant, double clutch control and double brake control. Equipment on all models

includes Bosch magneto, Schebler carburetor, Corbin V band and R-S contracting band brakes, Troxel saddles, Goodyear tires, etc.

#### Two Eagle Models.

The American Motor Company, Brockton, Mass., exhibited two nine horsepower twins, one being a continuation of the model marketed last season, and the other being fitted with a direct drive. Save for the transmission, the two are alike in every respect. The equipment includes Bosch magneto, Schebler carburetor, Eclipse clutch, Mesinger saddle, etc.

#### New Michaelson Line.

The Shapiro-Michaelson Motor Company, Minneapolis, Minn., which was incorporated Nov. 1 to continue the Michaelson line introduced for the first time a year ago, presented two models, a 5-6 horsepower single and a 10-13 horsepower two-speed twin. The motors have the same bore and stroke, 3.5 by 3.75 inches. The valves are mechanically operated. Both models are fitted with a two-speed transmission and multiple disc clutch and foot starter. In addition, the twin is supplied as a delivery tricar, with carrying capacity of 500 pounds.

#### Pierce Four and Single.

The Pierce Cycle Company, Buffalo, N. Y., exhibited its eight horsepower four-cylinder model and a five horsepower chain driven single. The changes are few and largely in the nature of refinements. The equipment includes Berling magneto, Breeze carburetor, Eclipse clutch (on single), Corbin brake, Goodyear, Diamond or U. S. studded tires.

#### With the Accessory Exhibitors.

The accessory division of the show was in every respect in keeping with the importance of the motorcycle section. While many of the manufacturers and jobbers making display also cater to automobile owners, their exhibit in each instance was calculated to appeal only to motorcyclists. Among the more prominent concerns represented were the following:

Bosch Magneto Company, New York City, magnetos, spark plugs and mechanical oilers; Hawthorne Manufacturing Company, Bridgeport, Conn., Old Sol lamps and a new combined lighting outfit and universal bracket; Herz & Co., New York City, magnetos and spark plugs; Marburg, Bros., New York City, Mea magnetos, S. R. O. combined radial and thrust ball bearings and Lucifer electric lighting equipment; A. R. Mosler & Co., Mount Vernon, N. Y., spark plugs; Splittdorf Electrical Company, Newark, N.

Y., Monarch spark plugs; Peter A. Frasse & Co., New York City, tools and supplies and Renold chains; Motor Car Supply Company, Chicago, motorcycle and bicycle supplies; H. & F. Mesinger Manufacturing Company, New York City, Mesinger saddles and grips; New Departure Manufacturing Company, Bristol, Conn., New Departure bearings and coaster brakes; Rhineland Machine Works, Chicago, imported ball bearings; Standard Welding Company, Cleveland, O., tubing, rims and electrically welded parts; Stewart-Warner Speedometer Corporation, Chicago, Stewart motorcycle speedometers; Weed Chain Tire Grip Company, New York City, Weed anti-skid motorcycle chains.

### Chicago-Kokomo Run.

Thirty-two riders took part in the recent two-day run of the North Shore Motorcycle Club of Chicago from that city to Kokomo, Ind., and return, a distance of 250 miles. The Yale, Thor and Henderson teams being tied with perfect scores at South Bend on the second day, it was decided to establish secret controls throughout

The 1914 Model of the Self-Starting Yellow Jacket Flying Merkel.

the remainder of the distance. The Thor and Henderson trios suffered because of this and the silver trophy was awarded to the Yale team. The final scores follow:

Perfect—W. S. Bailey, Ray F. Ray and I. F. Jacobs, Yale team; Harvey Barnard, C. W. Waughop and C. H. Drude, Henderson team; W. F. Brier, Jr., H. E. Bowe and J. F. Hough, Thor team; R. L. Kenny, Harley-Davidson; H. C. Scherer, Harley-Davidson; J. F. Newcas, Excelsior. George E. Miller, Excelsior, 999; M. Tannanbaum, Excelsior, 998; R. T. Fletcher, Excelsior, 988; R. B. Gardner, Excelsior, 985; E. W. Kewley, Excelsior, 984.

### In Telephone Service.

An accompanying illustration shows one of the Flying Merkel motorcycles used by the Middletown Telephone Company, Middletown, O., in its trouble department. This machine has displaced two horses, with a corresponding reduction in expense, to say nothing of the more efficient service rendered. Similar machines are being used with equal satisfaction, insofar as econ-

omy and efficiency are concerned, by numerous other telephone companies, gas companies, department stores, rural mail carriers, etc., throughout the country. In fact, business men in every line throughout the country are beginning to appreciate the value of the two-wheel mount for service requirements of various character.

### Buys Greyhound Business.

Announcement is made from Buffalo, N. Y., that the Autocrat Manufacturing Company of that city has purchased the plant and sidecar and accessory business heretofore conducted by the Greyhound Motor Company. W. C. Chadeayne, who was at the head of the old concern, will be general manager of the Autocrat company.

### The New Flying Merkel.

Changes in the Merkel line, produced by the Miami Cycle and Manufacturing Company, Middletown, O., consist mainly of refinements. The motor has been improved by the use of a new piston of standard pattern, with the wristpin located in the vertical centre, for the purpose of giving both ends of the piston an equal bearing on the cylinder walls. The piston rings are of the eccentric type and ground on three sides. The improvements in the valve mechanism include a new cam of reduced size. The rockers are now provided with hardened and ground steel rollers at the cam ends. The tappet guides are phosphor bronze bushings of large size, both in diameter and length. The intake valve tappets are provided with cushion springs, taking up lost motion. An accompanying illustration presents the 1914 self-starting Yellow Jacket model, and, as indicated in the last issue, the prices on all models have been reduced materially. They are as follows: Model 40, four horsepower single, belt drive, \$210; 41, same with chain drive, \$210; 70, seven horsepower twin, belt drive, \$260; 71, same with chain drive, \$260; 73, self-starting Yellow Jacket, seven horsepower twin, chain drive, \$310. All machines will be fitted with luggage carrier, footboards and foot starter without additional charge.

### Recent Racing Results.

The following summaries indicate the results in recent race meets throughout the country:

#### Columbia, S. C.

Three miles, singles—First, Gerard, Indian; second, Glenn, Excelsior; third, Williams, Indian; time, not given. Five miles, singles—First, Gerard, Indian; second,

Glenn, Excelsior; third, Williams, Indian; time, 5:20.

Ten miles, singles—First, Gerard, Indian; second, Williams, Indian, third, Glenn, Excelsior; time, 11:26.2.

Three miles, twins—First, Glenn, Excelsior; second, Buford, .....; third, Gerard, Indian; time, 3:13.

Five miles, twins—First, Glenn, Excelsior; second, Buford, .....; third, Gerard, Indian; time, 5:05.

Ten miles, twins—First, Buford, .....; second, Gerard, Indian; time, 10:19.

#### Road Race, St. Paul, Minn.

One hundred and twenty miles—First, Slaby, Indian; second, Sanberg, Yale; third, Boyd, Dayton; time, 3:50:00.

#### Pensacola, Fla.

Five miles—First, Suggs, Indian; second, Sweeney, Excelsior; third, Johnson, Indian; time, 6:46.

Ten miles—First, Suggs, Indian; second, Sweeney, Excelsior; third, Johnson, Indian; time, 13:22.5.

### Schickel Burns Kerosene.

One of the most interesting features that was noted in connection with the recent annual motorcycle show at Chicago was the cross country trip made by Victor Brunzel, who covered the 1380 miles between the factory of the Schickel Motor Company, Stamford, Conn., and the Coliseum in Chicago on a five horsepower, belt driven, Schickel single, utilizing kerosene as fuel. It is stated that the machine was stock in every particular, even to the carburetor, except for a slight readjustment of the air valve and needle valve to accommodate the heavier fuel. A small auxiliary tank, containing a limited supply of gasoline for starting purposes, also was fitted.

Brunzel was on the road 11 days, and averaged 85 miles a day. His longest day's run was 116 miles and the shortest 55. The ride was interrupted on five days because of rain. Brunzel declares that the machine operated perfectly, the two-cycle motor never failing to respond on kerosene once it was started. No statement is made as to the amount of kerosene consumed.

#### Other Long Distance Riders.

Other riders who came to the show from distant points on their machines were M. E. Gale and Ray Frawley from Angola, N. Y., on an Emblem twin, with side-by-side seating arrangement; Walter H. Bell, from Omaha, on a seven horsepower Indian twin; August Schlaefflein from Dayton, O., on a Harley-Davidson twin; Mr. and Mrs. A. P. Stroganoff from Schenectady, N. Y., on another side-by-side Emblem, and H. L. Clark from Worcester, Mass., on an Indian.

#### General News Notes.

Mr. and Mrs. James Henderson, White Plains, N. Y., recently completed a 2000-mile trip on a twin motorcycle.

R. L. Allen of San Francisco, Cal., is now on a 12,000-mile trip. He is riding to New York by the northern route and will return by the central.

An extensive motorcycle honeymoon trip is planned

by Mr. and Mrs. W. H. Hanlon of Columbus, O., who will visit New York, Boston, Montreal and Buffalo.

Mr. and Mrs. Oscar F. Becker of Milwaukee, Wis., have recently completed a honeymoon trip of 600 miles on their machine.

D. L. Reichard, Waynesboro, Penn., is riding his motorcycle to the Pacific Coast, where he will spend the winter, and will ride back again in the spring.

Charles A. Bottum, secret service agent of the War Department, is making his semi-annual inspection of the army and naval posts by motorcycle. He left Santa Monica, Cal., over a month ago and is gradually working his way across the continent to Virginia, visiting the various posts en route.

Rev. George W. Phillips, Hamilton, O., has planned a motorcycle tour through Jamaica and Porto Rico.

George B. Loveless, a mail carrier of Thornton, Ind., has been riding a motorcycle on a 33-mile route for the past three years and says that his entire upkeep expense, including repairs, oil and gasoline, does not exceed 26 cents a day, while if he were using a horse the least he could expect would be 80 cents.

F. J. Taylor of Portland, Me., is combining business

Pope and Harley-Davidson Riders in South Attleboro, Mass.: Left to Right, Joseph Ostiguy, Adelard H. Malo, Thomas Heap, Thomas Ostiguy, Lester Rowae and Clifford C. Walker.

and pleasure on a cross-continent motorcycle trip. He was married recently and shortly after was assigned to duty at a recruiting station at Bremerton, Wash. As his duties there did not begin for a month he decided to ride with his bride to their new home.

The police department of Birmingham, Ala., has doubled its motorcycle force.

Arrangements are well under way for the second national motorcycle road race of this season, which will be held on Christmas day on the automobile course at Savannah, Ga. The race will be for 300 miles and an award of \$500 will be given the winner. Riders from all over the country have entered.

The practicability of the motorcycle for salesmen has been demonstrated by F. A. Wall, salesman for a fire-proof storage company in St. Louis, Mo., who has ridden a machine in soliciting business for the past five years.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

**Augustyn Rotary Valve Engine Company**, Marshfield, Wis.; \$10,000; to manufacture rotary valve engine; R. J. Strauss, G. E. Harrington, H. E. Hoerl.

**Briskin-Wolsiffer Company**, Indianapolis, Ind.; \$10,000; to manufacture parts and accessories; J. H. Briskin, H. W. Bullock, C. C. Wolsiffer.

**B. F. Wade Tire & Rubber Company**, Los Angeles, Cal.; \$50,000.

**Sterling-Detroit Motor Company**, Detroit; \$105,000; to manufacture automobiles; H. Little, E. Finkenstead.

**Essex Motors Manufacturing Company**, Newark, N. J.; to manufacture motors and supplies; W. H. Simpson, M. E. Huddeh, J. J. Coyle.

**Sterling Spring Company**, Cleveland, O.; \$150,000; to manufacture automobile springs; F. C. Wood, E. D. Lindersmith, D. P. Osborne, H. F. Ehler, J. A. Flajole.

**Federal Rim Company**, Detroit; \$5000; to manufacture automobile wheels; A. H. Goss, H. W. Bailey.

**Boston Starter Company**, Louisville, Ky.; \$5000; H. W. Batson, G. A. Chrisman, G. Cary.

**Baxter-Frick Gear Cutting Manufacturing Company**,

Hower, William T. Helfer, John Claude Stafford, John Johnsen.

**Dimond-Warren Motor Company**, Quogue, N. Y.; \$8000; to deal in automobiles and operate garage; James R. Dimond, Arthur C. Warren, Thomas Dimond.

**National Auto Maintenance Company**, Chicago, Ill.; \$5000; to deal in motor cars; J. F. Kelley, R. G. Melcher, C. N. Addis.

**Auto Tire Brokerage Company**, Louisville, Ky.; \$10,000; to buy and sell autos and tires.

**Public Motor Car Company**, Dayton, O.; \$10,000; to buy and sell all kinds of automobiles; H. H. Williamson, R. J. Williamson, C. E. Borth, Brice Welsh, M. Kawen.

**Artillery Auto Tire Protector Company**, Wilmington, Del.; \$100,000; A. J. Coppock, Indianapolis, Ind.; J. C. Wellington, H. C. May, Pittsburg, Penn.

## WITH THE MANUFACTURERS.

The **Cameron Manufacturing Company**, maker of the Cameron line of pleasure and commercial cars, is now established in its new home at West Haven, Conn., as announced in a previous issue. The accompanying illustration presents the plant, and is important evidence that the concern is admirably well equipped to increase its production facilities to keep pace with the demand for the product.

The **Auto Parts Company**, Providence, R. I., has secured a permit for the erection of a new building at Goff and Eddy streets. It will be of brick, one story high, 45 by 116 feet.

The **National Auto Radiator Company**, White Plains, N. Y., has started business at 159 Stanley street.

The **Kelly Reamer Company**, Cleveland, O., has increased its capital stock from \$25,000 to \$50,000 in order to provide sufficient funds for increasing the manufacturing facilities.

The **Palge-Detroit Motor Car Company**, Detroit, expects to have its new plant at Fort and McKinstry streets ready for occupancy on Dec. 1, and anticipates doing business at the new address on or about that time. The financial statement of the company for the quarter ending in September shows that the gross sales increased \$1,200,000 over the same period of last year.

The **Vulcan Rubber Company**, Erie, Penn., has secured the permission of the state officials to increase its capital from \$100,000 to \$200,000.

The **Russian Tyre Sales Company**, importer of Prowodnick tires, has been taken over by the Columb Tyres Imports Company. The salesrooms will be retained at 1891 Broadway and 71 Columbus avenue, New York City.

The **National Drawn Steel Company**, East Liverpool, O., has recently been organized with a capital of \$100,000 to manufacture drawn steel products, including automobile appliances, gas engines, etc. It is expected that operations will be started in a few months.

**Chester L. Rieker**, designer of the Henderson car, is interested in a new cyclecar to be known as the **Bicar**. A company will be organized with headquarters in Indianapolis, Ind., to manufacture this product.

**O. G. Temme**, Chicago, Ill., proprietor of the **Triple Action Spring Company**, has recently purchased the entire business of the **Johnson Shock Absorber Company**.

**Arroll-Johnson, Ltd.**, Paisley, Scotland, manufacturer of a popular British car, has placed an order with **Gray & Davis**, Boston, Mass., for a large number of its starting and lighting systems.

The **Palmer-Moore Company**, Syracuse, N. Y., has established agencies in Binghamton, Utica, Auburn, Hudson and Rochester, N. Y., and in Providence, R. I. Plans are now being made to enter Boston and the other New England territory.

The **White Swan Cyclecar Company** is to erect a factory at Marysville, Cal.

The New Plant of Cameron Manufacturing Company in West Haven, Conn.

Cleveland, O.; \$25,000; gears; A. K. Baxter, William H. Frick, Vincent A. Taylor, Oswald M. Hoch, Mrs. Grace Barton.

**Breese Motor Plow Company**, Wapakoneta, O.; \$100,000; to manufacture motor driven vehicles; Robert A. Breese, G. R. Morris, David Lorbach, S. B. Everett, J. A. Hartford.

**Tulite Auto Bulb Company**, Detroit; \$25,000; to manufacture automobile lamps; J. L. Lepper, James M. Richardson.

**Freeport Tungsten Lamp Company**, Hoboken, N. J.; \$100,000; to manufacture lamps; H. J. Jaeger, R. H. Herschman, G. V. Williams.

**Taximeter Register Company**, Washington, D. C.; \$300,000; registers.

**Louisville Automobile Light Controlling Company**, Louisville, Ky.; \$10,000; to manufacture automobile headlights; B. D. Lake, N. G. Marks, James C. Stone, J. G. Harris.

**Flannely-Clarkson Auto Company**, Louisville, Ky.; \$2250; Charles C. Clarkson, T. P. Flannely, E. J. Clarkson, M. H. Flannely.

**Pitts Motor Car Repair and Sales Company**, Brooklyn, N. Y.; \$24,000; Frank G. Pitts, George O. Walbridge and others.

**Ohio Motor Company of Illinois**, Chicago, Ill.; \$5000; vehicles, parts and accessories; Joseph Slottow, Samuel C. Wood, Fred C. Churchill.

**Tanner-Hower Manufacturing Company**, Akron, O.; \$50,000; to sell automobiles; Perry B. Tanner, M. Otis

# NEW DEPARTURE

QUALITY GUARANTEED

AMERICAN MADE FOR AMERICAN TRADE

# BALL BEARINGS

*The* NEW DEPARTURE MFG. CO.  
BRISTOL CONN.

**The United Punctureless Company**, Detroit, has established a branch at 4108 Olive street, St. Louis, Mo., with Adolph Loehr as manager.

**The Pontiac Motor Castings Company**, Pontiac, Mich., is enlarging its building.

**Will H. Brown**, upon assuming his new duties as general sales manager of the Indianapolis branch of the Cole Motor Car Company, announced that the Brown Commercial Car Company will continue business the same as usual with office and service station at 425 North Meridian street, Indianapolis.

**The B. F. Goodrich Company**, Akron, O., has established a Canadian branch at Toronto, Ont.

**The Star Carriage Company**, Seattle, Wash., has started work on the production of the Northwestern one-ton truck. The company is comprised of J. G. Eyer and August Greyerblehl.

**Frederick C. Felker**, Racine, Wis., inventor of a new type of airless tire for automobiles, is planning to engage in the manufacture of this product.

**The Typhoon Signal Company**, Chicago, Ill., has moved its main factory and office to Lincoln, Ill.

**The Fellbach Motor Company**, Milwaukee, Wis., has increased its capital from \$50,000 to \$100,000.

**The Moon Motor Car Company**, St. Louis, Mo., reports an increase in business of 100 per cent. on August shipments, 100 per cent. in September and 100 per cent. in

rooms and a service station for the Imp cyclecar at 1325 Michigan avenue.

**Charles Fredricks**, Denison, Ia., has leased a new building and will open a garage and repair business.

**T. K. Julson**, Dillon, Mont., has erected a 50 by 30 foot addition to his garage, which he will use as a repair shop.

**The Eastern Motor Company**, Atlantic, N. J., has removed to 2720 Atlantic avenue, where three floors are used.

**Charles F. Fulmer**, Plainfield, N. J., who has conducted a repair shop in Sycamore street, has removed to 535 North avenue.

**Robert Hulse**, eastern manager for the Harroun Car-buretor Company, has opened sales and display rooms in the Longacre building, New York City.

**The Haynes Motor Company**, Birmingham, Ala., has just moved into the new service department at 619 South 20th street. The building has been entirely overhauled and modern equipment installed.

**The Ford Motor Company**, Kansas City, Mo., has discontinued the wholesale and retail branch at 1608 Grand avenue. The retail department has been moved to 1710 Grand avenue and the wholesale department to Sheffield, Mo., where the assembly plant is now located.

**The Brockway Motor Sales Corporation** has opened offices at 250 West 54th street, New York City.

**The Actna Garage Company**, Hartford, Conn., has re-

Factory of the Moon Motor Car Company, St. Louis, Mo., Maker of Moon Pleasure Automobiles.

October. This is taken as satisfactory evidence of the decided popularity of the new light weight six-cylinder Moon car announced recently by this concern.

**The Knox-Martin Automobile Company**, Springfield, Mass., is to establish headquarters in Cincinnati, O., for the distribution of the Knox-Martin tractor in southern Ohio, eastern Indiana and central Kentucky.

#### GARAGE AND DEALER.

**The Nashville Motor Car Company**, Nashville, Tenn., has opened a repair shop.

**The Lakewood Auto Supply Company**, Lakewood, N. J., has opened a store at 128 Clinton avenue.

**The Lehigh Valley Motor Company**, Allentown, Penn., has moved to 635 Linden street.

**The Donovan Motor Car Company**, Boston, Mass., has taken over the entire second floor of the Oldsmobile building on Commonwealth avenue.

**The Menshel Tire & Rubber Company**, New York City, has leased new quarters at 1675 Broadway.

**The Lake Auto Agency**, Danbury, Conn., has moved to new and larger quarters in Crosby lane.

**The Mercury Motor Truck Company**, Chicago, Ill., has opened new salesrooms and service station at the corner of 43rd and Halstead streets.

**Paul Wargny & Co.**, Chicago, Ill., has opened sales-

rooms and a service station for the Imp cyclecar at 1325 Michigan avenue.

**The Bradley-Moore Auto Company**, San Marcos, Tex., has moved into its new building.

**The Central Motor Car Company**, Reading, Penn., has opened new salesrooms at 522 Chestnut street.

**The Howe Rubber Company**, New Brunswick, N. J., has opened a state and local salesroom on Capitol avenue, Indianapolis, Ind.

**The Firestone Tire & Rubber Company** of New York has opened a branch at 223 East avenue, Rochester, N. Y.

**The Marathon Automobile Company**, Boston, Mass., has opened new salesrooms at 823 Boylston street.

**Charles E. Riess & Co.**, New York City, is now located in its new salesrooms at 1690 Broadway. The company is showing a complete line of 1914 model Hupmobiles.

**Theodore Crossley**, Riverside, Cal., has had work started on the erection of a new Overland station at 10th and Market streets.

**George A. Bloomfield**, Frankfort, Penn., is to move his business to Salt Lake City, Utah.

**The Chalmers Company**, Los Angeles, Cal., is now located in new quarters on Hope street.

**C. V. Lucius**, Youngstown, O., has moved his business to the Viaduct garage, South Side.

**The Alkire-Smith Automobile Company**, Salt Lake City, Utah, will move to larger quarters on West Temple street, where a new modern building will be erected.

## GENERAL NEWS OF THE INDUSTRY.

### Chicago Electric Motor Car Company Passes into New Hands—Mystery of Saxon Concern in Detroit Is Revealed—Other Organizations and Changes.

**T**HE Carl Electric Vehicle Company, Toledo, O., has purchased the business of the Chicago Electric Motor Car Company, and the equipment will be removed to Toledo. The Carl company was recently incorporated with a capital of \$300,000 and will manufacture electric vehicles. C. A. Neracher, formerly chief engineer for the Willys-Overland company, is one of the principal stockholders in the new organization.

The Chicago company was formed a little more than a year ago by Frederick J. Newman and others, and maintained a factory at 3612-3618 South Morgan street, Chicago, Ill., where electric pleasure cars were produced. It is understood that a business wagon will be added to the line by the new concern.

#### DEALER BECOMES MAKER.

##### Kleiber Company Plans to Build Trucks of Its Own Design.

The Kleiber Company, San Francisco, Cal., which has handled the Gramm trucks for several years, has completed arrangements to manufacture trucks on its own account in San Francisco. The company plans to build 100 of its new machines during the 1914 season, each one of which will be equipped with a Continental engine.

The officers of the new company are: President, Paul Kleiber; vice president, W. M. Remensperger; second vice president, E. Kleiber; treasurer, P. E. Rathjens; secretary, Otto T. Suden.

#### RE-ENTERS THE INDUSTRY.

##### William Mitchell Lewis to Be President of the Lewis Motor Company.

William Mitchell Lewis has actively re-entered the automobile manufacturing field and is to be president of the Lewis Motor Company, Racine Junction, Wis., which has been formed with a capital of \$250,000 to manufacture a car designed by Rene Petard.

Since he retired from the Mitchell-Lewis Motor Company, Racine, Wis., Mr. Mitchell has devoted his time chiefly to his newspaper and other

business interests. Rene Petard was closely associated with Mr. Lewis when with the Mitchell-Lewis company.

#### CHANGES IN SALES FORCE.

##### Woods Motor Vehicle Company Reorganizes This Department of Its Business.

A reorganization of its sales force has been announced this month by the Woods Motor Vehicle Company, Chicago, maker of the Woods electric cars, which should materially strengthen the position of the Woods electric in the field in which it is a pioneer.

The change in the management of this department includes the appointment of H. L. Goodwin as general sales director and W. A. Simonson as general sales manager in personal charge of the distributing agencies throughout the United States. Mr. Goodwin will make his headquarters in the general offices of the company at Chicago, where he will be in complete and intimate touch with all the details of the selling end of the organization.

#### GOES WITH GREEN COMPANY.

##### Melvin J. Adams Becomes Associated with Advertising Concern in Detroit.

Melvin J. Adams has joined the Detroit forces of the Carl M. Green Company, well known in the automobile advertising field. The addition of Mr. Adams should materially increase the efficiency of the service of this company, which has won a prominent position through the handling of the accounts of the Chalmers, General Motors, Detroit electric and other concerns both in and out of the automobile industry, as he has had a wide experience in both newspaper and advertising work.

For two years Mr. Adams was connected with the reportorial staff of the Chicago Tribune, following which he was connected with the United States Motor Company; became advertising manager of the Alco; was with the copy department of the Van Cleve Advertising Agency in New York, and with the Locomobile at Bridgeport, Conn.

### REAPPOINTED AS MANAGER.

#### Well Known Instructor to Head Boston Y. M. C. A. Automobile School Again.

It does not come exactly as a surprise to the many friends of Prof. Winthrop C. Hosford, manager of the Boston Y. M. C. A. automobile school, Boston, Mass., to learn that he has been appointed to this position for another year. Prof. Hosford is a hard worker, but studies continuously, keeping abreast of the improvements and developments of the industry. The reputation of the school, which was the first of its kind to be established in this country, is largely due to his efforts in its behalf.

Born in New Britain, Conn., Prof. Hosford

Prof. W. C. Hosford, Manager, Boston, Y. M. C. A. Automobile School.

entered a machine shop at the age of 16. During the next few years he studied machine drawing and designing evenings. He became identified with the New England Motor Carriage Company in 1898, thus assuming a place among the pioneers of the industry, and has been connected with the motor car field

in some capacity or other ever since that time. For several years he was chief instructor at the Boston Y. M. C. A. automobile school, previous to his promotion to become manager in 1912. Several thousand men—chauffeurs, operators and others connected with the industry in many different capacities—can testify to his skill as a teacher and to his genial personality.

### SAXON MYSTERY CLEARED.

#### Chalmers Officials Interested in Production of New Low Priced Car.

The mystery which has surrounded the recent incorporation of the Saxon Motor Company in

Detroit has been dispelled by the announcement that the concern is composed of nine of the present officials of the Chalmers Motor Company of that city. It is stated that the production of the company will be a new low priced car, with wheelbase of 96 inches and standard tread. It is further explained that it is not to be a cyclecar in any sense of the word, although selling at a price which might compete with that type.

W. H. Ford, secretary of the Chalmers company, is president and general manager of the Saxon concern, and other Chalmers men associated with him are: Hugh Chalmers, Lee Counselman, George Dunham and C. C. Hinkley. The capital stock is placed at \$350,000, with \$100,000 preferred and \$250,000 common. Offices will be maintained at 1305 Bellevue avenue.

### TO MAKE NEW ENGINE.

#### Augustin Rotary Valve Engine Company Will Locate in Marshfield, Wis.

A permanent organization has been perfected by the stockholders of the recently incorporated Augustin Rotary Valve Engine Company, Marshfield, Wis., by the election of the following officers: President, Dr. G. E. Harrington; vice president, Charles K. Herrick; secretary, Henry E. Hoehl; treasurer, R. J. Strauss.

The company was formed for the purpose of manufacturing and developing a new type of internal combustion engine, and a factory has been established at Marshfield, Wis. The incorporators are R. J. Strauss, G. E. Harrington and H. E. Hoerl, and the capital stock is \$10,000.

### NEW CANADIAN CONCERN.

#### Capitalized for \$1,000,000 for the Production of Commercial Vehicles.

The Canadian Bull Tractor Company, Ltd., has been organized in Winnipeg, Man., for the production of motor trucks. The capital stock has been fixed at \$1,000,000, of which only \$200,000 will be issued at present, a later call being contemplated when arrangements are completed for the erection of a factory. The directors have not decided upon a site for the plant, but there is reported to be a strong sentiment in favor of Winnipeg.

The officers of the company are: President, W. H. McWilliams; vice president, A. R. Hargraft; secretary and treasurer, J. S. Loudon; directors, W. J. Cummings, Roy M. Wolbin, Walter Pace, L. A. Cannon and H. F. Williams.

## THE GLIDDEN TROPHY METZ MODEL.

**B**ECAUSE of its especially good work in winning the 1913 Glidden trophy event, in competition with many cars of greater power and higher price, the 22 horsepower Metz roadster, made by the Metz Company, Waltham, Mass., has come very prominently before the public during the past few months. The design will be continued, without material change, throughout the coming season.

The motor is a four-cylinder unit, cast en bloc, with removable water jacketed cylinder head. The bore is 3.75 inches and the stroke four, giving a standard rating of 22.5 horsepower. The crankshaft is made of high grade steel, specially heat treated, and has three main bearings with long bearing surface. The lower half of the crankcase constitutes the oil reservoir. The valves, pushrods and springs are completely enclosed, making for noiseless operation and excluding dust and grit.

Cooling is by thermo-syphon, and the radiator is of ample size. Lubrication is by constant level splash, operated by pump.

The carburetor is a float feed automatic type of standard make. Ignition is by high tension Bosch magneto. The fuel tank is at the rear and has capacity of seven gallons.

One of the distinctive features of the Metz is the friction transmission. The friction rim is composed of compressed fibre, and the driving plate is of special alloy. The propeller shaft from the engine to the fibre disc is mounted on ball bearings of large dimensions, and forms a straight line drive from the motor to the jackshaft. Final drive is by chains running in oil.

The springs are full elliptic, heat treated, and carefully selected as to tension and weight. The frame is of pressed steel channel section. The wheels are of the standard artillery type, fitted with Goodrich 30 by three-inch clincher tires.

One set of internal expanding brakes operates on rear wheel drums, while an external contracting brake is located on the jackshaft. Of course, the friction transmission may be used as a brake in an emergency. The driver is placed at the left with control lever in the centre of the car. This latter is of steel tubing with a cap on the top, which, when pressed down, permits of shifting to any speed desired. The wheelbase is 90 inches and tread standard.

The body is described as of the semi-enclosed type, a modification of the fore door design, with seating capacity for two persons. The rear deck affords space for luggage, etc. The equipment

The Friction Driven, 22 Horsepower Metz Roadster—Winner of the Glidden Trophy.

includes a top, windshield, removable side curtains, gas lamps and generator, horn, tire pump and full set of tools.

Ninety-five per cent. of the parts comprising the Metz cars, including practically every component but the tires, magneto and carburetor, is made at the plant of the Metz Company in Waltham. In addition to the model described, it is understood that the company is practically ready to market a speedster design, having the same chassis details, but with an open body of racy appearance and equipped with wire wheels, electric lighting and motor starter. This will be sold at a slight advance in price over the regulation model. It is also stated that the electric lighting and starter may be secured for the older design as well as extra equipment.

## What the Ford Company Says

See Ford Model T Instruction Book, Page 30 (Sixth Edition).

"When the motor overheats and the water boils many car owners are only too ready to blame it to insufficient water capacity, when really the water capacity is ample and the difficulty is due to some outside influence."

### That ought to be proof enough for you that your Ford should not overheat

If the "Outside Influences" are properly adjusted the regular Ford equipment will keep your car cool without recourse to expensive alterations.

The Ford Special Boyce Motometer will enable you to adjust your carburetor properly and thus obtain maximum efficiency and mileage.

It will enable you to carry your spark at the right point.

It will tell you when to fill the radiator.

It will record when to tighten the fan belt.

It will enable you to regulate these "outside influences" correctly and scientifically, AND it will absolutely act as an oil gauge preventing scored cylinders, warped piston rings and burned bearings.

The Ford Special Boyce Motometer is here announced for the first time. Our standard instrument is in use as standard equipment on such cars as Mercer, Pilot, Henderson and is used by 91% of the world's greatest racing drivers.

The Ford Special Motometer requires no fitting or drilling. You simply unscrew your cap and replace with the Ford Special Motometer with cap. This instrument will be sent you prepaid on receipt of price--\$5.50--together with full instructions for operation.

**30 DAY TRIAL OFFER.** If at the end of thirty days you are not entirely satisfied with the Motometer return it to us and we will gladly refund your money. **WRITE FOR AGENTS' PROPOSITION.**

## The Motometer Company, 1790 Broadway, New York City

When Writing to Advertisers, Please Mention The Automobile Journal.

View From Seat

**FORD SPECIAL  
BOYCE**

**MOTOMETER**

**PRICE \$5.50**

Remove your cap and substitute this cap and the work of attachment is complete.

# FORD SPECIALTIES

## FORD HOOD AND RADIATOR COVER

Made from heavy rubber cloth, heavily padded and as a winter necessity it takes the lead. Keeps in the heat and keeps out the cold. Your car will start easy in cold weather and the snow and sleet will not go through the hood and on the spark plugs. The price is low when you consider the quality and you must have quality or you have nothing.

**Price \$5.00**

## EMERGENCY BRAKE ROD SUPPORT

Pat. Pending

This is one of the most necessary devices we have ever offered. Takes the place of the steel supports now on the Ford. Keeps the rods from vibrating. Put on in half an hour. Made from bronze. Guaranteed for life.

**Price per pair \$2.00**

## Ford Brake Shoes

Made in two qualities, manganese bronze and gray iron. The workmanship is good and they are guaranteed to fit. Set includes four pieces.

**Prices:**

**Bronze \$2.50**

**Iron \$1.00**

## FORD VALVES

Absolutely a better valve than has ever been offered to Ford car owners and at a price no higher than the cheap kinds.

**Price each . . . . . 30 cents**

## PRIMING PLUG

It is a well known fact that there is no way of priming the Ford cylinder without removing the plugs and the APCO Priming Plug is designed to furnish an easy means of doing so. The big trouble with the ordinary priming plug is that the quality of the spark plug itself is overlooked and we have taken our regular APCO spark plug that met with such success last year and installed a priming device in it without impairing its sparking qualities. APCO priming plugs insure clean contact points, clean cylinders and easy starting in any temperature. There is a lot to be said about the need of a priming plug in the Ford, but every Ford owner knows the need and we can supply the goods.

**Price each . . . . . \$1.00**

## Ford Clamp-on Bumper

Made from high grade material. Put on in an hour. No machine work necessary. Black enameled finish. Changes the looks of the car.

**Price . . . . . \$4.50**

## Anti-Rattling Ball Socket Caps

Made in three styles, two for the radius rods and one for the steering gear ball arm (shown in cut). Our No. 1 is for radius rod and has screw adjustment. No. 2 for the same purpose, but with disc adjustment. No. 3 (shown in cut) for steering gear ball arms. These devices are the best sellers in our entire line and no Ford should run without this equipment.

**Prices Each: No. 1, \$1.50  
No. 2, \$1.00 No. 3, \$1.00  
(Two required on car.)**

## FORD HUB CAPS

Made exactly the same as the ones furnished on the Ford car. Made from high grade heavy gauge brass, highly polished.

**Price each 30c**

## OVERHAULING THE FORD CHASSIS.

### Outlining the Components Requiring Attention and Suggestions for Cleaning and Adjusting---Timing and Wiring Diagrams---Special Tools Necessary.

**T**O OBTAIN maximum efficiency from the used model T Ford car in winter service it should be given a thorough inspection, the extent

ating the speeds and clutch must be in a certain position before the cover with pedals can be replaced.

#### Tools and Supplies Required.

There are a number of special tools which will be required in the complete overhaul of the chassis, among which may be named: A cam gear puller, transmission clutch puller, rear axle housing bolt nut wrench, valve seat reamer, crankcase bolt and nut wrench, etc. These may be obtained from the factory or purchased from concerns specializing on the Ford car. Some of the special tools named above will not be necessary unless certain parts are damaged and require replacement, such as the timing gear, for example. A practical set of special tools may be obtained at a reasonable cost and, supplemented with the average tool equipment, should suffice. The amount of supplies needed will depend largely on the work, and the owner will have to be guided by conditions. As the majority of supply houses carry Ford material, it will be a simple matter to purchase as needed.

#### Preparing for the Overhaul.

It is advisable before beginning the work of the overhaul to strip the machine of all accessories, such as lamps, generator, etc., and, if any need repairing, have the work done while the chassis is being given attention. Clean the motor, transmission housing and all other components which are covered with grease and oil, with gasoline. A stiff brush will serve if the garage

Fig. 1—Components Requiring Inspection in the Overhaul of the Chassis.

of which will depend upon the age of the machine, its condition, etc. It is possible that, aside from removing carbon, grinding in the valves, taking up the bearings, and making a few minor adjustments, the chassis may be prepared for the road. On the other hand, if the machine has seen considerable service, it will be advisable to make a complete overhaul. In planning the work the owner will find it to his advantage to study carefully the instruction book issued by the maker, familiarizing himself with the construction details. The parts catalogue, showing as it does each component of the chassis, will be valuable in disassembling and assembling.

#### Extent of the Overhaul.

The amount of work that may be done by the owner will depend to a great extent upon his knowledge of the mechanical construction of the car. There are several units which require experience to reassemble, the transmission, for example. While it is a simple matter to displace the transmission cover, which can be removed in approximately 30 minutes by the expert familiar with the Ford, it is likely to take the novice at least half a day. This may appear to be an extravagant statement, but a study of the transmission and its cover will reveal the difficulties to be encountered by the amateur. In further explanation it may be stated that the mechanism oper-

Fig. 2—Showing Members to Be Disconnected Before Attempting to Remove the Power Plant.

is not equipped with a compressed air cleaner. Next, wash the body and running gear. Before displacing the radiator, empty it and fill with a solution of common washing soda and water, or a marketed preparation for this work. Operate the motor for a few minutes to allow the solution to dislodge any rust, etc., that may have accumulated through not changing the water from time to time. If the water is badly discolored, repeat the treatment, after which refill with fresh fluid and run the engine.

Drain all water from the cooling system and then remove the clamps of the intake and outlet water pipes, taking care not to bend or break these retainers. Remove the rubber piping, inspecting same for loose fabric, and make a note if new is needed. The rods supporting the windshield are removed at the radiator and the latter may be displaced by removing two nuts as indicated at Fig. 1. It is assumed that the hood has been taken off and the tierod connecting with

Fig. 3—By Removing the Motor the Work of Inspection, Adjustment, Etc., is Greatly Simplified.

the dash unscrewed from the cooler. In handling the radiator care should be taken not to impose stresses upon the fins or tubes. If it has been leaking it may be sent to the expert or repaired by using a radiator compound.

#### Stripping the Motor.

The illustration at Fig. 2 will be of service in stripping the motor. Disconnect the wires at the spark plugs, also the primary leads at the timer. The last named should be tagged if the wires are dirty, as it will simplify the replacement. Otherwise, each wire will have to be tested. In marking the primary wires the drawing at Fig. 13 will be of value, showing as it does the direction of rotation and firing order. Disconnect the rod leading from the dash to the needle valve of the carburetor by screwing it out. Next disconnect the union of the fuel supply pipe at the carburetor, but first close the petcock at the tank. The spark plugs, intake and exhaust

Fig. 4—Before Taking Out the Power Plant, Disconnect Nuts and Bolts of Universal Joint Ball Cap.

manifold may be removed or left as is desired.

Before attempting to remove the motor, disconnect the cable at the magneto terminal and the union connecting the exhaust manifold with the exhaust pipe. These components are shown at Fig. 4. It will also be noted that the universal end of the drive shaft is retained by a ball cap, and the latter by nuts and bolts. If the rear construction is to receive attention, it is best to displace this before removing the motor. Disconnect the emergency brake rods and chock the front wheels securely, both front and back. Next, disconnect the rear spring retainer and jack up the frame and body so as to permit the withdrawal of the rear assembly; that is, so that the rear axle will clear. If the universal ball cap be clear the rear construction can be rolled out from the car, and the slip joint should separate from the transmission shaft easily. Block up the rear of the frame so that it will be steady when displacing the motor.

The motor is suspended at three points, one

Fig. 5—Showing Radiator and Connections Displaced, and Front Bearing of Motor.

**Fig. 6—Intake Side of Motor, Showing Frame Supports Which Should Be Inspected for Loose Rivets—These May Require Brasing.**

on either side of the transmission housing and at the front as shown at Fig. 1. Examine the bolts for wear. Remove the crankcase front bearing cap and inspect the frame bearing, also rear supports, as these may be loose and require tightening because of worn rivets. The Ford motor differs from conventional practise in that the lower crankcase is not removed with the cylinders. The latter are bolted and the bolts may be displaced easily with a special wrench, although the work may be accomplished with ordinary tools.

Before attempting to lift out the motor, make sure that all connections are loose. It will be an easy matter to take out the power plant with the assistance of one person. An important point to be observed in the work is the flywheel generator. As this is incorporated with the flywheel and practically with the motor, care must be taken not to injure the windings and their connectors. After lifting the motor from the frame, place it on its side. This will insure that the generator will not become damaged, and permit of working on the bearings, etc.

With the engine on its side, remove the spark plugs and valve cover plates. Next, take off the cylinder head and endeavor to remove the gas-

**Fig. 7—Motor with Cylinder Head Displaced, Permitting of Easy Access to Pistons, Valves, Etc.**

ket without injury. The exhaust and intake manifolds are retained by clamps or stirrups and these held by nuts. Place them on the work bench for cleaning with their gaskets. The fan bracket may be left on the motor if desired, it being assumed that the belt has been previously loosened by means of the adjusting mechanism to permit of displacing the motor.

If the overhaul requires the scraping in of the bearings, the timing gear plate must be removed in order that the gears may be correctly remeshed. Examine the timing and crankshaft gear to note if the teeth are marked as indicated at E, Fig. 12. If not, prick punch them as shown in the sketch. Before attempting to remove the camshaft and crankshaft, the bearing caps of these members must be prick punched so that they will not become mixed in the reassembly. Mark the centres of the main bearing caps 1, 2, 3, respectively, also one side, to insure correct re-

**Fig. 8—Components of the Motor, Requiring Careful Examination—Also Showing Slotted Wristpin and Its Bushed Bearing.**

placement. This precaution is very necessary.

An examination of the bearings will determine whether they need scraping or adjusting. Smear the shaft with Prussian blue, clamp down the cap and rotate the crankshaft. Begin with the rear bearing and observe if the blue indicates a full bearing. If not, the babbitt must be scraped and the cap refitted until a good seat is obtained. The second and third main bearings are treated in a like manner. In adjusting the bearings they should be set up snugly. Some advise a degree of tightness permitting of rotating the shaft with one hand, while others recommend a closer fit. Before replacing the caps, clean and lubricate the shaft and caps. It is possible that the caps will have to be reduced to obtain a good bearing. Do not use a file, but place emery cloth on a smooth board or surface plate which will insure accuracy. The camshaft bearings are treated in a similar manner, but it will first be necessary to

remove the valves to get at these members.

Assuming that the overhaul of the motor is to include the scraping in of the large ends of the connecting rods, it will be a simple matter to disconnect the bearings, but mark the caps as were the main bearing members, else considerable trouble will be experienced in the reassembly. The connecting rod bearings are of the split type, as shown at Fig. 8. After removing the caps it will be an easy matter to push the rod and piston out of the cylinder. It is also suggested that the connecting rods be prick punched 1, 2, 3, 4. This will insure proper replacement.

The piston rings should be displaced to clean all carbon from the piston, and in performing this work care must be exercised, else the rings will be broken. Slip three strips of tin or old hacksaw blades between the top ring and piston and it will be found that the ring will slide off easily.

Fig. 9—Sectional View of Rear Axle—Smaller Illustration Depicts How Radius Rods Are Retained and Adjusted.

Remove the others in order and place them so that they will go back in the same order.

The wristpin oscillates in a bronze bushing in the piston bosses as shown at Fig. 8, and is consequently clamped in the small end of the connecting rod. It is provided with a slot to prevent its turning and the bolt must be set up tightly in the reassembly. If the piston bushing is worn a new one will have to be fitted to eliminate the play, and this will require the use of a special reamer. It is possible that both the bushing and new wristpin will be necessary to complete a satisfactory repair.

#### Inspection of Valves.

The valves are removed by compressing the springs, for which a valve lifter will be required. Mark the valves in order, and after scraping off all carbon, grind them in, using any good valve grinding compound. Be careful to remove all traces of the abrasive, and in replacing the valves smear the stems with a mixture of graphite and

Fig. 10—Components of Rear Construction Which Should Not Be Overlooked in the Overhaul.

oil. It is assumed that all carbon deposits have been cleaned from the cylinder and piston heads, and the writer recommends the smearing of these with graphite, which will resist the formation of carbon.

The exterior components of the motor may be fitted before or after replacing the power plant, as convenient. The work of putting back the pistons may bother the novice, but by using a clamp device or tying the rings in place, and proceeding carefully, the result should be satisfactory. It is important that the connecting rods face the same way as when removed and for this reason the marking above referred to was suggested. In replacing the bearing caps, the fit should be so that the piston and rod will barely turn of their own weight. These bearings should be well cleaned and lubricated.

#### Cleaning Crankcase.

The crankcase ought to be cleaned and flushed with kerosene or gasoline before replac-

Fig. 11—Transmission with Cover Removed—Its Overhaul Will Require the Services of an Expert.

ing the cylinders. Throw away the old lubricant as it may contain particles of metal, dirt, etc. If the gaskets have been taken off carefully they may be used again, but, if doubtful, fit new, as a complete set is not expensive. Make sure that those between the intake and exhaust manifolds fit properly, as auxiliary air will create trouble, especially when the engine is operating slowly, and make starting difficult in cold weather.

The simplicity of the carburetor will permit of its being disassembled and cleaned. It is also an excellent idea to clean the pipe conveying heated air to the intake. Examine the float of the carburetor, as it may need shellacking. It may be tested by pouring gasoline in the float and noting its position.

With the motor in the frame, proceed to check up the valve timing. The valves of the Ford are

first and second timer leads are connected to similar primary terminals of the coil, but the third contact to be made in order by the roller of the timer is connected by wire to the fourth terminal of the coil. The cylinder firing last is the No. 3. The secondary wires are fitted in the same manner; that is, the firing order is observed.

Relative to the timer: If this member is worn, it is best to replace with a new one, as they are inexpensive. The cost of repairing the old one would doubtless exceed that of the new. It is a simple matter to replace a timer: Place the piston of the first cylinder (that nearest the radiator) on top dead centre, or compression. It will be found that the hole in the camshaft will register with that of the timer when the spark lever is retarded and the rod is connected to the commutator. Lubricate the timer before fitting, or if the old one is utilized, clean it with gasoline.

Fig. 12—Diagrams Showing Method of Retiming the Valves and Proper Method of Replacing Camshaft—The Opening and Closing Points of Valves Are Also Outlined.

not adjustable, but if the space between the stems and tappets does not conform to the diagram presented at Fig. 12, the openings may be corrected by the use of adjusters which may be obtained at any supply house. The timing diagram referred to shows the opening and closing points of both the intake and exhaust members, and a little study should enable one to set the valves correctly. A slight allowance should be made for the expansion of the metal when heated.

#### Rewiring Motor.

If the primary wires were tagged as suggested, it should be a simple matter to place these correctly. At Fig. 13 is shown the wiring plan, and it will be noted that the timer rotates anti-clockwise and that the firing order of the motor is 1, 2, 4, 3. This is not always taken into consideration by the owner making his first overhaul. By studying the wiring plan it will be seen that the

The disassembly of the rear axle will require care. A semi-sectional view is presented at Fig. 9, the smaller illustration showing how the radius rods are secured to the drive shaft housing. If the drive shaft is to be displaced, the nuts of the front ends of radius rods and those of the studs holding the shaft tube must be taken off. This will permit of removing the tube, shaft, etc., but, unless one is familiar with the construction, any repairs needed are best left to the expert, for in replacing the parts one is likely to so adjust the radius rods as to cause misalignment. While the instruction book of the maker gives in detail the operations necessary for this work, as well as for the disassembly and replacement of the differential, it is best to have the assistance of some experienced person. Ordinarily, the rear construction will not require any attention other than removing the old lubricant and replacing with new.

The same holds true of the transmission, except that the different speeds can be adjusted by the novice.

### Steering Gear and Linkage.

The inspection and overhaul of the steering gear and its linkage is important. Lost motion may be due to wear of the spindle bushing or pin, tierod, yokes, etc. These components are equipped with bushings which, if badly worn, may be driven out and replaced with new. In connection with this work it generally is necessary to ream the bushings to secure a fit, and a special reamer will be required if accurate work is to be obtained. Lost motion in the ball and socket members can be eliminated by filing the caps, but a better method is to fit the anti-rattlers marketed for these parts. The ball and socket of the front radius rod is subject to wear and as an anti-rattler with adjustable features

### Adjusting Ball Bearings.

Before lowering the jacks, unscrew the hub caps and inspect the ball bearings. These are of the cone and cup type, and should be carefully examined for wear and replaced with new if not in good condition. If one or more of the balls are worn or pitted, replace with a new set, packing the spheres in a good quality of grease, one free from acid, and readjust. Take up on the nut until the wheel binds, then slack off about half a turn and lock the nut. The wheel should spin freely, but if on slowing down it shows a tendency to bind at one point, examination of the spindle should be made. It will probably be found out of true.

### Care of Brakes.

Next to the steering mechanism, the brakes are of importance. The service member is operated by the foot, and this with the low speed band

Fig. 13—Wiring Plan of Both Primary and Secondary Circuits—It Will Be Noted That Timer Roller Rotates Anti-Clockwise When Viewed from the Front.

may be procured for a small sum, its use is to be preferred to the filing process referred to.

The steering gears proper are of the planetary type and are located in a small housing under the wheel. They are accessible for inspection and lubrication by loosening a set screw and unscrewing a knurled brass cap, first removing the wheel which is retained by a nut and key. If the gears are badly worn it may be necessary to replace with new, but this is an exception rather than the rule with this type of steering gear.

In testing for lost motion in the steering mechanism it is suggested that both of the front wheels be jacked up, and this method will permit of trying all linkage for freedom of movement. In inspecting the steering gear and its components it is well to clean the lubricating cups and refill with oil.

may need relining. They are accessible through the cover plate of the transmission. Rotate the clutch band adjusting nuts B and C, Fig. 14, to the extreme ends of their shafts, then remove the low speed band adjusting screw A. Displace bolts retaining the cover and, holding the slow speed pedal, lift the assembly. Slip the bands forward, sliding that nearest the flywheel over the first of the triple gears. Next, rotate the flywheel until the openings in the bands are down, when it may be lifted out. To accomplish this, it is necessary to spread apart the bands at the ears, and this is more easily done if the three sets of triple gears are so placed that one set is about 10 degrees to the right of the centre at the top. To replace, reverse the procedure, but in fitting the transmission cover see that the clutch release ring fits into the rear groove of the clutch shaft.

This is shown in the illustration at Fig. 11.

The emergency brake shoes may be obtained at the majority of supply houses and are of metal.

Fig. 14—Transmission Cover.

To remove the rear wheels a puller will be needed, but these are inexpensive and should be included in the tool equipment. In the overhaul of the chassis the muffler should not be overlooked. It may be disassembled and cleaned by taking off the nuts holding the rods in

place. Smear the threads with graphite.

If the rear system has been removed for any cause, in replacing it some trouble may be encountered in fitting the squared tongue of the universal joint into the transmission shaft. With the assistance of one person to steady the shaft housing, the workman can guide the tongue so that it will enter the squared section of the shaft.

Both the front and rear spring perches should be gone over and inspected for undue wear, also the spring retainers and clips. The perches are bushed and sometimes a new bushing will reduce lost motion, but if considerable wear is noted the bolts will have to be renewed. These components require lubrication. It is also suggested that after the overhaul and before the car is tried out on the road, all nuts and bolts be gone over, and tightened. This plan is recommended even after the chassis has been tested out for it will generally be found that several are loose.

Before starting the motor and, especially if

Fig. 15—Section of Differential Housing Cut Away to Show Grouping of Components.

the bearings have been taken up, make sure that there is plenty of oil in the crankcase and the radiator is filled with water. Run the motor slow-

ly at first and at intervals, until the bearings are well worked in. The matter of adjusting the low, reverse and high speeds is familiar to the owner, and the same is true of the brakes. If new shoes have been fitted to the rear wheels it is suggested that the brake drums be examined after a short run to note if they are heating. If such be the case, remove the wheels or examine the adjustment of the rods as the drums should not heat. With the shoes dragging the efficiency of the motor is impaired.

It will generally be found, after the road test, that there are a number of minor adjustments to be made, such as setting the carburetor, adjusting the vibrators, brakes, etc. The matter of tires and rims has not been discussed, having been dealt with fully elsewhere in this issue. While it is admitted that the novice will encounter ob-

Fig. 16—Front and Rear Spring Assembly—The Lower View Shows Cones and Adjusting Parts of Ball Bearings.

stacles in the overhaul, the experience gained will be of distinct value in that it will teach him to properly care for his machine in service.

### BOOTH FELT GASKETS.

In overhauling the Ford motor, too much emphasis cannot be laid upon the importance of proper gaskets and their use. One of the most important points to observe in reassembling the motor is the placing of the gasket between the upper and lower crankcase. This should be fitted with a gasket that will be absolutely tight, for if any leaks exist the lubricant will be forced out by the crankcase compression, and the loss of oil will result in burned connecting rod and main bearings.

N. E. Booth, 644 Pacific street, Brooklyn, N. Y., specializes in felt washers and gaskets, and produces a complete assortment for the model T Ford motor, etc., and these come ready for at-

tachment. They are made accurately to size so that no trouble is experienced in fitting the gaskets to the parts, a difficulty usually encountered

Fig. 17—Illustrating Parts Utilized in Adjusting the High, Low and Reverse Speeds—This Is Possible Without Removing Large Transmission Cover.

with home made members. All bolt holes, etc., align perfectly. The Booth gaskets are well known to the industry and felt presents many advantages, among which may be named that of permitting parts not in line to be drawn up and made tight without danger of breaking the members. The maker of Booth gaskets will submit samples to the trade and invites correspondence from the owner overhauling his car. Gaskets are also made for standard purposes.

### HUPP HAS BIG YEAR.

J. Walter Drake, president of the Hupp Motor Car Company, Detroit, in discussing the automobile business, recently brought to light some very interesting facts concerning his company. He said that last August the Hupp company closed the biggest year in its history. The receipt of orders for immediate shipment since Sept. 1 has broken all previous records, and the winter production, which ordinarily falls off on account of a lighter demand, now amounts to the pro rata daily output for the entire year and the daily shipments are up to the same mark.

### NINE NEW FACTORY BRANCHES.

The Stewart-Warner Speedometer Corporation, Chicago, Ill., maker of Stewart and Warner speedometers, has recently opened nine new direct factory branches in the following cities: Philadelphia, Pittsburg, Atlanta, Portland, Los Angeles, Kansas City, Minneapolis, Cincinnati and St. Louis. This brings the total to 17.

### JERICO HORNS.

The selection of a signalling device requires careful consideration, in that it must be efficient as well as ready for service when required. The exhaust type is favored by many owners, as the only expense involved is the original cost. Another quality is that being operated by the waste gases of the motor there is no expense attached to its upkeep.

The Randall-Faichney Company, Jamaica Plain, Boston, maker of the well known B-line grease guns, is marketing the Jericho horn shown in an accompanying illustration, and this is operated by the exhaust. It is fitted easily over the pipe extending from the muffler, as a special clamp is incorporated, one requiring no cutting or alterations. The maker points out that the Jericho may be attached by the most inexperienced in a few minutes and correctly.

The Randall-Faichney Company also is featuring the Blitz spark plug, which is stated to be the only construction having a mica wound sleeve completely encased in porcelain. One of the qualities of the plug is the use of large electrodes. It is simply constructed and is designed for all types of motors. It is claimed that the breaking or cracking of the porcelain will not short circuit the plug.

The Randall-Faichney Company is also marketing the Jericho motorcycle horn, which embodies the same quality of workmanship, material and efficiency as the Jubilee and Jericho horns made by this concern for automobile use. It is attached to the exhaust pipe between the motor and the muffler, the operation involving

Jericho Horn, Operated by the Exhaust and Easily Attached to Any Type of Standard Make of Car.

but little labor. Suitable fittings are supplied with the Jericho motorcycle horn, which is operated by a metal cable.

## SUPPLIES, EQUIPMENT AND ACCESSORIES.

ONE of the best known makers of Ford specialties is the Auto Parts Company, Providence, R. I., which concern for years has made a careful study of Ford automobiles and has produced a large number of accessories making for comfort and convenience in operation, as well as devices improving its efficiency. The name Apco is well known to the trade and owner as representing practical Ford specialties, and the line is constantly being augmented with new inventions.

A few of these products are shown in an accompanying illustration, several being particularly adapted to the season of the year when the

cialty is the radiator cover, which is constructed of high grade material, designed to fit over the hood and provided with practical fasteners. It has a curtain of the roll-up type for service in mild weather.

The Apco radiator compound, when mixed with the water of the cooling solution, forms a liquid cement which hardens when exposed to the air, as in a leaky tube or fin, for example.

The Apco anti-rattling ball sockets are made in two styles and provide means for eliminating play in the ball end of the front radius rod and its socket. This radius rod bearing should be snug, but have a certain amount of play to prevent

Illustrating Some of the Numerous Apco Specialties Marketed by the Auto Parts Company and Adapted Particularly to the Ford Motor Car.

machine is being overhauled and equipped for winter service. The Apco valve stem adjusters are utilized for obtaining the proper space between the valve stem and tappet without altering these parts, which are of the fixed type. These members wear in time, decreasing the valve opening, thereby resulting in a loss of power, and when such is the case the opening should be restored to its normal dimension. This is done easily with the Apco adjusters, which are slipped over the valve stem as shown.

The Apco priming spark plug will be appreciated by owners who have to remove the usual spark plugs to prime the cylinders. It is the usual Apco plug equipped with a priming cock as shown, permitting of easy starting of the motor in the coldest of weather. Another Apco spe-

cialty is the radiator cover, which is constructed of high grade material, designed to fit over the hood and provided with practical fasteners. It has a curtain of the roll-up type for service in mild weather. The Apco radiator compound, when mixed with the water of the cooling solution, forms a liquid cement which hardens when exposed to the air, as in a leaky tube or fin, for example. The Apco anti-rattling ball sockets are made in two styles and provide means for eliminating play in the ball end of the front radius rod and its socket. This radius rod bearing should be snug, but have a certain amount of play to prevent breakage. The Apco is adjustable, the No. 1 style having a screw plug, while the No. 2 is fitted with discs. Both contain a heavy spring, which automatically takes up wear, and additional adjusting means are provided by the screw plug and discs. The company also markets a steering rod anti-rattler which makes it possible to eliminate lost motion in the steering linkage, as well as to prevent rattling.

The Auto Parts Company manufactures material of service in the overhaul of the Ford, including a special brake lining, brake shoes, piston rings, valves, grease cups, hub caps, fan belts, wheel puller, gaskets, wrench sets and a number of special tools which simplify the work. The Apco catalogue contains a large number of useful and practical accessories for the Ford machine and a copy will be mailed free on request.

### CONNECTICUT FORD TRUNK RACK.

The Connecticut Steel & Wire Company, 61 Allyn street, Hartford, Conn., specializing in trunk racks, has brought out a moderately priced design for model T Ford cars. It is constructed of the same high grade material and workmanship for which the product of this concern is noted and comes complete and ready for attachment to the machine.

# SPLITDORF MAGNETO EQUIPMENT FOR FORD.

THE advantages of perfect synchronization of the spark, especially with high speed motors, is well known to ignition experts. Not only

Illustrating New Timing Gear Plate and Bracket and Splitdorf Magneto, an Equipment Designed Especially for Ford Motors.

is the output of the motor increased, but economy is obtained, as a more complete burning of the charge is possible. By synchronizing the spark, the power plant is subjected to less stresses.

The Splitdorf Electrical Company, Newark, N. J., is marketing a true high-tension, compact, high grade magneto designed especially for service with the model T Ford motor, and this with a new timing gear plate and all necessary fittings are offered at a moderate cost. The magneto is of the fixed spark type, which eliminates the usual Ford timer, timer rod, primary wires, coil, etc., and the design of the instrument makes for motor efficiency in that the spark cannot be improperly varied by the driver.

The installation is made easily, requiring no other knowledge than that of timing magneto.

One of the qualities of the Splitdorf magneto emphasized is that it permits starting of the motor easily on a quarter-turn of the starting crank. The equipment is carried at any of the branches of the company, which are listed in the Classified Buyers' Guide, found elsewhere in this issue.

## IGNITION SPECIALTIES.

The Eisner-Lenk Company, 1024 Boylston street, Boston, distributor for Eisemann, Simms

and Mea magnetos, makes a specialty of repairing all types of ignition, lighting and motor starting systems and carries in stock parts for standard types of magnetos. The Eisner-Lenk Company also represents the Gilbert line, this including covers for tires, lamps, magnetos, etc.

## BOYCE MOTOMETER FOR FORD.

The Motometer Company, 1790 Broadway, New York City, has brought out a special Motometer for the Ford car, which is illustrated herewith, and it is easily attached to the radiator by means of the cap shown, both units being included. The device is provided with a special type of thermometer or meter in which is a red fluid. The dial is calibrated as illustrated, and the fluid rises or falls according to temperature of the water in the radiator. The height of the red fluid is noted easily through an opening, making it possible to take a reading from the seat even at night, as the rays of the lamps make a white background.

As the Motometer is constantly in plain view of the driver, he can tell at a glance the operating conditions of the motor. When the fluid registers in proximity to the danger point it denotes a lack of oil or water, or other engine troubles, and inspection or correction may be made before damage ensues. Among the other advantages attendant upon its use is that the radiator cover may be so arranged

as to provide the best working temperature of the motor, which is also indicated on the dial. Another point denotes when the fluid approaches freezing, thereby eliminating guess work. The Motometer is moderately priced and a special offer is made to Ford owners.

Ford Special Boyce Motometer.

### APCO BRAKE ROD ANTI-RATTLER.

The Auto Parts Company, Providence, R. I., manufacturer of Apco specialties for model T

Apco Brake Rod Anti-Rattler.

For cars, has brought out a new device for these machines, which will be appreciated by owners whose brake rods rattle. The maker states that it is the only anti-rattler that can be applied without removing the clevis and without fitting, etc. All that is required to place the device is a screw driver, the tool being employed to tighten the clamping bolt on the radius rod.

As will be noted by the accompanying illustration, the brake rod is located between a ball bearing and a plunger, the proper tension being maintained by a spring. The pressure is such as to firmly hold the rod in place, but does not interfere with its forward or backward movement in service. The rattler is installed by removing the cotter pin and plunger and slipping the U shaped member over the radius rod, at the same time locating the brake rod as shown in the drawing.

### S-M-C FORD BRAKE LINING.

In renewing the service brake lining, which is enclosed in the transmission housing of the Ford car, it is recommended that the use of friction material having any metal reinforcement be avoided, as it is stated that it may affect the efficiency of the flywheel generator. The Staybestos Manufacturing Company, Germantown, Penn., is producing a special friction material for Ford machines which does not contain any brass wire or other material that would impair the efficiency of the generator.

The S-M-C friction material is not a cotton

S-M-C Brake and Clutch Lining.

as to make a homogeneous mass, one that will not deteriorate when subjected to the most severe service. It is treated with a special compound

fabric, but is made from long fibre, carefully selected, and tested asbestos, which is so woven

obtaining the same high degree of coefficient of friction until completely worn out.

The maker states that the S-M-C, when applied to metal as in brake service, will lock the wheels instantly if desired, an important factor to be considered in the selection of friction material. It is not affected by heat, water, oil, gasoline, etc., and is guaranteed in every respect.

The company manufactures brake lining for all types of machines, also all types of friction facings for clutches, etc., and these are carried in conventional sizes or made to meet special requirements. The Ford lining is 1.125 or 1.0625 inches wide and .15625 thick.

### MOSLER SPECIAL FORD PLUGS.

The value of proper design with spark plugs and the correct location of the firing points in the combustion chamber of the cylinders is recognized by car manufacturers and ignition experts. As a result of considerable experimentation, a distinct type of plug is now being made for each motor, which not only increases its output, but reduces troubles to a minimum. A. R. Mosler & Co., Mt. Vernon, N. Y., produces among many types two designs especially adapted to the model T Ford motor and one is illustrated.

Mosler Four-Leaf Clover Special Spark Plug.

The Four-Leaf Clover special, so designated because of its construction, not only provides four electrodes or firing points, but prevents soot, carbon or oil from short circuiting the points. Another quality emphasized by the design is that the flame is projected into the mixture, completely igniting it. The construction also permits of easy disassembly and assembly and without disturbing the position of the central electrode in respect to the shell members.

The Superior plug is also adapted for the model T Ford motor and embodies the same high grade workmanship and material that characterizes the product of the maker. The wire attached to the shell or base is so formed that the gap is protected against any particles of oil, soot, etc.

## SPECIALIZES ON FORD EQUIPMENT.

**T**HE preparation of the car for winter service, including as it does the overhaul of the chassis, etc., affords opportunity to replace worn parts and to add those accessories which improve its operation, as well as make for convenience. The American Auto Supply Company, 1741 Broadway, New York City, makes a specialty of Ford accessories, etc., and its 1914 catalogue is stated to be the largest ever devoted exclusively to the Ford car. Some idea of its size may be obtained by the number of illustrations utilized, there being over 200. These depict many new Ford specialties and all are described in such manner as to show the application and advantages derived from their use.

The section devoted to parts is very complete, the company making a specialty of these, all of which are constructed of high grade material and

tically every ignition accessory for the Ford motor is carried in stock, also standard parts. A number of pages are devoted to oil, gas and electric lighting equipment and devices making for economy when the car is fitted with acetylene.

The catalogue presents a wide variety of useful and practical articles necessary when equipping the machine for winter, as well as summer service. These include top covers, hood covers, signalling devices, shock absorbers, bumpers, trunk racks, anti-rattlers, locking devices, moldings, lamp brackets, license holders, trunks, lamp and tire covers, priming devices, fuel economizers, cigar lighters, inspection lamps, starting crank holders, fuel gauges, top holders, mats, ventilators, power tire pumps, demountable rims, etc.

The American Auto Supply Company will forward its catalogue free on request, and the

Showing Some of the Ford Parts, Accessories, Supplies and Equipment Marketed by the American Auto Supply Company, Which Issues Special Ford Catalogue Containing Over 200 Illustrations.

carefully finished to exact size. Among the many parts that may be needed in the overhaul and that are carried by this concern are: Gaskets, piston rings, carburetors, hose and clamps, valve springs, grease and oil cups, front and rear springs, hub caps, etc.

There is a large number of tire equipment listed, including casings, tire repair kits, vulcanizers, covers, tire holders, locking devices, etc. Various types of wrenches useful in the overhaul, comprising wrench sets particularly adapted to the Ford car, are illustrated among the tools, which also include valve lifters, wheel pullers, etc.

The American Auto Supply Company carries an extensive stock of ignition specialties and offers a number of different types of master vibrators. Parts for these and for coils and different designs of spark plugs are listed, and several of the last named have priming attachments. Prac-

booklet contains instructions for ordering, as well as a table on the cost of shipping by parcel post.

### BOSCH SPARK PLUGS.

The Bosch Magneto Company, New York City, is manufacturing the Bosch spark plug, which is constructed for motor cars and motorcycles. The insulator is steatite, placed in the shell under high pressure, insuring a gas tight construction. The electrodes are a nickel alloy and being knife shaped the spark does not jump across any particular point, but forms a ribbon of flame between the electrodes, which are three in number. Sooting is prevented, as the electrodes are maintained at a high temperature, burning away any lubricant that may gather. The plugs are in various sizes and are adapted to withstand magneto currents.

## NORTH EAST FORD MOTOR-GENERATOR.

THE North East Electric Company, Rochester, N. Y., maker of electric lighting and motor starting systems, has brought out an installation

Side View of the Installation of North East Motor-Generator on Ford Motor.

for model T Ford automobiles which presents interesting features, in that it can be mounted without alterations. The company states that it has equipped several cars with the system; that it has proven successful in every particular, and that the same high grade workmanship and material is incorporated as with similar equipment manufactured for larger vehicles. The equipment is simple and it is stated that it may be installed in a few hours by the garage man or by those owners familiar with the use of ordinary automobile tools. There are no fittings, wires, etc., to be purchased, the maker supplying all material, even including the adapters for the lamps. The instructions and diagrams accompanying each outfit are very complete, each part being numbered to facilitate installation.

The North East system is a unit, a dynamo and motor combined, the armature carrying but one winding and having a set of brushes mounted in a special manner. All insulation utilized is either clear mica or bakelite, and the pole pieces are of the built-up laminated type, accurately sized by grinding. The field ring is of pure wrought iron, heat treated and ground to size. The bearing housings are of aluminum, carefully machined. The system is entirely automatic in its operation, and the maker lays great emphasis on its simplicity, stating that it is fool proof in that no damage can result from operating the starting button with the engine running. It is also

claimed that it requires but a small amount of current to spin the motor and this is quickly restored with the motor operating. One of its features is that it is not restricted to low candlepower lamps, and 40 candlepower members may be fitted to the headlights if desired.

The operation of the system is simple. Upon desiring to start the engine the operator turns on the ignition current and depresses the pedal starting button, which closes the circuit between the storage battery, allowing current to flow to the electric motor. Upon the motor starting the generator charges the battery, which supplies current for lighting and when the car is inoperative.

The motor-generator is mounted on the left hand side of the engine, being supported and retained by a special bracket. The armature shaft carries a sprocket, and energy as a motor starter is supplied to a sprocket on the fanshaft through a silent chain. As will be noted by an accompanying illustration, another chain imparts the drive to the extension of the crankshaft of the engine, this being fitted with a sprocket. No provision is made for a back kick, as the engine is directly connected to the motor generator through chains and countershaft. The motor-generator operates at three times crankshaft speed and its output as a dynamo is ordinarily 96 watts, but

Front View of North East Lighting and Starting Unit, Illustrating Method of Mounting and Silent Chain Drive.

this can be doubled if desired. Regulation of the output of the dynamo is accomplished by the special field winding. The lamps are 14-volt.

### MOSSBERG FORD WRENCH SETS.

In dismantling the Ford chassis and making adjustments, there is a large number of nuts, bolts, etc., which are not removed easily with ordinary tools. Those retaining the caps of the three main crankshaft bearings present more or less trouble when the work is attempted with ordinary forms of wrenches. Then again, there are places where there is not room to swing an S wrench in displacing a part. As it is important that all nuts, bolts and parts be set up snugly, much better results will be obtained if the workman is equipped with the necessary tools.

The Frank Mossberg Company, well known maker of wrenches and wrench sets, has brought out an inexpensive wrench set for the model T Ford car which includes, in addition to the No. 350 ratchet wrench, 10 hexagonal and square, mottled finished, thoroughly hardened sockets. A specially designed oval socket is provided for removing and replacing the nuts retaining the main bearing caps, which are not easily accessible with the usual tools. In the equipment is a spark plug wrench, screw driver bit, Mossberg monkey wrench and a 10-inch extension, which permits of reaching parts within the crankcase, transmission, etc.

The No. 17 Ford set is less expensive and is a practical outfit, being designed especially for heavy duty work. It comprises five eight-inch bars with a socket at each end, also the oval socket above referred to and the spark plug member.

The Mossberg company is bringing out two new valve grinding tools made especially for Ford motors, also a new form of drop forged pliers. Announcement will be made shortly of a demountable rim brace with adjustable features, permitting of its use on all types of rims, as well as for other service.

### SE-MENT-OL.

Soldering a leaky radiator usually requires the services of the expert, and sometimes the work is expensive. The Northwestern Chemical Company, Marietta, O., is marketing Se-Ment-Ol, a chemical preparation which, when poured into the radiator, mixed with the water and circulated, finds all leaks and openings, completely sealing them. This result is obtained by the preparation hardening quickly when exposed to the air. The maker states that it does not injure the components of the cooling system and that ordinary leaks may be repaired in a few minutes.

The company is also marketing Thermite, which is an anti-freezing solution that is mixed with the water in any proportion to suit the temperature at which freezing is to be prevented. The maker states that the chemical preparation will not evaporate, injure the metal or rubber, and that it does not boil as easily as water, thereby adapting it to mild weather.

### RETURNS FROM ABROAD.

E. J. Kestenbaum, president of the American Auto Supply Company, 1741 Broadway, New York City, who is presented in an accompanying illustration, returned Nov. 10 from a combined business and pleasure trip abroad. He travelled throughout England, Ireland, France, Germany and Austria, and was particularly observant as to the possibilities of securing accessories for Ford cars.

The American Auto Supply Company is held to be one of the largest, if not the largest, dealer in Ford accessories and supplies in this country. Mr. Kestenbaum is especially active in this field, and loses no opportunity to get in touch

E. J. Kestenbaum, President American Auto Supply Company.

with manufacturers and designers of equipment which presents features making for economy, efficiency or convenience in the operation of this make of machine. The company is issuing a completely illustrated catalogue of such equipment, which will be mailed free upon request.

The Fulton Company, maker of the Aermore exhaust horn, has moved from Marshalltown, Ia., to its new plant at 726 National avenue, Milwaukee, Wis. This change involves a material enlargement of the company's production capacity and the incorporation under the laws of Wisconsin with a capital stock of \$25,000. S. A. Fulton is president and G. F. Morrissey is secretary and treasurer.

## DOVER SPECIALTIES.

The Dover Stamping & Manufacturing Company, Cambridge, Mass., is marketing a number of useful and practical specialties which make for economy and convenience in the upkeep of the motor car. Among these is the Dover compact oiler, shown herewith, which is very handy for carrying in the tool box, etc. It is 6.5 inches long, three wide and 1.125 thick, and has a four-inch reversible spout.

Dover Oiler.

The Saval funnel will appeal to motorists who experience difficulty in replenishing the supply of lubricant to the motor, as the Dover is equipped with an automatic shut-off attachment, which enables the user to incline the measure and control the flow of lubricant. The spout has a brass ball valve, ground to an oil tight fit, and it is controlled by an easily operated and convenient plunger member.

The Dover soap economizer is a sturdily constructed pail with ball, and by the utilization of a perforated disc or pan, not only is waste of soap prevented, but the sponge is kept clean. The pail is filled with water and utilized in the same manner as an ordinary member.

## BLUE RIBBON PRODUCTS.

The International Metal Polish Company, Quill and Naomi streets, Indianapolis, Ind., is marketing the Blue Ribbon cement for stopping leaks in the circulating system of a motor car. It is a chemical preparation which is mixed with the water by pouring it into the cooler and by operating the motor the fluid is circulated and forced through the cracks or openings in the radiator, etc. On coming in contact with the air the solution forms a cement.

In addition, the company manufactures Blue Ribbon cream metal polish, and Blue Ribbon nickel polish, both of which impart a high lustre to the metal trimmings of the car and with little effort. The company also markets the Blue Ribbon auto body polish for restoring the finish and gloss, and the maker states that it will not leave any coating to catch dust, etc.

## J-M (MEZGER) SPARK PLUG.

The H. W. Johns-Manville Company, New York City, manufacturer of motor car specialties, etc., has taken

J-M (Mezger) Spark Plug.

over the well known Mezger Soot-Proof spark plug, two views of which are shown herewith. The plug has been on the market for a number of years and is said to be one of the first in America to be designed and built on scientific principles.

Among the specialties produced by this concern are Solderall, J-M dry cells, J-M universal terminal, J-M Keystone radiator shield, J-M fire extinguisher, J-M friction tape, J-M non-burn brake lining, Noark enclosed fuse, etc. The company is marketing the J-M Mobilite electric lamp, which is particularly designed for used automobiles. The lamps are made in several forms and are very compact.

## J. M. SHOCK ABSORBER.

The J. M. shock absorber, marketed by the J. M. Shock Absorber Company, 210 South 17th street, Philadelphia, is the invention of a French mechanical engineer, who claims to have solved the problem of applying a helical spring principle to the laminated spring of a car. Except on a car having a full elliptic spring, the car spring is attached to its end by a shackle, to allow for elongation of the laminated member. In the J. M. this shackle is replaced by its equivalent, a bronze head, which acts as a guide for the helical bolts of the absorber and a bearing for the hanger bolt. Attached to the bronze head is a tube in which is confined the helical spring. This tube allows the spring to be compressed along a true plane at right angles to the car spring, thus obtaining its maximum efficiency. The J. M. is constructed for different types of springs and a special design is made for Ford cars. It is also made in single and twin types.

## REACTO ELECTRIC HORN.

The Holtzer-Cabot Electric Company, Chicago and Boston, is manufacturing the Reacto horn, shown in an accompanying illustration, and among the features of the design emphasized is its tone. It provides a clear and penetrating, but not harsh tone; is moderately priced and is constructed with the same high grade material and workmanship for which the product of this concern is noted.

One of the features of the horn is that it will respond to voltages 25 per cent. below normal and therefore does not require adjustment. Means are provided, however, for changing the tone. The Reacto horn is designed to meet the requirements of motorists desiring a strictly high grade signal, one having a pleasing tone, and capable of maximum service without attention. The casing and projector are of best material and the construction is sturdy.

Holtzer-Cabot Reacto Horn.

## PYRENE FIRE EXTINGUISHER.

Cold weather presents more opportunity for fires than in the summer, as in starting the motor it is likely to back fire if the mixture is weak and there is more or less opportunity for the vapor of the fuel to ignite when the building is heated by stoves, etc. The Pyrene Manufacturing Company, 1385 Broadway, New York City, is marketing the Pyrene fire extinguisher, which is very compact and weighs but five pounds. It extinguishes fires by the formation of an elastic non-poisonous blanket which separates the flame from the burning material. It contains no acid, alkali, salts or moisture, and it will not injure any material with which it is brought into contact.

## WEED ANTI-SKID TIRE CHAINS.

With the approach of winter and its attendant ice and snow, the careful motorist equips the rear wheels, and sometimes the front as well, with anti-skid tire chains. These are not expensive and make for a cheap insurance, as they not only provide traction on slippery thoroughfares, but prevent accidents. They are easily and quickly attached, and coming as they do in a neat canvas bag may be stored easily in the car. The Weed Chain Tire Grip Company, 28 Moore street, New York City, is the maker of the well known Weed anti-skid chains, which are carried in various sizes by dealers and supply houses.

**BOSTON FORD STARTER.**

The Automobile Sundries Company, 18 Broadway, New York City, is marketing the Boston starter designed especially for model T Ford motors. It is a mechanical starter, operates from the seat and starts the engine with the same certainty as though the crank were used. One of the qualities of the Boston is that it does not interfere with the use of the usual starting crank. The starter is provided with an automatic release for protection, and as a further precaution the spark is automatically fully retarded before the engine is turned over. The device may be installed easily and without interfering with or changing the appearance of the machine, as the equipment, with the exception of the operating handle, is fitted under the hood. The handle is installed on the dash within convenient reach of the driver, and is connected with the starter mechanism by a special cable. As a considerable leverage is obtained by the starter proper, the motor may be turned over easily by a child. The entire construction is neat and substantial.

**ATWATER KENT FORD IGNITION SYSTEM.**

The Atwater Kent Manufacturing Works, 4932 Stenton avenue, Philadelphia, well known to the trade as maker of the Atwater Kent ignition system, announces the application of its Unisparker or distributor to the model T Ford motor. It is designed especially for the engine in question and as shown in the accompanying illustration comprises a bracket carrying the Unisparker, and a feature of the construction is that it may be installed quickly and without any other tools than a screw driver and a wrench. The parts are accurately made and finished and require no fitting whatsoever.

**Atwater Kent Ford System.**

The Atwater Kent system is well known. It consists of the Unisparker or distributor and a single non-vibrating coil. It not only assures perfect synchronization of the spark, but permits of operating the motor at very low speeds, as well as at high ratios, without heating. Considerably more power is obtained, due to the perfect spark. The device made for the Ford motor replaces the usual timer and is in an elevated and accessible position. The system also includes a push button, permitting of starting from the seat. The Atwater Kent Ford ignition comes with hand or foot operated switch. Six ordinary dry cells or a six-volt storage battery replaces the Ford magneto as a source of current, permitting the generator to be used for lighting. The company has a special trial offer for Ford owners.

**EXCELSIOR VENTILATOR.**

C. B. Wattles, 441 Butler Exchange, Providence, R. I., is manufacturing the Excelsior adjustable ventilator for model T Ford cars, which is a moderately priced attachment and which permits of admitting fresh air to the front compartment of the machine. The opening is adjustable as desired and is quickly operated from the seat. It can be installed in a few minutes and comes finished in black enamel. When fitted to the dash it is hardly noticeable.

**HOYT FORD MAGNETO TESTER.**

The Hoyt Electrical Instrument Works, Penacook, N. H., maker of current testing devices, is manufacturing the Hoyt Ford magneto tester, shown in an accompanying illustration. It is utilized to show the quality of the electricity generated by the flywheel magneto on model T Ford motors, and the dial of the instrument is calibrated. The meter is compact, being 3.5 inches in diameter, and is constructed with the same care characteristic of the product of this company.

**Hoyt Ford Magneto Tester.**

For the purpose of simplifying the use of the magneto tester three points are indicated, these being "Poor", "Medium" and "Good". The test is made easily, the device being provided with two cables and either one may be utilized in connection to the magneto terminal. The remaining lead is grounded.

**NYCO TWO-SYSTEM SWITCH.**

The New York Coil Company, 338 Pearl street, manufacturer of a very complete line of Ford accessories, including a master vibrator, Nyco accelerator, etc., announces the Nyco two-system switch. This is a new device, the function of which is to enable the operator of a Ford machine to run on the four separate units, just as the car is regularly supplied, or, by kicking over the switch, the four vibrators become short-circuited and the master vibrator operates each of the four coils. It will thus be seen that to make the change from the four separate coils to the master vibrator does not necessitate changing any of the connections whatsoever.

This instrument will be appreciated by many operators who are skeptical about screwing down the vibrators and thus changing the adjustment of the coil.

**HEINZE MODEL T FORD COIL.**

The Heinze Electric Company, Lowell, Mass., is manufacturing a special type of four-unit vibrating coil designed for service with the model T Ford flywheel generator. Owing to the special windings, vibrator and general construction, the maker guarantees its efficiency when used with the Ford ignition system. The vibrator is rapid and positive in its action the high efficiency of the coil is emphasized. The secondaries are wound in eight sections with one continuous wire, on a patented wood spool with double silk insulated wire. This permits, the maker states, of utilizing a greater number of turns than ordinarily. The method of winding also is held to eliminate the possibility of burning out or breaking down.

**Heinze Four-Unit Ford Coil.**

The method of winding also is held to eliminate the possibility of burning out or breaking down.

# SPECIALTIES FOR **FORD** CARS

## This Is It! Just Off the Press!

—the latest, largest and most complete catalog ever printed, devoted specially to accessories and specialties for the *Ford Car*.

Remember that we are pioneer accessory dealers and positively the largest mail order auto supply dealers and jobbers in the country.

Low prices and *standard quality* of merchandise has held us at the top. That is why this is the best place in the country to buy *Ford accessories*.

### Every Ford Dealer and User Needs This Catalog

—so does every Retail Auto Supply Dealer having Ford customers.

**AMERICAN AUTO SUPPLY CO.**

# HEINZE COILS

HECO COILS were adopted by the FORD COMPANY for their model T cars because it was proved by tests that these coils would operate the light, high speed motor of the Ford up to its full capacity. The HECO COIL insures perfect synchronism with the fly wheel magneto. It provides a larger, hotter spark than others because its core is made of iron wire of proper gauge, while the secondary is wound with the best grade of silk covered wire. Everything about HECO COILS—their design, their construction, and the material used in them, points to the highest efficiency.

Motorists, our exchange offer is worth your attention. If you are not using the HECO COIL on your model T Ford car now, send us your old coil with \$15 and we will forward you one of our famous HECO COILS. This means that your old coil is worth \$23 toward the purchase of a new HECO.

## SPLITDORF "FORD SPECIAL"

### WATERPROOF HIGH-TENSION MAGNETO

Enclosed direct gear driven—no chains or open gears—the SPLITDORF "FORD SPECIAL" high-tension magneto is revolutionizing the running of the remarkable little cars.

Compact and strictly waterproof, the thoroughly tested SPLITDORF "FORD SPECIAL" magneto is specially constructed to meet the demands of Ford cars.

With its installation in a few hours the nuisance and expense of vibrators, coils and batteries pass away and a high-tension system secured that gives remarkable results.

## A Trouble Finder FOR Ford Magnetos

There is hardly any part of a Ford car where trouble when it does occur is so hard to locate as in the magneto. Often a great deal of time is wasted hunting elsewhere in the system for the defect before it is finally located in the magneto.

To obviate this difficulty is our purpose in presenting the

## FORD MAGNETO TESTER (HOYT QUALITY)

a simple instrument that will tell at a glance whether or not the magneto is generating and to what extent.

The scale is marked "poor", "medium" and "good", and the index needle points to the position on the dial indicating the condition of the magneto. The method of connecting is very simple. Two cables supplied with the indicator are connected to the magneto, and the engine is run at normal speed. The condition of the magneto is then read on the dial. The instrument is of unvarying accuracy and simply cannot fail to record magneto strength.

Service station and repair shops everywhere need this Hoyt instrument. Write for details and prices.

**Hoyt Electrical  
Instrument Works**  
PENACOOK, N. H.

## FORD SPECIAL BRAKE LINING

Is not a cotton fabric, but made from long fibre asbestos, has several times the life of cotton lining, compactly woven, treated through and through with a special compound, insuring same coefficient of friction until completely worn out.

The S. M. C. special Ford brake lining is made without brass wire, which makes it the one lining to use on Ford machines.

As manufacturers of the completed product we are in a position to make immediate delivery. Our guarantee goes with every sale as to the quality and service of the S. M. C. brake and clutch lining.

S. M. C. is not affected by heat, water, oil or gasoline, is made to fit any brake, friction or transmission clutch.

**Staybestos Manufacturing Co.**

Germantown, Philadelphia, Pa.

## The Atwater Kent Ford Ignition

does more than eliminate the frequent and troublesome adjustment of the Ford coils.

The Atwater Kent Ignition assures perfect synchronization at all speeds, eliminating preignition and overheating—starts easily with a quarter turn of the crank and frequently without cranking by means of the starting button on the coil.

Effects a saving in gas, wear and vibration by enabling the motor to run slowly while the car is standing and run as smoothly "on high" at four miles an hour as at thirty or fifty.

The Atwater Kent will, in addition, wonderfully increase the power, speed, flexibility and hill-climbing ability of the Ford car, and gives superior results and costs less than half that of the high tension magneto.

It consists of the Unisarker or distributor elevated to a convenient and accessible position which takes the place of the Ford timer and a single non-vibrating coil is installed in place of the four vibrating coils.

It is easily installed by any one who can time a motor—no holes to bore—a screw driver and wrench are the only tools required.

Price complete with hand-operated switch \$28.00—foot-operated switch \$2.00 extra.

Write for particulars regarding our thirty-day trial offer to Ford owners.

Write at once for Circular "L" and trade prices.

# BOSTON STARTER

FOR

## Ford Automobiles

The Boston Starter will start the motor of the Ford Automobile from the driver's seat with the same reliability and with greater ease than if the regular starting crank is used. It does not interfere with the use of the regular hand crank. It does not change the appearance of the car. It automatically retards the spark, and releases in case of backfire.

Thousands of owners of the Ford automobile testify to the satisfaction they have received from the Boston Starter. A most desirable addition to the Ford Automobile, placing it on a par with the highest priced cars.

## The Automobile Journal Publishing Company

Times Building,

Pawtucket, R. I.

**BOSTON'S AUTOMOBILE SHOW.****Many Manufacturers Have Selected That Event for Their Initial Appearance.**

Since the first automobile show in Boston there have been a number of car and accessory producers who have awaited that event each year before making formal introduction of their wares to the public. Manager Chester I. Campbell reports that the 1914 display will be no exception in this regard.

As is always true of this biggest and best show of the season, the number of applications for space far exceeds the possibilities of Mechanics' building. Already, Manager Campbell and his able corps of assistants are busy in an attempt to devise some means of securing additional floor space.

The pleasure car show will be held March 7-14, and the truck display, March 17-21. A recent visit to the motorcycle exhibition in Chicago resulted in securing several additional exhibits of motorcycles for the Boston display, and this section will be much larger than has been true during the past two years. The new cycle-car division of the industry is also making a plea for a separate section.

The possibilities for business in connection with the New England exhibition are too well known to need amplification. It would appear, from such evidence as is obtainable at this time, that the manufacturers were more than ever convinced of this fact. The competition that has been engendered as a result is particularly pleasing to the show management, although it will require exceptional diplomacy to arrange the details to the satisfaction of all who desire to make display.

**SECURES DEWAR TROPHY.****Maker of Cadillac Car Wins Coveted Foreign Prize for the Second Time.**

The 1914 Cadillac, made by the Cadillac Motor Car Company, Detroit, has been awarded the Dewar trophy by the Royal Automobile Club of Great Britain. This prize, presented by Sir Thomas Dewar, is awarded annually to the motor car demonstrating the greatest achievement toward the advancement of the industry. This year's award marks the second time that the Cadillac car and America have received this acknowledgment.

The terms of the contest this year involved

the driving over 1000 miles of all sorts of roads, the thorough testing of fuel and oil consumption, the recording of the number of times the electric cranking device was used, the duration of the current for lights during and after the run and numerous other practical matters that have to do with efficiency and service.

**THE HAYNES CATALOGUE.****An Exceptionally Interesting Work of Art Prepared by Elwood Haynes.**

Something entirely new in the way of a motor car catalogue is that issued by the Haynes Automobile Company, Kokomo, Ind. It is entitled "The Complete Motorist", and comprises 80 pages, fully illustrated throughout in two colors. The front cover is of conventional design, embossed in two colors, while the company's trade mark, likewise embossed, appears on the fourth cover. Elwood Haynes, president of the company, and inventor of the original Haynes car in 1893, is the author.

The first chapter is devoted to an historical sketch of the first Haynes, now a government exhibit in the national museum in Washington, D. C. Chapter two explains in detail the latest Haynes models, and the function of each part is minutely described. There follows complete instructions for the operation and care of the machine, which include a very lucid explanation of the Vulcan electric gearshift. The fourth and closing chapter dwells chiefly on the merits of the Haynes and sets forth by forceful argument the reason it is worthy of the consideration of every prospective automobile owner.

James M. Carples of New York City was a visitor at the Olympia show in London, England, in the interests of the Sharrer one-hand top for automobiles, made by the Sharrer Patent Top Company, 245 West 55th street, New York City. It is understood that he will negotiate for the disposal of the European rights to this equipment before his return to this country.

Those in charge of preparations for the Importers' Automobile Salon, which will be held in the Hotel Astor, New York City, Jan. 2-10, announce that the new tariff law permits the entry of automobiles for exhibition purposes for a period of six months without the payment of duty. This is expected to have a decided influence upon the number and character of the exhibits at the forthcoming display.

### NEW MOTOR MANUFACTURER.

#### Concern Organized to Produce Engines Burning Low Grade of Fuel.

It is stated in Detroit that Harry S. Shaffer, formerly secretary and treasurer of the Keeton Motor Company, has retired from that concern, to become president of Shaffer Motor Manufacturing Company, incorporated at Alexandria, Va. The new concern will produce the Dunham motor, designed and patented by Herman E. Dunham on the Pacific Coast and brought to Detroit many months ago for experimental work.

Few details concerning the new engine are available, but it is understood that it will utilize the lower grades of fuel, and that it will possess features making for noiseless operation. Mr. Dunham, the inventor, will be actively interested in the company, which is said to have taken contract to equip sample cars for more extended observation and trial.

### TRANSFERRED TO NEW YORK.

#### Peerless Manager in Newark to Have Large Field of Usefulness.

Announcement has been made by E. J. Kulas, general manager of sales of the Peerless Motor Car Company, of the appointment of George H. Smith as general manager of the Peerless Motor Car Company of New York. The appointment of Mr. Smith follows five years of efficient service in the employ of the company as manager of the Newark branch, where he has been very successful in placing the Peerless trucks among the New Jersey manufacturers.

Mr. Smith has been in the automobile industry since 1902 and during this time he has been connected with the Packard, Cadillac and White cars, joining the Peerless forces in 1908. He will be assisted in New York by H. T. Birnie, who has been promoted from salesman to assistant manager.

### AN ALASKAN GARAGE.

#### Pacific Coast Manager for Studebaker Corporation Expects an Agent at Juneau.

While Alaska has not been entirely devoid of automobiles, it is true that it is only within comparatively recent months motor cars have been considered practical vehicles on the somewhat primitive ways of that division of the United

States. It was in September, 1911, that Dr. Charles G. Percival drove the first automobile the residents of Juneau, Alaska, had ever seen over its city streets, giving many of the inhabitants their initial experience of riding in a self-propelled vehicle, and later left Juneau for an overland trip to the Klondike region.

Now, Alaska is to have its first automobile salesroom and garage. A. H. Brown of Portland, Ore., who has charge of the Studebaker Corporation's wholesale business in the Pacific Northwest, reports that he has been importuned for some time, by letter and by a personal visit, by a man in Juneau to be permitted to represent the Studebaker car in that territory. The matter was taken up with the officials of the company recently and Mr. Brown has been authorized to close the deal.

### MANAGER PRUDEN RESIGNS.

#### Head of KisselKar New England Branch to Return to Old Home in Chicago.

Announcement is made by the KisselKar New England branch, Boston, Mass., that its manager, H. B. Pruden, has resigned, to take effect upon the appointment of his successor, or Dec. 1. This news will be received with deep regret by his many friends throughout this territory, made during his occupancy of the position during the past three years.

Mr. Pruden came to Boston from Chicago, and since taking charge of the New England branch he has succeeded in building up a large business for the pleasure cars and commercial vehicles made by the Kissel Motor Car Company, Hartford, Wis. In addition, he has erected, and the branch is now occupying, one of the most attractive and fully equipped automobile salesrooms and service stations in the East. This is located at 940 Commonwealth avenue, on Boston's new Automobile Row.

No announcement is made as to Mr. Pruden's future plans, further than the statement that he will return to Chicago, where he will again make his home.

As an aftermath of the recent increase in the capital stock of the Premier Motor Manufacturing Company, Indianapolis, Ind., several new men have entered the directorate of the company. The board is now constituted as follows: F. Barnickol, C. O. Baxter, A. L. Reeves, Clarence Stanley, H. O. Smith, Timanus J. Wilson and G. A. Weidely.

CONCERNING AUTOMOBILE RACING.

**Mercer Official Believes It Has Not Lost Its Usefulness or Popularity.**

That road racing and contests on specially constructed and guarded tracks is soon to resume its important place in the motor car industry is the opinion of W. A. Smith of the Mercer Automobile Company, Trenton, N. J. The abandonment of the Vanderbilt Cup and Grand Prize events by the Savannah Automobile Club was a decided disappointment to this company, which had entered two cars in each event.

Mr. Smith says that the French automobile manufacturers found the abandonment of racing to be a very expensive lesson and that they are now attempting to mend the break with the result that there are more road races and other forms of competition in that country this year than ever before. That the same conditions may be experienced in this country unless there is a change of plans is his belief. He adds that contests of this character have by no means lost their value to the industry.

It is the opinion of the Mercer people that next season will see a resumption of interest in racing, enabling the public to see contests that will sparkle with interest, consequently increasing the demand for the automobile. "The days of speedway contests and road races are bound to return, and the sooner the better for all concerned", concludes Mr. Smith.

The Motor Dealers' Contest Association, New York City, will promote a 500-mile reliability run Dec. 3-5. The first day's route lies over the Long Island roads; the second, in Westchester county, and the third, to Poughkeepsie and return.

COMING EVENTS.

**November.**

Nov. 27—Endurance run, Philadelphia, Penn.  
Nov. 27—Track meet, Bakersfield, Cal.

**December.**

Dec. 1-3—Annual meeting, American Automobile Association, Richmond, Va.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

**J. M. Shock Absorbers**

The Ovington Data Chart "D" shows how the car jumps and jerks on all sorts of roads till **J. M. Shock Absorbers** are put on the rear springs. Then—as these lines drawn by the car itself prove—every jolt is minimized, every nerve-racking shock eliminated. Send today for this chart—it is free. But the edition is limited.

"K No. 00 Special Grade"

The transmission lubricant which has set a standard of lubrication never approached by any other.

Do not mix oil and grease in your transmission when you can get this lubricant of ideal consistency. It quiets and protects gears and perfectly lubricates the ball or roller bearings in the transmission. One filling suffices for thousands of miles.

Ask your dealer. Free Sample upon request.

**READ THE**

**Accessory and Garage Journal**

**EACH MONTH**

You can secure your monthly audience with all buying and selling heads in all concerns in every branch of the automobile industry through the Accessory and Garage Journal. Such interests must know what you have to offer. All are logical prospective purchasers. They constitute your market and are always looking for lines of merit. In this magazine the large and small manufacturer has equal opportunity to reach the whole trade and can secure a service equal to that of a trade mailing list and better than can be secured through any other medium.

100 Per Cent. Quantity—100 Per Cent. Quality—Circulation Value.

Every order carries with it a positive guarantee of service stated, and this in any form requested.

Ask how we give concern and product listing under proper classification in Buyers' Guides that have a distribution of more than 1,100,000 copies yearly. This service is free. Our trade mailing list is 100 per cent. active—Do you need it? Details gladly furnished on request.

Next issue Dec. 15th.

=POWER

The power of your automobile is simply the sum of your *motor-efficiency* plus your *fuel-efficiency* plus the *efficiency of your lubricant*.

Today most automobile *motors* are well designed. You are offered little choice in *gasoline*. But *lubricating oils* differ widely both in quality and in "body."

Despite this, motorists often select their lubricating oil with an indifference that is little short of reckless.

The penalty is paid in a multiplicity of motor troubles.

*Only oil of the highest lubricating qualities can properly protect the moving parts.*

*Only oil whose "body," or thickness, is suited to your feed system can properly feed to the friction points.*

Only oil that combines these qualities can give your car:—

- (1) The greatest horse-power efficiency.
- (2) The smoothest operation.
- (3) The fewest repair troubles.
- (4) The lowest operating cost.
- (5) The longest life.
- (6) The greatest second-hand value.

We have undertaken this serious problem with the thoroughness that has established our standing in the general lubricating field.

Each year we make a careful motor-analysis of each of the season's models. Based on

these analyses and on practical experience, we specify in a lubricating chart the grade of Gargoyle Mobiloil that is most efficient for each make of car.

If you are not interested in correct "body," there still remains the best of reasons for using Gargoyle Mobiloils.

*In sheer lubricating quality they stand alone.*

But you will make a serious mistake if you do not note down, from the chart, the grade whose "body" is best suited to your motor.

A booklet, containing our complete lubricating chart and points on lubrication, will be mailed on request.

## Mobiloil

A grade for each type of motor.

The various grades, refined and filtered to remove free carbon, are:

Gargoyle Mobiloil "A"  
Gargoyle Mobiloil "B"  
Gargoyle Mobiloil "D"  
Gargoyle Mobiloil "E"  
Gargoyle Mobiloil "Arctic"

They are put up in 1 and 5 gallon sealed cans, in half-barrels, and barrels. *All are branded with the Gargoyle, which is our mark of manufacture.* They can be secured from all reliable garages, automobile supply stores, and others who supply lubricants.

# This Is Vital to Every Owner OF A Maxwell-Briscoe Motor Car

**Made at Tarrytown, N. Y., and Newcastle, Ind., 1905 to 1913**

**Also to All Owners of Stoddard-Dayton, 1905 to 1914; Columbia Gasoline and Electrics, 1906 to 1914; Everitt Cars of Any Model; Brush, Sampson and Courier Cars**

THERE ARE THREE GOOD REASONS why you should have your car overhauled now and worn parts replaced.

**FIRST:** The garage man can give you better service—and you can spare the car better now than later. No matter whether you are going to keep the car, or sell or trade it in on a new one—it will pay you well to have it thoroughly overhauled, worn parts replaced by new ones and body repainted.

**SECOND:** We are able to furnish replacement parts for all models of above makes of cars within 48 hours from receipt of order. Have concentrated this branch of the business at Newcastle, Ind. (center of population of the U. S.). Here we have a \$1,750,000 investment in plant and stock. 45,000 separate bins of parts.

**THIRD:** And perhaps the best reason why you should secure your requirements now—we must increase prices 20% January 1st, when the new parts price lists will be off the presses.

**NOW NOTE THIS—**Never before in the history of this industry has a new concern, having bought the plants and assets of a bankrupt one, taken upon itself the obligation of furnishing replacement parts for the cars it never made.

THE MAXWELL MOTOR COMPANY DID. We considered it good business, even if not a moral or legal obligation.

**WE FOUND** 122,000 owners out in the cold, as it were—pleading for parts. Their cars laid up and useless in most cases.

**WE'VE INVESTED** about one and three-quarter million dollars (\$1,750,000) in a plant and stock of parts, for over 150 different models, made by the concerns that comprised the United States Motor Company, whose assets were purchased from the Receiver thru the U. S. Courts.

**WE TOOK THE NAME MAXWELL** solely for the protection of 60,000 persons who had bought cars under that name.

**HAD WE CHOSEN ANOTHER NAME** those 60,000 cars would have had almost no value in the second-hand market. As it is, they have a definite value. And by the replacement of the worn parts your car will be good for a long time to come.

**ANY RECOGNIZED DEALER** or repair man—whether he handles the present Maxwell line or not—can procure these parts for you. Or you can order direct. Shipment will be made within 24 to 48 hours after receipt of the order at Newcastle.

Write for our booklet, "How to Make Your Car Live Twice As Long," in which we set forth the Maxwell policy toward owners of the above mentioned cars. Address

**Maxwell Motor Co., Inc.**  
**DETROIT, MICH.**

Note: For quicker service those living East of the Alleghenies can order from Maxwell Motor New York Co., 13th and East Ave., Long Island City. From the Alleghenies to the Rockies, order direct from Maxwell Motor Newcastle Co., Newcastle, Ind. West of the Rockies, order from Maxwell Motor Sales Corporation, 675 Golden Gate Ave., San Francisco.

# Why The Austin Is Superior

It is the only car with a **two-speed axle** and **six cylinder** motor. It also has the new "**Austin**" **hydraulic spring controllers** and many other special and exclusive features.

A careful study of the editorials and many statements showing the merits and many advantages of a **two-speed axle** also of a **six cylinder motor** will prove conclusively that a really **superior car** must have **both**.

With the **Austin two-speed axle** and **six cylinder** motor, the special high direct drive will be used most of the time for both city and country driving, the regular or low direct drive being desirable mostly for hills, bad roads and crowded traffic. This will not, normally, amount to over one-tenth the total travel.

**Long life and durability:** Austin cars have always been noteworthy for their long life and durability. While this has always been a very desirable feature, the rapid improvement in design and construction has, heretofore, eliminated much of its real value, as most owners of real high grade cars have sold their old cars (while mechanically as good as new) at a very material loss because they wanted the new and improved features of the later models.

We have, however, a sufficient number of owners who have used our cars continuously for many years at such a low cost for repair as to warrant the statement that the cars we are now building will give at least ten or twelve years of satisfactory service and at such a very low cost for operation and general upkeep as to make the total cost very much cheaper for that length of time than it would be for most any of the lower priced cars.

Having all the latest improvements now used on other cars, and many special and exclusive features obtainable only with the Austin, they are now so absolutely complete, in every desirable respect, that any future changes must be limited to details of minor importance. And it should be many years before the owner will feel any desire or inclination to make any change whatever.

The assurance of being able to use this car for so many years of satisfactory service, has now become of such great value as to warrant the extra initial cost of a car which is sure to give such complete satisfaction in every way.

**Personal supervision:** We have been making only strictly high grade cars for the past twelve years and limit our production to three cars per week. This enables us to give the necessary personal supervision to the details of construction, to assure the highest quality of workmanship and perfection in every feature, which would be impossible in a larger output. This also enables us to give special attention to the desires and requirements of each individual customer.

We will be pleased to answer any questions relative to the construction and merits of our special and exclusive features, and to give any further information that may be desired.

OPERATION—OVERHAULING, BUILDING AND REPAIRING—THE MOTORCYCLE

## Automobile Mechanical Books

### A Library of Automobile Mechanical Information

800 Pages of Text—1500 Illustrations—All Copies Fully Indexed.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

|                                   |        |                                    |        |                                       |        |

## The Automobile Journal Publishing Company

Times Building,

Pawtucket, R. I.

## PUBLISHER'S COMMENT.

The Issue of The Automobile Journal for Dec. 25 will be devoted to the first National Automobile Show of 1914, which will be seen at Grand Central Palace Jan. 3-10. It will be largely given over to description of the exhibits that will be seen at this exhibition, which will be the 14th held in the Metropolis. Every detail of interest to motorists will be considered and the features of the vehicles will be described and illustrated.

The Importance of the Eastern Motor Vehicle Market, which includes machines, equipment, accessories, supplies and the like, is realized by the entire industry, and for years the show has been marked for the features, refinements and improvements which are displayed for the first time. The New York Show is first in importance with the industry. The coming exhibition will have greater prominence than ever before. The Dec. 25 edition of The Automobile Journal will advise its readers fully of what can be seen at the show. The issue of Jan. 10 will be given over to a review of the exhibition, and the two numbers will constitute a complete reference for a buyer who seeks general or specific information of any character. They will have particular value and will be preserved. You can obtain the full benefit of these issues by subscription, either direct or through your news dealer.

Our Series of Mechanical Handbooks would be particularly appreciated by any young man who is desirous of familiarizing himself with the mechanical details of motoring. They are written in an interesting, non-technical manner, and fully illustrated, so that the novice is able to understand the facts presented. The price for the set of 10 books is \$3.75, or with a year's subscription to The Automobile Journal, \$4.75.

The Buyers' Guide on Pages 87-96, contains the names and addresses of reliable concerns engaged in the manufacture and sale of pleasure and commercial cars, and their accessories, supplies and fittings. Always consult it when in need of anything new.

# We Prove It at the Shows

THE GRIP  
MULTIBESTOS  
BRAKE THAT GRIPS LINING

Every Salesman of brake lining has a few stock phrases that he uses continually in arguing for the quality and merit of his particular brand. Heat resistance; coefficient of friction; extreme durability---these and many others are among the features which are spoken of so often, and at times so loosely. One calls his "the original"; another flatly declares his "the best".

We have made several claims ourselves and

now that we have the opportunity we mean to prove these claims and back up our widest statements with substantial proof.

At all three of the big shows we will have on exhibition a mechanical device which will be driven by a friction wheel made of Multibestos. There will be a brake drum attached and the band will be lined with Multibestos. By this device we can show exactly what Multibestos will do.

There will be no guess-work about it---no loose statements; but there will be definite and absolute proof that every feature which goes to make a good brake lining is found in the highest degree in MULTIBESTOS.

## PERFECTING BOSTON'S FIRE SYSTEM.

**Experimentation, Which Began Before the Great Fire of 1872, Now About to Be Culminated in the Expenditure of \$300,000 for Automobile Equipment.**

**F**ORTY-ONE years ago last month, the business section of Boston was practically wiped out by the most disastrous fire New England has known. Several conditions com-

bined to make possible such a general catastrophe. These conditions have very largely been overcome, but the officials of the Boston fire department are not entirely satisfied with the results attained, since Fire Commissioner Charles H. Cole has re-

quested an appropriation of \$300,000 for the purchase of motorized equipment during the next two years.

Nov. 9, 1872, when the big Boston fire began, the Boston fire department consisted of a chief, seven assistant chiefs and 185 men. The equipment comprised six steam fire engines, six hose

wagons and two hook and ladder trucks. Of course, the area of the city has been extended several times since that date, by annexation, etc. At present, the fighting force of the department consists of a chief, two deputy chiefs, 15 district chiefs and nearly 1000

**Chief John A. Mullen of the Boston Fire Department, in His Ross Steam Car, and Apparatus at Headquarters in Front of the Station on Bristol Street.**

men, including captains, lieutenants, engineers, etc. The equipment in active service at the beginning of the present fiscal year comprised 48

**Engine 38, Self-Propelled, Installed June, 1897.**

steam fire engines, including two fire boats; their tenders, 14 chemical engines, 31 hook and ladder trucks and four water towers. This number has been increased slightly during the year by purchase, but some pieces have been transferred to the reserve list.

For several weeks previous to the big fire the horses of the city had been suffering from an epizootic, and the department was seriously handicapped in consequence. A few days before the fire the department had received permission from the city council to impress any available horses in the city into service in case of need. However, there were no horses in Boston available for fire duty when the alarm was rung in, and the apparatus of the city was drawn to the scene of the conflagration by hand. Some historians state that oxen were utilized, but Chief John A. Mullen, who was a member of the state militia and served in that capacity during the fire, says this did not apply to the Boston fire department, as the men were able to haul the apparatus much faster than oxen. It may have been true of some outside companies, for 36 steam fire engines were rushed to Boston from surrounding cities and towns in New England,

**Engine 35, Self-Propelled, Installed January, 1898.**

to aid the local department in fighting the flames.

The fire had gained some little headway before the first alarm was sounded, and the department was still further handicapped by the fact that the water mains in the district affected were fed by pipes of smaller dimensions and were themselves in poor condition. Many of the steam fire engines were forced to secure their water from hydrants at some little distance from the seat of the trouble, and the pressure was such that the supply in the mains was soon exhausted in many instances.

Five years before the big fire—Oct. 1, 1867, to be exact—Boston first turned its attention to self-propelled fire apparatus. At that time the Amoskeag people of Manchester, N. H., were experimenting with steam fire engines of this type, and it would appear that this experimentation was continued under an arrangement with the Boston fire department. One of the new engines

**Type of Self-Propelled Steam Pumping Engine Installed in Boston in 1872-3 and Later Converted for Horses.**

was brought to Boston and placed in the house of Engine Company 5 in East Boston. It was of the second class and its weight was 7000 pounds.

Perhaps it should be stated that the first steam fire engines were introduced in Boston in 1825, but their superiority over the old hand tubs was not recognized until 1858, for during that year six hand engines and two steamers were lined up on the Common in an exhaustive test. Two years later, in 1860, the entire department was placed on a horse drawn basis, in which steam fire engines predominated.

The arrival of the self-propeller in 1867 was an occasion of great importance, as may readily be supposed. Oct. 11 of that year it was placed on trial before the board of fire commissioners of New York City, the members of which came to Boston to see the innovation. At that trial it

developed a speed of three miles an hour, and later was able to traverse the crooked streets down town at a speed of four miles.

The propelling machinery consisted of a stout chain worked in slotted grooves and the links were fitted upon the main shaft and hub of the rear wheels, smaller chains being attached to the brake and connected with the forward axle. This information is available from a study of Brayley's "History of the Boston Fire Department".

From the same source, it is learned that during that same year an attempt was made to utilize liquid fuel, or what was known as a hydrocarbon, for steam engines, the invention of Col. H. R. Foot. This was applied to engine 3. To light the fire, a few shavings were placed under the retort, and when these were hot, the oil, which was carried in copper tanks placed over either spring at the rear of the engine, was let on, and vaporized as it issued from the burners. The

**Engine Tender 37, American-La France, Longwood Section.**

Engine 3, fitted with this invention, gave satisfactory results in a six hours' test, and in 1868 a committee was appointed to investigate Foot's claim that he could propel the apparatus to a fire without noise or smoke. This test proved a failure. The oil fuel was retained for a short time, but Nov. 7, 1868, it was abandoned as too dangerous, it having been found that the smoke stack became red hot under long exposure to the flame, and that no more steam pressure was secured than with coal.

It does not appear what became of the original self-propeller, but it is evident that it was not present in Boston during the big fire. Immediately after the fire, however, the department again turned its attention to self-propulsion. This machine also was made by the Amoskeag concern. It was installed with Engine Company 21 in Dorchester, very late in 1872 or early in 1873. At first this was considered a very satisfactory type, and the machine was in every respect similar to that delivered to the department in New York City in 1874. Hartford, Conn., purchased one of the Amoskeag self-propelled steam engines in 1876 and has had it in service ever since. The Boston engine remained in service a number of years, but it became unmanage-

**Chemical 13, Knox Machine, at Forest Hills Station.**

pump added the necessary air and the normal condition of the fire was attained. The oil was conducted from the tank to the retort by a common gas pipe tube and its flow was regulated by a stop cock, enabling the engineer to gauge the intensity of the flame at his pleasure.

**American-La France Hook and Ladder Truck Installed at Oak Square Station, Brighton Section.**

**American-La France Hook and Ladder Truck in Service at Eggleston Square Station, Roxbury Section.**

able on Beacon hill one day and rolled down the grade, injuring a citizen's foot. Subsequently the self-propelling chains were removed and it was converted into a horse drawn engine.

Boston has two self-propeller steam fire engines—engine 38, at the Congress street station, installed in June, 1897, and engine 35, at the Mason street station, installed in January, 1898. These are of the double extra, first class type, known as Jumbo, and have been utilized constantly until this year without rebuilding. They have only recently been fitted with rubber tires, which has increased their mobility some 50 per cent. in the opinion of Commissioner Cole and Chief Mullen. Both are of the Amoskeag make.

A knowledge of the automobile history of Boston at once raises the question as to why a larger percentage of the fire fighting apparatus is not motor equipped, for at present there are but four hook and ladder trucks, two combination chemical and hose wagons, one chemical engine and two tenders gasoline driven. One of these is a Knox machine and the others American-La France. To these vehicles should be added 24 Buick chief's wagons in service or ordered for immediate delivery, and four Velies. The answer is supplied by Chief Mullen.

He says that the absence of more automobile equipment is not due to a lack of apprecia-

tion of the efficiency of such apparatus, but rather to the fact that the department had invested a large sum in steam fire engines prior to the time when the practicability of the automobile was fully established. The 48 steam fire engines now in service were purchased between 1870 and 1910. Boston is forced to depend very

**One of the Three Knox Wagons with the Boston Protective Association.**

largely upon pumping engines, and it will be conceded that the gasoline pumping engine was not regarded as practical by fire department officials in 1910. Many of the chemical engines, hook and ladder trucks and tenders also were purchased some years ago.

Chief Mullen has been giving the subject decided consideration during the past year, as is evidenced by his recommendations, which include: Nine gasoline pumping engines with capacity of not less than 700 gallons a minute, seven of which are to replace horse drawn steam engines; one tractor drawn steam engine; three tractors, to replace horses on three steam engines; 10 combination chemical and hose wagons, to replace horse drawn equipment of the same type; one high powered hose wagon; nine chemical engines, to replace horse drawn chemical engines; two 75 or 85-foot extension ladders, to replace horse drawn box trucks; 11 combination ladder trucks, to replace horse drawn trucks; two tractors for hook and ladder trucks, and three

**Combination Chemical 5, Grove Hall Station, Dorchester.**

tractors, to replace horses on water towers. These recommendations are made by Chief Mullen in the interests of economy.

Fire Commissioner Cole goes one step further, adding a request that the \$15,000 appropriated for a new fire station at Parker Hill be transferred to the purchase of a motor ladder truck and a gasoline pumping engine to cover that section from other houses. This last recommendation, taken in connection with the approval of the chief's somewhat extensive list, is of particular interest, since Commissioner Cole reports that the experience of the Boston fire department does not bear out the figures made public from other cities, with respect to the comparative maintenance cost of the two types.

He asserts that a careful accounting shows that in large cities, where the apparatus is called upon to respond to alarms frequently, the cost of upkeep, including interest on the original in-

One of the Fire Boats with the Boston Fire Department.

Before deciding definitely in favor of gasoline chief's wagons, the department experimented for some years with Ross steam cars. Chief Mullen is shown in one of these machines in an accompanying illustration. Commissioner Cole explains that these have been abandoned, however, and that they should not be included in any listing of automobile equipment now in active service.

The Boston fire department maintains its own repair shop, in a special building close to the headquarters station on Bristol street. This is in charge of Eugene M. Byington as superintendent.

Superintendent Byington has seen long service in the department, dating from the days of the big fire, and is thoroughly familiar with every piece of apparatus. Under his direction many of the steam engines have been completely overhauled and rebuilt. When the automobile equipment first made its appearance he took advantage of every opportunity afforded to learn all about motor vehicles in a practical way. In view of the many factory branches in Boston and the large number of expert automobile workmen engaged in the service stations attached thereto, Superintendent Byington was enabled to secure the assistance of men who had had exceedingly practical experience in this work, and the repair

Superintendent Samuel Abbott, Boston Protective Association, and His White Roadster.

vestment, is greater with automobile equipment than the cost of a similar piece of horse drawn apparatus. He adds, however, that this does not take into consideration the matter of efficiency, or the fact that the department gains the services of the driver as an addition to the fire fighting force. From the above recommendation, it is apparent that Commissioner Cole also is mindful of the fact that the original investment may be reduced materially, when the cost of station and lot is added to that of equipment, for it is true in Boston, as elsewhere, that much less space is required for the housing of motor apparatus, than for equipment, horses, hay, etc.

White Wagon Installed with Company 2, Boston Protective Association.

shop is well equipped to take care of its motor driven apparatus.

It will be understood that the foregoing applies solely to the Boston fire department. Other motor apparatus already is installed in towns and cities comprising metropolitan Boston, and the Boston Protective Association, which virtually is a part of the fire fighting force, soon will be completely motorized.

This association had its inception in 1849, when the insurance firm of Dobson & Jordan, 50 State street, procured two canvas bags, each filled with three small oilcloth covers, which were placed in charge of Assistant Engineer F. A. Coburn. Upon the sounding of a fire alarm, Coburn ran to the office of the company, impressed into service anyone whom he could secure, and covered goods likely to be damaged by water or smoke. In 1858, the insurance people made arrangements to have six covers carried in a box

the dark, what valves to close in order to prevent unnecessary use of the sprinklers and the resultant damage from water.

The association comprises three companies, stationed on Purchase, Appleton and Roxbury streets, under the command of Samuel Abbott as superintendent. Each company is supplied with two wagons, in which are carried the necessary covers, etc. One White wagon and a Knox are located in the Appleton street house, and two Knox machines at the house on Roxbury street. Superintendent Abbott has the use of a White roadster. At present there are two horses in the Purchase street station, but it is anticipated that these will be replaced by automobiles early next year. The association has utilized automobiles since Dec. 6, 1907, when a Knox air-cooled machine was installed, to be followed by another July 13, 1909. These were replaced by water-cooled Knox vehicles during the present year.

**Ladder 20 and Combination Chemical 11, Both American-La France Machines, Located at Lauriat Avenue Station, in the Dorchester District.**

on ladder 1, the members of the company to spread them over goods when not otherwise employed, each man to be paid 50 cents an hour for such work.

The first company was organized Oct. 1, 1868, and an old milk wagon was purchased in which to haul 25 covers, brooms and shovels. Sept. 1, 1870, a suitable vehicle was secured and steps were taken to incorporate the association. This was finally accomplished in 1874, and since that time, the Boston Protective Association has worked in conjunction with the Boston fire department. The insurance companies doing business in Boston pay an assessment in proportion to the amount of their premiums during each six months' period, and the association acts to protect property exposed to water in the fighting of fires. It also inspects the sprinkler systems and has devised a scheme of tags by means of which firemen are able to determine, even in

Any statement concerning the efforts of the Boston fire department to remedy the defects which were made apparent during the big fire would be incomplete without mention of the installation of what is known as the salt water system of protection in the business district. The entire section has been piped with large mains, in which a supply of salt water is available at all times. Special hose is utilized and provision is made for siamesing three, four or five of these so as to deliver a powerful stream six inches in diameter at the nozzle.

In case of fire in the business section the fire boats respond to the alarm, warping into place alongside one of the wharves on the water front. The powerful guns on these boats are attached to the salt water system mains and, with Boston harbor as a source of supply, sufficient pressure is maintained to throw a stream to the top of the highest building.

## AUSTRIA'S ELECTRIC POSTAL WAGONS.

**An Installation in Vienna Which Comprises 30 Electro-Daimler 2.5-Ton Vehicles  
—Garage Facilities, Battery Care and Construction of Machines.**

ONE of the most interesting installations of electric vehicles abroad is that recently inaugurated by the Austrian Postoffice Department in Vienna. This is particularly true, because, for reasons which do not appear exactly clear in this country, foreign business men have not looked with favor upon the use of electrics. The official indorsement of the Austrian imperial government is expected to mean much to this branch of the industry in Continental Europe, and very probably in Great Britain, as well.

The installation comprises 30 Electro-Daimler wagons of practically 2.5 tons capacity, built by the Austrian Daimler Motoren-A. G., of Vienna, a concern which is much better known in America, at least, for its production of Austro-Daimler gasoline cars and trucks. The service was begun June 15 of this year, but not until experimentation covering a period of more than a year had demonstrated to the satisfaction of General Postmaster von Uhl that the electric was suitable in every respect.

It is not understood, as the result of correspondence with the maker of these cars, that they are owned by the government, inasmuch as the service is supplied by a private concern, the Austrian Daimler-Tudor Omnibus-Gesellschaft. This company has been operating electric omnibuses in Vienna for some two years, and it was from observation of these vehicles that the government officials first had their attention drawn to this type of transport.

Having decided to experiment with electrics, the imperial wagon works, Jacob Lohner & Co., Vienna, was commissioned to construct a special

body design to meet the needs of the postoffice department, in the transportation of packages and mails, and this was fitted to an Electro-Daimler chassis. This machine was delivered to the government March 1, 1912, and was at once placed under the charge of the omnibus company. During the year this was driven 17,000 kilometers (about 10,000 miles), and careful observation was made relative to its economy and efficiency. At the end of this experimental period the omnibus company made public the following:

General Postmaster von Uhl considered both types of vehicles, and found that the electric possessed the advantages of safety, cleanliness, simplicity, noiselessness

One of the Electro-Daimler Postal Wagons Utilized by the General Postmaster in the City of Vienna, Austria.

and of being odorless. It was also found that the cost for power was 20 per cent. less. The decision was made easily.

In Europe it has been felt that, on account of the disadvantages of the battery, electric power was not practicable for trucks, omnibuses, etc., while in America the use of specially heavy electric trucks has increased rapidly. With the constant advance in the price of gasoline, the electric will be used more and more, especially by such enterprises as this, where the installation is large. This year, this type of vehicle is gaining ground all over Europe, as is true in America. It is a mistaken idea that the battery gives trouble, as is borne out by a service of 15 months on a given line in Austria, covering 500,000 kilometers without interruption.

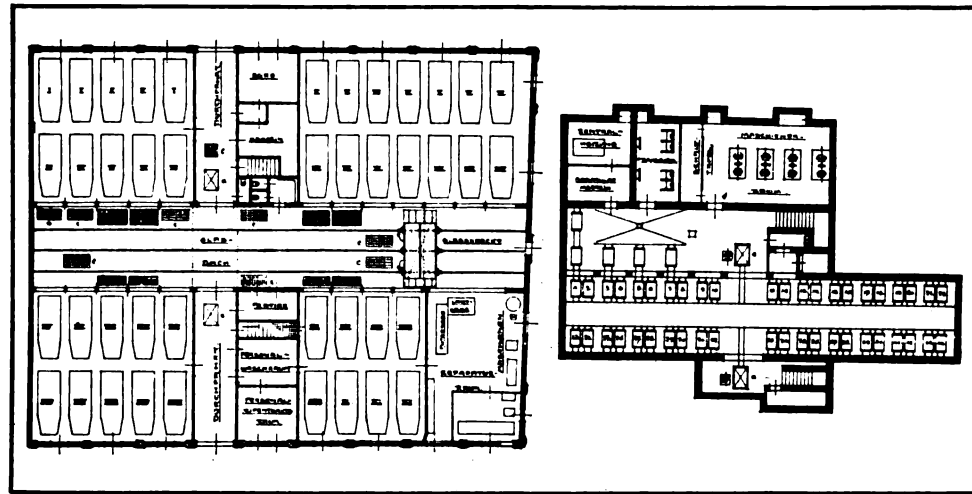

The postoffice machines in question are housed in a special garage, work on which was begun Oct. 29, 1912, and finished in May of this

year. The building is located with a frontage on three streets and is 40 by 31 meters (131 by 102 feet). It consists of one story and basement, the

ner, being supported by bars, as will be explained in more detail later, that a simple movement of these bars frees the crate and lowers it to the platform. The elevator then disappears into the basement and a fully charged battery is hoisted into place. The whole operation consumes between one and two minutes.

There were two good reasons for this arrangement of floor space, the first being that of segregating the battery work and providing for a quick exchange of batteries.

**Plan View of Postoffice Department's Garage in Vienna, Showing Arrangement of Stalls on the Main Floor at Left, and Location of Battery Room, Etc., in Basement at Right.**

cars being stored on the main floor, and the battery room being in the basement. The building was erected to accommodate 45 machines, although but 30 have been installed up to the present time.

An accompanying diagram indicates the interior arrangement. It will be seen that the machines are assigned to stalls on either side of a main driveway through the building, and the government demands 10 square meters for each. Cars are not turned around in the garage under their own power, but are driven upon a turntable, which is mounted on rails so as to permit of its being used on any portion of the main driveway.

Whenever it becomes necessary to change a battery, the car is shunted into an aisle branching off at right angles to the main driveway, at either side, and is located over an opening into the basement. An elevator, bearing a platform, is hoisted through this opening until the top of the platform bears against the bottom of the chassis. The battery is carried on the chassis in such man-

ner, and the other, the necessity for economizing on space so as to provide for a power room, stock room, office and a large tool room and repair shop.

The power room is located in the basement. Current is delivered to the garage from the city electric works and at a voltage of 5000. This is transformed to 220 volts, alternating current. This is again transformed to 110 volts, direct current, for charging purposes, in a special room equipped with the very latest electrical appliances for this work.

The chassis, which are the product of the Austrian Daimler Motoren-A. G., are distinctive, in that the motors are located in the front wheels, a type of construction which is not entirely new

**Stripped Chassis of the Electro-Daimler Postal Wagon, Indicating the General Constructional Features.**

in American practise, however. The frame is of pressed alloy steel, and this is mounted on extra long springs designed to possess easy riding qualities. The axles are of chrome steel, and the rear wheels of pressed steel, mounted on ball bearings. There are two sets of brakes, in addition to the electric brake which operates on the front wheels, and both of these act direct on rear wheel drums. Tires are solid rubber, 850 by 140 mm front and 900 by 160 mm rear. The wheel-base is 3300 mm (130 inches).

The motors in the front wheels are with the pole pieces arranged in the form of a star, while the armature is attached to the case forming one side of the wheel, supported on either side by ball bearings, and the assembly is so bolted together as to provide practically a unit construction. The armature is wound in the conventional manner and the collector brushes are so positioned that the vertical vibrations of the car cannot injure them. The brush bridge is of the ring design, located on the forward part of the axle. The construction is such that by removing the outer safety casing or cover, the collector with its brushes is fully exposed and accessible. The motors are dust and water tight, and easily dismantled.

They are of the high speed type, 90-volt, with maximum of 15 horsepower.

The battery is carried in a tray in the centre of the chassis at the front, as indicated in an accompanying illustration. The method of fastening is extremely simple, two bars, or parallel rails, one at the front and the other at the rear, as shown, being inserted in clamps provided for that purpose. With the platform on the elevator pressing against the bottom of the tray, as explained above, the weight is taken from these bars and it is an easy matter to withdraw them, when the battery tray is immediately released from the chassis.

The batteries are each of 42 cells, type VI Ky 285/4, and are rated at 300 ampere-hours, with five hours discharge rate, and with maximum ca-

capacity of 60 amperes. Their weight is 870 kilogrammes (1918 pounds). In order that there shall be no opportunity for delay in the service, the company maintains 56 of these, so that it practically is possible to have one battery in reserve for each truck at all times.

All electrical apparatus—controller, switch, meters and coil—is carried at the front of the dash, where it is protected from dirt and dust by a short hood. This is readily accessible by lifting the cover, which is hinged at the top and provided with rods to hold it in an upright position. The controller gives three speeds forward and one in reverse, and operates the electric brake on the front wheels. The driver is at the right, with two levers also at the right. One of these actuates the emergency brake on the rear wheels and the other the controller, the latter

**Details of Electro-Daimler Construction: At Left, Location of Controller and Electrical Apparatus, Showing Worm Drive Employed; at Right, Front Wheel Casing Enclosing Electric Motor, Etc.**

working through a neat application of the worm and worm wheel principle. Steering is accomplished by a hand wheel of the conventional type.

The bodies are of special design, conforming to the specifications supplied by the postoffice officials, and are the product of the imperial wagon works, Jacob Lohner & Co. They are entirely enclosed, with entrance from the rear, and may be locked so that the driver and attendant may not reach the contents. Inside is a special compartment for valuable packages, this box being lined with zinc. Provision is made on top for carrying extra large packages, a wire fence preventing dislodgement. This fence is made so that it may be turned down, on account of the entrances to several of the postal stations, the machines being driven directly into the buildings

and the contents being handled by government officials alone.

As the service is furnished by a private corporation, each vehicle is fitted with a speedometer, payment being made for each kilometer travelled. The wagons have a guaranteed radius of 35 kilometers (21.7 miles). The tires also are supplied on a guaranteed service basis.

### OAKLAND WINS ABROAD.

#### Cablegram from Buenos Aires Announces Victory for American Car.

A cablegram received last week from Buenos Aires, Argentina, announced that: "In Rosario, Argentina, race just finished, Oakland model 45, stock car, came in first, class C". No further details of the event are at hand, and it will be approximately 30 days before mails from Buenos Aires will be received in New York City.

The Oakland Motor Car Company, Pontiac, Mich., maker of the car, states that this machine was a regular 1913 stock export machine, and its performance cannot be compared with any of the races in this country. Such events in South America are invariably held over roads which are not prepared in any way. Drivers are called upon to exercise great skill because of the fact that many of these highways frequently cross open streams, etc. The Oakland has been entered in a number of these Argentina races and has always made an excellent showing.

### WILSON BECOMES PRESIDENT.

#### Pennsylvania Man Selected as Head of American Automobile Association.

John A. Wilson, of the Pennsylvania Motor Federation, was elected president of the American Automobile Association at its annual meeting in Richmond, Va., Dec. 3. Enos Laurens, Buffalo, N. Y., the retiring president, declined to stand for re-election. The other officers are: First vice president, Dr. H. M. Howe, Automobile Club of Maryland; second vice president, R. W. Smith, Colorado; third vice president, F. L. Baker, California; fourth vice president, H. J. Clark, Minnesota; fifth vice president, Preston Belvin, Virginia; secretary, John N. Brooks, Connecticut; treasurer, H. A. Bonnell, New Jersey; chairman of the executive board, A. G. Batchelder, New York City. President Wilson appointed the following committee chairmen: Good roads, George C. Diehl, New York; legisla-

tive, C. C. James, Ohio; touring, Howard Longstreth, Pennsylvania; contests, William Schimpf, New York.

The association gave emphatic indorsement to the Adamson measure in Congress, providing that after an automobile owner has registered his car in one state he shall be privileged to go anywhere in the United States without further registration. The secretary of the interior was complimented for his favorable action in admitting automobiles to national parks.

Perhaps the most important action of all was the passage of a resolution placing the association on record as opposing a registration tax unless it shall be in lieu of all other taxes, and the money thus raised to be expended in connection with roads maintenance. The so-called New Jersey test case has been taken to the United States supreme court and will be pressed with all due speed to an ultimate determination as to the constitutionality of existing registration laws of this character.

The next annual meeting will be held in Boston.

### INCREASES CAPITAL STOCK.

#### Hupp Motor Car Company Adds Another \$250,000 by Stock Dividend.

The officials of the Hupp Motor Car Company, Detroit, have filed papers with the secretary of state increasing the capital stock of the company from \$750,000 to \$1,000,000, the increase being made by a 33.3 per cent. stock dividend taken out of the surplus.

This action was taken to provide for extension of factory equipment and the expansion of the organization made necessary by the preparations for the coming season. Plans are now under way for the erection of additional buildings to take care of the increased production.

This stock dividend just issued makes the sixth increase in capital since the incorporation of the company. In November, 1908, the capital was \$25,000; in December, 1908, it was increased to \$50,000; in March, 1910, to \$250,000; in June, 1911, to \$500,000; in September, 1912, to \$750,000.

It is anticipated that many motorists will be interested in the safety and sanitary conference to be held in Rumford hall, Chemists' building, 50 East 41st street, New York City, Dec. 10-12. Several matters affecting the safety of the public under the present day changed traffic conditions will be considered by speakers of prominence who have specialized along these lines.

**JENATZY KILLED BY FRIEND.**

**Accidentally Shot While on Hunting Party, Being Mistaken for a Deer.**

Camille Jenatzy, the Belgian automobile racing pilot, was accidentally killed Dec. 8 by the editor of a Brussels newspaper during a hunting trip. Jenatzy was mistaken in the twilight for a deer and received an explosive bullet in his thigh. He soon died from the wound.

**J. H. S. SHOCK ABSORBERS.**

**The Sager Company Makes a Special Offer to Ford Owners.**

The J. H. Sager Company, Rochester, N. Y., maker of Sager equalizers, bumpers, etc., is marketing a new type of shock absorbers which includes a design for model T Ford automobiles. They involve mechanical principles and are similar in construction to the hydrocarbon motor in that a cylinder and piston are employed in conjunction with a coiled spring. The piston acts in harmony with the spring and the latter is so proportioned and fitted that all shocks, vibrations, etc., are eliminated and absorbed. One of the qualities of the J. H. S. is that as easy riding features are provided with the car empty as loaded. The application to the Ford cars is very simple and neat, as will be noted by accompanying illustrations, which show the absorber attached to the front and rear springs on a Ford machine. The J. H. Sager Company is making a special free trial offer, which provides for a return of the absorbers after 30 days' use if not satisfactory. The company also guarantees to replace any broken part within a year after purchase.

**CONSOLIDATION NOT EFFECTED.**

**Merger Fails Because Location Cannot Be Agreed on by Stockholders.**

The proposed merger of the Minneapolis Motor Company, Minneapolis, Minn., maker of motorcycles, and the Colby Motor Company, Mason City, Ia., maker of Colby cars, has fallen through.

The Standard Motor Company, Minneapolis, Minn., was formed for the purpose of taking over these companies and was incorporated under the laws of Delaware with a capital stock of \$6,000,000. The men identified with the new company went so far as to elect officers, but it is reported a controversy followed as to whether the company would locate in Minneapolis or Mason City, and as no agreement could be reached the stockholders decided to continue individually.

**KEYSTONE IS BUZBY'S PROPERTY.**

**Chicago Concern Ordered to Discontinue the Use of the Word in Corporate Name.**

Through a decision of the United States district court the word Keystone, as applied to greases and lubricating oils, is the property of Augustus C. Buzby, doing business as the Key-

**J. H. S. Shock Absorber Attached to Front and Rear Springs on Ford Car.**

stone Lubricating Company, because of his introduction of his product under that name in 1885. The suit in which the validity of this trade mark was established was between the Keystone Lubricating Company, Philadelphia, Penn., and the Keystone Oil & Manufacturing Company, Chicago, Ill., on complaint of former that the Chicago company had incorporated in 1900 under the name Keystone with the purpose of obtaining advantage through use of name of an established product, and the court decided that this claim was well founded, despite the fact that that product of the Chicago company was not marked with the trade mark nor sold as Keystone grease. The court ordered that the Chicago concern should incorporate its lubricating grease business under another name or adopt a plan that would not be an infringement of the Philadelphia company's rights.

tires on the rear. Quick detachable, quick demountable rims are standard equipment. With the exception of the raceabout, a pressure system of fuel feed is employed, a gear driven pump being utilized. The tank of the raceabout is located directly back of the seats, forming a part of the rear deck, and has a capacity of 25 gallons, and has a compartment that will carry five gallons of oil.

A 120 ampere-hour storage battery is included in the lighting and motor starting systems. The motor starter is located on a sub-frame and its energy is applied by a pinion meshing with a gear cut in the flywheel of the engine. The switch is located on the dash control board.

### CLARK SAFETY ENGINE STARTER.

**Designed to Replace Usual Crank and to Prevent Accidents Caused by Back Firing.**

W. R. Clark, Muncie, Ind., has invented and patented a safety starting crank for motor cars

**Clark Safety Engine Starter: A, Starter Assembled; B, Bracket Retaining Clutch Breaker; C, in Rigid Position; D, Handle or Clutch Proper; E, Hexagon Nut Securing Handle and Clutch Breaker.**

which is stated to be so designed that it cannot be turned anti-clockwise in the event of the motor being cranked with the spark advanced. The construction is simple, and one of the qualities of the invention is that it may be permanently attached to the car or instantly removed, making it adaptable to vehicles equipped with motor starters.

The Clark engine starter comprises three parts and a hexagon nut, the latter being utilized to secure the handle and the clutch breaker, as the safety device is termed by the inventor. The components of the device are shown in an accompanying illustration, that at A showing the parts assembled.

The bracket B is attached to the cross frame member, or usual support below the radiator, and serves to rigidly retain the clutch breaker C. It also provides a positive support for the handle proper. This bracket is made in various styles to fit all makes of vehicles.

The clutch breaker is of steel and manganese bronze squared to .625 inch, but can be increased up to and including 1.25 inches as the installation may require, and to engage with the motor crankshaft or the conventional starting handle. It is fitted by cutting off the old handle and squaring the shaft to fit the clutch breaker, which is supplied with all necessary adjustments so that it can be used with spring attachments provided for keeping the crank disengaged when the motor is operating. The roller members are of the anti-friction type and the ratchet is of manganese bronze. The handle D, the clutch proper, is of steel, and the maker states that the pawls are practically indestructible, as they mesh with the ratchet only in the event of a back fire.

The Clark safety starter is used by pressing in the handle D in the usual manner, which engages the shaft of the clutch breaker C. Rotating the handle to the right imparts movement to the crankshaft of the engine, but in the event of a reverse movement, such as follows back firing, two pawls engage the ratchet of the clutch breaker, throwing out the crank and breaking connection between it and the shaft. It will be noted that the teeth of the ratchet are so cut that the pawls will mesh only when a reverse movement of the shaft takes place.

Four different finishes are supplied, nickel, brass, oxydized and japan. The Clark safety device is moderately priced and the Clark Crank Company of Muncie, Ind., has been organized to market it.

### BUYS LONG HORN.

**H. W. Johns-Manville Company Takes Over Business of Piel Concern.**

All the manufacturing and selling rights and stock on hand of the Long horn, made by the G. Piel Company, Long Island City, have been purchased by the H. W. Johns-Manville Company, New York City.

The new owner will immediately send a supply of the horns to the different branches and dealers handling this product, and no interruption in the conducting of the business is expected.

## LARGE CARS VS. SMALL CARS.

**I**NTEREST in the cyclecar situation is such that discussions respecting the merits of the new type of machine are particularly timely. The communication presented below takes up the matter from the viewpoint of the cyclecar manufacturer. The opinions are those of Harry J. Stoops, vice president and general manager of the American Cyclecar Company, Bridgeport, Conn., maker of the Trumbull machine.

The fundamental principles of motor car manufacture and motor car selling are the same principles which underlie the great variety of business undertakings everywhere today. These principles may all be summed up and expressed in the idea of "the greatest good to the greatest number". Modern tendencies and business methods generally have this idea as the ultimate end to be reached, and conditions are molded, plans are laid and processes evolved to reach this goal successfully. With this idea in mind, a comparison of large motor cars with small ones, in the cost of manufacture and profit resulting from their sales, is of interest.

### Proportioning the Overhead.

The large car is manufactured on a limited scale and consequently its margin over and above its actual cost must be greater than the small car. The overhead cost of manufacture of a small quantity of large cars is greater proportionally than for small cars, and the necessary expense attached to the selling of them is equally so. This overhead for the small car is divided over a greater output and it stands to reason that a car which sells readily because its price enables a larger class of buyers to purchase, reduces the actual expense of its sale.

Then, too, as the manufacture of the large car is limited in number so is the class of people limited, who can afford to buy and operate it. The small car is produced in quantity because the demand—arising from a larger class of people who can afford it—is greater.

This idea of quantity production resulting in a car to be sold at a low price, small profit, and in large numbers to many purchasers, has its counterpart in familiar institutions of every day life. The department store, five and 10-cent stores and nickel "movies" are good examples. In the large department stores the profit per sale is very small, but the number of sales shows an enormous balance to profits in the end. Do you suppose for a moment that the Woolworth building (one of the modern architectural wonders) would have been dedicated with that name if the parent business and management had catered only to the few—carried charge accounts—instead of considering that class of people with the cash in hand, small though the sum may be, which made the millions of purchases? If the operation of our railways and street cars was such that the common people could not patronize them, what would be the value of their millions of stock?

### A Class to Be Considered.

The intermediate class must be considered, and their desires and wants catered to, if big business is to succeed. How many people do you know who started out to handle fancy goods of any kind, at fancy prices, that have succeeded? Only a few. There have been many failures. On the other hand, scores have succeeded where their goods were necessities, or even luxuries, if within reach of the numbers.

The fundamental idea which made big business in the past in other lines, is just as true today in the automobile industry. The few far sighted men, who have furnished cars within reach of the comfortable middle class, have made millions of dollars for themselves and have made thousands of people happy.

Too long the tendency has been to consider the class who purchase big cars; to consider only big profits; big fellows; to the almost exclusion of the intermediate class, whose human desires are the same as the so-called "big fellow"—those who have a few hundred dollars tucked away, but who cannot afford to speculate on the purchase of a big car. The people of this class would

enjoy the holiday in the country, or going to or from their homes to business quickly and comfortably, as much as their more fortunate brothers.

### Quick Sales, Small Profits.

There is one way to reach all these people—small cars at small profit, many quick sales at small expense—and it's a cash sale in a much larger percentage of cases than the larger car.

Think of the actual selling conditions of a small inexpensive car. You have made the sale quickly, your customer is satisfied, he owns something, and better yet, owes nothing, a pleasing transaction and you are elated that you have been instrumental in making another friend by selling him something he can afford to buy, to keep and operate without placing a mortgage on the home, and perhaps a second one, because of excessive operating and upkeep expense. You are making 10 friends, where you formerly took the chance of making one—10 small quick sales, 10 small quick profits. How long before you are a big man with a big business? Just one-tenth as long as had you followed big profits, big sales and big cars exclusively.

Your sales will not be confined to those who can afford only a low priced car on account of circumstances. The so-called "big fellow" would not be driving the big car if he had not used good judgment in business. If he is a man of a family (most of them are) and cannot house and keep a fleet of large cars, he will consider a small, light, neat, comfortable car as a tender to the big one. He can store two or three of these cars on the same floor that would be taken by a large one. These small cars can be used for most every purpose. When mother has use for the family machine, father goes to work in the small one. His sons and daughters use the small cars to get to their clubs, parties, or picnic and without a chauffeur, but with a friend. All are taken care of, and all are happy—thanks to the small car.

### Possibilities with the Cyclecar.

Get in touch immediately with the manufacturer of the cyclecar, miniature automobile, or light car, to fill the gap which has existed for years—that intermediate field between the automobile and the motorcycle. This car you can sell your friends who told you, last season and this, that they could not afford an automobile and that the motorcycle did not meet their requirements. This is the car that will take you anywhere the "big fellow" can go (and some places he cannot); a car in keeping with the income, with upkeep and operation reduced to a minimum. Anyone with such a car feels equally as secure with a \$10 bill in his pocket, and is as amply protected as the "big fellow" with the big car and 10 times \$10.

You will have more prestige, more business, more friends and more money if your place is known as the house of the small car, small profits, many sales, than to continue lending your strength in support of large cars, few sales and profits which in the end amount to less than the profit from many small sales.

The cyclecar, or miniature automobile, comes nearest in its field to the fundamental idea of all big business—"the greatest good to the greatest number".

Announcement is made by those in charge of the Importers' Salon to be held in the Hotel Astor, New York City, Jan. 2-10, that many of the attractive foreign body designs seen at the recent Paris Salon and the Olympia show in London, will be displayed here next month. Chief among these is the new boat type, and several different interpretations of this will be presented.

Seattle, Wash., has plans under way for the construction of a \$200,000 two-mile wood saucer track, on which it is expected a \$25,000 prize meet will be held early in 1914.

## U. S. ROAD OFFICE ADVISES "RAISE TRUCK TAX."

**T**HE power wagon industry, the owners of motor wagons and trucks, and practically every business man in the nation, will be interested in the attitude of the United States government as demonstrated by the report of Logan Waller Page, head of the office of public roads of the Department of Agriculture, made to Governor Pothier of Rhode Island, which, among other things, advocates the increase of present taxes, or a direct taxation of service vehicles for the maintenance of state highways.

This is one of the most radical recommendations ever issued by a United States official, and it seemingly has the approval of the Department of Agriculture, for it proposes that motor trucks be specially taxed to secure funds to keep in repair the roads included in the state system. This proposition has been taken up by the Rhode Island Motor Truck Owners' Association and that organization is now fortifying itself to oppose such legislation as may be proposed at the coming session of the General Assembly in January.

The state board of public roads was the object of an attack by a Providence newspaper that sought to defeat a proposal to issue state bonds to provide funds to meet appropriations made for the construction of new highways. This was inaugurated two days before the election and the bond issue was not approved. Later on, possibly by invitation of Governor Pothier, although the authority is not stated, an engineer attached to the office of public roads made a tour of the roads of the state system, examined the records of the office, and data secured are the basis of a report that suggests the abolition of the present state board of public roads, recommends the substitution of a single-headed commission, criticizes the general conditions of administration as "very loose", declares the records are not accurately kept, states that the specifications are inadequate, maintains that quality of materials is not tested, scores the system of payment, comments on expensive errors of judgment, proposes that the manner of designating roads to be built or repaired be changed, advocates the increase of registration tax on motor trucks and advises the building of state roads by convict labor.

This is the first time in the history of state highway system administration that the federal government has undertaken to direct or advise. There is no precedent for this, any more than for supervision of the state courts or any other

department of state government. Why the federal government was invited to undertake this "investigation" does not appear, and apparently the supposition is that the people of the state are incapable of governing themselves. Governor Pothier has apparently assumed that this is desirable. Primarily the inquiry appears to be the result of attack on the members of the state board of public roads, who have held office continuously for 12 years.

The fact remains that there are state and federal constitutions to be considered. Motor trucks are taxed in Rhode Island as personal property at a rate of \$16.50 for each \$1000 valuation, and any increase of registration tax (\$2 a vehicle is now paid) would be a second tax, which is unconstitutional under a number of state decisions. There are now about 12,000 pleasure cars and 1800 motor wagons and trucks registered in the state. An increase would affect residents of other states who have occasion to do business in Rhode Island, especially those of Massachusetts and Connecticut.

Aside from the unconstitutional aspect, a majority of the owners of machines maintain that if they are required to pay an increased registration tax they will discontinue the use of motor vehicles.

The most threatening fact is that if the federal government has the right to dictate what shall be a registration tax for power wagons in Rhode Island, it certainly can exercise the same supervision in every other state, and direct and influence the tax, or a part of the tax, that shall be paid by individuals to the state.

---

### B. T. KINSMAN DEAD.

---

**Manager of Studebaker Chicago Branch Succumbs to Acute Indigestion.**

---

B. T. Kinsman, manager of the Chicago branch of the Studebaker Corporation, Detroit, and formerly connected in a similar capacity with the Boston and Buffalo branches, died suddenly in Buffalo from acute indigestion. Mr. Kinsman was known to a wide circle of friends in the automobile industry.

---

The Studebaker Corporation of South Bend, Ind., and Detroit, has presented the engineering department of the University of Michigan a stripped Studebaker chassis.

## GENERAL NEWS OF THE INDUSTRY.

### Notable Increase in Working Forces of Four Detroit Concerns—United States Court Upholds Canfield Patent, Owned by A. R. Mosler & Co.

**A**N INTERESTING commentary on present business conditions, with special reference to the automobile industry, is found in the fact that at least four of the big Detroit concerns have greatly increased their working forces over those for November, 1912. The comparison for the two years follows:

|                  | 1912 | 1913   |
|------------------|------|--------|
| Ford .....       | 8000 | 12,000 |
| Cadillac .....   | 6200 | 7,070  |
| Studebaker ..... | 4800 | 7,000  |
| Chalmers .....   | 3600 | 4,000  |

This should by no means be taken as a total list of the concerns in the heart of the industry which have found it necessary to increase their factory facilities in this respect. It so happens that these are the only figures which have been made public in this connection, but it is known that several other companies have found it necessary to follow the same plan.

#### CANFIELD PATENT IS VALID.

#### A. R. Mosler & Co. Obtains Injunction Prohibiting Sale of Infringements.

A decision by the United States district court of appeals in New York City, made by Judge Lacombe and concurred in by Judge Ward and Judge Rogers, in the suit of A. R. Mosler & Co., against John Lurie, maintains that the Canfield patent, owned by the complainant, is valid and the defendant is enjoined from selling the six different makes of spark plugs named in the bill of complaint. The attorney for the complainant, W. A. Redding, claims that the decision is very broad and that it will affect practically every maker of spark plugs.

The Canfield patent is the invention of Frank W. Canfield, engaged in lumber trade at Manistee, Mich., the papers establishing it being issued Oct. 18, 1898. He died the following year. The patent was acquired by the Associated Patents Company, which organization was affiliated with the Association of Licensed Automobile Manufacturers. The association licensed each member to use the plug and then sold the patent to A. R. Mosler & Co.

Lurie was proprietor of the Automobile Supply Company, New York City. The suit for in-

fringement was begun in 1909 and it was dismissed in the United States circuit court by Judge Mayer. An appeal was taken and this has now been decided. The principal claim is for a recess in a spark plug surrounding the central electrode to prevent the accumulation of soot or carbon, this recess being necessary to insure a full spark and prevent a short circuit.

A. R. Mosler, president of A. R. Mosler & Co., states that the policy of his company will be broad and unselfish, but the co-operation of every legitimate spark plug manufacturer is expected. On the other hand, the rights of the company under the recent decision will be vigorously protected. The licensees under the Canfield patent now include A. R. Mosler & Co., Auburn Ignition Company, Benford Manufacturing Company,

Two Prominent Haynes Officials: At Left, L. R. McKensie, Assistant Sales Manager; at Right, T. L. Tinscher, Special Representative.

Champion Ignition Company, Champion Spark Plug Company, Frontier Specialty Company, Hartford Machine Screw Company, Jeffery-De-witt Company, C. A. Mezger, Inc., Rajah Auto Supply Company and the Silvēx Company.

#### NEW HAYNES MANAGERS.

#### Something Concerning the Men Who Help Make Success for Kokomo Product.

The Haynes Automobile Company, Kokomo, Ind., maker of the Haynes line of pleasure cars, is enjoying a particularly successful year, and it is of interest to consider personally some of the

men who have helped. An accompanying illustration presents L. R. McKenzie, assistant sales manager, and T. L. Tincher, special field representative.

Mr. McKenzie is thoroughly acquainted with all the mechanical details of an automobile, and can drive, sell, demonstrate or repair a machine, as well as handle with equal efficiency both men and correspondence. He formerly was connected with the Studebaker Corporation of Detroit and South Bend, Ind.

Mr. Tincher is considered the dean among Haynes men on the firing line, so to speak. Like Mr. McKenzie, he is thoroughly conversant with every phase of the automobile business, but excels chiefly in his ability as a salesman. Before his connection with the Haynes company he was engaged in the manufacture of Tincher cars in

one of any other make of electric. During the past the electric car manufacturers had secured space at these shows only after the association members who manufactured gasoline cars had been assigned space. Today the electric vehicle builders are placed on the same plane as are the gasoline automobile makers, an evidence of the greatly increased demand for electrics.

### IN NEW HEADQUARTERS.

**Executive Offices of Empire Automobile Company Occupy Handsome Building.**

For a long time the executive offices of the Empire Automobile Company, Indianapolis, Ind., maker of the Empire Little Aristocrat, have been inadequate, and it is with some little satisfaction

that it is announced that the new headquarters at Capitol avenue and Michigan street are ready for occupancy. The structure is shown in an accompanying illustration, and is located in the heart of Indianapolis' motor colony.

The building is of concrete and steel, three stories high, and equipped in the most modern manner. There are 25,000 square feet of floor space, and the ceilings are high, assuring light and airy offices and workrooms. In it are housed the executive and general offices, the central supply station of the service bureau and the large

parts stock room. On the first floor are the offices of the sales, advertising, service and accounting and purchasing departments, also the general sales showrooms. The offices of General Manager Cecil E. Gibson, Chief Engineer Louis Schwitzer and the latter's engineering staff are located on the second floor.

The service and parts stock rooms occupy the remainder of the space, and these are arranged along modern lines that insure speed and accuracy in filling parts orders, and in rushing them to trains and transportation companies. Incidentally, the central location of Indianapolis, both in relation to the population of the country and to quick rail communication with all parts, are features which make for speed Empire service. The Empire plant at Connersville, Ind., is also conveniently situated.

**New Headquarters and Executive Offices of the Empire Automobile Company in Indianapolis, Ind.**

Chicago, and became well and favorably known to the trade.

### ANDERSON HAS FIRST CHOICE.

**Detroit Concern Given Precedence in Show Space Allotment on Business Done.**

By the conditions of the new plan of the National Automobile Chamber of Commerce for allotting space at the annual New York and Chicago automobile shows, the Anderson Electric Car Company, Detroit, has been given first choice of the electric vehicle manufacturers.

The first allotment in the automobile divisions is now made to the manufacturer with the largest annual business to his credit, and in the order of production. During the 1913 season approximately two Detroit electrics were sold to

**BUYS HARROUN CARBURETOR.****Pennsylvania Oil Interests Acquire Plant and Business in Indianapolis.**

The Harroun Company, Indianapolis, Ind., maker of kerosene carburetors, has been absorbed by the Electric Renovator Manufacturing Company, Pittsburg, Penn. The Pittsburg company is said to be controlled by a group of the largest independent oil operators in America, and the fact it has taken over the Harroun interests is held to be an indication that the future necessity for a kerosene carburetor is appreciated by those who are in a position to know the actual fuel conditions.

The factory will remain in Indianapolis, at least for the present, and will be operated in conjunction with the Pittsburg plant. Ray Harroun, who has developed the carburetor from its inception to its present form, will remain with the new interests as an officer of the company, and will concentrate his efforts in development and exploitation work toward broadening the field for the product.

**WILL REDUCE PRICES.****KisselKar Maker to Set a New Low Record for Six-Cylinder Machines.**

Following the annual inventory and plant renovations of the Kissel Motor Car Company, Hartford, Wis., during which both the Hartford and Milwaukee factories were closed, interesting manufacturing plans are being discussed. It is expected that early in January announcement will be made of two entirely new KisselKar models, one of which will be a four-cylinder machine and the other a six.

The prices on both are to be reduced, according to the information disclosed, and the latter will set a new low price record for sixes, selling for considerably less than \$2000. Details of the two new models are not yet ready for publication, but it is stated that there will be no sacrifice in quality, either of workmanship or material.

**GASOLINE-ELECTRIC TRUCK.****New Concern Organized in New York City to Produce a New Design.**

The Roland Gas-Electric Vehicle Company has been formed in New York City with a capital stock of \$200,000 by Perch K. Hexter, Roland

R. Conklin and Stanley L. Conklin as incorporators. It will produce a gasoline-electric truck which has been developed by Mr. Hexter.

The vehicle weighs about 8000 pounds and is rated at four tons capacity. The company has secured factory accommodations at Avenue B and 20th street and expects to start with an initial output of 100 trucks.

**KINCAID GOES WEST.****Well Known Oil Man Now Special Representative of National Refining Company.**

William T. Kincaid, who is well known throughout the East, because of his long connection with the handling of automobile lubricants in that district, has followed Horace Greeley's advice, going as far West as Cleveland, O., where he is now located as special representative for the National Refining Company of that city. Located is hardly the proper word in this instance, since it is Mr. Kincaid's duty to place an agent for the product of the National Refining Company in every city in the country.

W. T. Kincaid, Special Representative, National Refining Company.

He is particularly well fitted for this work, through a long connection with the oil industry, and is entirely familiar with the duties imposed upon him by his new position. His acquaintance in the motor car field is by no means confined to the East, since he has at times been more or less intimately connected with automobile racing, both in his capacity as an oil salesman and as a promoter of such events. His most recent achievement along the latter lines was in connection with the beach races at Old Orchard, Me., in 1911 and 1912.

Mr. Kincaid's many friends, both in and out of the industry, will be glad to learn of his promotion to a wider field of usefulness, and will bespeak for him and the National Refining Company a large measure of success in his work.

### LOCATES IN OHIO.

#### **Maker of Grant Car Purchases the Plant of the Findlay Motor Company.**

Ever since the announcement of the formation of the Grant Motor Car Company of Detroit, for the production of a light weight, low priced car, it has been rumored that the concern would secure a plant outside the so-called heart of the industry. Negotiations were at one time under way, as a result of which it was expected that Dayton, O., would prove the ultimate selection. It is now stated, however, that the Grant company has purchased the factory of the Findlay Motor Company at Findlay, O.

The plant has a floor space of some 50,000 square feet and is modern in every sense of the word. It is stated that it comprises all the necessary machinery equipment for present use and that orders already have been given for sufficient material to warrant the production of 5000 cars. It is expected that demonstrating machines will be shipped shortly to the many dealers throughout the country who have been appointed by Sales Manager George S. Waite.

### NEW EDISON PLANT.

#### **General Manager Bachman Also Denies Rumor Concerning New Edison Battery.**

The immense new plant of the Edison Storage Battery Company at Orange, N. J., is practically completed, and only awaits the installation of machinery to start the production of the Edison alkaline, nickel-iron storage battery on the enlarged basis made necessary by the rapid development of storage battery applications in electric trucks and pleasure cars, street and railway cars, train lighting, wireless telegraphy, railway, police and fire signalling, farm lighting, etc. In this connection Vice President and General Manager R. A. Bachman takes occasion to deny the rumor that a new type of Edison battery is soon to make its appearance.

Mr. Bachman explains that undoubtedly this rumor was started as the result of the temporary laying off of some 100 employees pending the arrival of new machinery and the opening of the new plant. The fact that the company is soon to place in the market a new type of miner's lamp, for which the Edison battery is particularly well adapted and which was awarded the Ratheman medal last year by the Museum of Safety, may also have had to do with the matter.

It is expressly stated by Mr. Bachman that the Edison battery is practically the same today as that perfected by Thomas A. Edison about five years ago, and which has been responsible for the increase in storage battery transportation. Lord & Taylor recently purchased a fleet of electric delivery wagons for its new store, and, following the example of such concerns as R. H. Macy & Co., Hearn's, Loeser's, Abraham & Strauss, Adams Express Company, etc., has standardized on Edison batteries. Mr. Bachman says this is the best evidence that the present type of battery is not likely to be changed.

It is expected that by the latter part of December all the new machinery will have been received and the present machinery so rearranged in more efficient positions in the enlarged plant that an addition of over 2000 new employees will be required.

### WITH NEW MANAGEMENT.

#### **Muncie Gear Company to Continue Business Under a Reorganization Plan.**

Arrangements have been made by the Muncie Gear Company, Muncie, Ind., to continue the business under new management. Thomas W. Warner of Toledo, O., becomes president and the capital stock is increased from \$300,000 to \$500,000.

It is understood that creditors of the company will receive both cash and preferred stock, and that about \$230,000 of the stock has been distributed in this manner. Besides Mr. Warner as president, the new officers are: Vice president, Dr. W. A. Spurgeon; secretary and treasurer, J. Roy Goethus.

### SHARRER TOP ABROAD.

#### **Maker Reports Good Results from Display at Recent Olympia Show.**

The Sharrer Patent Top Company, New York City, maker of the new Sharrer one-hand top, exhibited one of these at the Olympia show in London, England, with the result that it has the promise of a good foreign business. The concern has sold its patent rights for Australia, and has negotiations pending for the sale of such rights in other countries.

Although incorporated but a short time, interest in the product of the new concern has been very marked in this country. The Sharrer top will be seen at New York and Chicago shows.

## LAMBERT LINE HAS MANY REFINEMENTS.

**L**AMBERT pleasure vehicles for the season of 1914 will include two new models, these to be known as model 60 series C and model 46 series C, which embody the same chassis construction as in former designs, with the exception of refinements and added conveniences. The Buckeye Manufacturing Company, Anderson, Ind., has departed from conventional practise, in that option is given of two makes of motors, a Continental or a Rutenber. With the model 60 the choice may lie between four-cylinder units having a bore of 4.125 inches and stroke of 5.25 and 4.25 by 5.25. The cylinder dimensions of the model 46, which is also a four, are 3.75 by 5.25 inches.

In addition to the changes in the cylinder dimensions, which make for increased horsepower, the steering wheel is placed at the left instead of right, and centre control has been adopted. The shifting lever operating the fibre wheel on the jack-shaft of the Lambert gearless transmission, which provides a multiplicity of speeds, is equipped with a ball top which fits the hand. The emergency brake lever carries an attachment which locks at the will of the operator, preventing use of the car by others than those intended. Keys are provided.

The model 60 has a wheelbase of 117 inches and two types of bodies will be fitted, a five-passenger touring and a roadster. The fuel tank in both designs is located in the dash with a convenient filler. The seats are very roomy and the upholstery very deep, providing the maximum in comfort. Electric lighting and motor starting are supplied at an additional cost.

The model 46 is the newest addition to the Lambert line, and, while it has no untried features, it was designed with a view to offering a lighter car with ample horsepower and seating capacity for five persons. The body lines are stated to be the lowest of any friction driven car offered up to the present time, owing to the special features in the mechanical design. The standard equipment includes an electric motor starter which is guaranteed for life, and any defective material will be replaced free by the maker, provided it gives out under normal serv-

ice. The body is very attractive, being long and low, and has large, roomy seats. The equipment is most complete, including electric lighting, mohair top and cover, speedometer, Titanic front springs and full elliptic rear springs, and all of the minor accessories that make a machine complete for all kinds of service.

The Lambert gearless transmission remains, as in the past 14 years, the stellar feature of the Lambert product. The company points out that the 40 per cent. increase in sales during the past year is indicative of the popularity of this form of transmission and that an increase is anticipated in 1914. The Reynold silent chain for final drive is continued and it is enclosed as formerly in a dust and weather proof case. An equal number of both models will be built dur-

**Model 46 Series C, the Latest Addition to the Lambert Line, a Five-Passenger Touring Car, Fully Equipped.**

ing the coming season, and in these will be incorporated the same high grade material and workmanship for which the product of the Buckeye Manufacturing Company is noted.

---

Charles W. Bosworth, Springfield, Mass., referee in bankruptcy, reports that the first dividend of two per cent. has been declared in the matter of the Westfield Motor Truck Company. The trustee has been ordered to pay in full all claims which have been proved and allowed, and are entitled to priority.

---

Some little interest attaches to the announcement in England that S. F. Edge, designer of the six-cylinder Napier car, has purchased a 30 horsepower Siddeley-Deasy car equipped with a Knight engine, for his personal use.

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Mosler Vesuvius Spark Plug.**

A. R. Mosler & Co., Mt. Vernon, N. Y., well known maker of the Mosler Spitfire spark plugs, is marketing the Vesuvius plug, which is designed to withstand severe service. The centre core is of a special stone, practically indestructible, and one of its qualities is that it is so shaped and constructed as to be absolutely gas tight. Another feature is that the plug may be disassembled easily and the parts replaced without interfering with the original adjustment of the points. The last named are of genuine platinum, liberal in size, making for efficiency and durability. The Vesuvius plug is made to fit any motor and is manufactured with various threads. The same high grade workmanship and material for which the product of A. R. Mosler & Co. is noted is incorporated in the new design.

**Ford Gasoline Gauge.**

The Modern Specialty Company, Racine, Wis., has brought out a fuel gauge for model T Ford cars, which is a distinct improvement over the usual method of noting the contents of the container, that of employing a stick or a rule. The Modern gauge is constructed of an outer tube of heavily leaded steel, with an inner casing containing a brass float, fitted to a spiral upright, which turns the indicator on the dial as the fuel is raised or lowered in the tank. The head containing the etched dial and indicator is of heavy brass and is threaded to fit any Ford gasoline tank. The gauge is installed easily and without any alterations by simply removing and discarding the usual filler cap and screwing in the Modern. All parts are substantially constructed and the maker states that there are no parts to become disarranged through service.

**National Foot Scraper.**

More or less mud and dirt is carried into the car, soiling the carpets and robes, and to keep these articles clean the National Motor Supply Company, Cleveland, O., has brought out a useful and inexpensive device, termed the National foot scraper. It is secured to the running board by clamping screws, is very compact and neat in appearance and is provided with a suitable edge for removing deposits from the shoes.

**Fordoid Radiator Hose.**

The importance of having an unobstructed flow of water in the cooling of the motor, especially with the thermo-siphon system, is well understood by those familiar with the internal combustion engine. With the model T Ford motor the outlet water manifold is connected to the radiator by a rubber hose, and to obtain efficiency from the system this tube should be kept clear. With inferior material, the plies of fabric separate, diminish-

ing the diameter of the hose and impeding the flow of the water. The Thermoid Rubber Company, Trenton, N. J., is producing the Fordoid radiator hose especially for the model T Ford motor. Both inlet and outlet designs are made and the maker guarantees that the material will not harden or soften in service, or when various anti-freezing solutions are utilized.

**Rusco Brake Lining.**

Rusco brake lining is produced by the Russell Manufacturing Company, Middletown, Conn., and the maker states that it is constructed of the best quality asbestos, solidly woven and thoroughly impregnated with a special compound to render it water, oil and heat proof. It contains a number of brass wires, these being interwoven with the asbestos. It is produced in standard sizes and thicknesses.

**Dover Breech Lock Oiler.**

The Dover Stamping & Manufacturing Company, Cambridge, Mass., is marketing the Dover wide mouth breech lock oiler, a new design, which makes for convenience in that the spout may be easily and quickly detached and replaced by a rotating movement. This permits of replenishing the supply of fluid without spilling as the opening is ample in size. The oiler is practically a one-piece construction, the bottom being of the best clock spring steel, pressed against the shoulder of the dome, and the seam double turned. The spout and breech are put together in the same manner. No cement, solder or brazing is used in the construction. The oiler is made of the best cold rolled steel, brightly polished, plated and lacquered, and is designed to withstand severe use. It is made in 10 sizes, Nos. 12 to 16, these having capacities ranging from three ounces to one pint.

**Glareless Headlight.**

Otto Luyties, 546 Fifth avenue, New York City, is marketing the Glareless headlight, which the maker states eliminates the dazzling and blinding rays without affecting the efficiency of the lamp. This is held to be due to the type of front glass utilized, it involving details of optical principles which are said to be very complicated. When viewed from the front the effect is that of an attractively frosted globe having a diffused light and showing a relatively small central bright spot. It is stated that this portion is not blinding because it is seen against an illuminated background.

**Kells Tank Cover.**

The W. J. Kells Manufacturing Company, Jersey City, N. J., is producing a cover for tanks, although especially designed for Prest-O-Lite gas tanks. It is constructed of spring metal, a one-piece design, and has a diameter slightly less than the tank and clamps over the last

Pomo Trouble Lamp

named member. One end is rounded while the other is open to permit of inspecting the pressure gauge of the Prest-O-Lite tank. The purpose of the cover is that it can be polished to correspond with the other trimmings.

#### O'Brien Fore Door Ventilator.

The Joseph F. O'Brien Company, 61 Park Place, New York City, is marketing the O'Brien fore door ventilator, an outside view of which is shown herewith. It is so constructed that it can be adjusted to any thickness of cowl or dash by employing different lengths of machine screws. The amount of air admitted is regulated from the inside by turning an inside projection, and the maker states that the vibration will not affect the adjustment. The exterior of the ventilator is covered with a wire gauze, preventing entrance of rain or dust.

#### Fairchild Radiator Cap.

The Fairchild Sales Company, 1777 Broadway, New York City, distributor for the Fairchild Ford crank locks and spring radiator caps, is offering a new Fairchild product termed the bayonet lock radiator cap. It is designed for model T Ford radiators and as the principle involved is similar to the socket utilized in electric lamp connectors, it is removed and replaced easily by a slight movement. The Fairchild is fitted easily and quickly and includes a new cap, loss of which is prevented by the use of a chain, a feature of the Fairchild design. The maker states that the new cap can be fitted in three minutes. It is moderately priced.

#### Backus Lock.

Numerous locking devices have made their appearance on the market, but generally they have been designed to lock a particular component of the car, the clutch, ignition, etc., for example. The Backus, manufactured by the Backus Novelty Company, 512 Water street, Smethport, Penn., differs from these in that it may be employed for a number of purposes. It comprises a pair of movable jaws having an opening of 4.5 inches and a locking mechanism, also a ratchet arrangement which permits of locking in any desired position. The jaws are provided with rounded teeth which will not tear or injure soft materials, as when securing the robe, for example. The Backus may be utilized for locking the gearshift and emergency brake levers together, the ignition and throttle levers, securing the robe to the radiator cap when it is thrown over the cooler, or to the robe rail and numerous other articles carried in the car. No two sets of locks are made alike and the sets of two and three have the same key combination, two keys to each lock.

#### Kent Pocket Meter.

The Atwater Kent Manufacturing Works, Philadelphia, is marketing the Kent pocket meter, which is an automatic volt-ammeter for ascertaining the condition of dry cells and storage batteries. The instrument may

be utilized for testing batteries in connection with automobiles, stationary engines, launches, etc., being calibrated especially for the work. The needle is delicately pivoted and the readings are accurate. One of the qualities of the instrument is that no change is made in the connection to the battery for reading voltage and amperage, as the latter is obtained by simply pressing a button. A flexible lead of ample length is provided with each meter, which is of the dead beat type, insuring accuracy. The Kent comes in a neat hand sewed leather case and is calibrated for both volts and amperes. One of its qualities is the use of a substitute for glass, the maker stating that it is unbreakable.

#### Weed Chain Plier.

The Curreir-Koeth Manufacturing Company, Coudersport, Penn., is producing the Koeth interchangeable tool, to which a large number of heads may be attached to provide for using it as pliers, pinchers or a shearing tool. The automobile kit comprises, in addition to the tool, six heads, including those for obtaining a Weed chain plier as illustrated. This design opens the link easily and for the proper distance, and the maker states that it can be operated easily with one hand. The tool and heads are constructed of tool steel, drop forged, ground and tempered, and it is stated that the heads may be changed as readily as auger bits in a brace.

#### Pomo Pocket Trouble Lamp.

The G. C. Parker Company, 122 Milk street, Boston, is marketing what is claimed to be the smallest inspection or trouble lamp manufactured. It is equipped with a hook member, making for convenience in service, and the lightness of the design permits of hanging it from the button hole of a coat or the brim of a hat. The lamp is an all-metal construction with the bulb protected by a cage. The bulb is a six-volt, six candlepower tungsten. Ediswan sockets are utilized for the lamp base and the battery plug, and are connected by 10 feet of silk cord. The lamp is finished in nickel and is inexpensive.

#### Destroy-O Carbon Remover.

Destroy-O carbon remover is manufactured by the Atlas Supply Company, 3233 West Lake street, Chicago, and comes in 1.5-quart cans. As the name implies it is utilized to remove carbon and other deposits from the cylinders without displacing these members. The fluid is inserted through the spark plug opening and allowed to remain in the cylinders for about 30 minutes, after which it is removed with a grease or oil gun. The motor is then started. The preparation taken from the cylinders may be used over and over again, and the maker states that it will soften the carbon which is carried out in the exhaust. Destroy-O carbon remover is moderately priced and makes for economy in that only a small amount is employed in each cleaning process. The Waite

Auto Supply Company, 81 Exchange Place, Providence, R. I., is representative for the maker.

#### A C Titan Spark Plug.

The Champion Ignition Company, Flint, Mich., maker of the Champion spark plugs, has brought out a new design which is stated to be regular equipment on Cole and Cadillac cars. A very large porcelain, easily replaced, is employed, and it is maintained that the dimensions make for durability and efficiency. The centre electrode is screwed into the porcelain and cemented. A special washer is fitted to the top of the porcelain and pressed down with a closed nut to prevent leakage. The bottom of the porcelain has a very wide seat and where it takes its bearing in the shell is fitted with a corrugated aluminum washer. It is stated that the last named member conducts the heat from the porcelain. Both the centre and shell electrodes are substantial, the latter being blade shaped, and have an increased diameter at the point of contact with the shell to draw the heat. A cool plug is claimed for the design of the electrodes, making for more satisfactory operation of the motor at low speeds.

#### Breaznell Clips.

J. H. Breaznell, 26 Court street, Brooklyn, N. Y., is marketing the Breaznell clip and terminal connector for batteries and spark plugs. One of the qualities of the

tool, other than the brace wrench supplied with each equipment, is necessary to remove and replace a tire. With the E-Z the clincher shoes may be utilized until worn out and replaced by quick detachable types, a universal arrangement. The company manufactures a rim for model T Ford cars which are fitted with clincher rims.

#### Kimball Ford Crank Holder.

To retain and prevent the swinging of the starting crank, the Northern Specialty Company, Crystal Falls, Mich., has brought out a special design for model T Ford cars. It is attached easily as shown, and a hinge member permits of holding the crank in an upright position when not in service. Provision is made for locking the handle, thereby preventing use of the car by others than those intended. An opening is provided in the hinge member for the locking device. The Kimball crank holder is inexpensive.

#### Hassler Shock Absorber.

Robert H. Hassler, West 10th and Canal streets, Indianapolis, Ind., has brought out a new type of shock absorber for model T Ford cars, which differs materially from conventional designs. The absorber includes a spiral spring of tempered spring steel which takes up all jolts and jars without hampering the movement of

clip is that it can be attached to a spark or other terminal without displacing the usual nut. The Breaznell clip is provided with two gripping jaws, which may be expanded and contracted easily. A lock washer construction is included, so that when the spark plug nut, for example, is screwed down, vibration cannot loosen the clip. Provision is also made for retaining the bared end of the wire and clamping it securely, and without the use of solder. The clips are well made, substantial and inexpensive.

#### E-Z Rim.

Many owners desire to obtain the advantages and convenience of the quick detachable rim, but hesitate to make the change owing to the alterations and expense involved. With some types of rims it is necessary to cut down or build up the felloe and sometimes the spokes must be altered. The E-Z Rim Company, 146 Summer street, Boston, is marketing the E-Z rim, which presents interesting and practical advantages, in that the maker states that it can be applied to any automobile wheel without alterations and at a moderate cost. As will be noted by the accompanying illustration, the use of split rings, cams, levers, etc., is eliminated in the E-Z, it comprising a removable ring to which lugs are fitted, these retaining it to the rim proper by means of bolts. The method of retention is similar to that employed with demountable types, six nuts and bolts anchoring the ring to the felloe. One of the qualities of the E-Z is that no

the car spring. The end of the car spring is supported by a lever arrangement and in such manner that when the spiral spring is compressed, the end of the car spring yields downward over a range of 1.25 inches. The rebound or expansion of the vehicle spring is retarded gradually by an extension of the lever member, which engages with the axle at the time of the upward movement. The lever member is held stationary during the movement and by reason of the compression of the spiral spring, holds the leaf or car spring down. The same principle is used for the rear of the machine.

#### Cox Rebound E-Zer.

The Cox Brass Manufacturing Company, Albany, N. Y., is manufacturing the Cox Rebound E-Zer, which retards the rapid upward movement of the car springs by means of a friction clamping device and gradually allows the springs to expand to their normal position. The action of the friction clamps is entirely automatic, as they open when the springs are compressed and grip on the rebound. The clamps are fitted with cylinders enclosing compression springs, to which is attached an especially treated woven heavy canvas belt, 1.5 inches wide. This belt is water proof and feeds through the automatic friction clamps, and is fastened on the axle by special clips provided for this purpose. The E-Zer is applicable to all types of springs, and does not affect the resiliency of the car, loaded or empty, as it does not come into action until the rebound occurs.

## WRIGHT COMPANY ANNOUNCES AEROBOAT.

**A**LTHOUGH the Wright brothers were engaged in experimental work upon an hydroaeroplane before the appearance of the first

New Wright Aeroboat in Flight Near Dayton, O.

successful machines of this type, the plans apparently were abandoned for a time. It is generally conceded that the first flying boat of the fuselage float type was designed by Grover C. Loening and exhibited at an aeroplane show in New York City late in 1911. Subsequently, Loening became associated with the Wright Company at the plant in Dayton, O., and for the past year or more he has been developing a machine of this type under the direction of Orville Wright.

Recently the Wright Company announced a Wright model C-H equipped with pontoons, and this was held to be a satisfactory flying machine adapted for use in shallow water. The next step was to so perfect this design as to make the craft suitable for use in rough water, and this is believed to have been accomplished in the Wright aeroboat shown herewith.

It will be noted that the plane construction follows the standard Wright design, to which has been attached a modified Loening fuselage float, and two Wright pontoons midway between the central boat hull and the tips of the lower plane. The details of the float and pontoons are not made public, but it is explained that the arrange-

ment is such as to make for a better co-ordination of the aeroplane surfaces and rudders, and the closer proximity of the line of thrust to the centre of weight. In addition, the form of boat hull has been studied so that air pressures on it will add to the natural stability of the machine, instead of detracting therefrom. The Wright Company claims for this aeroboat a marine aeroplane that is absolutely seaworthy and one which enables the sportsman to really enjoy flying, not only because of the safety of the machine but because of its perfect balance and control in the air.

Orville Wright has been testing the aero-boat on the Miami river, back of hills and dales in different kinds of winds to determine its stability and has declared it satisfactory in every respect. Last month, Oscar Brindley, with Grover Loening as passenger, secured what is said to be a new record in this respect, by rising from the water in a run of only 200 feet.

In this connection it also may be stated that the Wright Company has recently brought out a new Wright biplane, model E, which is the first produced by this concern equipped with only one propeller. Other features of construction follow closely standard Wright practise, but the details have been worked out a trifle differently to accommodate the single propeller. The total weight of the machine is 730 pounds, and demountable features are incorporated so that it is possible to prepare it for shipment within 12 minutes after it is rolled into the hangar.

The company is also announcing a new six-cylinder motor fitted with Zenith carburetors.

Indicating Construction of Wright Aeroboat Fuselage and Disposition of Pontoons on Lower Plane.

## PRODUCING MULTIBESTOS BRAKE LINING.

How Asbestos Is Woven into a Homogeneous Mass and Treated to Withstand Friction Stresses at New Factory of Standard Woven Fabric Company.

(By C. P. Shattuck.)

**T**HERE is no component part of the motor car, unless it be the steering mechanism, that is more necessary to its safe operation than the brakes. That designers attach considerable importance to these members is emphasized by the fact that at least two independent sets of brakes are provided, either of which when properly constructed and adjusted is capable of locking the wheels. The efficiency and dependability of modern brakes—which may be said to receive

velocity of the rubbing surfaces and the coefficient of friction. The durability of the material depends to a great extent upon the temperature it attains, and this in turn is influenced by the pressure required to resist the motion of the rubbing surfaces.

The early designs of brakes were of the metal-to-metal type, but this construction is not favored, because a certain amount of lubricant is necessary to prevent cutting of the surfaces and

**New Factory of Standard Woven Fabric Company, Framingham, Mass., Maker of Multibestos Brake Lining—Some Idea of the Enormous Growth of Business May Be Obtained by Comparison with Worcester Plant, Seen in Inset.**

too little attention from the average user—are due to the careful and scientific study and development of the friction material, or brake lining.

Few motorists realize the energy which must be absorbed before a machine is brought to rest after being in motion. If a car be set in motion by the power of its motor and the energy be cut off, it will not come to a stop until this momentum is overcome by the friction of its bearings, the rolling friction and air resistance.

The capacity of a brake is dependent upon the total area of the surfaces in contact, the pressure per square inch with which they are held, the

heating, and the oil causes a decided loss in efficiency.

The very high heat resistance of asbestos early attracted the attention of engineers as a possibility for a friction material, but difficulties were experienced in producing a homogeneous mass; one that would not disintegrate, glaze or present uneven surfaces. Among those who gave these problems serious consideration was the Multiple Woven Hose and Rubber Company, Worcester, Mass., which concern was engaged in the manufacture of solid multiple fire hose fabrics and solid cotton belting. The difficulties were ultimately overcome by the construction of

**Section of Testing Room Where the Asbestos Yarn Is Tested for Tensile Strength, Weight, Twists, Etc.**

special looms and the treating of the asbestos fabric with a compound, resulting in the production of Multibestos, a trade name well known throughout the automobile industry.

In March, 1911, the Standard Woven Fabric Company was incorporated under Massachusetts laws and in April of the same year took over by purchase the business of the old concern.

The company began operations in a brick building at 7 Summer street, Worcester, Mass., the two floors and a basement providing about 12,000 square feet of floor space. Shortly after, Multibestos brake lining was offered to the trade. Technical tests and actual service demonstrated its efficiency and durability and in 1912 the demand for the material assumed such proportions that it was necessary to add a second plant, this being located on Arch street and being known as the brake lining factory. In it was the machine shop, where the special looms for weaving the yarn were made and assembled.

The business grew rapidly, showing an increase of fully 400 per cent. in two years, and the capacity of the Arch street plant proving inadequate, it was found necessary to provide for increased facilities and a new factory. After a thorough in-

vestigation it was decided to locate at Framingham, Mass., on the Boston & Albany railroad. The new building was started about Dec. 1, 1912, and the removal of machinery from the two Worcester factories was completed Aug. 1. The manufacture of Multibestos brake lining, multiple woven fabrics and solid woven cotton belting was resumed shortly after.

The new factory provides 50,000 square feet of floor space, is pleasantly located, and is designed and equipped to overcome the many problems of quality production. It exemplifies the value of scientific methods of manufacturing and it is a structure in which the efficiency of the manual worker is developed to a high degree, in that ample light

and pure air are provided in the rooms. No matter how warm the day, the difference in the temperature and quality of the air upon entering the building is very noticeable. A certain temperature and humidity are maintained, summer and winter, throughout the plant, by the Sturtevant Carrier Air system, which may be termed an air laundry, in that the atmosphere is washed of all impurities, saturated with moisture, forced to each room, drawn from each department, and again washed. By this method any predetermined temperature may be maintained.

**Machine Designed by Chief Engineer E. E. Walte for Testing Brake Linings —The Same Conditions to Which Linings Are Subjected in Service Can Be Produced Accurately.**

**A Portion of the Machine Shop Where the Components of the Special Weaving Looms Are Constructed.**

The building itself is of re-enforced concrete and brick construction, fitted with sprinklers throughout. The ground floor is divided, one-half being utilized for the offices, laboratories, testing rooms, etc., and the remainder for the stock and shipping departments, and winding rooms. The other floors are devoted to the weaving and treating departments and machine shop. Steam is supplied by a Robb-Brady marine type boiler of 150 horsepower capacity. As all of the units are driven by direct connected electric motors, and the building throughout is lighted by electricity, a large generating set will soon be installed.

The process of making the 90 to 95 per cent. asbestos yarn into a homogeneous mass and treating it without injuring the original vitality of the material is an interesting one. The asbestos is mined in Canada and spun into a three-ply yarn having two strands of brass wire and wound onto reels or spools, according to specifications of the Standard Woven Fabric Company, which hopes soon to manufacture its own material from the raw products.

The yarn is tested for tensile strength, weight and number of twists, by machines designed for this work and shown in an accompanying illustration. After testing for tensile strength, the material is placed in the twisting machine, which determines accurately the number of twists to a three-inch strand, a factor making for strength of the material. It is next wound onto a reel,

which mechanically indicates on a dial the number of yards of the material to be weighed. These tests are conducted carefully and the limits are very close.

From the testing room the yarn goes to the winding room, where a special machine is employed for winding it onto tubes. This machine may be said to handle the delicate material with gloves, in that the yarn is wound without loss of the fluffy asbestos.

One entire floor is devoted to the looms which weave the yarn into compact form and into the shapes and thicknesses shown in an accompanying illustration. The weaving rooms are accessible only to the officials of the company and certain employees, as the machines embody valuable features not found in other looms, which produce a brake lining retaining non-glazing, non-granulating qualities under the most severe conditions of service. The efficiency of these looms is such that the yarn is woven with slight loss of material, and production is aided by maintaining the proper moisture and temperature. Some idea of the capacity of the machines may be obtained from the dimensions of the material, Multibestos being produced in thicknesses of .125, .15625, .1875, .25, .3125, .375 and .5 inch, and in widths varying by quarters from one inch to eight. It will not be long before looms will be operating, producing these goods in the solid weave up to 20 inches width.

The yarn fed from the tubes into the looms presents an appearance similar to a maze of white wires, and emerges in the form of a white tape, which is wound on special reels. Each machine has a capacity of over 1000 feet daily, and

**A Corner of the Shipping Room. Showing Various Sizes of Multibestos Brake Lining Awaiting Shipment.**

George D. Moore, President, at Left, and Arthur H. Burdick, Treasurer and General Manager, at Right.

some idea of the annual output of the company may be gained by the statement that if the brake lining were made into a continuous length, it would reach over 1000 miles, or approximately from New York City to Chicago by the shortest road route.

From the weaving room the lining is taken to the treating department, where by a special process, involving the use of a chemical compound which permeates every fibre of the fabric, the material is rendered heat, dust, water, oil and grease proof. After passing through the various processes, the lining is fed through what is termed a gravity elevator, each length passing through a sized compartment to the floor below, where the trade mark of the company, Multibestos, is stencilled with aluminum letters. The machine was designed and constructed in the machine shop of the company, and in addition to marking the material, measures and reels it into 100-foot lengths. These rolls are next taken to the stock room and made ready for shipment, a spur track leading to the factory providing excellent facilities.

In addition to producing standard sizes of Multibestos brake lining, the company manufactures special sizes to order. One of the specialties produced is a special lining for Ford cars, the Ford Motor Company specifying a material having the same qualities as Multibestos, but without the brass wire. Another feature is that this lining must not be affected by oil, and

the chemical treatment of Multibestos Ford Special fully meets this requirement.

The Standard Woven Fabric Company has in the process of construction machinery for producing Multibestos facing for the various forms of clutches employing a dry friction material, and the plans include the manufacture of standard and special sizes. The flexible qualities of Multibestos make it adaptable for other than service with motor cars, it being utilized for clutches in mill transmission equipment, mining machinery, cranes, hoists, elevators, presses, etc., where a material having a high coefficient of friction is desirable.

One of the most interesting departments in the factory is the testing room, in which is located the machine utilized for testing brake lining, and which is shown for the first time in an accompanying illustration. It is the creation of E. E. Waite, the chief engineer of the company, and on it can be produced exactly the same conditions to which brake lining would be subjected in actual service.

These include, as previously pointed out, the coefficient of friction, the pressure required to resist motion of the contacting surfaces, speed, temperature, chatter, etc.; in fact, those factors entering into the efficiency and durability of the friction material. The action of water, oils and greases is noted by immersing the band carrying the lining in these liquids. Any desired speed may be produced, equalling that of an automobile travelling at a few miles an hour to the maximum, and the action resulting from the

Power Is Supplied by a Marine Type of Boiler of 150 Horsepower Capacity—A Certain Temperature and Humidity Are Maintained Throughout the Plant by the Sturtevant Carrier Air System (Shown at the Left), Which May Be Termed an Air Laundry.

Edwin E. Waite, Factory Manager, at Left, and T. J. Daley, Secretary, at Right.

gradual application or locking of the brakes is charted on a revolving drum.

Throughout the factory is noted every modern convenience tending to promote the quality of Multibestos brake lining and other products of the concern, and a large force of machinists is employed in executing new designs of looms and machinery by which the output may be augmented, as the business is steadily increasing.

The Standard Woven Fabric Company has prospered to such an extent that since its incorporation the annual dividend of six per cent. has always been paid on its outstanding preferred stock. The capital consists of \$200,000 preferred and \$200,000 common stock, both carrying a par value of \$100 a share. The stock is closely held, largely by those directly connected with the management of the affairs of the company. At no time has the stock been placed in the hands of underwriters, but has always been disposed of by the directors and officials. Quite a block of the common stock still remains unissued, and this will be held in reserve to provide additional working capital or further extensions, if required. The success of the company is attributed to the use of the highest grade of material and the most rigid inspection of it, and the workmanship entering into the construction of Multibestos and the other products.

The officers of the Standard Woven Fabric Company elected at the time of the organization are the same as today and are as follows: President, George D. Moore, Worcester, Mass.; vice

president, W. B. McSkimmon, Boston; treasurer and general manager, A. H. Burdick, Framingham, Mass.; secretary, T. J. Daley, Worcester, Mass.; factory manager, E. E. Waite, Framingham, Mass. The board of directors comprises the above-named officers and William Lowell Putnam, J. H. Drury, Stoughton Bell and Ashton L. Carr, all of Boston.

### NEW BALTIMORE HOME.

#### H. W. Johns-Manville Company Removes Branch to Enlarged Quarters.

The Baltimore branch of the H. W. Johns-Manville Company, in order to properly take care of the big increase in the volume of business, has been compelled to seek larger quarters. The new home which the company has secured is a six-story building with inside floor measurements of 47 by 187 feet.

The building, which is located at 207 East 13th street, is within two blocks of the postoffice and is right in the heart of the business section of the city. In addition to large warehouse accommodations, it will include an attractive store and up-to-date offices, while for the purpose of facilitating the handling of shipments there will be a railroad switch running into the building.

De Palma, Bragg and Wishart are expected to be at the wheels of the three Mercer cars entered for the fourth international sweepstakes, 500-mile race, which will be run on the Indianapolis speedway on Memorial Day, 1914.

Offices of the Standard Woven Fabric Company Are Spacious and Well Lighted.

# MECHANICAL INSTRUCTIONS FOR NEW OWNERS.

## Valve Assembly of Inter-State and Timing Diagrams of Several Models--Replacing Worn Fibroid with New on Metz--Cadillac Starting System.

**I**N THESE days, with the car manufacturer equipping his product with a motor having reserve capacity, the average owner does not

Valve Assembly of Inter-State Motor.

the engine will not develop anywhere near its rated energy. Other factors may enter into the problem, such as ignition and carburetion, but even with these in perfect order it is obvious that the valves must function correctly if satisfactory results are to be anticipated.

In an accompanying illustration is shown the valve assembly of the model 25 Inter-State car, manufactured by the Inter-State Automobile Company, Muncie, Ind., the components being lettered to make plain their operation. The valve proper is held on its seat by the valve spring, which is normally compressed by a washer retained by a key. The valve is lifted by the head of the adjusting screw, a part of the pushrod, and this is raised by the cam. As shown in the drawing the valve is seated, and it will be noted that a space exists between the head of the adjusting screw and end of the valve stem.

With this design the valve should lift .3125 inch and for this purpose a predetermined space must be maintained between the head of the adjusting screw and the valve stem. If the space be increased through wear, etc., it is obvious that the intake valve, for example, will open late and that the efficiency of the cylinder will be considerably impaired.

give the power plant that attention necessary with early designs which required frequent tuning up. The efficiency of the poppet valve type of motor depends largely upon the proper openings of the valves and if these do not conform to the factory timing

Provision is made for compensating for wear by raising the adjusting screw, this being accomplished by loosening the locking nut and rotating the screw member to the left. While some utilize a business card, a sheet of paper, etc., to determine the space, the method is not recommended if accurate adjustment is desired. The better plan is to utilize the marks on the periphery of the flywheel.

This is not difficult if one will bear in mind that the piston of each cylinder makes four strokes—intake, compression, firing and exhaust—and that the crankshaft and flywheel make two complete revolutions. In laying out a timing diagram, the circle represents the flywheel and it is divided, the uppermost point denoting top centre and that diametrically opposite the bottom centre. These represent the piston at the top and bottom of its stroke, and generally the flywheel of a motor is thus marked.

The timing diagram of the Inter-State four-cylinder motor fitted to the model 25 car is shown herewith. The power plant is of the L head type and is equipped with a flywheel having a diameter of 18.25 inches. The timing of the motor is as follows:

Intake opens 2.53125 inches before centre.  
Intake closes 5.0625 inches before centre.  
Exhaust opens 7.609375 inches past centre.  
Exhaust closes 2.03125 inches before centre.

These are the flywheel markings as shown in the diagram, which depicts the periphery of the flywheel marked off in inches to simplify matters,

Timing Diagram of Inter-State Model 25 Motor. Showing Opening and Closing Points of Valves.

although degrees are also utilized. It will be seen that the intake opens 2.53125 inches before top centre and closes 5.0625 inches before bottom

Adjusting Mechanism of Overland Fan Belt.

centre, during which time the fly wheel has not made a complete half turn.

These points are checked by utilizing the indicator or arrow or the centre of the rear cylinder or crankcase. For example: If it

be desired to check the timing, rotate the flywheel until the marks 1-4 register with the indicator, when either the pushrod of the first or fourth cylinder should start to lift the valve. If not, the space between the rod and valve stem is too great and the adjusting screw previously referred to should be raised until it makes contact with the valve stem and starts to lift it. The closing point is checked similarly. The opening and closing points of the remaining valves are also checked in the same manner. It is better for the novice to adjust both the intake and exhaust of one cylinder and not attempt to pass to the intake valve of the second cylinder.

The following is the timing of models 50, 40, 35 and 30 Inter-State motors:

#### Model 50.

Four-cylinder motor, T head type. Pairs. Bore five inches, stroke six. Diameter of flywheel 18.25 inches. Valve lift .375 inch.

Intake opens 2.5 inches before centre.

Intake closes 5.5 inches before centre.

Exhaust opens 9.0 inches past centre.

Exhaust closes 2.0 inches before centre.

#### Model 40.

Four-cylinder motor, L head type. En bloc. Bore 4.5 inches, stroke 5.5. Diameter of flywheel 16.75 inches. Valve lift .375 inch.

Intake opens 3.50 inches before centre.

Intake closes 5.00 inches before centre.

Exhaust opens 7.00 inches past centre.

Exhaust closes 1.17 inches before centre.

#### Model 35.

Four-cylinder motor, T head type. Pairs. Bore 4.75 inches, stroke 5.5. Diameter of flywheel 18.25 inches. Valve lift .25 inch.

Intake opens 1.5 inches before centre.

Intake closes 5.5 inches before centre.

Exhaust opens 9.0 inches past centre.

Exhaust closes 2.0 inches before centre.

#### Model 30.

Four-cylinder motor, L head type. Pairs. Bore 4.5 inches, stroke five. Diameter of flywheel 18.25 inches. Valve lift .375 inch.

Intake opens 1.5 inches before centre.

Intake closes 5.5 inches before centre.

Exhaust opens 8.5 inches past centre.

Exhaust closes 1.0 inches before centre.

## OVERLAND FAN ADJUSTMENT.

The adjustment of the fan belt of models 69 and 71 Overland cars is very simple, it involving the loosening of a locking nut and rotating an eccentric until the belt is sufficiently tight. The components utilized in this work are shown in an accompanying illustration and after adjusting the belt the lock nut should be set up snugly.

## CADILLAC STARTING SYSTEM.

There are two components of the Delco lighting and motor starting system that may require attention after considerable service, according to the instructions issued by the maker of the 1913 Cadillac car. These are the magnetic latch, shown in detail at A, and the generator switch depicted at B in an accompanying illustration.

The magnetic latch, when energized by current from the battery, causes the mechanism operating the starting transmission and generator switch to be linked to the clutch pedal shaft, and consequently to be thrown into operation by the depression of the clutch pedal. The magnetic latch pawl is adjustable by means of a screw and the last named member should be so set that the arm will pass the pawl, permitting the points indicated by the points of the arrows to clear each other when the main clutch is disengaged. Raising the screw increases the distance and moving it downward decreases it. The lock nut should be set up firmly after the adjustment is made.

The generator switch, shown at B, is mounted on the starter transmission housing, and when in a forward position connects the generator windings with the cells. When at the rear, it completes the path for the current through the motor windings. Beneath the cover are three con-

Cadillac Starting and Lighting System: A, Magnetic Latch Adjusted by Means of Screw; B, Contact Blocks of Generator Switch Which May Require Cleaning.

ductors having terminals, and under these is mounted a sliding contact block which presses against the conductors in the cover. These blocks

form a part of an operating rod, the exposed end of which is connected by an arm to the transmission operating rod. The sliding contact block is not directly fastened to the pull rod, but is forced into its starting and operating positions by collars, a coiled spring being interposed between the block and collar upon the forward end of the pull rod and the rear collar, abutting directly against the sliding block. A latch engaging with pins upon the sliding block, serves to retain it in a forward position.

When the clutch pedal is depressed as in starting, the interconnected operating rods of the switch and transmission are pulled to the rear. The action of the switch operating rod is to first compress the coiled spring against the sliding block. When the pull rod nears the limit of its travel, the rear collar upon the switch rod trips the latch retaining the sliding block in its forward position, and the pressure of the coiled springs snaps the block into its rear position, permitting current from the battery to flow through the motor windings. The sliding block does not change its position until the sliding gears are fully meshed.

It is pointed out that should the energy imparted to the flywheel decrease below normal, and when the cells are fully charged, the generator switch cover should be displaced and the contact blocks and bars inspected. If these be dirty, creating resistance to the passage of the current, they should be thoroughly cleaned. If pitted, grinding with a valve compound is recommended. They should be cleaned after the work and lubricated with a light oil.

### REPLACING METZ FIBROID.

One of the qualities of the Metz friction drive is the ease with which adjustments and replacements are made. Energy is imparted to the jackshaft or driven wheel by a friction wheel in the design manufactured by the Metz Company, Waltham, Mass., as shown in the accompanying drawing. The jackshaft wheel carries what is termed a fibroid, which is made in two sections to make easy displacement as well as renewal. It is retained by a band which is secured by bolts as shown in the sketch.

Wear of the fibroid is automatically taken up, but after considerable service and when it has become so worn that the clutch pedal must be pushed to its maximum, a new adjustment must be effected in the distance between the friction wheel and the driven member. This is obtained by adjusting the nuts on the clutch pedal and

drive plate bracket rods, and with the clutch pedal released.

To replace a worn fibroid with new, the bolts and retaining band are removed, the new halves inserted and the components rebolted. This may be accomplished easily by the owner as the parts are very accessible and do not require that any fitting be accurately made.

It is advisable to open and clean the chain cases and chains at least once a month. Wash the chains thoroughly in gasoline or kerosene, then immerse and boil in a mixture of mutton tallow or beef fat and powdered graphite. This will penetrate all points subject to friction.

The chains are adjusted by rotating the turnbuckles on the radius rods and in doing this work it is important that an equal number of turns be given each turnbuckle to preserve the alignment of the road wheels. If these be suspected of be-

Driving Mechanism of Metz Car, Showing Retention of Fibroid of Driven Wheel and Turnbuckles Utilized in Adjusting Chains.

ing out of line they should be checked up with the front members. It is important that the front wheels be kept aligned, for if these members are out of true rapid wear of the tires will result.

### PAINT FOR MOTORS.

The maker of the K-R-I-T cars recommends the use of Venetian black for painting the motors or touching up the worn paint.

### CARE OF UNIVERSAL JOINTS.

The following suggestion is made by the maker of the Premier cars and it is one that should be followed: At least once a season disassemble the universal joints and thoroughly clean, inspect and repack with grease.

## THE REGISTRATION FEE.

Organized motorists appear to be having little difficulty in convincing the judiciary of the unconstitutionality of some of the motoring laws which have been passed by state legislatures. The Mississippi supreme court set the example by declaring the law in that state null and void, and practically the only provision of the discredited statute was that for a registration fee. One of the lower courts in Ohio has now found the registration provisions of the Warnes law, passed at the last session of the legislature, to be a form of double taxation and therefore contrary to the supreme law of the commonwealth.

Immediately after the Mississippi decision was made public the American Automobile Association announced its intention of taking a New

Jersey test case to the United States supreme court. In the meantime, the Ohio motorists have not been idle, and it would appear that the latest success has spurred the automobile owners in other commonwealths to action. The new California statute is to be tested in like manner, and it is understood that the Michigan supreme court is to have opportunity to pass upon the recently enacted law in that state.

In each instance the objection has been based upon the registration provision. In Ohio, California and Michigan, motorists have been called upon for nominal fees only until now. The new laws seek to impose a graduated fee, based upon the horsepower rating.

From the first the various state legislatures have contended that they were acting in this matter solely because of the police powers reserved to the state authorities. Motorists are themselves somewhat to blame because the fees have been placed at a figure much higher than necessary to pay the expenses of the system. In the days when the agitation for improved highways had not made the converts it now enjoys, automobile owners expressed themselves as willing to be taxed in this manner, providing the fund thus created should be applied to highway construction.

However satisfactory this arrangement may have been in the first place, it has resulted in a gradual increase in this form of taxation until at present it would appear that many legislators feel that whenever more money is needed the motorist is the logical source. And it has also raised the proposition that since automobiles wear the highways unduly they should be made to bear the larger share of the expense of construction and maintenance, which is entirely beside the case.

It is particularly interesting to note the activity of the organized motorists in the states named, since it is bound to have a wholesome effect upon the legislatures in other commonwealths. During the past two years there has been plenty of indication that legislators were anxious to increase registration fees and enact other regulations which could not help but be detrimental to the industry. Manufacturers and dealers would do well to study this situation in the several states and lend such assistance as may be desirable in securing the judicial determinations needed.

## TWELFTH ANNUAL SHOW AT OLYMPIA.

**P**ERHAPS the chief feature of the 12th automobile show of the Society of Motor Manufacturers & Traders in Olympia, London, England, last month, was the appearance of so many small cars. These were in no sense cyclecars, not even as cyclecars are classified in Great Britain, but for the most part miniature automobiles equipped with four-cylinder motors rated at 12 horsepower and under. No less than 23 different makes were rated at 10 horsepower or less. Of course, the rating is based upon the bore, as the Royal Automobile Club's formula is the same as that of the Society of Automobile Engineers in this country, but the piston dis-

character than the Paris Salon which preceded it by a few weeks. Of the 127 makes on display, 47 were produced in England, 36 in France, 10 in America, nine in Italy, nine in Belgium, eight in Germany, three in Scotland, two in Switzerland, and one each in Austria, Holland and Spain. The American manufacturers represented were the makers of Buick, Cadillac, Hudson, Hupmobile, Mitchell, Oakland, Overland, Regal, Stanley steamer and White.

While six-cylinder cars are somewhat more popular in Great Britain than in Continental Europe, it is of interest to note that but one British maker, Rolls-Royce, is producing sixes exclu-

Some Interesting Designs Revealed at Olympia Show: A, Humber Open Type; B, Delaunay-Belleville Limousine; C, Crossley Three-Quarter Landaulette; D, Panhard Touring; E, Wolseley Touring; F, Benz Cabriolet; G, Talbot Torpedo; H, Austin Vitesse Phaeton; J, Sheffield-Simplex Landaulette.

placement in cubic inches is correspondingly small.

For the first time in the history of the industry British manufacturers were willing to admit that there had been little reason for making changes in design. This means that in a large number of instances makers have listed their last year's models with the statement that these have proved so satisfactory in service that only changes in the nature of refinements have been necessary. Others frankly state that they have made no changes whatever in last year's design. This would seem to indicate that motor car construction has reached a certain standardization abroad, as undoubtedly has been true in this country.

The show was decidedly more international in

sively. One and two-cylinder engines always have been found in the Olympia display, but this year the number of these was reduced very materially. It follows that the four-cylinder car is the prevailing type.

The matter of relation of stroke to bore is one which has interested British manufacturers and owners for the past two years at least. This has been due to the method of taxation, which is based upon the horsepower rating under the R. A. C. formula. The tendency has been toward the selection of a maximum stroke and then to vary the power of the motor by varying the bore. Perhaps a majority of the British makers favor a maximum stroke of 130 mm (5.1 inches), but the number of those who have selected 150 mm (5.9 inches) has grown very materially during

**Additional Models Seen at Olympia: A, Humber Touring; B, Austin Landaulette; C, Wolseley Limousine; D, La Buire Touring; E, Vauxhall Limousine; F, Argyll Limousine; G, Armstrong-Whitworth Touring; H, Adler Cabrio-Landaulette.**

the past year, and a stroke so nearly approaching six inches for four-cylinder engines is no longer looked upon as excessive.

The practise of casting the motor en bloc has gained many advocates, even among those who at one time declared they would have nothing to do with it. This applies to the four-cylinder unit, of course, though there is more than one maker of a six who follows the same practise. Usually, however, the six-cylinder engine is cast in pairs or triplets.

The Daimler and the Siddeley-Deasy are the

only British cars which utilize non-poppet valve motors exclusively, both being fitted with the Knight sleeve valve engine. The Knight and Argyll, the latter having a single sleeve instead of two, have more than held their own. The Itala with its rotary valve engine now has three models instead of one. A new engine of this type is the Maudslay-Reno, which employs a single short sleeve above the piston to open and close the ports in proper sequence.

As was expected motor starters were very much in evidence. It does not surprise Ameri-

**Chassis and Motor Details at Olympia: A, Benz 12 Horsepower Model, Typical of Small Cars Produced Abroad; B, Daimler 20 Horsepower Chassis; C, Eight-Cylinder, 26 Horsepower De Dion Motor; D, Six-Cylinder 30-35 Horsepower Napier Engine, Which Recently Completed Alpine Test Trip; E, Daimler Engine, Showing Starting Dynamo.**

can motorists to find that a majority of these were of the electric type, but British writers have been warm advocates of the compressed air starter and some of them attribute the preponderance of the electrical devices to the widespread adoption of electric lighting. It is true that the subject of lighting has been given decidedly more consideration by British motorists and manufacturers during the past year, with the result that many of the chassis now have provision for the installation of a lighting generator, and it is but a short step to the addition of the starting mechanism.

The air starters fall into two classes, that utilized by the S. C. A. T. and Wolseley, requiring a special distributor and separate piping to the engine, and the type used on the Sunbeam, which

individual specifications, or at least by a manufacturer who specializes in coach work. Heretofore this plan has resulted in the exhibition of many extreme designs, but this year these were by no means so prominent. Some of the new body types, such as might be regarded as standard equipment in America, are presented herewith.

Other illustrations indicate some of the chassis constructional details which should prove of interest to American readers. It will be noted that in most instances these partake of innovations which might be classed as making for convenience or comfort in operation, in which respect the foreign designers appear to be following the example of American constructors. Space does not permit of extended comment upon each

**Constructional Features on Foreign Cars: A, Side Lights Set in Base of Windshield on Fiat; B, Springs on Opel Fan Bracket; C, Enclosed Brake on Riley Propeller Shaft with Provision for Air-Cooling Through Gauge Top; D, Driving Mirror on Front Mudguard of Metallurgique; E, Spare Wheel Locker at Back of Front Seat on Hurtu; F, Singer Water Jacketed Induction Pipe; G, Foot Operated Engine Starter on English Jackson.**

comprises an air driven motor, acting as a starting engine for the motor proper. The electric starters also are divided into two classes, one being that in which the charging dynamo and the starting motor are separate units, and the other that in which both are combined and known in Great Britain as a dynamotor. The electric starter on the Sheffield-Simplex is described by British writers as the most startling innovation, in that the dynamotor takes the place of the fly-wheel.

The matter of body design is one in which British motorists have long considered themselves proficient. It will be remembered that the usual practise abroad is to purchase the chassis separately and have a body installed to

of the examples shown, but it is anticipated that the reader will have little difficulty in understanding the details as presented.

Shortly after his arrival in Indianapolis, after being away for three months on the trans-continental test trip, H. C. Bradfield, field advertising manager of the Cole Motor Car Company, left for another journey of a similar character to the West and Pacific Coast.

E. C. Patterson, who has entered three Mercedes cars for the fourth annual 500-mile race at Indianapolis, is negotiating with Pilette, Salzer and Lautenschlager to act as pilots for these machines.

## WITH THE CYCLECAR MANUFACTURERS.

**First Organization in This Branch of the Industry Is Formed in Detroit---Makers Discuss Possibility of Uniform Nomenclature---New Designs Revealed.**

**W**HAT'S in a name? Shakespeare is authority for the statement that "A rose by any other name would smell as sweet". Perhaps the same rule applies to the cyclecar. That is to say, the demand for a miniature automobile, selling at a price well below that which has hitherto been regarded as possible, undoubtedly will be quite as insistent no matter what the manufacturers decide to call their product. It is somewhat significant, however, to find some 40 persons connected with this branch of the industry in Detroit meeting in the Hotel Pontchartrain to discuss the relative merits of cyclecar, voiturette and motorette as a term by which to describe the new type of vehicle.

The outcome of the discussion appears to have been in doubt, except that the term voiturette was omitted from the name of the organization which was perfected at the conclusion of the meeting. So far as is known this is the first association of cyclecar enthusiasts and the name is the Detroit Cyclecar and Motorette Club. Other clubs are to be organized in the near future, and it is proposed that the question of name shall be decided by a convention of such organizations to be held in the near future.

In the meantime, new cyclecar companies will be formed, and other manufacturers will announce small cars, voiturettes, motorettes and cyclecars indiscriminately. There are said to be 31 of these concerns in Detroit alone, either with vehicles in the course of construction or contemplating actual work within a few weeks. There are no means of knowing how many more there are in other cities, but new companies are making their appearance every week.

By the way, the officials of the Detroit Cyclecar and Motorette Club are as follows: President, F. E. Spooner; first vice president, J. P. LaVigne, LaVigne Cyclecar Company; second vice president, J. J. Batterman, Scripps-Booth Cyclecar Company; third vice president, C. F. Gazeley, Detroit Commercial Axle Company; fourth vice president, I. N. White, Princess Cyclecar Company; secretary, P. A. Teats, P. E. T. Cyclecar Company; treasurer, R. C. Albertus, Mercury Cyclecar Company; directors, the above and K. L. Hermann, Hermann Cyclecar Company; W. J. Marshall, Mercury Cyclecar Company; Ernest

Weigold, Detroit Cyclecar Company; J. F. Wilkinson, Wilkinson Starter Company; S. A. Clinton, Detroit Cyclecar Company; James Scripps Booth, Scripps-Booth Cyclecar Company; A. J. Farmer, Farmer Manufacturing Company; Theodore F. Millington, Detroit Body Company; H. S. Baker, Hinchman & Baker, and P. Heseltine, Gadabout Motor Company.

### A CYCLECAR TRANSMISSION.

The Fuller & Sons Manufacturing Company, Kalamazoo, Mich., well known in the industry as a producer of automobile parts for a number of years, has brought out a small two-speed planetary transmission, suitable for cyclecars and other small machines. It is stated that light weight with maximum strength has been attained in this design without sacrificing quality, and that by the use of high grade materials throughout, it will handle small four-cylinder motors of 2.75-inch bore and four-inch stroke on cars weighing up to 1000 pounds.

A multiple disc clutch is utilized, giving very easy engagement. All the gears are hardened and many of the parts are drop forgings. Bands are also supplied for either chain or shaft drive, and equipped with levers for tightening the bands onto the transmission drums. The low and reverse may be operated by pedals, and the high speed may also be actuated in a similar manner. The maker claims superiority for this type of drive, on the ground that it is positive, has a sufficient number of speed changes and will be durable and efficient.

### MALCOLM DESIGN READY.

The Malcolm Jones Detroit Company, which had its inception in Detroit last May, has been devoting its attention to the experimental work necessary to the production of a satisfactory model, and is now prepared to make public the accepted design. It is stated that one of the Malcolm cyclecars is now undergoing a road test in the mountains of Pennsylvania, and that deliveries will be made shortly. In the spring it is proposed to open a branch factory in Windsor, Ont., to take care of the Canadian demand.

Provision is made for two passengers, arranged tandem. The motor is in front under a foreign cyclecar type of hood, and the air openings thereto are covered with wire screens, surrounded by nickel plated rims. The wheelbase is 100 inches and the tread 36. The weight is 560 pounds.

It is maintained that the cooling system is somewhat new. The motor is an air-cooled, two-cylinder V unit rated at 10-15 horsepower. Back of each cylinder is a separate fan, driven by a single belt, and a V shaped air deflector is set in the centre just forward of the motor. Lubrication is by a piston pump. The carburetor is a special type and the magneto a high-tension instrument. Starting is accomplished by a detachable crank operated from the seat, with an automatic device for releasing compression.

Another departure from American cyclecar

which the maker calls special attention, are as follows:

The front end is attached to brackets by means of a U shaped shackle, snugly fitted, which permits freedom of movement endwise, but does not allow any motion sidewise. The rear end is attached by plates and bolts to a sleeve which pivots on the rear axle. Reverse leaves are built up with the spring, each spring having one leaf at its underside and at the centre and rear end. These leaves are so formed that they do not stiffen the spring under normal conditions, but only come into action on the rebound, or extreme deflection, thus eliminating the possibility of breakage and crystallization from excessive bending. This construction makes auxiliary shock absorbing devices wholly unnecessary, gives ample road clearance and freedom from side swing when passing over rough roads at high speed.

### LA PETITE IS RECALLED.

Nine years ago, J. P. LaVigne of Detroit, constructed a little car "within the reach of all", and listed it at \$375. His plan was to reach the masses with a machine that could be sold to meet

Accepted Design of Malcolm Cyclecar, Which Presents Novel Features in Its Treatment of the Body Lines.

design is found in the friction transmission, which is of the standard automobile type, affording any number of speeds forward and reverse. Final drive is by long 1.125-inch V belts from jackshaft pulleys to the rear wheels. Hard wood blocks working in the rear wheel pulley grooves provide the necessary braking effect.

Steering is by a special piano steel cable wound around a bobbin attached at the extreme forward end of the steering rod. Springs are fitted at either end of the cable to take up all slack. A single transverse spring of the platform type is mounted over the forward cross member of the body sills, while the rear springs are of the cantilever type. The axles are tubular, and radius rods hold them in their relative position with the body. Wire wheels, fitted with 28 by 2.5-inch tires, are employed.

Details of the rear spring suspension, to

the demands of almost everyone with any means at all. The original creation was called La Petite and exhibited at an automobile show in Detroit, but for some reason the general public was not yet ready for this type of vehicle.

Mr. LaVigne is one of the pioneer automobile manufacturers, in that he produced his first car in New Haven, Conn., in 1899. This was with a three-cylinder, two-cycle motor of the horizontal type. In September, 1902, he started work upon a machine which embodied features that were not perfected until many years later, these including a motor starter, reversible engine, worm drive, etc. This car was burned at New Haven, but not until after it had been demonstrated that the starter was a practical device, in that it started the motor without cranking after it had been left standing for 64 hours in a temperature far below freezing.

This bit of ancient automobile history is recalled in Detroit, by the announcement of Mr. LaVigne's re-entry into the motor car manufacturing field with the LaVigne Cyclecar Company of that city. The details of the new machine, which will be known as 'the LaVigne, have not yet been made public, but it is understood that it will be equipped with a

Rear Wheel Construction on Falcon.

four-cylinder, air-cooled motor, underslung pressed steel frame, sliding gear transmission, 96-inch wheelbase and 50-inch tread. Its weight will be about 600 pounds. It will be understood that Mr. LaVigne has designed a number of successful cars since the days of his earlier experiments and that he has by no means been out of the industry, although he has not been found in its list of manufacturers for some little time.

#### DETAILS OF FALCON DESIGN.

Because of a misunderstanding on the part of the motoring public, it has seemed desirable to Francis R. Hoyt, designer of the Falcon cyclecar, to state that this machine is the product of the Falcon Cyclecar Company, Wright building, Cleveland, O. All correspondence should be addressed directly to the company.

Two views of Falcon components are presented herewith, and special attention is directed to these details. It is maintained by the company that the construction of the front axle is such that, by the use of a bracket of novel design, there is a single point of suspension for the frame. This is held to permit either front or either back wheel to be elevated without disturbing the level of the frame, and thus confines road shocks to a single wheel to the axle instead of transmitting it to the frame.

A forward extension, in the form of a swan's neck steel piece or bracket, terminates in a lock socket which provides a bearing for a king bolt and fork. The fork carries a casting between its jaws on a horizontal pivot. To this casting are fastened two sets of parallel springs, of two

leaves each. Each main spring is shackled to the other at both ends, and the spindles are formed integral with the shackles. The movement of the axle in steering is controlled by means of steel cables from a sprocket and chain operating from the end of the steering column. When one wheel hits an obstruction, the axle, consisting of the two springs, rocks in the fork and the springs combine to take care both of the shocks and the recoil.

The rear spring is a reversed cross arch. To either side member of the frame, which is of seamless tubing, a bracket is fastened, the upper end of each being shackled to an end of the rear spring. This leaves the frame of the car at axle level, while it gives, in combination with the front bracket design, a three point suspension. Frame distortion is held to be impossible, either from road conditions or when there is a single occupant in the car.

Another feature of the Falcon design is found in the rear wheel construction. It is maintained by the designer that large rear belt pulleys are not feasible for rutted roads, and this condition has been met by a smaller rear pulley, the gear reduction being secured by chain drive from the driven disc on the friction transmission to a second jackshaft. This permits of the use of a larger forward belt pulley.

It also will be noted, from an accompanying illustration, that this company has made use of the internal expanding brake. The Falcon brake is said to give a braking surface sufficient to hold a vehicle five times its weight in an emergency. Both rear brakes operate by pedal, on which there is fitted an equalizer designed to insure

Illustrating Falcon Frame Design and Provision for Travelling Over Rough Roads.

equal application of pressure to both wheels. An emergency brake lever, with ratchet stops, operates the same brakes.

**PIONEER FROM CHICAGO.**

The American Manufacturing Company, 29 South La Salle street, Chicago, announces the Pioneer cyclecar, which embodies features not heretofore brought to the attention of the public by the American manufacturer. This is particularly noticeable in the seating arrangement, provision being made for two passengers so placed that the driver's back is on a line with the front of the other seat. The wheelbase is 96 inches, tread 40 and weight 550 pounds.

The motor is a twin-cylinder unit, set at an angle of 45 degrees, with rating of 12-15 horsepower, and is specially designed for cyclecar service. Cooling is by air and lubrication by piston pump. The carburetor is a standard float feed with compensating air valve. Ignition is by dual type Briggs high-tension magneto.

The transmission is of the friction type, and is ball bearing throughout. In keeping with general cyclecar practise in this country, provision is made for four speeds forward and reverse, each speed being locked when set by a device connecting the shifting rod with the clutch pedal. Final drive is by riveted block belt to pulleys fastened direct to rear wheel drums, on which the brakes, pedal operated, also act.

Springs are semi-elliptic transverse, one at each end of the frame. Axles are of the strong tubular type, rigidly stayed by truss rods. Both are cranked slightly to afford ample clearance for movement. Wire wheels are utilized, the hubs being fitted with self-contained ball bearings. Tires are 28 by 2.5 inches.

Accompanying illustrations indicate the general appearance of the completed vehicle, and the plan view presents the seating arrangement, location of the throttle, spark and speed changing controls on the dash, and the position of the motor and transmission at the forward end. The equipment includes a top, top boot, windshield, storm curtains, horn and starter.

It is understood that the American Manufacturing Company has subjected one of these cars to a series of road tests covering several months and expects to be in a position to make deliveries in a very short time. It is prepared to make demonstration of the vehicle at any time, and it is stated that the concern has made arrange-

ments for speedily placing the new design on the market when production plans shall warrant.

**CYCLECAR NOTES.**

J. J. Batterman, sales manager of the Scripps-Booth Cyclecar Company, Detroit, reports that his company expects to begin deliveries on the Rocket cyclecar about Jan. 1. This is the machine which recently underwent a 1000-mile road test in the Middle West with decidedly satisfactory results.

The Comet is the name of a new cyclecar design from Indianapolis. It is equipped with a twin-cylinder motor, planetary transmission, final drive by belt, motorcycle wheels, tandem seating arrangement of body and 36-inch tread.

Dayton, O., is one of the latest cities to report a cyclecar, this being known as the Dayton. The machine has wheelbase of 104 inches,

Three Views of the Pioneer Design, Indicating Distinctive Seating Arrangement and Other Details of Construction.

36-inch tread, tandem seating arrangement, twin-cylinder motor, friction transmission, wire wheels, etc.

The Warren Electric & Machine Company, Indianapolis, Ind., announces that it soon will place a cyclecar on the market. The machine will be designed by E. A. Shelley and Theodore A. Meyer and it is anticipated that it will present a number of innovations.

A. R. Lambert, general sales manager of the Buckeye Manufacturing Company, Anderson, Ind., maker of Lambert cars, states that he has information that an impression has been created that this concern is interested in some manner with the development of a cyclecar now being produced in Louisville, Ky. He adds that the Buckeye company has no connection whatever with this proposition and that the Lambert factory has not been used at any time for the development of this cyclecar.

# CORRESPONDENCE WITH THE READER.

## Adjusting Ford Tappets.

(1672)—I have a slight knock in the motor of my model T Ford, which seems to be in the pushrods, although they appear to be tight. I would like to have

Fig. 1—Method of Lengthening Ford Valve Stems.

your opinion as to what causes it as I have had several garagemen work on the car, but they have been unable to fix it. I would also like to know how to adjust the pushrods.

FRED C. GOODALE.

Madera, Cal., Nov. 17.

Too much space between the valve stems and the pushrods may be responsible for the noise referred to, but it would be more of a click than a knock. It is difficult to diagnose the cause of trouble from the description given and it would appear to the writer that any Ford expert should be able to eliminate the noise.

The maker of the Ford motor states that the clearance between the valve stem and pushrod should never be greater than .03125 inch or less than .015625 inch. If the space be larger than .03125 inch, the valve will open late and close early, resulting in an uneven running of the engine. If less than .015625 inch the valve may remain partially open.

There are two methods of readjusting the space between the valve stems and the pushrods—by drawing out the stems or utilizing the adjusters marketed for this purpose. The first named plan involves removing the valves from the cylinders and drawing out the stems as shown at Fig. 1. The stem is drawn out at the point indicated between A and B, or about .75 inch and just above the opening utilized by the cotter pin.

The simplest method is to obtain the adjusters, which may be secured at any supply house. These are especially designed for the Ford motor, and are easily fitted. The adjusters consist of hardened steel caps which are fitted to the end of the valve stem or pushrod. They are fitted by raising the valve and slipping over the stem, and if necessary the space may be decreased by utilizing thin discs, a number of these being provided and of varying thicknesses to permit of accurate work. In fitting these members allowance should be made for the expansion of the stems when hot. Full directions accompany the adjusters and it is likely that resetting the valves will cure the trouble mentioned.

## Racing Cars.

(1673)—Do racing automobiles use piston rings?

WALTER BUTMAN.

Lawrence, Mass., Nov. 9.

The pistons of motors fitted to racing chassis are equipped with rings.

## S. A. E. Horsepower Formula.

(1674)—Will you please publish in your Correspondence with the Reader column the A. L. A. M. formula, also the S. A. E., for computing the horsepower rating, and explain the difference between the two?

A SUBSCRIBER.

Newark, N. J., Nov. 21.

The formulae referred to are identical, the Society of Automobile Engineers having taken over the data of the Association of Licensed Automobile Manufacturers, which organization has disbanded. The formula is as follows:

Square of bore x number of cylinders ÷ 2.5.

It is based on an assumed piston speed of 1000 feet a minute.

## Straight Storage Battery Lighting.

(1675)—Will you please publish the proper method of wiring a car for electric headlights employing a storage battery as a source of current supply?

OLD SUBSCRIBER.

Watertown, N. Y., Nov. 10.

A wiring plan for electric headlights is presented at Fig. 2, two wires being employed instead of grounding one side of the battery. The diagram includes the tail light, but this member could be eliminated. The leads are easily noted, being depicted by black and dotted lines.

Fig. 2—Wiring Diagram of Electric Headlights with Straight Storage Battery System of Lighting.

Complete information on installing electric lighting systems is given in "Lighting the Motor Car by Electricity", published by The Auto-

ble Journal Publishing Company, the book containing over 210 illustrations and wiring diagrams.

#### Anti-Freezing Solutions.

(1676)—In reading over the table of anti-freezing solutions published in the Nov. 10 issue of The Automobile Journal, I notice that you do not state what percentage of glycerine or alcohol you use in a solution made up of water, glycerine and alcohol. You state the percentage of water, plus that of alcohol and glycerine together.

D. C. THOMAS.

Minneapolis, Minn., Nov. 18.

The anti-freezing solutions and their freezing points were described in the Oct. 25 issue of The Automobile Journal. In preparing the water, glycerine and alcohol solution, equal parts of the first two named ingredients are utilized. For example: With the mixture prepared to withstand a temperature of 23 degrees below zero Fahrenheit, 60 per cent. water is employed and 20 per cent. each of alcohol and glycerine.

#### Focal Adjustment of Bulbs.

(1677)—Enclosed find money order for renewal of my subscription to The Automobile Journal. I look forward every two weeks for your magazine with interest. I have a few questions I would like to have answered if possible.

1—Can you give me the address of a concern making a special type of piston ring? The article appeared some months ago in The Automobile Journal.

2—Could you give me the address of a concern making copper asbestos gaskets of all sizes? I would like to obtain some for the bottom of the Buick valve cages, as it is quite difficult to grind them into a perfect seat, especially the older types of Buicks, models 17, 10 and 8.

3—A party here asks me if it is possible to place a storage battery in a model T Ford car and charge it from the flywheel generator, and fit an automatic cut-out which would cut out when the battery was charged to six volts? Also is there any firm making a specialty of felt gaskets to go between the crankcases of different types of motors?

4—Do you know of any good book on motor troubles and how to correct them; that is, a book containing practical experiences of different men and what they have done to overcome carburetor, magneto and valve troubles? I have read a large number of books on automobiles but never came across one to my suiting. Probably it is not printed.

5—Relative to the electric headlights on a Cole 40: When standing and looking in the headlights they are very dazzling, yet when on the road they do not throw a strong light, as they did formerly. The bulbs were dark, so I replaced them with new ones, but it made no difference. Changed the positions and threw the light on a wall in a dark place. It looks when sitting in the car that the left hand light does all the lighting and the right none. The lamps have been lined up with each other.

C. B. F.

Portage la Prairie, Manitoba, Can., Nov. 20.

1—The piston ring referred to is the Leak-proof, marketed by the Motor Parts Company, 185 Columbus avenue, Boston, and 818 North Broad street, Philadelphia.

2—The Victor Manufacturing & Gasket Company, Troy and 21st streets, Chicago, Ill., produces a wide variety of asbestos copper gaskets.

3—A storage battery cannot be charged by the electricity generated by the flywheel gener-

ator of the model T Ford motor unless the system includes a rectifier, as the current is alternating and must be changed into a direct. Automatic cut-outs are employed to cut in the current from the generator when it attains a predetermined value, and to disconnect the dynamo when its output or energy is less than that of the cells, or, in other words, the device prevents the battery discharging through the generator. To cut out the charging apparatus when the battery is fully charged a manually operated switch is employed in the lighting systems abroad, but the writer does not know of any American system utilizing this method. A voltmeter is included with the equipments referred to.

4—The Automobile Journal Publishing Company issues a set of mechanical handbooks dealing in a practical manner with ignition, carburetion and internal combustion engines, and the data were compiled by men of experience.

Fig. 3—Depleting the Focal Value in Parabolic Automobile Electric Headlights.

5—The lighting system employed on the Cole car is the Delco, made by the Dayton Engineering Laboratories Company, Dayton, O., and this concern will supply complete data as to the operation, maintenance and care of its product.

The headlights utilized are 21 candlepower members and have a reverse spiral filament which is stated to make for extreme penetration, as well as to give a good side light. With the use of these bulbs it should become a question of proper focal adjustment and the illustration at Fig. 3 depicts the focal value in headlights.

When one attempts to alter the distribution of light from a headlight, upon moving the bulb backward or forward along the axis of the reflector, it will be found that there is one position at which the nearest approximation to a needle or parallel sided beam is secured. If the lamp be brought nearer to the vertex of the reflector a more divergent beam is obtained, while at the

same time the field is rendered less uniform.

These diverging and parallel beams, as well as the value of focal adjustment, are shown in the illustration previously referred to, the drawing depicting a sectional view of the reflector, lamp and socket. There are three cases to be considered, namely: The filament at the successive positions, a, b and c, as denoted. Positions a and c are any two locations behind and ahead, respectively, of the geometrical focus of the deflector, and that at b is at the geometrical focus.

Assume that the centre of the filament is at a. A ray of light emanating from this point and incident upon the reflector at any point, as at P, will propagate along the line  $Pa^1$ . It will be noted that a system of rays taken through a complete revolution about this point will form a truncated cone of rays. A large amount of light will, therefore, be uselessly dissipated in the air.

In the second case to be considered, a ray of light also striking the reflector P will assume the

Fig. 4—Components Utilized in Adjusting Model L Schebler Carburetor.

direction  $Pb^1$ . Thus a complete series of rays will form a cylinder parallel to the major axis A B. This is held to be an ideal condition for a long concentrated projection.

Thirdly, a ray coming into contact with the reflecting surface at P will in turn follow the direction  $Pc^1$ . Concentric zones of light and dark on the illuminated plane will be the result.

From the above it will be seen that in the first case the rays are spread out and that distance projection is sacrificed for a wide display of light on the ground close to the machine. In the second instance, a long projection of light, and in the third case an undesirable collection of light and shadow due to the crossing of the rays are the results.

#### Carbon Removers.

(1678)—Kindly advise me as to a safe carbon remover which can be placed in the cylinders instead of having

to scrape the deposits, also information as to the air adjustment of a model L Schebler carburetor.  
W. R. KEELER.

Bridgeport, Conn., Dec. 3.

There are a number of carbon removers marketed and a list of makers will be found in the Classified Buyers' Guide, elsewhere in this issue.

The model L Schebler carburetor has two air intakes, one a fixed member and the other an automatic or auxiliary as shown at Fig. 4. The maker recommends adjusting the auxiliary air in such manner that the valve seats lightly; that is, a light tension of the spring retaining the valve on its seat. Regulation of the fuel is by the needle valve for low speed and by two dials for intermediate and high, respectively. If trouble be experienced with the auxiliary air valve it is suggested that it be disassembled and cleaned as it is possible that the valve stem has become dirty and sticks.

#### BOSCH AT FOREIGN SHOWS.

This Type of Ignition Well Represented at Recent Paris and London Displays.

According to the Bosch Magneto Company, New York City, of the 534 gasoline automobiles exhibited at the Olympia show, London, England, 450, or 84.27 per cent., employed the Bosch magneto for ignition purposes. The balance of 15.73 per cent. was divided among 10 other magneto manufacturers, the nearest to the Bosch having 7.6 per cent.

At the Paris Salon, where car makers applied magnetos on 483 machines shown, 393 were Bosch. This means a percentage of 81.37.

#### ADOPTS GRAY SYSTEM.

McFarlan Six First to Be Equipped with Pneumatic Gearshift.

The McFarlan Motor Company, Connorsville, Ind., has announced that its six-cylinder model will carry the Gray pneumatic gearshifting and engine starting system, made by the Research Company, Plano, Ill., as standard equipment at a slight increase in price over stock models. This marks the first formal adoption of the apparatus by any car manufacturer.

The Gray system consists of a small compressor which is driven by the engine, a compressed air reservoir and the gearshifting mechanism, which operates by selection through a quadrant on the steering wheel and plungers working in cylinders, the plungers being attached to the sliding gears.

## IMPROVED ROADS AND MOTORING LAWS.

### California Motorists to Test New Registration Provision in the Courts—Ohio Judge Declares Warnes Statute Unconstitutional—Convict Labor on Highways.

**M**OTORISTS in California, led by the Western Motor Record, which has engaged attorneys, will attack the constitutionality of the recently enacted California motoring law, scheduled to become effective Jan. 1. The papers already have been prepared and ask that the registration clause be declared unconstitutional for the following reasons:

In that it is excessive and unreasonable for the purpose for which it is intended, being out of all proportion to the actual cost of operation of the law, which the fee is supposed to pay.

In that it constitutes a double tax, inasmuch as automobiles are also subject to tax as personal property.

In that it attempts to impose a license fee upon property, instead of an occupation or profession.

In that it is really a revenue raising measure, and not primarily one of regulation.

In that it attempts to license a right common to all, instead of a privilege.

In that it unjustly and arbitrarily classifies persons and imposes burdens upon a portion of the same class not common to all.

The old California law provided for a perpetual registration fee of \$2, and the new seeks to impose a graduated fee based upon the horsepower rating. Should the petitioners be successful the court decision would not affect other portions of the statute, special provision having been made in the act as follows:

If any section, sub-section, sentence, clause or phrase of this act is for any reason held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this act. The legislature hereby declares that it would have passed this act, and each section, sub-section, sentence, clause and phrase thereof, irrespective of the fact that any one or more other sections, sub-sections, sentences, clauses or phrases be declared unconstitutional.

#### OHIO LAW UNCONSTITUTIONAL.

#### Lower Court Holds It Is a Double Taxation Measure and Therefore Void.

The automobile owners in Ohio appear to have won a decided victory in the decision of Judge Kinkead of the court of common pleas, Franklin county, who holds that the registration law passed by the last legislature is unconstitutional. The case will undoubtedly go to the supreme court, but in the meantime the secretary of state is enjoined from collecting fees on the horsepower basis as provided in the statute, which was to have gone into effect Jan. 1.

Until the passage of the Warnes bill automo-

biles in Ohio were registered on a flat rate of \$5 a year. The new law sought to impose a graduated fee according to horsepower. There does not appear to have been any objection to the payment of the \$5 fee on the part of owners, but as soon as the horsepower rating was adopted, organized motorists throughout the state immediately arranged to take the matter into the courts.

Judge Kinkead finds that the law is unconstitutional because it seeks to impose a double taxation contrary to the supreme law of the commonwealth. It is now maintained by motorists that the old law is unconstitutional for the same reason, and it is not unlikely that steps will be taken to test this in the courts should there be any attempt to enforce its provisions, in lieu of those of the Warnes law.

#### PUBLIC ROAD MONEYS.

#### How the Expenditures for Highway Improvement Have Gained in Ten Years.

An interesting comparison between the expenditure on public roads in the United States in 1904 and in 1912 has just been compiled by the Department of Agriculture, through its office of public roads, showing the tremendous growth that has taken place in the movement for better highways during that period. In 1904 the total expenditure on all public roads in the United States was \$79,771,417, but in 1912 this amounted to \$164,232,365. The expenditure for each mile in 1904 was \$37.07, and in 1912, \$74.65. The expenditure for each inhabitant in 1904 was \$1.05 and in 1912, \$1.78.

The office of public roads finds that the greatest progress in road building has been made in the states which contribute from the state treasury toward the construction of state aid or trunk line highways. In 1904 there were 13 states that contributed out of the general fund \$2,607,000, but in 1912, there were 35 states contributing \$43,757,438. The states having the largest expenditures for this purpose in 1912 were: New York, \$23,000,000; Pennsylvania, \$4,000,000; Maryland, \$3,370,000; Connecticut, \$3,000,000.

### TRUCK FENDER ORDINANCE.

#### Police Commissioner in Detroit Extends Time Until First of the Year.

The new ordinance in Detroit, compelling motor driven business wagons to be equipped with some form of fender, approved by the police commission, which was to have gone into effect last month, is causing some little difficulty for Police Commissioner John Gillespie. Mr. Gillespie has discovered, what practically every truck manufacturer, owner and user already knew, that there is no such thing as a satisfactory fender of this type, and has made the following announcement:

The truck fender business is still in its infancy and no perfect type of fender has yet been developed, so I shall extend the time until Jan. 1, 1914, for the equipment of motor trucks with these safety devices.

It is probably safe to predict that Police Commissioner Gillespie will discover, before Jan. 1, that the truck fender business is no such lusty infant that it can be expected to develop a perfect type of fender within these additional two months.

### PRISON LABOR LAWS.

#### Thirteen States Have Taken Definite Action on This Plan During 1913.

Thirteen states have passed laws during the present year allowing the use of convicts in the construction and repair of highways, according to a compilation by Dr. E. Stagg Whitin, assistant in social legislation in Columbia University, and chairman of the executive committee of the National Committee on Prison Labor. They are: Arkansas, Delaware, Florida, Illinois, Indiana, Kansas, Maine, New Jersey, North Dakota, Pennsylvania, Vermont, West Virginia and Wisconsin. Several states had previously passed similar legislation, so that the number of commonwealths that have not taken favorable action is growing much smaller.

Colorado, North Dakota, Oregon, New Jersey, Michigan and Ohio are among the states where the honor system has been developed to its highest degree, according to this same authority. It was in Colorado, under Warden Thomas J. Tynan, that the honor system was first employed among prisoners at work on the highways, and it is in that state and in Oregon that the system has been most extensively utilized. In a recent statement concerning the system, Governor West of Oregon said:

Our road gangs are made up of from 15 to 25 men, with a free man as foreman, who lives and works with his crew. His word is law in camp, and his report as to conduct of the prisoners carries great weight with the prison officials. It is most essential, therefore, that great care be exercised in the selection of these foremen. We have had unexpected success in the operation of our road gangs. Some have been maintained as far as 300 miles from the prison and nearly all in the hills and mountains, where every opportunity was given to escape. At first we lost a number of men, due largely to the novelty of the plan and unjust newspaper criticism, which made many of them fear the abandonment of the policy and their return to prison. There has been less newspaper criticism of late, and the public, seeing the merits of the system, is accepting it as a settled policy.

### FIFTEEN WANT CONVENTION.

#### American Highway Association Undoubtedly Will Meet Next Year in the South.

Competition for the honor of entertaining the 1914 convention of the American Highway Association is unusually keen, judging from the report that 15 cities have made application, as follows: New York, Chicago, Kansas City, Milwaukee, Minneapolis, Detroit, St. Louis, Atlanta, Denver, Cincinnati, Peoria, Rochester, Buffalo, Louisville and New Orleans. No decision has been reached, but it is understood that the association favors a city in the southern tier of states, and that the choice will rest between three—Atlanta, Denver and New Orleans.

It will be understood that the selection of the convention city is an important matter, because of the impetus for good roads throughout the immediate territory of which the city is a commercial centre. It is for this reason that it is anticipated that some portion of the country will be honored, in which there is decided need for promotion of this character.

### ST. LOUIS' ROAD MEETING.

#### Convention of United States Good Roads Association Lacks in Attendance.

It would appear, from published reports from St. Louis, that the first annual convention of the United States Good Roads Association in that city last month, was hardly the success that had been expected. About 300 delegates were in attendance at the opening session, but this number rapidly dwindled to 14, who decided to adjourn to meet in Tulsa, Okla., in 1914.

The announcements prior to the opening of the convention indicated that the association was formed largely to support the passage of certain bills introduced in Congress for federal aid in state and local highway construction. Inasmuch as there are already two large national bodies of

good roads advocates, one committed more less to the federal aid proposition and the other to the actual building of national highways with federal funds, it is assumed that most improved highway enthusiasts feel that there is little need for another national organization of this character.

### RELOCATING HIGHWAYS.

#### Government Holds That the Longest Way Around May Be the Shortest Way Home.

In connection with its campaign of education in the matter of road building the office of roads, Department of Agriculture, Washington, D. C., is issuing a bulletin, calling attention to its position with respect to the relocation of highways. It reads in part as follows:

The doctrine of the office of roads is that the longest way around may often be the shortest and most economical way home, and that frequently by building a highway around a hill or grade, but little appreciable distance is added and this is more than offset by the reduced strain of hauling.

The chief drawback from the farm owner's point of view is that the laying out of roads on this principle of avoiding grades necessitates, in some cases, running the road through good farm land, or orchard or pastures, instead of going around the farm line and building the road through old worn-out fields and over rocky knolls. This, of course, must raise a question in the mind of the individual land owner, as to whether the cutting up of his property by a road yields him individual advantages and so benefits his community as to offset the use of such land for a road, or to overcome the inconvenience of having his land divided.

In this connection the office of roads points out that the running of a road and the resulting traffic through a good farm, where there are good sheep, cattle, horses, grain, fruit or vegetables, has a certain advertising value and in many instances makes the land more valuable. In other cases, the importance of such a level road to the community is so great that it might well repay those using the road to give the farmer the equivalent in land equally good in place of what he has sacrificed to the common welfare.

According to the testimony of farmers consulted, where a horse might be able to pull 4000 pounds on a level road, it would have difficulty in pulling 3000 pounds up a steep hill. The size of the load, therefore, tends to be measured by the grade of the largest hill on the road to market. In a number of cases actual experiment shows that the relocating of roads around hills has been accomplished, either with no addition in road length in some instances, and with the adding of only a few feet to the highway in others. The office knows of no case where a properly relocated road, which has cut out grades, has led to any question as to its material reduction of hauling costs.

### LINCOLN HIGHWAY NEWS.

According to figures just completed by Frank H. Trego, chief engineer of the Lincoln Highway Association, the Lincoln highway is 3388.6 miles long from New York to San Francisco. The half-way mark is between Lexington and Cozad, Neb.

The association has taken advantage of the opportunity afforded by the J. L. Hudson Company in Detroit to utilize one of its show windows for a special display calling attention to the Lincoln highway. At one end of the window is a view of New York and its skyscrapers, while at the other is the Golden Gate. A road runs between, on which are located automobiles, road making

apparatus, supplies, etc. It is probable that other window displays of a like character will be utilized throughout the country.

The recently organized Automobile Club of Northern California, with headquarters in Oakland, Cal., is perfecting plans for raising \$1,000,000 in that state for the Lincoln highway. The club has a membership of 300, and the directors are: Fred M. Franklin, Charles D. Heywood, William Cryer, C. L. Lamb, William E. Dean, W. S. Rymer, John Howard, A. Moffitt, E. A. Young, Hugh M. Hogan, H. S. Martin, L. Church, Grant B. Miller and H. B. Lyon.

The name of the Indiana division of the Transcontinental Highway Association has been changed to the Northern Indiana Lincoln Highway Association. The new organization includes 10 towns and cities in the northern part of the state, as follows: Ligonier, Goshen, Elkhart, Mishawaka, South Bend, New Carlisle, Rolling Prairie, Laporte, Valparaiso and Hobart.

Rather unusual conditions surround the proposed \$50,000 bond issue for Church county, Nevada, the money to be used in the improvement of its section of the Lincoln highway. The amount is to be borrowed from the state and will bear interest of five per cent. In return, the state will expend the money in the public schools of Churchill county.

### TIRE PRICE REDUCTION.

#### B. F. Goodrich Company Announces Cut on Goodrich and Diamond Products.

The B. F. Goodrich Company, Akron, O., has announced a reduction in price on its Goodrich Safety Tread and Diamond Vitalized Rubber tires. In explanation of this action, it is stated by the company that it was the first to announce a price reduction in the spring of 1912 and again in the spring of 1913. It is added that it was not thought possible that a further cut would be made before early next year, and the present decision comes somewhat as a surprise in consequence. In discussing the matter W. O. Rutherford of the general sales department says:

This action is characteristic of the Goodrich company's policy of maintaining its leadership. It is our policy to deserve and hold the confidence of our customers by always sharing with them the benefits derived from improved methods of manufacture and changing conditions of the rubber and other markets. At this time a lowering in the cost of tires means a lot to the user. It means a genuine help to him in reducing the expense of operating his car. The price reduction is considerable and every man who has to buy tires is going to appreciate it.

The executive committee of the automobile fire insurance conference, held recently to consider the competition of the Automobile Insurance Company, Hartford, Conn., an allied company of the Aetna Life Insurance Company, voted to allow a discount of 15 per cent. on all gasoline automobiles equipped with an "approved" fire extinguisher. This action follows an announcement by the Automobile Insurance Company, offering a similar reduction on automobiles equipped with a certain make of fire extinguisher which had been approved by the National Board of Fire Underwriters.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**T**HE usual method employed for equalizing or truing up the bearings of a crankshaft is to place the work in a lathe. The G. B. Sales Corporation, 1790 Broadway, New York City, is marketing the G. B. crankshaft equalizer shown in an accompanying illustration, it being designed for truing up bearings by hand. The maker states that it will true up the bearings of a crankshaft in from three to four hours and that accurate results are obtained.

**G. B. Crankshaft Equalizer.**

If one or two bearings require attention it is stated that the work may be done without removing the crankshaft from the motor, only the displacement of the bottom of the crankcase and dropping the bottom half of the crank arm being necessary.

The operation of the tool is best explained by the directions accompanying each member: Take out the Nos. 1 and 2 pins, pull the tool apart and attach to crankshaft, then replace the pins. Screw down the adjusting screws Nos. 3 and 4, until a light but firm contact is made with the shaft. Next adjust the steel roller by the screw No. 5 until the same touches the shaft lightly. Screw down the cutting knife by the screw No. 6 to a cutting position and turn the tool slowly and steadily.

The G. B. crankshaft equalizer is constructed of high grade material throughout. The cutting blade is made of the finest quality of high speed, oil tempered tool steel, and it is stated that it will true up 25 shafts with one sharpening. It may be resharpened by the user, but the factory makes no charge for this work. The tool is made in two sizes, the No. 1 taking shafts from two to 3.5 inches, the No. 2 being designed for shafts from 1.5 to 2.5 inches.

### HEALY VALVE RESEATER.

The Healy valve reseater and dresser is manufactured by the Healy Tool & Appliance Company, Brocton, N. Y., with New York City office at 1790 Broadway, of which Ralph Waldt is man-

ager. The complete equipment is shown in an accompanying illustration with the components lettered.

A bearing on the valve stem is provided at A, it being in the same relative position as to seat as is the bearing in the cylinder. This bearing coming so near to the valve head eliminates chattering while the valve is being dressed. A second valve stem bearing is provided at B, it holding the stem central and rigid while a cut is being made. The adjustable bearing handle is shown at C and it may, by a few turns, be adapted to any size valve stem or worn members.

The reversible face cutter D has a 45-degree cutter at one end and a 60-degree at the other. These being adjustable, a roughing cut may be first used then a finishing cut without disturbing the adjustments.

The adjustment of the face cutter is depicted at E. It can be set to the thousandth of an inch. The seating cutter F is so shaped that it will remove all shoulders. The cutter carrier G has a taper which corresponds with that of the cutter, aligning it perfectly in the carrier. A Brown & Sharpe taper to the pilot aligns the same perfectly with the cutter as shown at H.

The tool is operated by hand; all wearing parts are of tool steel, hardened and ground to

**Healy Valve Reseater and Dresser.**

exact proportions, and the equipment comprises a dressing head complete with an extra roughing cutter, also one each of 1.625, two, 2.25 and 2.5-

inch valve seat cutters and carriers. The pilots included consist of one each of .3125, .375, .4375 and .5 inch. Labor and time saving qualities of the tool are emphasized by the maker.

### MOORE CHAIN HOIST.

The Chisholm & Moore Manufacturing Company, Cleveland, O., maker of chain hoists and trolleys, is marketing the Moore anti-friction chain hoist shown in an accompanying illustration. It is produced in capacities ranging from one-half to 10 tons and is provided with an improved automatic brake which locks the load at all points and yet permits of a very free and smooth lowering movement.

The brake is adjustable, permitting of lowering the load more freely, and all friction surfaces require no oiling as they are self-lubricating. The locking device is released by a slight reverse pull on the hand chain. The maker states that it has less working parts than any other hoist except the direct differential, and that spur gears are utilized.

The chains are made of the highest grade material and are tested and stretched to gauge on a pull of 100 per cent. greater than the maximum load they are intended to carry. The height of lift varies from eight feet for the half-ton hoist to 12 feet for the 10-ton member. By utilizing two extra feet of both main and hand chain an additional foot of lift may be obtained. The company will forward catalogue free upon request.

### JASCO LEAKLESS TANK.

After experimenting for over a year, Janney, Steinmetz & Company, Philadelphia, has perfected a series of square dies to make a seamless, leakless, drawn, bolster shape underhung tank. The growing practise of carrying the fuel tank at the rear of the chassis and the advantages derived therefrom has led the company to produce various sizes, the most popular being 13 inches wide by 13 high and from 30 to 36 long, according to the location of the hanging straps of the chassis. The tank is also produced 12 inches high and 14 wide and in convenient

lengths to accommodate the hanging straps.

All models are supplied with standard fittings made by the company, including brass goose neck extension filler, outlet with sediment cup, up-feed tube for pressure service and gasoline indicator to show contents. The company is continuing its line of cylindrical or round tanks and in all diameters.

New Jasco Seamless Tank.

### TESTING WATER MANIFOLDS.

Indicative of the care exercised in the manufacture of the parts utilized in the Overland cars is the method of testing the water manifolds of the motor. An accompanying illustration shows how each cast aluminum manifold is tested before being placed on the power plant.

Each manifold is securely fastened to a level surface on which a strip of rubber has been placed to act as a gasket. The ends are connected to a large water main through which water is pumped at a pressure of 100 pounds to the square inch. When the connection is complete a valve is opened, which allows the water to rush into the manifold, making possible the detection of the smallest hole and any flaw that may exist in the casting.

It is stated that cold water under pressure will find a smaller opening than steam or liquid,

How Water Manifolds of Overland Car Are Tested for Imperfections.

and that the method is utilized in testing locomotive, steamship and stationary boilers carrying 100 to 200 pounds pressure.

## THE REPAIR SHOP AND GARAGE.

### Adjustable Trammel for Quickly Testing Alignment of Wheels—Suggestion for Enlarging Capacity of Lathe Chuck by Fitting Jaws—Easily Made Drilling Block.

**A** DESIGN for testing the alignment of road wheels, which is adjustable, is shown at Fig. 1 and it will be of value in the service sta-

Fig. 1—Trammel for Testing Alignment of Wheels Quickly and Adjustable to Any Chassis.

tion and where a number of cars are to be inspected for suspected misalignment. The inventor of the device was awarded the weekly prize by the Commercial Motor, an English publication. The method of application is to place one of the front wheels parallel with the chassis, which is done by measuring from the inside rim of the wheel to the outside edge of the spring, then slip the trammel over the wheels about the height of the hubs. If the trammel will not go on both sides of the wheels, it can be ascertained how much they are out of line.

To test the lock of the front wheels, the steering wheel is placed to the maximum right hand position and a measurement taken from the inside edge of the left hand road wheel to the chassis, then the lock is put over on the opposite direction and the left wheel is measured again in the same way. If the two dimensions do not correspond, it is evident there is misalignment.

The construction of the trammel should not be expensive as the material could be procured

from the scrap heap and the parts could be assembled easily.

#### DRILLING HARD STEEL.

Hard steel may be drilled more readily by using turpentine instead of oil. The drill will cut when it would not touch the work with oil.

#### EASILY MADE DRILLING BLOCK.

Some types of work, such as light U shaped members, are not easily drilled. At Fig. 3 is presented a method of utilizing a section of an old crankshaft for making a drilling block. The cheeks are planed smooth and parallel, thus making this portion of the shaft particularly suitable for the purpose. The journals are sawed off so that each cheek can be utilized on the table of the drilling machine. The remaining members can be cut up and employed on a shaping machine for packing strips.

Fig. 3—Drilling Block Made from Crankshaft.

The block as shown is specially suited for drilling light bent work and the raised portion enables the bent part of the work to clear during the operation of drilling. A spring clip is best adapted for clamping the block onto the machine table.

#### INCREASING CHUCK CAPACITY.

Small shops are sometimes called upon to do machine work which requires a larger chuck than that with which the lathe is equipped. At Fig. 2 is presented a suggestion for increasing the capacity of the chuck. It will be noted that to increase its radius, four extra blocks are machined and rectangular holes provided to enable them to be fitted over the standard jaws. It is stated that with a lathe having a capacity of 10 inches the additional jaws will permit of work up to 14 inches being turned.

Fig. 2—Suggestion for Enlarging Capacity of Lathe Chuck by Fitting Additional Jaws.

## IN THE COMMERCIAL VEHICLE FIELD.

**Some Innovations in the B. A. Gramm Line Produced by the Gramm-Bernstein Company—Knox-Martin Tractor in Difficult Places—Fire and Police Wagons.**

**A** NNOUNCEMENT is made by the Gramm-Bernstein Company, Lima, O., that the B. A. Gramm's trucks made by it will be produced in four sizes for the 1914 season. These will be with capacities of one, two, 3.5 and five tons. The two and 3.5-ton vehicles have been manufactured for the past year and will be continued with several changes. The one-ton chassis was first announced a few months ago and will be built without change. The five-ton machine is new, and constructional details have not yet been made public.

The most distinctive change has been made in the starting equipment, this having been a feature of the B. A. Gramm design from the first. The original starting mechanism was mounted on the engine case, and the motor was started by coupling it with the flywheel. After careful observation and experiment it has been decided to install the electric starting motor and the generator on the cover of the transmission gearset. No sliding gears are used in the mounting, all the gears being permanently in mesh. The generator is driven by silent chain. The cover of the case forms a housing that protects the motor and generator, and it is very accessible. Provision is made so that the starter gear and any one of the transmission dogs cannot be engaged at the same time.

The company is also producing a dumping body, designed so that it may be fitted to the two, 3.5 and five-ton models. An accompanying illustration shows the first of these, which was delivered to the Brownlee Park Gravel & Material Company, Battle Creek, Mich., and which is said to have been entirely practical in service. The body is of steel and has a capacity of three cubic yards. It is mounted on two heavy bearings at

the rear of the chassis, and the forward end is elevated by an hydraulic hoist driven off the main shaft. By this hoist the body may be raised to an elevation of 37 degrees and can be raised and lowered in 25 seconds. The hoisting mechanism is operated by driver without leaving the seat.

### KNOX-MARTIN TRACTOR.

**An Interesting Illustration of Its Adaptability in Difficult Places.**

One of the strong points claimed for the Knox-Martin tractor, made by the Knox Auto-

**B. A. Gramm's 3.5-Ton Truck Chassis Equipped with Hydraulic Hoist Dumping Body.**

mobile Company, Springfield, Mass., is its versatility. Coupled with this is its flexibility. In fact, it is maintained by the inventor, Charles H. Martin, that it is capable of supplanting the horse in every respect. Perhaps it were better to state that it is capable of supplanting a number of horses, for, of course, this is true when the pulling ability and speed of the tractor are taken into consideration.

An accompanying illustration calls special attention to the ability of the tractor to operate in difficult places. The machine has been found unusually well adapted to the hauling of coal, from the fact that one body may be loaded in the yards while the tractor is absent with an-

**Knox-Martin Tractor Backed into Difficult Place.**

other. In the case illustrated, it was found necessary to back the load of coal into a narrow alley, and it is stated that this feat was accomplished quite as easily in every respect as with horses.

### **FEDERAL FIRE WAGON.**

**A Body Design Which Has Met with Decided Favor During the Past Season.**

The Federal Motor Truck Company, Detroit, maker of Federal truck, is calling special attention at this time to its combination chemical engine and hose wagon, a body installation which has received decided approval in various sections of the country. The first Federal vehicles of this type were produced about a year ago, and their popularity has been such as to win a large measure of success for the company in this field.

The capacity of the chassis is one ton, and the wheelbase is 144 inches. The engine is rated at 30 horsepower and the maximum speed of the wagon is placed at 22 miles an hour. Control is at the left side.

Brass clutch rails extend the full length of the body to the rear step-board, on which are two spindles for

hose nozzles. The equipment includes: One thousand feet of standard fire hose, 35-gallon chemical tank with connection for hose from the hydrant, two five-gallon hand extinguishers in brass receptacles, hose basket suspended over the front of the body with capacity of 250 feet of chemical hose, two 20 to 25-foot extension ladders, poles, hooks and many other implements necessary for fire fighting.

### **EMPLOYS TRAILERS.**

**New Orleans Postmaster Develops Parcel Post Distribution Service by Auxiliary Vehicles.**

The New Orleans postmaster has developed his parcel post distribution service by using trailers with the motor wagons available for this work. The requirements were such that the motor equipment was inadequate and so that there might be no diminution of the delivery animal wagons were fitted with axles built for motor vehicles, and street car drawheads for coupling them to the machines. The trailers have been found to draw easily and the loads can be largely increased, the motor wagons having sufficient power to take them wherever needed and with practically no loss of time.

### **WHITE PATROLS IN SERVICE.**

**Stability and Efficiency of Worcester Equipment Is Satisfactorily Demonstrated.**

In October, 1911, the police department in Worcester, Mass., placed in service one combination patrol wagon and ambulance and a vehicle equipped exclusively for ambulance work. About a month later another combination machine was added. All three chassis were of the White make,

**Federal One-Ton Chassis with Combination Chemical and Hose Wagon Equipment.**

produced by the White Company, Cleveland, O. The stability and efficiency of these three machines has been so well demonstrated during the past two years that a fourth has now been purchased and will be installed shortly.

During the two years which the three machines have been in service they have answered an aggregate of 18,728 calls, and have covered 43,455 miles. As ambulances the wagons are expected to go anywhere, and several instances are on record in which they have been called upon to traverse places that an ordinary motor car driver would consider impossible. Trips have been made through fields and wood lots, and often the way has been strewn with rocks or the mud has been hub deep.

All three machines have been in constant service, with the exception of two or three days, when overhaul work has been deemed advisable. Each is in good running condition, Chief Mathews being of the opinion that they are practically as serviceable in every way as when they left the factory. The expense for repairs has been so small as to almost negligible.

Aside from the economy afforded, as compared with horse equipment, the people of Worcester have had many examples of the value of the ambulance feature, in the numerous quick runs which have oftentimes resulted in the saving of human life.

This has been particularly true in a number of cases of asphyxiation and drowning, where the pulmotor has been rushed to the scene without loss of time. There also are hundreds of instances in which people have been wounded and have been saved from serious results through the ability of the police department to make rapid time in reaching the hospital or medical attention. Surgeons in charge of these patients state that many of them would have died had they been compelled to wait for a horse drawn ambulance.

## "SAFETY FIRST" BATTALION.

### Factory Foremen in Goodyear Tire Plant Organize to Protect Workmen.

A "Safety First" battalion of 115 factory foremen was organized at a recent banquet, presided over by President F. A. Seiberling of the Goodyear Tire & Rubber Company, Akron, O. The meeting was addressed by a number of "safety first" experts. A squad of men will patrol the 41-acre factory constantly, looking for dangerous operations, instructing workmen and suggesting safety devices. In introducing the subject President Seiberling said as follows:

During the past year 8000 men have worked for Goodyear. During the coming year this number will be in-

White Patrol Wagon, Which Has Seen Two Years' Service in Worcester, Mass.

creased to 10,000. It is inevitable among such a multitude that accidents will happen. Goodyear foremen need to realize the necessity of safeguards and constant vigilance. This company holds the safeguarding of the lives and well being of its employees as a high moral obligation.

The Kalamazoo Automobile Dealers' Association has been formed by a number of the dealers of Kalamazoo, Mich., for the purpose of taking charge of the annual automobile show in that city, which will be held Feb. 3-7 at the state armory. In the past the show has been conducted by some fraternal association. This season it is planned to display 90 pleasure cars in addition to a number of commercial cars, motorcycles, cyclecars and there will also be a representative showing of accessories and supplies.

## MECHANICAL NOTES FOR OWNERS.

### Increasing Temperature of Water Jacketed Carburetors---Causes of Hard Starting and Suggested Remedies---Priming the Intake Manifold---Testing the Ammeter.

**T**HE motorist who has purchased his first car since last winter may be somewhat discouraged to find in cold weather that it is not only difficult to start the motor, but it does not pull as well as it did in the warm weather, especially during the first 10 miles of a run. The reason is that in cold weather the fuel does not vaporize as readily as when the temperature is warm, and it may be necessary to heat the carburetor or the incoming air to secure more efficient carburetion.

If the carburetor is water jacketed the water may never in cold weather reach such a temperature as will materially improve vaporization. That is to say, the radiator and fan in combin-

them may be impeded to a considerable degree.

If the water supplied to the jackets of the carburetor is too cool, and removing the fan belt does not afford the desired temperature, the suggestion made at Fig. 1 will improve conditions. It will be noted that instead of the usual pipe leading directly from the cylinder jacket to the carburetor it is coiled around the exhaust pipe or manifold. This arrangement does not involve any alterations in the fittings to the water jackets, requiring merely a sufficient length of annealed copper tubing to wind it around the exhaust pipe. The number of coils to be used will depend upon conditions and can be determined by experimentation.

Fig. 1—Increasing the Temperature of a Water Jacketed Carburetor by Coiling Tube Around Exhaust Pipe.

ation may reduce the water to a degree where it will not heat the carburetor. It is obvious that a motor that will not heat in hot weather will be even cooler in operation in winter, and this condition not only prevents thorough vaporization of the fuel, but the engine is kept so cold that its full efficiency is not realized. On many cars the temperature of the cooling system may be raised by removing or slackening the fan drive.

When the carburetor is heated from the exhaust and the heat is not sufficient for good carburetion, it is advisable to remove the inlet and outlet pipes to the carburetor jacket and ascertain whether they and the jacket are unobstructed. These pipes and the exhaust jacket of the carburetor may become partially clogged, especially if considerable lubricant is fed to the motor, so that passage of the exhaust gases through

#### PRIMING THE CARBURETOR.

When the motor is fitted with petcocks it is a simple matter to prime the cylinders for starting in low temperatures. There are, however, many old models which are without these fittings and to prime the motor it is necessary to remove the spark plugs to introduce the fluid.

At Fig. 2 is shown a suggestion made by a reader who states that he has obtained excellent results and that the work may be performed easily and at a slight expense. The drawing clearly shows the principle employed, which is that of supplying gasoline or a priming fluid to the float chamber of the carburetor.

The container or tank may be of any desired size, but in the installation made one of a quart capacity was used. It was secured to the dash under the hood by clamps soldered on, these being drilled to take screws.

A hole was drilled and tapped in the float chamber of the carburetor as shown and an .125-inch elbow coupling fitted. Incorporated in the line was a petcock for controlling the supply and which was turned on when priming of the carburetor was desired. The contributor states that he filled the dash tank with high test gasoline, and in starting the motor when cold, flooded the float chamber with this fuel. Ordinary gasoline could be used and its vaporizing point increased by the addition of ether.

At Fig. 3 is shown another application of the auxiliary dash fuel container. In this instance the supply pipe is led to the intake manifold

above the carburetor. The intake pipe is drilled and tapped to take a connector and a petcock incorporated in the line. With this design the

Fig. 2—Suggestion of a Reader for Introducing Priming Fluid to the Float Chamber of Carburetor.

walls of the intake pipe are flooded with fuel, creating a rich mixture, which should facilitate starting when the motor is cold. With either arrangement the necessary fittings are inexpensive and can be obtained at any supply house.

### CAUSES OF HARD STARTING.

Motorists who have experimented with the carburetor in warm weather to cut down the supply of fuel to the very lowest limit to obtain economy, are likely to experience more or less difficulty in starting the motor when cold. Too rare a mixture is usually indicated by backfiring, denoting too much air, and generally this symptom disappears upon the engine becoming warm.

To insure easier starting the supply on the low speed should be increased, that is, the mixture be enriched, and with many types of carburetors this may be done without necessarily altering the proportions of air and fuel at higher ratios.

When the carburetor is fitted with a starting valve, the supply of air can be restricted until the motor warms, but unless the valve is controlled from the seat it will be necessary to hold it closed. Generally this may be done by a control wire at the front of the car.

As a good spark is necessary for starting, attention should be given the batteries. With the large number of dual systems of ignition, the average motorist is apt to neglect the dry cells that are the source of current for starting. These should be tested from time to time, and any that

are weak replaced with new. When storage batteries are used readings should be taken of each cell with a hydrometer to learn the specific gravity of the electrolyte. The gravity of the solution in cells fully charged is 1.275 to 1.300, but if 1.150 or less the cells are completely discharged and they should be recharged.

While the better method of testing cells is the indication of a hydrometer, a voltmeter may be used. Each cell should be tested separately and should the reading be 1.8 volts or less, the battery should be recharged. It should be remembered that the efficiency of any storage battery decreases with the fall in temperature and it is only about 50 per cent. efficient at zero temperature. For this reason it is advisable to take frequent readings and to keep the cells charged in cold weather.

### TESTING THE AMMETER.

In its booklet on "Electric Lighting Systems for Automobiles" the Electric Auto-Lite Company, Toledo, O., gives some interesting information on the use of the ammeter, which is employed to indicate at all times the amount of current being produced by the generator or being discharged from the battery. The instructions are as follows: Always note the position of the index hand of the ammeter when the car is stopped. With the motor not operating and no lamps burning, the hand should point at zero. If it does not, one of two conditions exists, either the ammeter is out of calibration or there is a leakage of current from the battery at some point in the wiring, which should be corrected.

Fig. 3—Priming an Intake Manifold from an Auxiliary Tank Installed on Dash.

To determine if the ammeter is correct, disconnect one of the battery terminals of the lighting system. If the hand swings to zero the

trouble is leakage of current, which should be immediately located and corrected. If the ammeter index hand does not point to zero with one battery terminal disconnected, the instrument is out of calibration. This in no way affects the operation of the system but must, of course, be taken into account when reading the ammeter.

If the engine backfires when stopping and makes one or more revolutions in the reverse direction, the ammeter needle may be found pointing to the extreme left hand side of the scale. This is caused by the circuit breaker contacts being held closed, and means a dead short circuit of the battery through the generator. This must be corrected at once by momentarily disconnecting one of the wires at the generator or cranking the engine.

One of the terminals on the generator is marked positive + and the other negative —. If the wires to the generator are disconnected for any reason, make certain when again connected that they are attached exactly as they were originally. Should the wires be reversed the ammeter will show a dead short circuit by swinging to the extreme left when the motor is started, and if allowed to remain in this condition a discharged battery will result.

The ammeter should be wired so as to read the generator charge into the battery when the index hand is pointing to the right, and a discharge from the battery to the lamps when the hand is pointing to the left. If the indication is in the opposite direction it may be corrected by simply reversing the two wires connected to the terminals of the ammeter.

### MOLINE-KNIGHT NEWS.

#### Some Interesting Information Concerning the Latest Knight Engined Car.

The Moline Automobile Company, East Moline, Ill., which announced its first Knight engined model last month, has decided upon a new trade mark. The new name plate comprises a harmonizing combination of gold and royal blue coloring—the color scheme of King Arthur's knights—and the famous painting of Sir Galahad is depicted in the centre upon a shield shaped medallion in gold. On one side of Sir Galahad is the name Moline and on the other Knight, printed in white on a background of blue enamel.

Beginning Dec. 19, and continuing for two weeks, night and day, one of these 50 horsepower Moline-Knight motors will be placed on test in the laboratory of the Automobile Club of Amer-

ica in New York City. The club will have absolute charge of the test, and the officials of the Moline company will have nothing whatever to do with it. President W. H. Van Dervoort has such implicit faith in the reliability of the new engine that he readily consented to this practical demonstration of its efficiency.

The adoption of the Knight engine by this company, which has won chief honors in Glidden tours and racing events throughout the country, and which has been a successful producer of poppet valve engines for the past nine years, is a matter for some little comment in the industry. President Van Dervoort explains the action of the company, in part, as follows:

Following our Moline-Knight announcement scores of letters have come to us from engineers, technical students and laymen, asking the "reason why" we adopted the Knight sleeve valve type of motor after nine years' success with the old poppet valve type. In a nutshell, the answer is: "The Knight motor represents progression". Every dealer and motor car owner is candid in admitting that the Knight design is more silent than any other type of motor, but the story of its unusual power, economy and flexibility has not half been told.

The superiority of the sleeve engine over the poppet valve lies in the fact that the efficiency and durability of the sleeve valve system is not affected by high pressures. The sleeve valve is balanced against lateral pressure, and the explosion does not affect or shock it at any point. The ports are large, the inlet and outlet most effective for their area, and the action of the motor is not affected adversely by their increased size. Increase in compression up to the preignition point is no disadvantage, because the explosive pressures developed are expended in useful work upon the piston and the valves are no more difficult to open under high pressure than low, because they slide without resistance past their port openings, instead of being made to lift against pressure.

In the sleeve valve, therefore, it is possible to combine the advantages of both types of poppet valve motors. In the sleeve valve is combined the silence, endurance and reliability of the small poppet valves and low compression, with the high efficiency of the high compression, large valves, powerful springs and precipitous cams of the racing poppet valve motor, and the operator has in the one sleeve valve all the advantages of both types.

A standard sleeve valve motor is capable, so far as efficiency is concerned, of delivering all the power of the racer with all the softness and quietness of the inefficient poppet valve motor, and the operator has within his control a surplus of power which he can call into service when needed in emergencies. Of course, with standard bodies, wind resistance and weights of touring cars, nobody expects extreme racing speeds upon country roads, but the power is there when required for acceleration and hill work, as thousands of owners testify.

The H. K. McCann Company announces the resignation of Fred M. Randall, who has been associated with Gleeson Murphy in the management of its Detroit office. Mr. Murphy will continue with the company as manager of its advertising business in that city.

Tacoma, Wash., is said to be interested in the construction of a speedway, following closely the plans utilized in the speedway at Indianapolis.

## TWO BUICKS HEAD SCORE.

### A Six and a Four Not Penalized in 500-Mile New York Reliability Run.

Two Buicks, one a four and the other a six-cylinder, completed the 500-mile reliability run that took place under the auspices of the Motor Dealers' Contest Association of New York on Dec. 3, 4 and 5, with clean scores. The Chandler six was third, with the penalization of one point for a leak in the stuffing box of the water pump. Fourth place went to the Buick No. 2, which lost five points, and No. 5 was a Hudson car, which was penalized because of a broken lamp bulb. No. 6 was the Oakland, that lost 14 points. The De Dion-Bouton led the National by one point. The latter was demerited for a blowout, for running over the mark in the brake test and a faulty dash light.

The conditions of the test were very severe, penalties being imposed for damaged or inoperative accessories, tire troubles, etc. The operative tests included trials of the motor, clutch, gearset and brake. At the completion of the run the machines were subjected to a final technical examination. The equipment was inspected before and after the run.

## ATTRACTIVE PUBLICITY.

### Advertising Manager L. M. Bradley Evolves Striking Design in Blue and Gold.

One of the most attractive displays of advertising appearing in current publications is the four-page advertisement of the Moline-Knight, made by the Moline Automobile Company, East Moline, Ill. It is the creation of L. M. Bradley, advertising manager of the company, and attracted unusual attention in the automobile industry. The announcement was printed in blue and gold, as was the trade mark, which is described elsewhere in this issue.

## FORTUNE IN BLUE PRINTS.

### Maxwell Motor Car Company Has Collection at Newcastle Plant Valued at \$1,000,000.

The Maxwell Motor Company, Detroit, is building a special fireproof vault at its Newcastle, Ind., plant to safeguard a collection of blue prints which is valued at over a million dollars. The drawings are of parts of models now obsolete, but in service on old cars, and are employed in filling replacement orders every day. The

blue prints have been collected from various plants and many of them are of machines manufactured by the former United States Motor Company.

The vault is larger than those utilized by banks, being 20 feet deep and 32 long. Until the work is completed a special watchman guards the drawings during the day and another at night. The Maxwell Motor Company decided to build the vault after the loss sustained in the Dayton flood, during which practically all of the Stoddard-Dayton car patterns were ruined. Fortunately the drawings were preserved, enabling the company to get out new patterns.

Apropos of the flood, Walter E. Flanders, president of the Maxwell Motor Company, states that it will make a difference of at least 2000 cars in the season's output, as the new model 35 was being built when the flood took place.

## TAIL LIGHT DETECTOR.

### Boston Dash Device Shows a Red Light When Rear Light Is Extinguished.

In some cities the ordinances governing the use of tail lights are strictly enforced and excuses are not accepted when the lamp is extinguished. The Harding Specialties Company, Inc., 755 Boylston street, Boston, is manufacturing the Boston tail light detector, which is a neat, compact device for mounting on the dash in plain view of the driver. The signal is equipped with a red eye, which warns the operator when the tail light goes out. The Boston tail light detector is installed easily and provision is made for connecting up the speedometer or dash light if desired. The light differs from conventional designs as series wiring is eliminated by the use of special lamps. The detector is made with a heavy brass covering and the standard finishes are black-nickel, brass, oxydized-black and nickel. Other finishes are supplied at a slight extra cost.

Practically all of the automobile dealers of St. Joseph, Mich., are members of the newly incorporated St. Joseph Automobile Show Association. This organization was formed for the purpose of conducting an annual show in St. Joseph and its first exhibit will be held Feb. 4-7.

H. Rodakowsky, designer of the famous Brooklands track in England, is now in this country and is making his headquarters in New York City. He is investigating the possibilities of a motor speedway near Trenton, N. J.

## IN THE REALM OF THE MOTORCYCLIST.

### Twelve Manufacturers to Make Display at New York Show---F. A. M. Would Co-Operate with Cyclecar Interests---General News of the Maker and the Rider.

ONLY 12 makers of motorcycles will be represented at the annual New York motorcycle show this year, according to the advance announcement made by the show committee. The event will be held in the new Grand Central Palace, no part of the exhibit being in Madison Square Garden this year. As was the case last January, the motorcycles will be displayed on the fourth floor. The manufacturers who have already secured space are:

Aurora Automatic Machinery Company, Aurora, Ill.; Thor; Consolidated Manufacturing Company, Toledo, O.; Yale; Davis Sewing Machine Company, Dayton, O.; Dayton; Emblem Manufacturing Company, Angola, N. Y.; Emblem; Excelsior Motor Manufacturing & Supply Company, Chicago; Excelsior; Harley-Davidson Motor Company, Milwaukee, Wis.; Harley-Davidson; Hendee Manufacturing Company, Springfield, Mass.; Indian; Miami Cy-

now located in Portland, Me., and received a three months' furlough in which to make the double transcontinental trip.

#### Breed to Discontinue Production.

The Breed Manufacturing Company, Bay City, Mich., maker of the Breed motorcycle, has filed a petition for dissolution in the United States circuit court of northern Michigan.

#### Recognizes the Cyclecar.

As a result of a discussion concerning the matter at the recent meeting of the board of directors of the Federation of American Motorcyclists in Chicago, steps have been taken to recognize the cyclecar by that body. The federation invites a union with the cyclecar interests, characterizing the new type of vehicle as

Mr. and Mrs. F. J. Taylor and Their Pennsylvania Tired Excelsior Tandem, at C. A. Lowd's Motorcycle Agency in Portsmouth, N. H.

cle & Manufacturing Company, Middletown, O.; Flying Merkel; Pope Manufacturing Company, Hartford, Conn.; Pope; Reading Standard Company, Reading, Penn.; R-S; Schickel Motor Company, Stamford, Conn.; Schickel; Henderson Motorcycle Company, Detroit, Henderson.

#### Transcontinental Honeymoon Trip.

Mr. and Mrs. F. J. Taylor left Portland, Me., Oct. 20, for a honeymoon trip to Portland, Ore., and return, riding an Excelsior mount with tandem attachment, and equipped with Pennsylvania Vacuum Cup motorcycle tires, made by the Pennsylvania Rubber Company, Jeannette, Penn. The machine was fitted for its long journey by C. A. Lowd, Pennsylvania tire agent in Portsmouth, N. H., where Mr. Taylor was stationed, until recently, with the navy yard. He is

an evidence of the progress and development in motorcycle matters. The board cordially suggests co-operation in regard to membership and competition with any and all cyclecar interests.

#### Motorcycles in National Parks.

Motorcyclists throughout the country will be interested in learning from California that the recent order of the Secretary of the Interior has been interpreted to mean that motorcycles are to be excluded from the Yosemite national park, although automobiles are to be admitted under certain restrictions. The following resolution is self-explanatory:

Whereas, it has come to the notice of this board that the Department of the Interior prohibits the use of mo-

**8,400 Miles---Two Years' Service---\$1.60 Repair Expense!**

You can get the same service by riding the same motorcycle.

Middletown, Ohio, Oct. 30, 1913.

The Miami Cycle & Mfg. Co.,  
Middletown, Ohio.

Gentlemen:—I live in the country and bought a Flying Merkel two years ago to take me from the rolling mill where I work. I have also made a lot of long trips. I have always kept careful track of the amount I had to pay out for repairs and it was only \$1.60 all this time. I made 8,460 miles altogether. Mr. Clark, the Merkel agent, knows this is so. I am going to get a 1914 Self-Starting Yellow Jacket Model.

Yours respectfully,  
(Signed) BENJ. FINKBONE.

The best motorcycle in the world is better than ever for 1914. Its equipment includes the Merkel Ever-Ready Self-Starter, Spring Frame and Fork, F & S Annular Ball Bearings, the Musselman Automatic Coaster Brake and a host of other features. Write today for 1914 catalog and Free Demonstration Coupon. And remember—

*"If it passes you; it's a Flying Merkel!"*

**The Miami Cycle & Manufacturing Co.**

320 Hanover Street

Middletown, Ohio

NEW ENGLAND BRANCH, 315 DWIGHT STREET, SPRINGFIELD, MASS.

When Writing to Advertisers, Please Mention The Automobile Journal.

**Edward Seibel of Cleveland, O., and His 1914 Flying Merkel Mount.**

motorcycles in the Yosemite national park, while admitting other motor vehicles, and this discrimination is made without apparent reason, be it

Resolved, by the national board of directors of the Federation of American Motorcyclists, duly assembled in regular session, that the secretary of the interior is hereby earnestly requested to revise the regulations before the opening of the touring season of 1914, granting to motorcyclists the same rights and privileges that are accorded to automobilists.

#### **With 1914 Merkel.**

Edward Seibel, who is shown in an accompanying illustration, recently made a trip from Cleveland, O., to Florida on a 1914 Flying Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O. He reports that the new Merkel was built to pull through sand and up rocky roads that other motorcycles could not begin to negotiate.

#### **Encircled the United States.**

One of the most interesting motorcycle trips taken this summer was that of Mr. and Mrs. Charles W. Bratton, Princeton, Ill., they having practically encircled the United States on a machine. They first went to Canada and then southward to Mexico, whence they took the southern route to the Atlantic Coast. About six months were spent on the trip.

#### **Savannah Racing Results.**

The following is the summary of the recent race meet at Savannah, Ga.:

Five miles, 61 cubic inches—First, Davis, Excelsior; second, Schmitz, Indian.

Ten miles, 61 cubic inches—First, Schmitz, Indian; second, Davis, Excelsior.

Seven miles, open—First, Glenn, Indian; second, Schmitz, Indian.

Five miles, 61 cubic inches—First, Glenn, Indian; second, Schmitz, Indian; third, Buckner, Excelsior.

Ten miles, stock—First, Glenn, Indian; second, Schmitz, Indian.

Ten minutes, stock—Greatest distance, Glenn, Indian. Ten miles, open—First, Buckner, Excelsior; second, Glenn, Indian.

One mile trials, stock—First, Schmitz, Indian; second, Glenn, Indian.

One mile, open—First, Buckner, Excelsior; second, Glenn, Indian.

One mile, stock—First, Buckner, Excelsior; second, Glenn, Indian.

Three miles, stock—First, Schmitz, Indian; second, Buckner, Excelsior.

Four miles, open—First, Buckner, Excelsior; second, Schmitz, Indian.

Five miles, free-for-all—First, Schmitz, Indian; second, Buckner, Excelsior; third, Glenn, Indian.

Eleven miles, 61 cubic inches—First, Buckner, Excelsior; second, Glenn, Indian; third, Schmitz, Indian.

#### **Girls as Mountain Climbers.**

Miss Grace Selkurk and Miss Alice Selkurk, two girl motorcyclists of San Diego, Cal., have made a new record for climbing Mt. Wilson on a two-wheel machine. Just 58 minutes from the time the girls left the foot of the toll road they reached the summit, a distance of nine miles. The young ladies made the return trip in 35 minutes.

#### **General News Notes.**

A motorcycle was the first vehicle to cross the new \$75,000 viaduct at Waukegan, Ill.

George Olson, Minneapolis, Minn., recently returned from a week's motorcycle hunting trip. He had 10 partridges, 15 rabbits and a 250-pound deer strapped to his machine when he arrived home.

A mid-winter run has been planned by the motorcyclists of Ohio to the New York show in January.

Motorcycles are to be used in the police department of the city of Wheeling, W. Va.

L. W. Hoffman, Canton, S. D., has just completed a 550-mile motorcycle trip through Iowa, Nebraska and South Dakota.

Practically every real estate firm in Louisville, Ky., employs one or more motorcyclists.

**Mr. and Mrs. B. A. Swenson, Providence, R. I., and Their Indian with Sidecar Attachment.**

**New Van Sicklen Motorcycle Speedometer, Completely Assembled and Disassembled to Show Components.**

These riders are attached to the collection departments and some of them are also sent out to look after complaints.

Gus Ehly and Jay McCullough, Minneapolis, Kan., recently rode their motorcycles to Broken Bow, Neb., where they staked claims on the reservation just opened by the government.

The work of the Moody Fresh Air Camp, Chicago, Ill., which has been giving healthy and happy summer vacations to hundreds of Chicago children, has been greatly facilitated by the use of a motorcycle.

#### Club Notes, Here and There.

The Lawndale Motorcycle Club, Chicago, Ill., has planned an endurance run from Chicago to Wilmette and return. The test will take place at the advent of the first snow storm of the winter.

The Aurora Motorcycle Club, Aurora, Ill., is considering plans for a new clubhouse to be built in the spring. The club already has an attractive house of five rooms, but the membership has grown to such proportions that larger quarters are now necessary.

Motorcyclists in Michigan are organizing a state F. A. M. A. R. Ketcham, Ann Arbor, has been appointed as state commissioner and he expects to get the different clubs together to have a state convention next June. Members of the Bay City Motorcycle Club are working to have the convention held in their city.

New F. A. M. affiliated clubs are announced as follows: Alamo, W. E. Dobrowolski, 203 Sycamore street, San Antonio, Tex.; Fort Smith, H. M. Swickard, 915 North A street, Fort Smith, Ark.; Gadsden, William B. Greene, lock box 4, Gadsden, Ala.

The state commissioners of Michigan and Ohio have appointed the following county commissioners: Donald A. Magill, Bay City, Mich., Bay county; Louis Beltrawites, Saginaw, Mich., Saginaw county; Dr. A. C. Carney, Hamilton, O., Butler county; L. O. Rhoades, Bloomer, O., and R. E. Morrison, Middletown, O.

B. J. Patterson, president of the F. A. M., has appointed F. S. Morse, 44 Grove street, Keene, N. H., commissioner for that state.

J. L. Donovan, chairman of the competition committee, has appointed the following state referees: W. V. Miller, Atlanta, Ga.; Arthur Mitchell, Montgomery, Ala. He has also appointed E. L. Moore, Seattle, Wash., as

North Pacific representative of the competition committee.

New registered repair shops have been announced as follows: H. F. Beck, 386 Monroe avenue, Memphis, Tenn.; Staples Motor & Supply Company, Staples, Minn.; Linehan Bros., 505 Market street, Steubenville, O.; Frederick Tiemeyer Motor & Supply Company, 1401 East Eager street, Baltimore, Md.; Whitney & Lange, 203 14th avenue, Cedar Rapids, Ia.; L. I. Goodrich, Goodland, Kan.; A. E. Counsell & Son, 36 Railroad street, St. Johnsbury, Vt.

#### Van Sicklen Speedometer.

An accompanying illustration presents the new Van Sicklen motorcycle speedometer, which was revealed just previous to the opening of the Chicago show. It is the product of the Van Sicklen Company, Aurora, Ill. The illustration shows the instrument completely assembled ready for installation and disassembled to indicate the working parts.

The speed dial is of the floating type. The figures are large and plain and instead of being set on one line are staggered, it being maintained that this permits of easier reading. The speed indicating mechanism is controlled by air, and it is claimed that it is not affected by temperature, climatic or other conditions.

The instrument also includes an odometer, with both trip and season dials, the former recording in tenths, to 100 miles, the miles in black and the tenths in red. This portion can be reset quickly at any time. Another feature is that the registration is steadily progressive, instead of utilizing wheels that turn one notch at a time. All dials are lithographed on a plain white enamelled surface. It is stated that it also will be made for automobiles.

The type that is supplied for motorcycles is driven by an endless wire belt running on V grooved pulleys, the driving pulley being attached to the spokes of the front wheel, from which point to a similar pulley at the end of the flexible shaft the power is transmitted by the belt. The bottom of the grooves in the pulley used for transmitting the power is hobbled to the same pitch as the coil of the belt.

#### JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

#### E. M. ESTABROOK

Chairman Membership Committee Federation  
American Motorcyclists,  
BANGOR, MAINE.

Please send me the F. A. M. Booklet and all information interesting to prospective members.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

**Coast Four Wheel Drive Auto Company**, Everitt, Wash.; \$10,000; E. J. Kennedy, M. A. Kennedy, L. A. Frazier, C. R. Frazier.

**Ferguson Auto Springs Manufacturing Company**, Spokane, Wash.; \$1,000,000; A. B. Ferguson, F. W. Stephens.

**Sagamore Motors Corporation**, Syracuse, N. Y.; \$75,000; J. S. Brown, C. G. Hanna, E. W. Lawton.

**Roberts Gas & Gasoline Engine & Car Company**, Nashville, Tenn.; \$50,000; to manufacture engines.

**Ohio Tractor Sales Company**, Marion, O.; \$50,000; W. W. Williams, H. A. Stevens, N. M. Miller, W. H. Schaeffer, C. Lee.

**Northwestern Motor Company**, Eau Claire, Wis.; \$25,000; to manufacture motors; K. Roshold, T. W. Roshold, R. P. Roshold.

**Automobile Machine Company**, Canisteo, N. Y.; \$3000; springs and other parts; C. B. Schaumburg, W. E. McGreevy, C. L. Thomas.

**Taylor Motor Cut-Out Block Company**, Columbus, O.; to manufacture device for finding trouble in motors.

**Paige-Detroit Company of New York**, New York City; \$50,000; E. M. Dalley, S. J. Wise, F. W. Kolb.

**Fellboch Motor Company**, Milwaukee, Wis.; \$100,000.

**Clemens Motor Sales Company**, Buffalo, N. Y.; \$50,000; W. J. Clemens, J. G. Lesswing, R. B. Metro.

**Leather Tire Goods Company**, New York City; \$7000; tires and specialties; Hans Gurlitt, Dodge Loebmann, William Loebmann.

**St. Joseph Automobile Show Association**, St. Joseph, Mo.; \$2000; E. T. Rhodus, M. N. Hall, H. C. Davis.

**Indian Taxicab Company**, Rochester, N. Y.; \$5000; Henry F. Lucas, Anna B. Lucas, William S. Lucas.

**E. H. Garcin & Co.**, New York City; \$25,000; asbestos and rubber goods; E. H. Garcin, George E. Richards, George S. Fulton.

## WITH THE MANUFACTURER.

**The Mercury Cyclecar Company**, Detroit, has begun the production of Mercury cyclecars in the factory building at 807-815 Scotten avenue, shown in an accompanying illustration. It is stated by the company that deliveries will be begun about the middle of December.

H. C. Gentry, formerly with the Thermoid Rubber

Plant at 807-815 Scotten Avenue, Detroit, Where the Mercury Cyclecar Company Produces Mercury Cyclecars.

**Evinrude Motor Company**, Milwaukee, Wis.; \$350,000; A. Zinn, John F. Koch, C. J. Meyer, Walter A. Zinn.

**Goodwin-Gallivan Motor Company**, Newcastle, O.; \$10,000; to retail automobiles; William M. Goodwin, John C. Goodwin, James P. Gallivan.

**Maxwell Motor Sales Corporation**, Wilmington, Del.; \$10,000; James J. Butterly.

**Breese Motor Plow Company**, Wapakoneta, O.; \$100,000; Robert A. Breese, G. D. Norris, David Lerbach.

**Parsons Motor Car Company**, Windsor, Can.; \$500,000; to manufacture motor vehicles; Thomas G. Ellis, A. J. Denomy and others.

**Archibald Wheel Company**, Lawrence, Mass.; \$800,000; vehicle wheels; F. N. Andrews, E. H. Archibald, I. M. Archibald.

**Robinson Auto Heater Company**, Milwaukee, Wis.; \$25,000; to manufacture heating devices; J. K. Robinson, E. W. Robinson, H. L. Kellogg.

**H. L. F. Trebert Company**, Rochester, N. Y.; \$150,000; motors; H. L. F. Trebert, L. Gergoine Ogden and others.

**Motor Cigarette Company**, Buffalo, N. Y.; \$30,000; H. J. Cardigan, C. J. Kerm, A. M. Pearsall.

**Memphis Overland Company**, Memphis, Tenn.; \$5000; T. H. Smart, F. D. Graham, Roy Moyston, Earl King, Caruthers Ewing.

**New Jersey Auto Exchange**, Union, N. J.; \$10,000; George Rich, Jr., Henry E. Forscutt and others.

**H. M. Kinsman Company**, Norwood, N. Y.; \$25,000; H. M. Kinsman, H. L. Farmer, E. E. Wright.

Company, Trenton, N. J., has been appointed special factory representative of the Cataract Rubber Company, Wooster, O., in New York City and vicinity. His headquarters will be with Meyers & Grayson, 1608 Broadway, New York City, which firm has been appointed distributor for Cataract tires.

**The L. P. C. Motor Company**, recently formed in Racine Junction, Wis., has elected the following officers: President, Capt. William Mitchell Lewis; vice president and engineer, Rene M. Petard; secretary and sales manager, James M. Cram; treasurer, F. S. Cordon; general counsel, E. B. Hand; superintendent, O. R. Delamater; purchasing agent, C. B. Chamberlain.

**The H. W. Johns-Manville Company**, New York City, has removed its Toronto branch to 19 Front street, East, where it will have a store and warehouse with floor area of approximately 35,000 square feet. A larger stock of J-M automobile specialties and the other products manufactured by this concern will be carried than heretofore was possible.

**The Chase Motor Truck Company**, Syracuse, N. Y., has placed on the market a kerosene motor roller farm tractor, designed for the severe condition of soil and topography existing throughout the eastern United States. This tractor furnishes all traction and belt work required by the farmer.

**The Detroit Wagon Works**, Detroit, is making a new type tractor, which will be announced soon.

**The Detroit Steering Wheel & Windshield Company**,

*American Made for American Trade*

## New Departure Manufacturing Co.

**BRISTOL, CONN.**

When Writing to Advertisers, Please Mention The Automobile Journal.

Detroit, has changed its name to the Metalwood Manufacturing Company. The change affects the name only.

**The Mouhan Vehicle Company**, Providence, R. I., has

**Exterior of the White Company's Boston Branch at 930 Commonwealth Avenue.**

installed in its painting department a new compressed vapor cleaning system for cleaning cars before painting.

**The Dudley Tool Company**, Menominee, Mich., will produce a cyclecar along conventional lines with seats arranged tandem style.

**The Lee Tire & Rubber Company**, Conshohocken, Penn., has placed agencies for its tires with the Lee Tires Sales Company, Newark, N. J., and the Lee Tire & Rubber Company, Brooklyn, N. Y.

**The Pullman Motor Car Company** is making arrangements for the establishment of an agency in Boston, Mass.

**The Briggs-Detroit Company**, Detroit, maker of the Detroit cars, will be represented in New York State, New Jersey and all of New England, by a new company that has been formed under the name of the Detroit Motor Sales Company. Julius Lichtenstein is head of the new company.

**The Lord Motor Car Company** is to establish a new automobile plant at Los Angeles, Cal.

**The Front Wheel Drive Company**, Hoboken, N. J., maker of Christie automobile fire trucks, contemplates establishing its plant in Erie, Penn.

**The Champion Spark Plug Company**, Toledo, O., is now operating in its new four-story addition. The building gives the company 40,000 square feet more of floor space and increases the minimum capacity to 75,000 a year.

**The Dayton-Dick Company**, Quincy, Ill., maker of the "Da-Lite" generator and ignition and the Dayton-Dick starter, has moved into a new factory that affords ample floor space of 80,000 square feet. This plant is equipped with the latest design of machinery in all departments.

**The Firestone Tire & Rubber Company**, Akron, O., has established a service station at Des Moines, Ia. A building has been secured on Walnut street and machinery for repairing wheels and tires will be installed.

**The Allyne Brass Foundry**, Detroit, has awarded a contract for the erection of a one-story addition, 30 by 47 feet, to its plant on Crawford avenue.

**The Oregon Top Company**, Portland, Ore., has moved to larger quarters on East Eighth street.

**The Motor & Manufacturing Company**, Dunkirk, N. Y., has erected a new plant on East Second street.

**The Flyer Automobile Company** is to erect a plant in Mt. Clemens, Mich.

**The Gibson Motor Car Company**, Pittsburg, Penn., has purchased a building at Monaca and will remodel it for the manufacture of automobiles.

**The General Motors Company**, Detroit, has declared a semi-annual dividend of 3.5 per cent. on the preferred stock.

**The Goodyear Tire & Rubber Company**, Akron, O., has declared a dividend of 12 per cent. on the common stock.

**The White Company**, Boston, Mass., factory branch, is now housed in its new home at 930 Commonwealth avenue, Boston's new new Automobile Row. Accompanying

illustrations present exterior and interior views of the structure, but convey only a partial idea of the extensive arrangement of the building to accommodate the salesrooms and service station for White pleasure cars and trucks. The garage on Newbury street, further down town, has been retained.

**R. M. Bean**, who for some time past has been secretary of Claire L. Barnes & Co., Chicago, Detroit and Cleveland, now discontinued, has become sales manager for the Lefever Arms Company, Syracuse, N. Y., maker of transmissions for touring cars and transmissions and jackshafts for commercial vehicles.

#### GARAGE AND DEALER.

**The Auto Exhibit & Supply Company**, San Francisco, Cal., has moved into the quarters recently vacated by the Howard Automobile Company.

**A. F. Nelson**, Benson, Minn., has opened his new garage, which was recently erected at Kansas and Pacific avenues. The building is 126 by 50 feet.

**The Franklin Motor Car Company**, Rochester, N. Y., has opened new salesrooms and garage at 298-300 East avenue.

**The Ford Auto Garage Company**, Middleport, O., has moved to its new repair shop located on Third street in that city.

**The Automobile Tire Company**, New York City, has opened a branch at 14th and L streets, N. W., Washington, D. C.

**Angus J. Crites**, Bakersfield, Cal., has sold his interest in the Ford garage to his partners.

**E. J. Daly**, Hettinger, N. D., has repurchased his former garage.

**The Vesta Storage Battery Company**, New York City, located at 1718 Broadway, has become agent in New York State and New Jersey for the Empire gasoline economizer.

**The Rhineland Machine Works**, Detroit, has taken the agency for the A. V. shock absorber.

**The Pedneau Garage & Machine Works**, Raleigh, N. C., will build a new garage and machine shop.

**Thomas W. Cohoon**, Suffolk, Va., has purchased land on East Washington street and will build a new garage to cost \$3000.

**Fry Bros.**, Columbia, Tenn., is building a new fireproof garage on South Garden street which will be completed about the first of the new year. The company will handle automobiles and supplies.

**W. Leroy**, St. Louis, Mo., is preparing specifications for a one-story garage, 86 by 150 feet.

**Patrick Driscoll**, Harrisburg, Penn., is to erect a new one-story garage at a cost of \$8500.

**Bobb Bros.**, St. Louis, Mo., will erect a garage, 50 by 95 feet, to cost \$3000.

**Parker, Thomas & Rice**, Baltimore, Md., is preparing plans for a large commercial car garage to be erected on St. Paul street, that city, at a cost of about \$100,000.

**Jones & Harris**, Miami, Fla., will occupy a new large garage that will be erected on Avenue E by John Fro-

**Interior of White Pleasure Car and Truck Salesroom in Boston.**

hock. The building will also be used as a repair shop.

**The Shengren-Hunt Auto Garage**, Burlington, Ia., is to erect a new garage building.

## RECENT PATENTS.

**Adjustable Reamer**, Robert L. Ellery, Portsmouth, N. H., No. 1,077,463. Filed Aug. 17, 1912.

**Tire**, Gottlieb Anger, McKees Rock, Penn., assignor of one-half to Theodore A. Sprague, Bellevue, Penn., No. 1,077,504. Filed Oct. 28, 1912.

**Battery Box**, Charles A. Mahla, New York City, No. 1,077,539. Filed March 6, 1913.

**Wrench**, Samuel Moss, Waltham, Mass., No. 1,077,543. Filed Jan. 22, 1913.

**Vehicle Brake**, Stephen R. O'Brien, Pittsburg, Penn., No. 1,077,546. Filed March 24, 1913.

**Auto Dumping Truck**, Ernest Henry Vincent, Emeryville, Cal., No. 1,077,570. Filed June 20, 1911.

**Wrench**, Frank C. Wutke, Chicago, Ill., No. 1,077,575. Filed Feb. 25, 1913.

**Resilient Wheel**, Gilbert A. Leitzman, Clayton, Ind., No. 1,077,612. Filed July 25, 1912.

**Car Motor**, William F. Davis, Kansas City, Kan., assignor to McKeon Motor Car Company, No. 1,077,679. Filed Oct. 10, 1905.

**Combustion Engine**, Hugo Junkers, Aix-la-Chapelle, Germany, No. 1,077,718. Filed Oct. 7, 1907.

**Motor Control System**, Edwin J. Murphy and John E. Brobst, Schenectady, N. Y., assignors to General Electric Company, No. 1,077,737. Filed June 20, 1912.

**Sidecar Attachment for Motorcycles**, Oron Overton, Mobile, Ala., No. 1,077,743. Filed May 24, 1912.

**Nut Lock**, Alma P. Stark, Spanish Fork, Utah, No. 1,077,763. Filed Dec. 17, 1912.

**Shock Absorber**, Carl Yeager, Birdsboro, Penn., No. 1,077,781. Filed March 15, 1913.

**Resilient Tire**, David A. York, Northgrove, Ind., No. 1,077,782. Filed Dec. 7, 1912.

**Lubricating System for Gas Engines**, Julian P. Farnham, Minneapolis, Minn., assignor, by mesne assignments, to Emerson-Brantingham Company, Rockford, Ill., No. 1,077,823. Filed Feb. 9, 1912.

**Engine Starter**, John Deam Kneidler, Sioux City, Ia., assignor of one-third to Buel Couch and one-third to N. T. Hanson, same city, No. 1,077,841. Filed Sept. 17, 1912.

**Engine Starter**, Gilson W. Roth, Jackson township, Brown county, Ind., assignor, by direct and mesne assignments, to George H. Evans, Evansville, Ind., No. 1,077,858. Filed June 10, 1910.

**Muffler**, Edward L. Dewey, Whiting, Ind., No. 1,077,905. Filed March 10, 1913.

**Carburetor**, William H. C. Higgins, Laporte, Ind., No. 1,077,910. Filed Oct. 14, 1910.

**Stop Cock for Motor Vehicles**, Jean Mazuel, Paris, France, No. 1,075,429. Filed Feb. 3, 1913.

**Electrical Distributor**, James L. Adams, Jr., Wilkesburg, Penn., assignor to Westinghouse Electric & Manufacturing Company, No. 1,075,457. Filed Nov. 16, 1911.

**Self-Propelled Sleigh**, Andrew J. Denney, Cambridge, Idaho, No. 1,075,465. Filed Aug. 5, 1912.

**Connecting Means for Springs**, Jacques Minette de Saint Martin, Paris, France, No. 1,075,498. Filed Oct. 10, 1912.

**Demountable Rim**, Robert P. Scott, Cadiz, O., No. 1,075,501. Filed March 14, 1911.

**Wrench**, Robert W. Sturdy, Stephenson, Mich., assignor of one half to Cassius W. McEwan, Omaha, Neb., No. 1,075,516. Filed May 13, 1912.

**Explosive Engine**, Joseph F. Buhr, Detroit, assignor, by mesne assignment, to Herman B. Strate and Joseph F. Buhr, Detroit, No. 1,075,545. Filed Feb. 7, 1911.

**Indicating Device**, Mildred Felix, New York City, No. 1,075,555. Filed Feb. 23, 1907.

**Battery**, William H. Fenoughty, Belleville, Ill., assignor to American Carbon & Battery Company of Missouri, No. 1,075,556. Filed May 12, 1913.

**Automobile Construction**, Henry Ford, Detroit, No. 1,075,557. Filed July 21, 1909.

**Internal Combustion Engine**, Frederick O. Kilgore, Somerville, Mass., No. 1,075,578. Filed Dec. 28, 1911.

**Ignition and Starting Mechanism**, Loren E. Clark, Madville, Penn., No. 1,075,763. Filed Feb. 7, 1913.

**Frame for Motor Bicycles**, Edward Y. White, San Antonio, Tex., No. 1,075,886. Filed March 9, 1906.

**Two-Cycle Engine**, Ellis J. Woolf, Minneapolis, Minn., assignor to the Woolf Valve Gear Company, same place, No. 1,075,889. Filed Oct. 26, 1908.

**Electric Gearshift**, Ralph W. Bradley, Fort Collins, Col., No. 1,074,599. Filed Jan. 28, 1913.

**Radiator Vent Valve**, Andrew Jackson, Chicago, No. 1,074,624. Filed March 14, 1913.

**Muffler**, Charles Hinton Kenney, New London, Conn., No. 1,074,627. Filed March 29, 1913.

**Ignition System**, Leon J. LePontois, New Rochelle, N. Y., assignor by mesne assignments to H. W. Johns, No. 1,074,724. Filed June 15, 1909.

## COMING EVENTS.

## December.

Dec. 10-12—Convention, Retail Implement & Vehicle Dealers' Association, Milwaukee, Wis.

Dec. 11-20—International exposition of safety and sanitation, American Museum of Safety, New York City.

## January.

Jan. 2-10—Importers' Salon, Hotel Astor, New York City.

Jan. 3-10—Pleasure car show, Grand Central Palace, New York City.

Jan. 4-8—Winter meeting, Society of Automobile Engineers, New York City.

Jan. 10-16—Show, Milwaukee, Wis.

Jan. 10-17—Show, Cleveland, O.

Jan. 10-17—Show, Philadelphia, Penn.

Jan. 10-21—Show, Brussels, Belgium.

July 25-29—Grand Prix race, Belgium.

## NEW BOOKS RECEIVED.

**The Silent Knight Engine**—Reprint of a paper read by C. Y. Knight, and the discussion which followed, at the meeting of the Royal Automobile Club, London, England, Oct. 15, 1908.

**The Relation of the Manufacturer to Our Patent System**—Paper read by W. M. Grosvenor before the Boston meeting of the American Institution of Chemical Engineering, in June, 1913.

**The Marmon "Forty-Eight" in Service**—Published by the Nordyke & Marmon Company, Indianapolis, Ind. An interesting portfolio of photographs of Marmon cars taken in America and foreign countries.

**The Electric Vehicle Hand-Book**—Published by H. C. Cushing, Jr., Pulitzer building, New York City. Written by H. C. Cushing, Jr., and Frank W. Smith. An instruction book on the operation, care and maintenance of electric vehicles, their storage batteries, motors, controllers, tires and accessories. Price, \$2.

## RECENTLY ANNOUNCED 1914 MODELS.

**S**TILL another pleasure car maker has announced the abandonment of its four-cylinder models, this being the Locomobile, which will offer sixes exclusively for the 1914 season. For the most part, the new models announced during the past two weeks indicate but few changes in general design and construction, although there is abundant evidence of detailed refinements. The following brief descriptions are intended to present only the more important changes outlined by the manufacturers:

**Lozier**—Lozier Motor Company, Detroit. New series six-cylinder model and a new four. Four-cylinder motor, L head type, cast en bloc, with bore of 4.25 inches and stroke of 6.5. Enclosed valves, easily accessible. Cool-

ope, windshield, electric lighting and starting, electric horn, demountable rims, etc.

**De Soto**—De Soto Motor Car Company, Auburn, Ind. De Soto Six. Motor, six cylinders cast in pairs with bore of four inches and stroke of five. Lubrication, positive pump and level splash; cooling, centrifugal pump; ignition, lighting unit; carburetor, Schebler. Clutch, multiple disc, Raybestos lined. Transmission, selective, three speeds forward and reverse. Full floating rear axle. Front springs, semi-elliptic; rear, three-quarter elliptic. Wheelbase, 130 inches. Tires, 35 by four inches. Equipment includes: Electric lighting, pneumatic starter, top, curtains, windshield, either electric or exhaust horn, etc. Body seats five, with provision for two extra seats.

**Locomobile**—Locomobile Company of America, Bridgeport, Conn. Four six-cylinder models, which are really only two, rated at 38 and 48 horsepower respectively, each fitted with right and left hand drive and known as 38LD, 38RD, 48LD and 48 RD. Four-cylinder chassis has been dropped. Chassis show few changes, except in the left hand drive models, which have been altered to conform to the new placing of the operator. Improved carburetor design and new body lines. Gray & Davis electric system continued. Addition of six-cylinder air compressor.

**Austin**—Austin Automobile Company, Grand Rapids, Mich. Model 55. Motor, six-cylinder, T head type, cast in blocks of threes, replaces L head of last season. Exhaust on right, inlet on left. Bore four inches, stroke 5.5. Lubrication, force feed and splash; ignition, Bosch magneto. Two-speed rear axle retained. Left hand drive, centre control. Remy two-unit starting and lighting system, with LBA battery. Seven-passenger body, with disappearing seats, and with rear seat wide enough to hold four with comfort, it is maintained. Line also includes: Model 66, with motor of 4.5-inch bore and 5.5-inch stroke and model 77, with motor of 4.5-inch bore and seven-inch stroke. Both are six-cylinder engines and the construction is practically the same as model 55.

**Fal**—Fal Motor Car Company, Chicago, Ill. Greyhound model. New roadster, designed to be converted readily into a sleeping car if desired. Motor is a Buda, four-cylinder, en bloc, 4.25 inch bore, 5.5-inch stroke. Chassis design is standard throughout. By pushing the seat cushion forward upon the floorboards there is exposed sufficient room in the rear deck to admit a six-foot person, whose head is supposed to rest on the seat cushion. Body design is streamline throughout, and a feature is the installation of a single headlight in the centre of the hood extension, the radiator being about four inches behind the light.

**Bailey Electric**—S. R. Bailey & Co., Inc., Amesbury, Mass. Roadster. Continued from last season. Motor, specially designed General Electric. Battery, 60 cells Edison A-5. Mileage, 75 to 100. Speed, standard maximum, 25 miles an hour. Motor is connected to countershaft by Morse silent chain, final drive by double roller chain. Wheelbase, 112 inches. Tires, special electric pneumatic, 33 by four inches, on quick detachable rims. This is the type of car utilized by Col. E. W. M. Bailey on his recent Boston-Chicago tour. Company is also producing a special four-passenger roadster or touring car.

**Arbenz**—Arbenz Car Company, Chillicothe, O. Models show no radical changes, except such as to make for increased efficiency and ease of operation. Electric lighting and starting system, with dimming arrangement for headlights. Electric horn mounted under the hood. Fuel tank in cowl dash. Improved carburetor. Larger rear axle of full floating type. Healer wheels, fitted with quick detachable, demountable rims carrying 36 by four-inch tires. Spare rim. Wire wheels optional.

Col. E. W. M. Bailey Leaving Boston in the Bailey Electric Roadster on His Recent Boston-Chicago Trip.

ing, centrifugal pump, lubrication, pressure feed; ignition, Bosch high-tension magneto. Unit power plant. Multiple disc clutch. Selective transmission, four speeds forward and reverse. Full floating rear axle. Front springs, semi-elliptic; rear, Lozier platform. Left hand drive, centre control with ball type lever. Wheelbase, 120 inches; tread, 56. Tires, 36 by 4.5 inches. Equipment includes: One-man top, Kellogg four-cylinder tire pump, Gray & Davis electric lighting and starting system, electric headlight dimmers, etc. Six-cylinder chassis is a continuation of last season's model with the addition of refinements, and with the same equipment as the four. Two body designs on the four; seven-passenger touring car, convertible into five-passenger by disappearing seats folding into back of front seat, and two-passenger roadster.

**Paterson**—W. A. Paterson Company, Flint, Mich. Models 32 and 33. One chassis, two-passenger roadster and five-passenger touring car. Motor, four-cylinder, L head; bore 3.5 inches, stroke five. Lubrication, constant level splash; cooling, centrifugal pump. Unit power plant. Cone clutch. Selective transmission, three forward speeds and reverse. Front springs, semi-elliptic; rear, three-quarter elliptic. Wheelbase, 112 inches. Tires, 32 by 3.5 inches. Equipment includes: Top with envel-

## MAUDSLAY CAR ADOPTS RENO MOTOR.

ONE of the most interesting features revealed at the recent Paris Salon in France and the Olympia show in London was the 17 horsepower Maudslay car, fitted with a four-cylinder Maudslay-Reno engine. This is not exactly a new motor, since it first made its appearance in America some time in the summer of 1911 and had been given tests on cars in Europe previous to that date. It originally was known as the Reno-Bois, and in this country was introduced as the Sphinx. The Maudslay design embodies some changes, as might be expected after more than two years of experimentation, and, so far as is known, this is the first time the motor has been offered as regular equipment on any make of machine.

Chief interest attaches to the engine because it is of the non-poppet valve type, employing a split ring, or cuff valve as it is termed abroad. The Maudslay Motor Company of Coventry, England, is an old established pleasure car manufacturer, and its reputation is such as to make its indorsement of the motor of distinct importance. The Maudslay-Reno will be in direct competition with the Knight double-sleeve valve and Argyll single-sleeve valve types, which have given decided satisfaction on the British market, to say nothing of the success of the Knight in America.

The principle of the design is simple. A perfectly plain, straight sided cylinder barrel is closed at its upper end by means of a screwed cap the full dimensions of the bore. Around the upper portion of this cylinder, in what forms the combustion space, are cast two circumferential slots, one above the other. In this section is fitted a cast iron split ring, the width, or rather the height, of which is such that it will completely cover both slots. Means are provided for moving this split ring from the position where it covers both slots, upward or downward, to uncover each in turn. One of the slots thus becomes the inlet port and the other the exhaust port. As the valve ring is split, the pressure of the gases on the inner sides of the ring, during the compression or firing strokes, tends to fortify the gas tightness of the joints.

The valve mechanism is operated by a camshaft, which is carried in a long circular passage through the water jackets of the cylinders, level with combustion chamber. The cylinders are cast in pairs and a single cam is mounted opposite the centre line of each. On each cam rests a roller carried in a fork forming part of a lever

which has its fulcrum in a detachable cap bolted to the side of the water jacket. The other end of the lever terminates in a ball, and the lever passes through a square hole in the cylinder wall to a lug, which is cast on one side of the split valve ring. This rocking lever projects through the cylinder wall until the ball end is situated centrally in the split ring valve casting. The ball end, however, is carried in a steel bushing, which serves to provide the wearing surface necessary to allow for the horizontal movement of the end of the lever as the latter is moved upward and downward in a radius. A recess is cut on the rocking lever, just above the fork which carries the roller, and in this works a spherical ended tappet shaped something like a dumb bell. The upper end of this dumb bell is carried in a plunger, which in turn works in a guide plug screwed into the upper horizontal fall of the main

**Maudslay-Reno Motor:** At Left, Sectional View with Valve Removed; at Right, Valve in Place and Operating Mechanism.

cylinder casting. Between the plunger on the one hand and the guide on the other is compressed a stout helical spring, and this, having to all intents and purposes the top wall of the casting for one abutment and the spherical end of the dumb bell for the other, serves to keep the rocking lever in close contact with the cam.

It will be understood that the normal position of the sliding split ring valve, during the compression and firing strokes, is such as to cover both slots. In this engine the lower slot forms the exhaust and the upper the inlet. The camshaft runs at half the engine speed. The cam blank consists primarily of a half circle, which allows the split ring valve to maintain its midway position; then, a considerable excrescence for a quarter of the circle, causing the valve to rise and thus open the exhaust port, and lastly, a depression below the midway radius for the remaining portion of the circle, which permits the valve to

drop below the normal position and open the inlet port.

Silent chain drive is employed for the camshaft, the chain case being carried at the forward end of the engine. Two chains are used, with an intermediate shaft and pinions rotating on ball bearings. On the rear face of the last cylinder is mounted an aluminum case which carries a chain drive, taken from the rear end of the camshaft, for the magneto, which is mounted on a plate attached to the chain case. At the front end of the engine, on the crankshaft, is a gear driving a short transverse shaft, which has a gear pump for lubrication at one end and a pump for water circulation at the other.

The lubrication system consists of a pressure feed to the five main bearings of the crankshaft, the webs and pins of which are drilled to enable oil to be forced to the big end bearings, etc. Surplus oil runs down to a sump in the bottom of the crankcase. An oil lead also is taken to the rear end of the circular passage in which the camshaft works, and the lubricant is forced along the hollow camshaft to all the camshaft bearings.

Considerable care has been taken to lubricate the mechanism which actuates the split ring valves. Each plug screwed into the upper wall of the cylinder casting, to form a guide for the spring loaded plunger which serves to hold each rocking lever in contact with its cam, is provided with an oil lead. Each plunger and dumb bell tappet is drilled so that oil can flow to the bottom spherical end of the tappet. Where the dumb bell tappet is recessed into the rocking lever another hole is drilled, and a passage from this is taken right along the lever to the ball end. It will be noted, by the drawings, that the sides of the ring are provided with three circular recesses, which serve to reduce friction and to a certain extent hold lubricant.

#### **PITTSBURG SHOW, FEB. 14-21.**

##### **Fourth Annual Event Will Include Pleasure and Commercial Cars.**

The Pittsburg Auto Show Association has completed arrangements for its fourth annual show, which will be held Feb. 14 to 21 inclusive. Pleasure and commercial vehicles will be exhibited, and the display will be known as the Big Exposition Auto Show. The officers of the Pittsburg Auto Association are as follows: President, Aaron DeRoy; vice president, J. Casper; secretary, J. D. White; treasurer, E. A. Will-

iams; board of directors, A. A. Buhl, C. C. Laughner, W. M. Laird, R. D. McCurdy and Elias Lange. J. H. Zimmerman is show manager and headquarters have been established at 130 North Highland avenue.

#### **BIG MILEAGE AT LOW COST.**

##### **Owner of 1910 KisselKar Pays \$48.75 for Repairs in 65,874 Miles.**

The durability of old machines is emphasized by the statement of F. H. Cunningham of Hoopston, Ill., who states that to date he has driven his 1910 KisselKar "50", made by the Kissel Motor Car Company, Hartford, Wis., 65,874 miles. "I have never had any engine trouble and the car is always ready to go day or night", writes Mr. Cunningham. "It has cost me all told only \$48.75 for repairs, and \$21.65 of that was for damage to another machine with which I came into collision. Mine was not even scratched in the accident".

#### **DEALERS FORM STATE BODY.**

##### **Local Associations in New York Organize for General Welfare Work.**

A meeting of delegates from the automobile dealers' associations throughout New York State was held in Albany, Dec. 3, for the purpose of organizing a state dealers' association. The bodies in Albany, Buffalo, Rochester, Syracuse, New York City and Brooklyn, and the Importers' Automobile Alliance of New York City, will comprise the nucleus of the new organization.

The following directors were chosen: Arthur M. Daly, New York City; R. E. Brown, Buffalo; Thomas Northway, Rochester; C. D. Hakes, Albany; G. H. Norris, Syracuse; E. Lascaris, Importers' Alliance, and H. I. Carpenter, Brooklyn. These directors elected the following officers: President, Arthur M. Daly; vice president, C. D. Hakes; treasurer, R. E. Brown; secretary and general manager, Charles A. Stewart, New York City.

The purpose of the new association is to promote the automobile industry in every way possible, to encourage and further the maintenance of good roads and the improvement of existing highways, to aid in the passage of uniform and consistent laws relating to motor vehicles, and to aid in the defeat of legislation detrimental to the industry.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## What the J. M. is doing for "Globe- girdler" Kohl

Edwin F. Kohl set out from the University of Wisconsin last summer to circle the globe by motor car. Taking his cue from A. L. Westgard, the world's most experienced pathfinder, he equipped his car with

## J. M. Shock Absorbers

Here is what Kohl wrote from Brussels:

The "J. M.'s" have made the around-the-world journey so smooth for me that I was not given a "jolt" to remind me that I should express my appreciation for what your product has done for the world-girdling car. We have traversed four European countries to date: Great Britain, France, Holland and Belgium, and the "J. M.'s" in the back are certainly doing all that your literature assures for them. During the past few days we have been traveling over nothing but cobblestones for hundreds of miles, but we do not seem to get any more jolting than over other pavements. The "J. M.'s" seem to be especially adapted for taking up short, successive bumps, for which this part of the world is notorious.

Your debtor for touring comfort,

EDWIN F. KOHL.

What are the reasons for the universal use of J. M. Shock Absorbers in every country where automobiles run? Real service—proved facts, rather than mere claims. The Ovington data chart "D" tells the whole story by eight simple lines, drawn by the car itself. No more convincing piece of shock absorber literature was ever issued. Do you want a copy? Write today.

Nearly every motor car owner experiences at some time or other the disastrous effect of an inferior lubricant--then he insists on the best thereafter.

But just here is where "an ounce of prevention is worth a pound of cure".

**EMCO AUTOMOBILE OIL**

is refined exclusively from Pennsylvania Crude. It is not affected by extremes of temperature. It is free from all animal, vegetable and acid ingredients, is of high fire test and represents the highest grade automobile lubricant on the market.

Sold under the following money back guarantee:

If Emco Oil does not prove satisfactory to YOU in absolutely every respect, we will refund your money in FULL—pay freight (both ways if oil is returned) and make no charge for oil used in trial.

If your dealer cannot supply you, we will ship Emco direct to you in five or ten gallon cans, barrels or half barrels.

## Winter Lubrication

If you plan to keep your car in service through the cold weather you especially need

because it is impervious to change in temperature. It lubricates as perfectly at zero as in warm weather.

If you are planning to house your car for the winter, it will pay you to clean out all the bearings and gears and repack them with NON-FLUID OIL. This lubricant does not dry or gum when the car is idle and will not cause the slightest corrosion of balls and rollers

NON-FLUID OIL excludes moisture and prevents rust.

Ask your dealer for these lubricants packed in orange-colored cans bearing the above trade-mark.

# BUYING AND SELLING IS MADE EASY

## 12,000 Trade Interests

### READ THE Accessory and Garage Journal EACH MONTH

You can secure your monthly audience with all buying and selling heads in all concerns in every branch of the automobile industry through the Accessory and Garage Journal. Such interests must know what you have to offer. All are logical prospective purchasers. They constitute your market and are always looking for lines of merit.

In this magazine the large and small manufacturer has equal opportunity to reach the whole trade and can secure a service equal to that of a trade mailing list and better than can be secured through any other medium.

100 Per Cent. Quantity—100 Per Cent. Quality—Circulation Value.

Every order carries with it a positive guarantee of service stated, and this in any form requested.

Ask how we give concern and product listing under proper classification in Buyers' Guides that have a distribution of more than 1,100,000 copies yearly. This service is free. Our trade mailing list is 100 per cent. active—Do you need it? Details gladly furnished on request.

Next issue Dec. 29th.

## HAVOLINE OIL

For Perfect  
Lubrication of  
Automobile

And Marine  
Gasoline Engines

This OIL is NOT AN EXPERIMENT, here today and gone tomorrow, but has for many years maintained the highest reputation as a scientifically prepared lubricant which is properly filtered, so that it burns clean, without leaving carbon deposits on plugs or cylinders.

The biggest engine manufacturers in the East and in the West recommend it; thousands use it on Touring and Racing Automobiles, and Working, Cruising and Racing Motor Boats, and all are pleased to find that

# The Varnish That Defies Soap

## See it at the Automobile Show

**Look for the wheel revolving in the soapy water at our Booth**  
at the Automobile Show, Grand Central Palace, New York.

It is a startling demonstration of our Vanadium Chassis Finishing, a varnish which is absolutely unharmed by the caustic action of automobile soap.

Six of the spokes of the wheel are finished with the best automobile gear varnishes heretofore made. They cannot withstand soap, and turn gray and lose their lustre. The other six spokes are finished with

## Valentine's Vanadium Chassis Finishing

These spokes stand up absolutely unharmed after weeks of exposure to soap and water. This is the varnish for the hood, fenders, and underparts of your car. It resists mud, road oil, grease, and the heat from the motor as well as it resists soapy water. It will keep the finish of these parts of your car in perfect condition many months after the ordinary varnish would be destroyed.

You will be interested in a new booklet we are issuing, "The Care of the Car." It tells all about how to preserve the finish of the car, and will, we are sure, prove of value to you. It describes Vanadium Chassis Finishing. We should like to send it to you, free of charge of course. Just fill out the coupon.

*A feature of our exhibit at the Show this year will be a novel representation of automobile bodies in various colors.*

# CAMERON

## \$1200 4

Electric  
Lighting &  
Starter

FOUR  
SPEED  
DIRECT  
DRIVE

### Individuality

Producers of moderate priced cars in their desire to market a product at a low cost have all followed along the beaten path. Sheep-like they have all produced machines that offer nothing but sameness—in other words bulk at small cost. Stock parts gathered here and there, assembled in haste, is a story now familiar to the purchasing public.

THE CAMERON 4 STANDS AS THE MOST DISTINCTIVE LOW-PRICED CAR BUILT IN AMERICA. Its mechanical superiorities stamp it as the CAR OF INDIVIDUALITY. Built in our own factory, under personal direction of our own skilled engineers and designers, everything that typifies motoring perfection is incorporated into its make-up. It is the sturdiest and most economical automobile constructed.

## Cameron Features

### FOUR SPEED DIRECT DRIVE

The problem of delivering maximum power at minimum cost has been solved by the use of the CAMERON FOUR SPEED DIRECT DRIVE TRANSMISSION. This type is absolutely the only one that permits of direct drive on all speeds, and DELIVERS 35 PER CENT MORE POWER THAN ALL OTHER MAKES.

### THE MOTOR

The long stroke CAMERON motor cast en bloc is as distinctive as the transmission. Valves located in centre of combustion chamber gives highest efficiency to motor and the valve mechanism entirely enclosed insures quietness and freedom from wear.

THE CAMERON 4 has been constructed with a principle in view not a price. A MODERATE PRICED CAR—STURDY, COMFORTABLE, POWERFUL YET SIMPLE AND ECONOMICAL IN OPERATION.

Four and Five Passenger

# National Six \$2375

To see this new car is to desire it — ride once, and you determine to own it

**W**E have added to our famous line of National 40 cars, this new beautiful Six. No other manufacturer offers a better range of cars in quality, appearance or service.

**T**HIS new Six is a positive winner. If it were not so we would not build it nor guarantee it. When the National builders put their confidence in a car and give their guarantee for it, you can not find a better proposition even if you use a microscope.

## You Don't Have to Raise the Hood

**N**ATIONAL owners have learned that we build whole cars—the name *National* is their guarantee. Every *National* car is built as a unit—every mechanical part operates harmoniously to produce satisfactory results. You leave the responsibility for its mechanical construction to our experience—forget that there are gears and mechanical parts in the car. Just rest in comfort and enjoy your ride with absolute confidence in your car.

## You Can Buy Over Telephone

**N**ATIONAL owners buy performance and not specifications—they can buy their new Nationals over the telephone. We sell our experience, ability, responsibility and our guarantee—not a mere job of

wheels, axles, gears and parts. That's why you don't have to raise the hood to buy a *National*, you know no better is made.

## Brief Specifications---National Six

Motor, six-cylinder,  $3\frac{3}{4} \times 5\frac{1}{2}$  inch, cast en bloc. Tire pump, integral part of motor. Clutch, self-contained aluminum cone. Starting and lighting, electric two unit system. Transmission, sliding gear selective type, three speeds forward, one reverse. Gauge 56 inches. Oiling, crank case constant level, force feed, with gear driven pump. Ignition, high tension, dual magneto with storage battery. Tires  $36 \times 4\frac{1}{2}$ . Firestone demountable rims. Air pressure gasoline feed, generated by small pump in crank case. Capacity 23 gallons.

Automatic carburetor. Two sets of brakes on 16-inch rear wheel drums. Bevel gear drive through straight line shaft with universal joints and torsion member. Full floating rear axle. Left side drive. Access all four wide doors. Single lever in center controls all speeds. Half elliptic springs, front, special National construction, rear.

Equipment:—Top complete with side curtains and boot, ventilating rain vision wind shield, extra Firestone rim, electric lighting and starting systems, 12-inch double bulb electric headlights, electric license tail light, Warner speedometer, electric horn, tools and jack.

**PAIGE**Illustration shows  
Model Glenwood**\$1275**

## **VITAL FACTS THAT THE SHOWS WON'T SHOW**

You won't be able to find out all you ought to know about a car from looking it over at the show, for there are certain factors of the most vital importance to every prospective car purchaser that will not be a part of the exhibits.

We mean the capitalization—the indebtedness—the plan of organization and the financial policy of the company building the car.

Yet the dealer and the buyer should inquire into these things. They are of the utmost importance to every buyer who is attempting to select the greatest value for his money. In the last analysis these factors almost alone determine the comparative value of the various makes of cars.

You will see Paige motor cars exhibited. You will see that they are better designed, better equipped, better built cars than are sold at anywhere near Paige prices. You will see such features in Paige cars as the multiple disc cork insert clutch, silent chain drive for motor shafts and a score of other equally high grade features. You will see a complete electric lighting and starting system on the Paige "25" selling at \$975—the first car with this equipment at less than a thousand dollars. And you will realize that Paige cars offer an extra value for the money.

But to know why the Paige Company is able to produce so much better cars for the money than competing manufacturers you must know the Paige organization.

Inquire into the capitalization of the Paige Company and you will find that the total capital

stock amounts to just \$250,000. This is all the stock that must earn dividends.

The Paige stockholders are satisfied with normal earnings on this investment and insist that all profits over and above this earning be put back into the car.

There is not a dollar's worth of bonded indebtedness to drag the Paige Company down.

No large office force—high salaried officials or expensive branches and agencies to load the output down with overhead expense.

All these factors play a part toward building up Paige extra value.

With these facts in mind you will take more than ordinary interest in the Paige exhibits at the coming shows. You will know why the Paige Company are able to put on these great extra value features you will see on the cars.

You will find the famous Paige "36" touring car and roadster selling at \$1275. Also three closed body types ranging from \$1850 to \$2250. And the Paige "25" touring car and roadster at \$975.

## The Cartercar Gearless Transmission— Twelfth Year of Success

**F**OR twelve years, or since the real beginning of the automobile business, we have been making Cartercars, the car with the gearless transmission. Far past the experimental stage, they are today a tremendous success, and their growing popularity shows the service that they give.

There are many reasons why the gearless transmission is the nearest perfect form of transmission on the market today:

**First**—Its simplicity. It has but two unit parts, a disk and a friction wheel. They roll together so smoothly that there is no jerk or jar in starting.

**Second**—Its flexibility. It gives you hundreds of speeds instead of three or four; permits you to go from high directly into reverse without injury to the mechanism. The operation is merely moving a lever forward for greater

**There Are Now Six Cartercar Models—Including Two**

We are proud of our Cars and naturally we want to tell you about them. To begin with, we will tell you about the newest model.

Model "7" is produced in two designs, full 5-passenger, fully equipped, including electric lights and starter, demountable rims with one extra. Model "7" roadster is equipped the same, is on the same chassis, seats two people, has large space in rear for luggage, extra tires, etc. Each model "7" sells for \$1250 and is one of the best automobile values ever offered to the public. Ask to ride in a model "7".

**A CARD WILL BRING OUR NEW CATALOGUE.**

speed and pulling the same lever back to reverse the car.

**Third**—Its power. The tremendous leverage obtained enables you even to climb 50% grades should you so desire. It also proves its worth on a steep hill, in a sandy road or on a crowded street, for it permits the car to roll along on any of the low speeds without racing the engine.

The roomy bodies, the long wheel base, the perfect upholstery, the superb finish, the big tires, the electric starting and lighting all controlled from the driver's seat, all these add touches that go to make the Cartercar the most satisfactory all around car on the market today.

It doesn't make any difference how many other makes of cars you have owned, or how exacting you are, or how hard you are on a car, if you purchase a New Model "7" Cartercar at \$1250, you are sure to be more than pleased.

**There Are Now Six Cartercar Models—Including Two New Ones—Will You Let Us Tell You About Them?**

Model 5-A, 5-passenger touring, 116-inch wheel base, front seat 40 inches wide, rear seat 50 inches, completely equipped, including electric starting and lighting. Price \$1700.

Model 5-B, 2-passenger roadster, 116-inch wheel base, seat 40 inches wide, completely equipped. Price \$1700.

Model 5-C, 8-passenger Colonial Coupe, the ladies' favorite. Price \$1900.

Model 5-D, 5-passenger Colonial Sedan, an ideal winter car, warm and luxurious, fully equipped. Price \$2000.

# Greatest Knight Motor

## \$2400 MOLINE-KNIGHT \$2400

Nothing extra to pay Completely Equipped

### The car you have long wanted

*More Power—More Flexibility—More Economy—More Silence*

**Guaranteed fifty brake horsepower** The car of the future is here today—a guaranteed fifty brake horsepower “Four” as powerful and as flexible as any “Six”—a big, roomy five-passenger car, ironed for two auxiliary seats, with an electric starter that starts each and every time. The Moline-Knight will be a delightful surprise, with its perfect, graceful, smooth streamline body and foreign air. Moline upholstery quality has been embodied throughout.

**The car of the future will not have poppet valves** The old poppet valve has outlived its usefulness because high compression, large valves, strong springs and precipitous cams are necessary in the poppet valve engine to get great power and high speed. Here is a weakness the poppet valve will never be able to overcome. In the Moline-Knight there are no valves to clog or grind—no cams, no springs, no timing gears to get out of order.

**Everything you have desired** Full floating rear axle, 128-inch wheelbase, selective transmission, half elliptic rear springs of unusual length,

Truffault-Hartford shock absorbers, Bosch ignition, Schebler carburetor, Moline-Wagner electric starting and lighting, adjustable foot pedals, center control, left side drive, lubrication by force through hollow shaft, 36x4 1/2 artillery or wire wheels, Firestone demountable rims, 18-gallon gasoline tank in rear, finished in blue-black, other colors optional with three weeks' notice. One-man Mohair top, cover and side curtains, automatic wind shield, electric horn, power tire pump, Warner 60-mile speedometer, Goodrich Unit Molded Tires, gasoline and oil gauge and speedometer, foot rail, robe rail, tire irons, complete set of tools, jack, tire repair kit, eight-day clock.

At least investigate—write today for our Advance Information Folder—learn the truth about motors.

**Dealers, if you can show us you are entitled to a Moline-Knight contract, write or wire us at once.**

**Moline Automobile Co.**

200 Lillie Street  
East Moline, Ill.

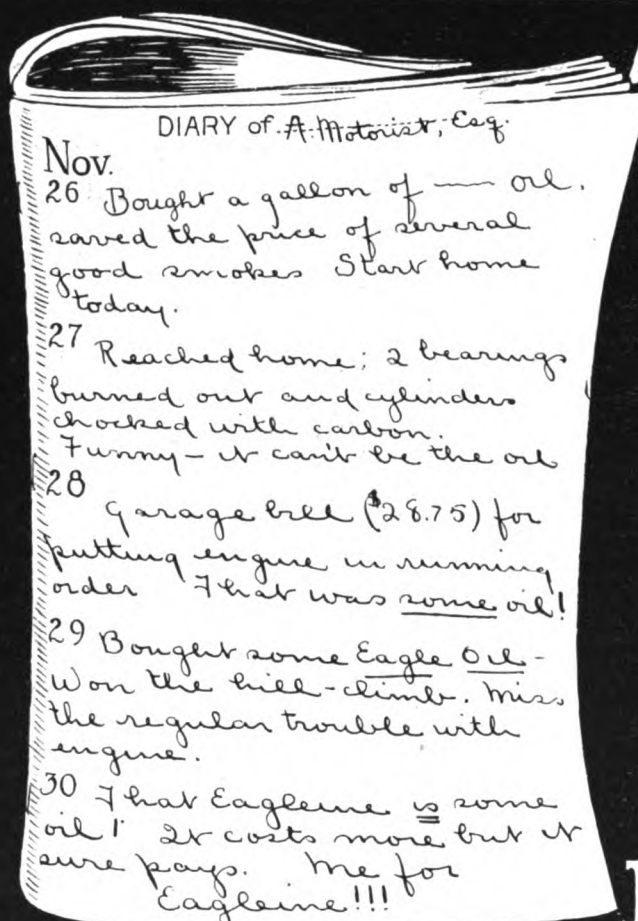

Four-cylinder, five-passenger, guaranteed 50 B. H. P., 128-inch wheelbase, Bosch ignition, Moline-Wagner electric starting and lighting, price \$2400. Wire wheels extra.

## CAR-NATION

"The Car for the American Public"

## More Than a Cyclecar

The Car-Nation has all the features hitherto only found on large expensive cars, yet it is light, snappy, economical (25-30 miles to the gallon) and the price is within the reach of the great majority of buyers.

The Car-Nation is made of standard parts, every one of which has been time tried and proven by use in bigger cars costing \$1000 and over. Just think of what this means in every day service to an owner.

Read the specifications and go over them part by part with any car you can think of. The 4-cylinder block motor with 3 speed forward and reverse, selective type transmission and multiple disk clutch as a unit power plant—wire wheels. Left hand drive center control—V shaped radiator with a sloping hood and cowl—in fact every part is a "feature" in many larger cars.

DEALERS—We are now producing these cars and the territory is going fast. You can make a very advantageous connection by closing your territory for this line. Write or wire now.

See Our Exhibits at New York and Chicago Shows

# REVIEW NEW YORK Show Number

## January 10, 1914

90 per cent. of the readers of the Journal are motor car owners—The men that constitute the market.

In this edition will be presented a complete resume of the New York Exhibition and a carefully prepared analysis of cars, parts and equipment that will be marketed during the year to come.

The Journal circulates in the field in which the greatest volume of business is done in America—where cars and equipment are being sold—it reaches the men who are buying.

**The Automobile Journal Publishing Co.**  
**TIMES BUILDING** **PAWTUCKET, R. I.**

Does it pay to put the very best of everything into a motor car or any other manufactured product? Does the public appreciate the untiring effort of the manufacturer to produce the best?

An emphatic answer to this question lies in the steady growth and present strength of this great institution. For more than sixty years it has followed the policy of producing the best at a fair price, and the American public has responded with generous recognition of honest value.

In motor cars, as in other high-grade machinery, this company may be depended upon now and in the future years to produce the very best that long experience, trained brains, fine workmanship and ample resources can bring forth, and to sell it at a price that will give the fullest measure of value to the purchaser.

*Inquiries to our factory or to the Marmon dealer in any city will be treated with the respect and consideration which the average purchaser of a high class car desires and expects.*

## The Marmon for 1914

In addition to the Marmon "Thirty Two," four-cylinder car, and the Marmon "Forty Eight," six-cylinder car, we are pleased to announce a new medium-size six-cylinder Marmon, model "Forty One," which will be exhibited first at Space B-1 at the New York Automobile Show in January.

Detailed information with specifications and prices may be obtained from dealers or factory.

# The TIRES THAT STAND THE KNOCKS OF TIME CATARACT

4000 Mile Guarantee

## QUANTITY vs. QUALITY

In order to maintain their grip on the tire market the so-called standard manufacturers have today been forced by the tremendous increase in the demand for their product to substitute quantity for quality. The year 1914 will witness a tire war among these companies such as never before seen in the business world. Price cutting with its ultimate results—poor product—will be the effect. The burden as usual will fall upon the consumer.

## CATARACT QUALITY

Notwithstanding this condition there is a demand for quality goods. Tires that are built right, that look right and that perform right. Tires made from the finest of rubber and fabric by the most skilled workmen. **SUCH ARE THE CATARACT TIRES.** A little higher in cost price—but a great deal lower in mileage price.

*May we not send you our booklet  
on CATARACT tires and policy?*

**WHEN YOU TIRE OF OTHERS—  
RE-TIRE WITH US**

## Sturdy Stutz Proclaimed Champion

The year 1913 was a period of splendid achievement for the Sturdy Stutz. It saw the Stutz outclass the most carefully built cars in the world, in the most severe tests ever attempted.

### A year of triumphs

Since July 5, 1913, the Stutz has won seven consecutive road race victories. In these seven races, totaling 1847.86 miles of service at an average rate of 70 miles an hour, the performance of the Stutz has been the most consistent ever seen on American tracks.

The triumph of the Stutz comes from building into the car the utmost stamina and endurance, with just the right balance between weight and power.

### Built to endure

The years of gruelling service on the race tracks and in private use, which the Stutz has undergone, have been an education to our designers and mechanics. From these tests, they have learned just what must be put into a car to make it a permanent success.

As a result you get perfection of form as well as mechanical perfection when you buy your Stutz. Its stamina, sturdiness, beauty, roominess and comfort will please you always.

### See the Stutz at the shows

The Stutz will be on exhibition at Space B-7 First Regiment Armory, Chicago and Space B-10 Grand Central Palace, New York. Take the time to look it over carefully. You should know the facts about this truly remarkable car. Write for our new illustrated catalog, No. A-5, Series E.

**Dealers** We still have a little desirable territory open and an interesting proposition to make responsible dealers. Write or wire.

# AUTOMOBILE ELECTRIC LIGHTING SPECIALTIES

For the Automobile Owner & Manufacturer  
Who Wants *SERVICE* For His Money.

## Combination Dash And Trouble Lamp With Extension Cord

(Patent Applied For)

**Style D  
Combination**

**Extension Cord**

**Rear  
Number Lamp**

We are the pioneers of this country in the manufacture of **Automobile Electric Lighting** equipment—We have passed the experimental stage—and today sell only equipment that is perfected.

Our Electric Lighting Equipments are standards—they have been selected by many of the leading automobile engineers of this country and installed on every car as part of its regular equipment—

CULVER-STEARN'S Electrical Products never become loose at the sockets—never a short circuit—no breaking of current—always working when wanted—and will wear indefinitely.

WE HAVE ILLUSTRATED TWO OF OUR SPECIALTIES  
WHICH ALWAYS DELIGHT THE PURCHASER.

### Style "D" Combination Dash and Trouble Lamp (Patent Applied For)

With Extension Cord

The only combination Dash and Trouble Lamp on the market and a most practical and satisfactory article.

In less than one minute it can be disconnected from the dash and converted into an ideal trouble lamp.

Constructed of the best of materials, perfectly fitted, and finished in a beautiful bright nickel.

It takes only a few moments to install this lamp on any car—any novice can do it—may be used with magneto or battery.

Style "D" complete with 2 C. P. 6 V Mazda bulb, 10 ft. of cable and either flush or projecting dash connector. List \$3.00 each.

### TO MANUFACTURERS AND THE TRADE

We can promptly make to your order any  
Electrical Equipment, or will originate and manufacture any special parts desired—

### Style "K" Rear Number Lamp

This Lamp, as its name indicates, is designed to meet a demand for a good lamp that will really illuminate the rear number plate. This lamp should be placed directly over, or attached to, the rear number plate, and the diffusion of light is such that the entire number plate can be easily read.

While this Lamp is not designed for a Tail Lamp, it does carry a small but powerful red lens.

This Lamp is an absolute protector to automobile owners living in those states which impose a penalty if numbers are not properly lighted—a novice can install it in a few moments.

This Lamp is made of the very best grade of materials, and fully guaranteed.

Style "K" complete with Mazda Bulb, list \$3.50 each.

### OUR NEW 1914 CATALOGUE

is ready for mailing—It contains information of the most desirable Electrical Equipment on the market today—mailed upon request.

### Special Notice To Car Owners

We want every automobile owner to be able to get our goods promptly when they are wanted. If your dealer does not have C-S goods in stock—write us and we will see that your order is promptly filled.

# J. H. S. SHOCK ABSORBERS

PATENT APPLIED FOR

are a revelation as well as a revolution in spring suspension.

Their sensitiveness of action **AUTOMATICALLY** takes up and destroys jars and jolts, either heavy or light, and to the occupant of a car it seems like riding on air—fairly floating through space.

Vibration is eliminated, thus giving long life to tires, motor, transmission and other components. In consequence greater speed is possible, as the car does not tend to skid or roll. The mechanical principle of the J. H. S. Shock Absorber is as scientific as that of a hydro-carbon engine. A cylinder and piston are used to insure durability, there being no fragile parts to wear or easily get out of order. The piston acts in harmony with coiled springs which destroy all shocks.

**PRICE—\$15.00 AND \$25.00 A PAIR**

**ATTRACTIVE OFFER TO FORD OWNERS**

# One Million Cars Prove the Truth About Lighting

Most of them, over four-fifths of the million, are gas lighted.

Those that are lighted with electricity are contributing even stronger proof why gas lighting is more economical, most efficient, just as convenient and far safer.

Investigate carefully before you buy your new car. It will save you time, money and trouble if you use the coupon below.

## Economy

Absolute proof in actual tests and service show that electric lights cost you five times more than Prest-O-Lite. Evidence awaits you. Get it.

## Efficiency

The candle power of the electric lamp bulb is about half that of the naked flame of gas lighting. If you want only a dazzling beam, half a mile down the road, you can get it with a parabolic reflector. But experienced drivers prefer gas lamps that show the road immediately in front of the car **where it is needed.**

*The coupon brings added proof. Use it!*

**DEALERS** Every day we are hearing from a few practical dealers, who have sunk profits in trying to make electric lighting equipment live up to the maker's claims. We have a special message for the wise dealer who can see ahead of today—who is figuring on the future. Ask for it.

**The Prest-O-Lite Co., Inc.** 226 SPEEDWAY  
INDIANAPOLIS, IND.

Exchange Agencies Everywhere  
(Contributor to Lincoln Highway)

## Convenience

With the Prest-O-Liter and Automatic Reducing Valve, gas lighting offers every "push-the-button" convenience. You can light or extinguish any or all the lamps on your car from the seat.

## Safety

Here is a quotation from one paper—

"Seventy-five per cent. of the collisions that have taken place in the night time in San Francisco of late, can be laid to the glare of the electric headlights of the modern car."—Pacific Motor, San Francisco.

# THE BRAKE LINING OF QUALITY

At New York  
Booth No. 175  
Fourth Floor  
Don't miss seeing it

## We Prove It at the Shows

THE GRIP  
**MULTIBESTOS**  
BRAKE THAT GRIPS LINING

Every Salesman of brake lining has a few stock phrases that he uses continually in arguing for the quality and merit of his particular brand. Heat resistance; coefficient of friction; extreme durability---these and many others are among the features which are spoken of so often, and at times so loosely. One calls his "the original"; another flatly declares his "the best".

We have made several claims ourselves and

now that we have the opportunity we mean to prove these claims and back up our widest statements with substantial proof.

At all three of the big shows we will have on exhibition a mechanical device which will be driven by a friction wheel made of Multibestos. There will be a brake drum attached and the band will be lined with Multibestos. By this device we can show exactly what Multibestos will do.

There will be no guess-work about it---no loose statements; but there will be definite and absolute proof that every feature which goes to make a good brake lining is found in the highest degree in MULTIBESTOS.

**A VISION**  
of your car,

smashed on the  
slippery curve  
ahead—

*You* have neglected to put on  
Weed Chains.

*You* anxiously view the slippery  
curve ahead and have *a mental*

*picture of your car smashed against a rock.*

Why nurse anxiety and coax calamity—why take such chances  
when you know

# Weed Anti-Skid Chains

## *Absolutely Prevent Skidding*

*No other device* has ever  
been invented that takes the  
place of Weed Chains. All  
kinds of "make-shifts" have  
been tried—useless and worth-  
less all. The *real value* of  
Weed Chains has been proven  
so often and so satisfactorily  
during the last ten years that  
there is no room for argument.

They are slipped on in a  
moment without a jack. *They*  
*don't injure tires* even as  
much as one little slip or skid.  
*They never fail* in an emer-  
gency and take up hardly any  
space when not in use.  
*Send for Booklet proving the*  
*efficiency, economy and nec-*  
*essity of Weed Chains.*

*Sold for ALL Tires by Dealers Everywhere*

## OUTLOOK FOR BUSINESS IN NEW YORK.

**Broadway's Automobile Row That Prospects for the Immediate Future Are Exceptionally Promising and Every Dealer Is an Optimist---Reorganization of Sales Methods Has Resulted in the Adoption of Policies Making for Stability and Permanence---The Used Car Problem and Loss Account---Dispopulation and the Practise of Shopping for Cars---Effect of the Present Garage Situation---Reasons for Expecting Good**

**A**UTOMOBILE Row in New City is sufficiently near Wall street to warrant

the assumption that the dealers in that centre are in a position to judge of the possible effect of the "Market" upon the sale of motor cars and accessories. If it be found that the men representing the industry in New York City are optimistic concerning the immediate future, it ought to follow that the conditions in this respect throughout the rest of the country are even more reassuring.

**Group of Car Agencies at Broadway and 59th Street, and the United States Rubber Building—The Heart of New York City's Automobile District.**

**Is Unanimous in the Opinion that Prospects for the Immediate Future Are Exceptionally Promising and Every Dealer Is an Optimist---Reorganization of Sales Methods Has Resulted in the Adoption of Policies Making for Stability and Permanence---The Used Car Problem and Loss Account---Dispopulation and the Practise of Shopping for Cars---Effect of the Present Garage Situation---Reasons for Expecting Good**

Business methods vary according to the city and the section of the country. Conditions which must be

met in one commercial centre may not exist in others. Policies which will apply to one line cannot be worked successfully with another. New York

presents certain problems that are unknown in some sections. It will be the object of this discussion to report the result of an investigation of the situation in that city, and it will be un-

**The White Company's Branch, Broadway and 63rd Street.** derstood that the record is that of actual conditions as revealed by personal interviews with men representing every branch of the industry in the Metropolis.

#### Reorganization of Sales Methods.

Let it be stated at the outset that the sales end of the business in New York has been very largely reorganized during the past year. By this is meant that the men engaged in the distribution of cars and accessories have adopted systematic methods tending toward a more careful supervision of details, so that it shall be possible at all times to determine the condition of the business and its several departments. With this has come a determination to educate the purchasing

public to the necessity for considering each transaction on a strictly business basis.

#### Early Days Recalled.

Times have changed very materially since the days immediately preceding the organization of the National Association of Automobile Manufacturers, now the Automobile Chamber of Commerce, a little over 14 years ago. At that time the number of agencies could be counted without going far beyond the fingers of one hand. Chas. E. Miller's establishment on 38th street was the centre of New York's Automobile Row. Mr. Miller is practically the only New York dealer of that period who is still in business in that city, although others have graduated into the manufacturing end of the industry.

Mr. Miller's position in the industry always has been rather unique. His name is known today in every section of the globe as that of a dealer, manufacturer, jobber, exporter and importer of accessories, supplies and fittings. Upon entering his headquarters at 97 Reade street, the first object to attract special attention is a framed membership certificate, numbered 3, in the National Association of Automobile Manufacturers, and the question at once arises as to the presence of an accessory man in an organization of automobile manufacturers.

Long before John Wanamaker first exhibited Mobile steam cars in his New York department

**Upper Left, Jackson Eastern Distributors, Jackson; Upper Right, DeLamater-Byrnes Company, Moline-Knight; Lower Left, Sidney Bowman Automobile Company, Marmon and Oakland; Lower Right, Ford Motor Company, Ford.**

Upper Row, Detroit Cadillac Motor Car Company, Cadillac, and F. B. Stearns Company of N. Y., Stearns; Lower Row, J. I. Case Threshing Machine Company, Case, and Buick Motor Company, Buick.

store in the latter part of 1898, Chas. E. Miller was an important factor in the American automobile industry. It was while he was handling bicycles and bicycle accessories in a national way that Mr. Miller became interested in the horseless carriage. It will be remembered that many pioneer motor vehicle men were graduates from the bicycle industry, and their acquaintance with this establishment led them to commission Mr. Miller to search out various parts that could be adapted to the new product, such as steam boilers, rear axles, and in fact almost every part entering into the assembly of the car—for the automobile manufacturer of those early days was most assuredly an assembler.

#### Situation Never so Promising.

Detroit may be the heart of the automobile industry today, but New York shared honors with Boston in the beginning, and this fact had its influence on the selling of cars. One of the oldest New York dealers is Theodore E. Schulz, now sales manager for the Sidney Bowman Automobile Company. He has been selling motor vehicles in the Metropolis for 13 years, and he has witnessed all of the changes in methods and conditions during that time. He holds that the situation never looked so promising and that the stability of the industry never was better assured.

#### Need for Efficient Salesmen.

When the industry was young, and before the practicability of the horseless carriage was established, it was deemed necessary to adopt sales methods that, whatever the results at the time,

cannot be regarded today as satisfactory. Many men engaged in the production of cars realized the importance of getting these machines in the hands of users, for it was believed that only by constant use could their practicability be determined. There is no disposition to interpolate a history of the automobile industry, or of its sales methods, but this reference to the past appears necessary in order to indicate the desirability of the changes which have been brought about on the part of New York dealers—and it may be added that these changes have been adopted much more generally by the dealers in that city than in some other sections.

Mr. Schulz considers that the most important

condition with which the New York dealer must contend today is that of securing efficient salesmen, and with this opinion many others agree. The usual practise in that city has been to pay the salesmen a stated salary plus a commission on each sale, this commission being based upon the amount of cash received. The subject of trading will be taken up in more detail as this discussion progresses, but it is sufficient for present purposes to state that this is a very serious problem in the Metropolis, as elsewhere.

#### Defects of the Old Plan.

The plan was considered a very satisfactory one, until systematic study revealed its shortcomings. Many dealers, in going over their

books at the close of the year, were somewhat surprised to note that, although sufficient business had been done to indicate a satisfactory profit, there was a deficiency. As a result there appears to have been a general awakening on the part of those in charge of the several sales departments, each working independently, and inquiry reveals that a very large majority have devised good, working systems to determine the actual value of each salesman to the establishment with which he is connected. These systems, no matter by what specific method, invariably show just how much profit resulted from each individual transaction. For example: In one instance, the salesman with the best showing with respect to number of sales covering a given period had cost the firm some \$750 in losses on these sales, while the man who had sold the fewest cars had netted a profit to the house very nearly as large.

#### Training Experienced Men.

It might be assumed that one of the results of this systematic study of the question would be that several salesmen would soon be in a situation to accept new positions elsewhere, but the reorganization plans contemplate such action only where it appears absolutely necessary. It has been the opinion of those responsible for the success of the sales departments that best results could be obtained by retaining the services of experienced men and educating these men to the new order of things. For this purpose, weekly

The R. & L. Company, Garford Cars and Trucks.

meetings are held, at which specific details of the business are considered from every aspect.

#### The Used Car Problem.

Some dealers maintain that from 80 to 90 per cent. of their sales involve the second hand problem. A large majority hold that it is absolutely impossible to do business without trading. A few declare that they positively will not trade. Practically all of those in the last named class avoid the necessity for trading, by maintaining a used car department as a separate institution, by which the second hand machine is sold for a customer without charge.

It is the question of allowance on the old machine which enters so largely into the matter of salesmanship, with that majority which believes it to be a necessary evil. Several plans have been tried. It is realized, or at least it is beginning to be realized, that the man who enters a salesroom with a second hand car proposition often is a much better salesman than the man with whom he is seeking to do business. That the temptation to make a sale many times outweighs the salesman's better judgment is evidenced by the showing reported above. The plan most generally in vogue today is that of asking the superintendent of the service station to place a value on the used car offered for trade and limiting the salesman to that figure.

Of course, there are dealers in New York, as there are in every other city, who do not strictly

Harry S. Houpt, Inc., Losler Agency.

adhere to this plan, although professing to do so, but they are decidedly in the minority. The whole subject has been under discussion in conference a number of times and the dealers themselves have come to the conclusion that more satisfactory results can be obtained individually. By this is meant that those men who believe in the necessity for establishing their business on a basis that shall endure, have decided upon a definite course with respect to this matter, and are permitting others to take such steps as they desire. These men are confident that it is impossible to continue long in business in New

## HOW NEW YORK DEALERS HANDLING VARIOUS TYPES

### **Baker Electric—**

Despite unfavorable financial conditions in Wall Street, we have enjoyed the best fall selling in our history. We believe in conducting business with a view to normal success, rather than employing brass band methods.

A. J. BROWN.

### **Bulck—**

We have made more sales by 118 between Aug. 1 and Dec. 1, than during the same period last year, and business was better last year than ever before. Every Bulck branch in the country paid a profit for the first time. We are finding a decidedly increasing demand for light delivery wagons, here in New York.

A. L. NEWTON.

### **Cadillac—**

We have already delivered 100 per cent. more cars of the 1914 models than was true of the 1913 models last year at this time. We have taken more orders for late winter and early spring delivery, by 100 per cent., than in any other year. Our enclosed car business has been somewhat phenomenal. Despite the generous allotment of such bodies from the factory, we have been obliged to have special bodies made by four other concerns, one of these being a foreign house. We have been in this location five years, and Jan. 1 we will remove to our new building at 62nd street and Broadway.

ERNST H. BRANDT.

### **Cole—**

The market is stronger for this grade of car, than for those above it. We expect good business, and certainly will get our share. I look for a shortage of cars in the spring. We are selling more machines right now than last year at this time.

F. L. WISEBERGER.

### **Ford—**

The demand for Ford cars is greater than ever before. We are selling many to people of wealth and social position. This does not mean that there will not always be a demand for high grade cars, but a great many people have found that it is not necessary to pay so much, and that the Ford car is a good little car for the money.

A. McDONALD.

### **Garford—**

Last week was the biggest week we ever had. We sold 21 trucks. Inquiries from big concerns respecting large installations indicate that next year will be the biggest truck year we have ever seen. We have attempted to do very little pleasure car business, but upon the arrival of the Garford-Knight we expect to begin an energetic campaign in that field.

PAUL LINEBERGER.

### **GMC Trucks—**

We have sold more trucks since July than in any other similar period. Inasmuch as we handle both gasoline and electric vehicles, we have an advantage over some other concerns. We find business houses very much interested in mechanical transports. We are making a number of fleet sales, but the one-car orders net the largest profit. Just as soon as this little financial flurry is over there are a great many concerns in this city who are going to buy, and buy heavy.

C. B. WARREN.

### **G. V. Trucks—**

More people are interested in commercial motor vehicles than ever before. We are looking forward to 1914 with the expectation that business will be even better than in the past.

F. NELSON CARLE.

### **Haynes—**

Our business shows an increase of from 25 to 35 per cent. every month over that of the same month last year. We are not looking forward to any decrease in the near future. We are feeling pretty good over the outlook for the next year.

E. W. HEADINGTON.

### **Hudson—**

I would say that the possibilities for business are wonderful. I mean by this that the conditions with respect to the automobile buying public are so different today from those of any other period in the history of the industry that the dealers are only just beginning to realize the possibilities. We are selling cars to a large number of people who have always hitherto purchased larger and higher priced machines. I believe this is going to be even more largely true in the future.

D. C. WEGMAN.

### **Hupmobile—**

If the garage conditions in New York were as satisfactory as in many other cities, there would be at least one-third more immediate sales. The excessive garage charges and the ready accessibility to the taxicab have deterred many persons from gratifying their desire to own a machine. In spite of these conditions, the solving of which would mean much additional business, it looks as though we were going to be exceptionally busy during the next few months.

CHARLES E. REISS.

### **Jackson—**

Business should be good in the spring. We are behind on deliveries, and the actual deliveries this year have been greater than last. The conditions look just as good as ever. One phase of the business must be corrected. When a man asks for a pound of coffee and is told that the price is 35 cents he does not offer 30. Why should a different rule apply to the purchase of an automobile?

H. S. STRONG.

### **King—**

Conditions look good to us. This is a comparatively new line in this city, but the people are interested and we expect to make a great many sales.

K. G. JOHNSTON.

### **KisselKar—**

We did more business last month and during December, thus far, than a year ago at this time. It is going to be a good year, so far as I am able to foresee. The demand for small trucks, ranging in capacity from 1500 to 3000 pounds, is very marked just at present.

C. H. McCAUSLAND.

### **Losier—**

Conditions point to a good business in New York. We sold 24 cars in November, and 12 thus far in December. In the future there will be less branches, for the reason that the branch manager has only to consider his salary, while the agent must make his living from the business. I think it will be necessary to solicit trade rather than wait for it to come in.

HARRY S. HOUP.

### **Marmon, Oakland—**

There is plenty of business for the man who does business on a business basis. The greatest problem confronting the New York dealers today is that of securing efficient salesmen. It is not a question of how many cars are sold, but how much profit results from each sale.

THEODORE E. SCHULZ.

## OF CARS VIEW THE PROSPECTS FOR BUSINESS IN 1914.

**Maxwell—**

The demand is gradually getting toward cars selling around \$1000, particularly where it is desired to have a family machine that can be used for every day purposes. Prospects for sales in this field never were brighter than right now.

L. W. BITTING.

**Mets—**

We are going to sell all the cars we can get. We have bona fide orders in our territory for 225 machines, but, of course, our territory covers a wide area. The demand is not as great here in the city, but these little cars are big sellers in the suburban towns. Our principal trouble lies in securing deliveries from the factory fast enough to supply the demand.

ADOLPH MORRIS.

**Moline-Knight—**

We are having many inquiries concerning the new Knight engine, and expect much business in consequence. It is my belief that conditions are much more favorable than formerly, for the reason that the buying public is not demanding so much from the dealer. In a measure, the reason dealers have failed to make money in the past has been the fault of the buyer, and now that these people are beginning to consider the sale of cars as a business proposition, I expect much better results. I would say that conditions for business were better than ever before.

H. E. DELAMATER.

**National—**

Every indication points to better business conditions than ever. We find that 80 per cent. of our sales are to new owners, and that 90 per cent. of these are sold because of the advice of old National owners.

W. T. POERTNER.

**Overland—**

Business looks very good for the trade leaders, of which the Overland is one. Our sales are increasing very rapidly.

L. A. HOWELL.

**Packard—**

Our business for 1913 has been better than in 1912, both as to volume of sales and valuation. Our selling season has kept right up, owing to the weather. New York always has been a good automobile market, and I am of the opinion that we have conditions here which make for good business when the reverse may be true elsewhere.

H. W. NUCKOLS.

**Paige—**

We find conditions much more promising than last year at this time.

CHARLES M. KOHN.

**Palmer-Singer—**

I shall be very much surprised if our sales do not show a 50 per cent. increase next year.

HENRY DROUET.

**Peerless—**

I am a new man in this territory, having only recently been transferred to this branch from Newark. I believe conditions are much better than most men realize, but business principles must be adopted in doing business with the class of men who can afford to buy a high grade, high priced car. The salesman must be able to meet his customer more nearly on an equal basis than has been true in the past. Just at present there is a decided demand for motor trucks and this is a field which offers splendid opportunities for salesmen of the necessary ability.

GEORGE H. SMITH.

**Pierce-Arrow—**

We have always believed that we occupied a position as leader in the sale of high grade cars in New York City. I see no reason to change this opinion at present. Our sales continue to be decidedly gratifying in this respect. In the motor truck field we have been equally successful, having placed 99 machines in two years. The market for trucks is exceptionally good.

ROBERT D. GARDEN.

**Rauch & Lang Electric—**

Business in the electric field, here in New York, is going to be better than ever. I'll do business if conditions are good, and I'll do business if they are bad. I have been spending my time educating the people as to the economy of the electric, and that is why I am confident of success.

C. Y. KENWORTHY.

**Reo—**

The outlook is very good. This is unquestionably a year for high grade cars of medium weight selling at a moderate price. We are interesting many men who intended to purchase higher priced machines. We look for good business.

R. E. INGERSOLL.

**Simplex—**

Our car must be placed in the high grade class. It sells at the highest price. If our business is any indication of the tendency of the public there has been no falling off in the demand for high grade, high priced cars. Our sales have increased each month over any preceding month.

F. H. BOWEN.

**Speedwell, Velle—**

We expect from 50 to 100 per cent. more business next year than this. We have made several holiday sales—quite as many as in other years. By holiday sales, I mean those in which the car is purchased for a Christmas present. The truck business is growing very rapidly.

G. W. GARLAND.

**Stevens-Duryea—**

There always will be men who can afford and will buy nothing but the best. The prospects are better for us the coming year, because some concerns which have been making high priced cars have withdrawn from this field, thereby limiting the output in this class. In this great, big country, there will be sufficient demand to take all the cars our factory can produce.

FRANK EVELAND.

**Studebaker—**

The outlook is good. Ninety per cent. of our prospects walk into the store. So long as people continue to shop up and down the street in search of the car that meets their needs, business must be good.

G. H. PHELPS.

**Stuts—**

Business has been decidedly better since Sept. 1 than during the summer months. We fully expect to do good business during and right after the show.

J. H. AMORY.

**White—**

This has been the biggest year of our history, and we look forward to 1914 with a good deal of confidence. Records show that business is becoming concentrated. Our company is getting its share and a large proportion of the commercial vehicle business in New York City.

R. H. JOHNSTON.

At Left, Colt-Stratton Company, Cole; at Right, Drouet & Page Company, Palmer-Singer, and Garland Automobile Company, Speedwell and Velle.

York without making a profit on each transaction.

#### Transients and Shoppers.

A distinctive feature of the situation in the Metropolis is found in the large transient population of the city. This probably applies more largely to New York than any other centre in the country. There is, of course, the possibility of interesting residents of the city proper and its suburbs, and, in addition, the large number of people who visit New York from a distance are possible purchasers.

Because of this condition there undoubtedly is more shopping for automobiles in that city than elsewhere. People are continually walking

up and down Broadway, from 46th to 63rd streets, the present limits of Automobile Row, searching for the type of car which meets their desires. This does not apply solely to out-of-town prospects by any means. A general estimate, by the dealers themselves, indicates that 75 to 80 per cent. of the prospects are secured in this manner.

#### Rent and Overhead.

Columbus Circle, at Broadway and 59th street, is one of the busiest corners in the city, and locations in that vicinity are held to be most desirable. The United States Rubber building at Broadway and 58th street, might almost be considered the heart of the industry in New York.

Upper Row, Pennsylvania Rubber Company of New York, Pennsylvania Tires; Columb Tyres Import Company, Prowodnik Tires, and Spiltdorf Electrical Company, Spiltdorf Ignition; Lower Row, Fisk Rubber Company, Fisk Tires, and Gaulois Tire Corporation, Gaulois Tires.

The offices in this structure are occupied by more sales companies and concerns of like character connected with the industry than any one other building in the city.

However, the question of rent has had and is having a decided effect upon the dealers under the reorganization. Palatial establishments—Tiffany fronts as they are sometimes termed by New York dealers—are rapidly becoming a thing of the past. All these items must be considered in the overhead expense, and those who represent the industry in the Metropolis are strongly of the opinion that men with whom they must expect to do business are thoroughly conversant with overhead expenses and the fact that these

ber of cutting remarks which they can bring to bear upon the unfortunate owner who feels he must work upon his own machine have a decidedly depressing effect upon his enthusiasm, to say the least.

#### Solving the Garage Problem.

Several dealers recognize this evil, and at present there is a well developed movement under way looking toward the establishment of a co-operative garage which shall be exclusive in character, to the extent that none but owners who drive and work upon their own machines shall be permitted to secure space therein. The plan is to sell stock to dealers only, the management to rest in a board representing them. At

Upper Row, A. T. Demarest & Co., Renault, Mercedes, Etc.; Kissel Motor Car Company, KisselKar, and Stratton Motor Car Company, Pope-Hartford and Jeffery; Lower Row, C. J. Cross & Co., Dayton Airlens Tires; Knox Automobile Company, Knox; Swinehart Tire & Rubber Company of New York, Swinehart Tires, and Poertner Motor Car Company, National and Waverley Electric.

must be included in the price at which the car must be sold.

#### The Garage Situation.

One other condition enters very largely into the situation—the absence of satisfactory garage accommodations. With this might be linked the ready accessibility of the taxicab. The garage proposition is somewhat distinctive. There are plenty of good garages, but it is said to be almost impossible for an owner to care for his own machine in them. Many garage proprietors forbid such work entirely, and wherever the owner is permitted such liberty, other conditions exist which make for unpleasantness. Most New York owners employ a chauffeur. These men frequent the garages, and the variety and num-

ber of cutting remarks which they can bring to bear upon the unfortunate owner who feels he must work upon his own machine have a decidedly depressing effect upon his enthusiasm, to say the least.

first it is proposed to employ perhaps one or two men for day duty and a like number for nights, these to be in charge of the stores and supplies and to assist the owners as requested by them. Each owner would have his separate stall and a key thereto, with permission to use any necessary machinery or equipment.

The effort is to provide every facility of the private garage, and more, under such conditions as would make the owner feel perfectly at home. It is believed that this would have a decidedly important effect upon the sale of machines and fill a long felt want in the city. The only question as to the success of the plan, from the viewpoint of the dealers, is that of securing a site sufficiently central at a price which will permit

rental charges which will not prove prohibitive.

There will be little disposition to question the statement that these conditions make for stability and permanence. The New York dealers believe they will have the co-operation of the buying public in carrying out these plans, and that business men will be able to appreciate the influence of strictly business principles as applied to the marketing of a product which has come to be recognized as an economic necessity.

#### **Present Market Conditions.**

While, as a whole, the influence of Wall street upon the sale of automobiles is no greater in New York than elsewhere, it is true that some dealers in that city come directly in touch with men who are embraced within the term Wall street, and these may be assumed to be in a position to give valuable information as to the effect of the present market conditions on the automobile industry. Such dealers maintain that the effects of the tariff had been more or less discounted before the passage of the Underwood bill; that any money stringency as the result of pending currency reform is largely manufactured by banking interests, and that the possibilities of a Mexican war are too remote to be considered at all seriously. They are quite as optimistic concerning the immediate future as those who have had less opportunity to study the situation in detail. In short, there is a decided tendency on the part of all New York automobile dealers to feel that conditions already are much better than was true previous to Dec. 1.

On other pages are presented short statements from several dealers representing the different grades of cars, setting forth their opinions with respect to the prospects for business. Not one man was found along Automobile Row in New York who did not feel entirely optimistic as to the immediate future. This feeling is due in part to the reorganized condition of individual concerns, as set forth above, and in part it is based upon the opportunities which have presented themselves during the past month especially. In this latter connection it must be remembered that New York dealers estimate that between 75 and 80 per cent. of their new prospects are recruited from the list of people who go up and down Broadway on a shopping tour.

#### **Electric Pleasure Cars.**

The same conditions apply with respect to the sale of electric pleasure vehicles. The dealers in these machines have been carrying on an energetic campaign of education during the past two years, and for this reason the market is giving much greater promise than ever before. Traffic

conditions in certain sections of Manhattan are such as to discourage driving by women, but the electric has done much to overcome timidity in this respect. The garage situation, mentioned above, has led some men to decide upon the electric, and the method of enforcing traffic regulations has had its effect upon the use of such machines by those who frequent the shopping district and the theatres. There seems good reason for believing that the sale of electrics will increase very materially during 1914.

#### **Commercial Vehicle Business.**

The commercial vehicle situation is affected most largely by financial conditions. New York has proven a good market for both gasoline and electric business wagons, and the results which have been obtained with such machines have created an increased demand. The sales have held up well right through the fall, and the outlook for future business is decidedly promising.

The selling of motor trucks is readily divided into two classifications, one of which embraces the order for a single machine and the other what is termed fleet business. The first involves conditions which permit of the usual character of salesmanship, with the addition of a thorough knowledge of the truck and the character of the service in which it is to be used. The second however, presents a somewhat complicated problem in New York City, from the fact that it often becomes necessary to sell the purchasing agent, engineer, superintendent of the delivery system, president and other officials, and finally the board of directors. To cope with such conditions it usually is advisable to adopt team work, in which different men of the sales staff are working on several members of the combination at the same time.

#### **The Accessory Situation.**

Accessory men in New York, both those engaged in the retail end of the business and those who act as jobbers or wholesalers, are content to accept the opinion of the automobile dealers with respect to future conditions. If there is every indication that new cars are to be sold in increasing quantities, those who provide the supplies and fittings feel that they have no reason for expecting any other result.

#### **Mr. Miles' Views.**

Opportunity was had to secure the views of Samuel A. Miles, general manager of the Automobile Chamber of Commerce and manager of the forthcoming New York and Chicago shows, upon conditions affecting the industry generally. He shares the same optimistic views and in his discussion of the situation, said:

Have you stopped to think just how wonderful has been the growth of this industry of ours? In 1903, less than 10,000 cars were produced. In the year which ended July 1, 1913, more than 400,000 were manufactured in this country. Each year the production has exceeded that of the previous year, and, in addition, if we go back five years each time, it has exceeded that of the entire previous period. See if you get what I mean. We have produced 400,000 cars for 1913, and if we go back to 1908, that is more cars than had been manufactured by the industry previous to and including that year. The same thing ap-

plies for any year and any period of five years previous thereto, as 1910 and the period including 1905, for example.

It is not surprising that the industry should stop to consider this wonderful increase and its bearing upon the automobile market. I feel that the so-called panic of 1907 was the best thing that ever happened to the industry, for it is practically certain that otherwise there would have been an over production in 1908, which would have been serious in its effect. I do not believe that anything of this nature could happen at this time.

## SUCCESSFUL TOLEDO AUTOMOBILE SHOW.

**A**UTOMOBILE dealers in Toledo, O., adopted a very satisfactory innovation in connection with the sixth annual show of the association in the new Automobile Factories building, on East Woodruff avenue, between 12th and 13th streets, Dec. 6-13. Besides the formal exercises the opening evening, when Mayor Brand Whitlock turned the switch which flooded the elaborately decorated halls with light, there was, throughout the week, a special programme of addresses on technical and general motor car subjects by speakers of authority. The object was to supply the prospective owner with information of decided value, and the plan met with a hearty response on the part of the buying public.

The Automobile Factories building is an entirely new structure and proved eminently satisfactory for this purpose. Previous displays have been held in the Terminal Auditorium, but the new building not only possessed the added advantage of enlarged floor space, but its central location was appreciated by both out-of-town and resident visitors at the show.

Pleasure cars were exhibited on the first floor, and the display of motor trucks, motorcycles and accessories was on the third. Cyclecars were included among the pleasure vehicle displays. The attendance was in every respect gratifying and the amount of business transacted or in prospect wholly in keeping with the magnitude of the undertaking. It is stated that the value of the cars on display was estimated at practically \$1,000,000.

The committee in charge of the event was composed of the following officers and members of the association: President J. G. Swindeman, Vice President Guy R. Ford, Secretary H. W. Blevins, Treasurer J. W. Banting, T. H. Dear-dorf, A. A. Atwood and Frank L. Mulholland. The following were the exhibitors:

**Pleasure Cars**—Abbott Motor Sales Company, Abbott-Detroit; H. J. Adams, Reo; Atwood Automobile Company, Overland, Marmon, Standard electric; Auto Distributing Company, Regal; Banting Machine Company, Paterson; Baumgardner & Kibby, Oakland; Blevins Auto Sales Company, Studebaker; Bunnell Auto Sales Company, Cole, Chevrolet, Detroit electric; Cornelius-Hohly Auto Company, K-R-I-T; Gamble Motor Company, Peerless, Hudson, Garford, Ohio electric, Baker electric; Gauntlett Auto Sales Company, Buick; Roberts-Toledo Auto Company, Ford; E. W. K'Burg, Stearns-Knight; Landman-Griffith Company, Maxwell, Lozier; Lichte Automobile Company, Cadillac; Maumee Motor Company, Empire, King; Standard Auto Company, Packard, Rauch & Lang electric; H. E. Throne, Mitchell, Paige; Union Supply Company, Chalmers, Pierce-Arrow; C. J. Clapp, Winton; White Motor Car Company, White; W. H. McIntyre Company, Detroitter, Jeffery, Lyons-Knight; Grasser Motor Company, Hupmobile; Allen Motor Company, Allen; First Garage & Motor Company, Partin-Palmer.

**Commercial Vehicles**—H. J. Adams, Reo; Atwood Automobile Company, Willys Utility; Blevins Auto Sales Company, White; Bunnell Auto Sales Company, Federal, Detroit electric; Gamble Motor Car Company, Garford, Peerless, Baker electric; Gauntlett Auto Sales Company,

A Corner of the Recent Automobile Show—Regal Cars in the Foreground.

Buick; Standard Auto Company, Packard; Union Supply Company, Pierce-Arrow; Grasser Motor Company, B. A. Gramm's.

**Cyclecars**—Greyhound Cyclecar Company, Greyhound; Lima Cycle Car Company, —.

**Motorcycles**—Oberwegner Motor Company, Excelsior, Henderson; Consolidated Manufacturing Company, Yale.

**Accessories**—Union Supply Company, Toledo Rubber Company, National Cement & Rubber Company, Ray-Kuhn Company, Bock Bearing Company, Toledo Tire & Supply Company, Erie Supply Company, Lewis Foundry Company.

The Moon Motor Car Company, St. Louis, Mo., has shipped one of its new Moon models, with six-passenger streamline body, to Auckland, New Zealand. Vice President Stewart McDonald believes this will prove the initial order in a very satisfactory business with the people of New Zealand.

## GROWTH OF THE AUTOMOBILE INDUSTRY.

**I**N AN authorized statement by Horace A. Bonnell, speaking for the Automobile Chamber of Commerce, attention is not only called to the origin and objects of this body, but to the splendid growth of the automobile industry during the past 14 years. The prediction is made therein that during 1914 the total output in American cars will represent a valuation of something like \$500,000,000, and in accessories, close to \$95,000,000. The number of cars produced for the 1913 season is placed at 400,000.

Fourteen years ago only a few hundred machines were manufactured. In 1903 the industry began to assume increased proportions and 10,000 cars were produced; in 1904, 18,000; in 1905, 24,000. By 1908 the number had jumped to 56,000, and the following year this was more than doubled, the number being 120,000. There was a substantial increase each year, and in 1912, the annual output had reached 200,000.

The Automobile Chamber of Commerce is composed of a large number of automobile manufacturers, and is the outgrowth of an amalgamation of the National Association of Automobile Manufacturers and Automobile Board of Trade, the latter being the name of the organization which succeeded the old Association of Licensed Automobile Manufacturers.

The objects of the organization are: To foster the interests of those engaged in the trade or business of manufacturing automobiles and all other self-propelled vehicles; to reform abuses relative thereto; to secure freedom of its members from unjust and unlawful exactions; to diffuse accurate and reliable information as to the standing of merchants and others dealing with members, as to all inventions, patents, processes or devices designed or intended for use in, upon or in connection with such vehicles and the manufacture thereof, as to the state of the art relative thereto, and as to the condition and development of the trades in which the members are engaged, in the United States and foreign countries; to procure uniformity and certainty in the customs and usages of such trade; to promote the construction of better highways; to advocate the enactment of just and equitable laws affecting members; to settle differences between members, and to promote a more enlarged and friendly intercourse among business men engaged in such trade or dealing with persons engaged therein.

The membership consists of two classes, manufacturing and representative. The former is the

manufacturing concern or corporation and the latter the person designated by the manufacturer to represent it. The directors are: Charles Clifton, Charles C. Hanch, Hugh Chalmers, Alvan Macauley, Samuel T. Davis, Jr., Wilfred C. Leland, Windsor T. White, William E. Metzger, H. O. Smith, Albert L. Pope, J. H. Kittredge, R. D. Chapin, H. H. Rice and J. N. Willys.

The results which have been achieved by this organization, and those which preceded it and of which it is a continuation, are further indicated by the fact that originally most ideas in automobile construction came from abroad, whereas within a few years after the industry gained a foothold in this country, American makers were ceasing to borrow ideas and began inventing and perfecting devices on a large scale. Although American motor car manufacturers imported nearly everything at first, they now export automobile goods valued at more than \$30,000,000 annually, and import less than \$2,000,000 worth.

### TO TALK ON ENGINEERING.

#### Need of Trained Men Spurs Metropolitan Activity in Securing Junior Members.

Automobile engineering as a career will be made the subject of a series of talks before the engineering societies of various colleges according to the plan that has been formulated by the Metropolitan Section, Society of Automobile Engineers, of New York City. The need of trained men is constantly being felt throughout the industry, and it is believed by this body that it properly devolves upon it to assist in attracting the attention of undergraduates to this field.

Incidentally, the advantages of junior membership in the society will be advocated as a means of getting into touch with current practise before engaging in practical work. The plan will be under the direction of the membership committee, which is composed of the following: Morris R. Machol, Hydraulic Truck Sales Company; Roger B. Whitman, Stromberg Motor Devices Company; C. W. Fletcher, Walter Motor Truck Company; E. R. Waterman, Hartford Suspension Company; H. V. R. Scheel, Brighton Mills; Harold W. Slauson; W. J. Somers, New York Telephone Company; Lloyd G. Busby, Electric Launch Company; Austin M. Wolf, Twombly Motors Company; F. C. Wulf, Gray & Davis, and H. G. McComb, General Vehicle Company.

# SPECIFICATIONS OF NEW SIX-CYLINDER MODELS.

Accompanying Table Gives Detailed Information of Chassis Construction for Only Those Models Which Are Entirely New.

| Name and Model       | Cylinders How Cast | Bore and Stroke, Inches | S. A. E. H. P. | Carburetor | Fuel Feed | Ignition  | Cooling | Clutch | Gearset    | Forward Speeds | Tires  | Driving Side | Lighting | Starting | Wheel-base |

# FEATURES OF NEW FOUR-CYLINDER CARS.

## CRESCENT OHIO.

### Five-Passenger Car Fully Equipped, Including Electric Lighting.

The Crescent Motor Company, Carthage, O., is featuring a large, roomy five-passenger touring car,

termed the Ohio, which is held to have sufficient reserve power to meet varying requirements of service. The chassis details follow conventional practise. The four-cylinder motor is cast in pairs, with bore and stroke of 4.25 by 4.75 inches respectively.

Light weight, combined with a careful selection of material and skillful workmanship are qualities emphasized in the chassis. The driver is placed at the right. The wheelbase is 116 inches.

## CAMERON MODEL 30.

### Four-Speed Direct Drive and Completely Equipped.

The Cameron Manufacturing Company, New Haven, Conn., is offering an entirely new model, in which are incorporated all of those refinements making for comfort and convenience, as well as a low cost of maintenance. The cylinders are cast en bloc and have the valves in the centre of the combustion chamber. The S. A. E. horsepower rating of 21 is very conservative.

The Cameron patented four speeds forward and one reverse gearset, with direct drive on all four, which has proven its efficiency in severe service, is again featured. This, with a flexible, long stroke motor, makes for economy in fuel. The clutch is an inverted cone, self-adjusting, and the rear axle is a Cameron, of the full floating type.

The radiator is of the pointed type, cooling by thermo-syphon, and the large capacity fuel tank is mounted in the cowl dash. The driver is placed at the left with centre control. The upholstery is deep and luxurious and the appointments throughout are in keeping with the high grade of material and workmanship. Electric

lighting and motor starting are standard equipment.

The wheelbase is 115 inches. Full elliptic springs are used at the rear and semi-elliptic at front. The brake drums are extra large, providing an ample margin of safety. The weight of the car, equipped, is 1975 pounds, which places it in the light class.

## WAHL ROADSTER.

### Follows Conventional Practise Except Radiator, Which Is V Shaped.

A V shaped radiator, all metal trimmings nickel plated, and a long stroke motor are features emphasized in the Wahl two-passenger roadster, manufactured by the Wahl Motor Company, Detroit. The power plant follows the very general practise of placing the motor, clutch and transmission in a unit. Although rated at 16.90 horsepower by the S. A. E. formula, the maker claims 24 at 1400 revolutions a minute.

Ample leg room, full size doors and a low centre of gravity are among the features of the model. Ignition is by a true high-tension, fixed spark mag-

neto. Cooling is by thermo-syphon. The clutch is a disc and a selective gearset provides the usual three forward speeds and a reverse. The equipment is very complete.

## MOTORS CAST EN BLOC.

In the new four-cylinder models the use of motors cast en bloc is very noticeable, 15 makers favoring this construction as against eight utilizing the cylinders cast in pairs. This is noted in the lower priced machines, although the en bloc casting is favored by makers of cars listing much higher. With the exception of several well known makes the S. A. E. horsepower rating is below 30, and eight models are equipped with motors rated at less than 20 by the formula. As is to be expected, individual cylinders have entirely disappeared.

With three exceptions, these being strictly high priced machines, the fuel feed is by gravity. In the matter of cooling, the advocates of the thermo-syphon principle and the pump appear to be evenly divided, although with the popular priced cars the first named is generally employed.

## CHEVROLET BABY GRAND.

### Four-Passenger Light Touring Car with Low Centre of Gravity.

The Chevrolet Motor Company, Flint, Mich., is manufacturing two popular priced models, a four-pas-

senger touring car and a two-passenger roadster. The chassis is identical, the cylinders being cast en bloc and having a bore of 3.69 inches and stroke of four. The horsepower rating is 22.

Cooling is by thermo-syphon principle, the clutch of the disc type and the gearset is selective. Ignition is by a Simms magneto and carburetion by a Zenith. The driver is placed at the left. Thirty-two by 3.5-inch shoes are fitted to each wheel. The wheelbase of both models is 104 inches.

## PARTIN-PALMER.

### Popular Priced Six-Passenger Car Designed for Family Service.

Although the bore and stroke of the Partin-Palmer "38", a popular priced six-passenger touring car, are not given by the maker, the Partin Manufacturing Company, Chicago, it is stated that the rating of 38 is very conservative. The motor is well designed, and presents novel features, including overhead and enclosed valves and a removable cylinder head.

The cylinders are cast en bloc, integral with the upper half of the crankcase to secure rigidity. The cylinder head is secured to the main casting by bolts, the joint being made with copper asbestos rings, insuring tightness. Cooling is by thermo-syphon and the lubricant is circulated by a gear driven pump, it being stated that it will circulate 1.5 gallons a minute at normal speed.

The material and workmanship throughout are strictly high grade and attention has been paid to those details making for comfort and convenience. Although gas and oil lighting are standard equipment, electric lighting and motor starting are supplied at a very low cost.

**CHEVROLET ROYAL MAIL.****Two-Passenger Roadster with Attractive Lines.**

The Chevrolet Royal, a two-passenger roadster, manufactured by the Chevrolet Motor Company, Flint,

Mich., was designed for those desiring a light, ample powered runabout. The chassis details are identical with those of the touring model. The body design is attractive by reason of its straight lines.

The fuel tank is mounted at the rear of the seats and there is ample room to carry a trunk or spare tires if desired. The equipment includes a top, windshield, etc. Lighting is by oil and acetylene lamps. The tire size is 32 by 3.5 inches all around. A low centre of gravity, ample wheelbase and comfortable upholstery are qualities emphasized in the model.

**LYONS-KNIGHT K.****Silent Knight Motor and Worm Driven Rear Axle Among Features.**

The Lyons-Atlas Company, Indianapolis, Ind., is offering for the season of 1914 the combination of a silent Knight motor and a worm drive rear axle, and it is stated that the model K, as the new car is to be known, is the only one in America having these features. The new vehicle is a strictly high grade car in every particular and embodies the latest and most desirable features that have been perfected and adopted by foreign car builders.

The aim of the manufacturer has been to provide an abundance of room, so as to give the maximum amount of comfort to even the largest people. The sides of the car, including the top of the doors, are high. The Knight motor utilized embodies many improvements over the conventional designs and its output is rated at 55 horsepower at 1200 revolutions. One of its features is an improved oiling system, which feeds lubricant in proportion to the motor speed.

The chassis and wheelbase of the model K cars are similar, except the rear springs, which are heavier on the six and seven-passenger cars. The five and seven-passenger bodies are standard, but the four and six-

passenger types are built to order. Additional body types are offered in a sedan, five-passenger, and a berline, seven-passenger. The equipment of the Lyons-Knight cars is noticeable for its completeness.

**MAXWELL 25-4.****A Popular Priced Four-Passenger Ample Powered Touring Car.**

By manufacturing in large quantities the Maxwell Motor Company, Inc., Detroit, is able to offer a popular priced machine embodying high grade material and workmanship. The Maxwell "25" was designed to meet the needs and the preference of that class of buyers who consider first cost and that of maintenance. The engineers of the company are well known to the industry and have incorporated in the new design mechanical principles indorsed by sound engineering practise.

The output of the motor is sufficient to meet all requirements of service, and it is a unit with the cone clutch and three-speed selective gearset. The power plant is very compact and a detachable cylinder head makes for accessibility of the valves, which are fully enclosed. The body is a flush side streamline, and ample leg room is provided, both in the driver's

compartment and tonneau. The upholstery is in keeping with the high grade finish, and the equipment is most complete.

**TIRES AND EQUIPMENT.**

A noticeable feature of the new fours is the use of large tires, and in many instances the car is what may be termed over tired. This applies to the smaller machines as well as the larger and more expensive, and with two exceptions, those of the Mercer and Multiplex, the same size casings are fitted to the rear wheels as to the front. It will be noted in the table of specifications that 32 by 3.5-inch shoes are used on a number of different makes, a size that formerly was considered as odd by the tire manufacturer. Demountable rims are fitted to the more expensive makes, and, generally, quick detachable, to those machines listing under \$1000.

The wheelbases vary considerably, but this is to be expected where a large number of cars of differing price are listed. The maker of the popular priced vehicle has considered the purchaser in the matter of equipment and with rare exceptions the machine is ready for the road with no other expense than that for gasoline and oil.

**ALLEN 40.****Moderate Priced Car with Two and Five-Passenger Bodies.**

The Allen "40", manufactured by the Allen Motor Company, Fostoria, O., was designed to meet the demand

for a moderately priced car, having those refinements and high grade material characteristic of high priced machines. Two bodies are fitted to the one chassis, a five-passenger touring and a two-passenger roadster. These have attractive lines and are complete in appointments.

The motor, clutch and gearset are a unit. Attention has been given to the accessibility of components and to the careful selection of material. The equipment is very complete and includes electric lighting and motor starting. The driver is placed at the left. The wheelbase is 118 inches and tires are 34 by four inches.

**READ.****Light, Five-Passenger Touring Car with Wheelbase of 115 Inches.**

The initial product of the Read Motor Car Company, Detroit, is a five-passenger touring car which has a very compact unit power plant, clutch and transmission. The motor is cast en bloc and is rated at 32.6 horsepower. Fixed ignition is favored, a Bosch true high-tension magneto being utilized.

The clutch is a multiple disc and the gearset is of the selective type, providing the conventional three forward speeds and a reverse. Lubrication is a combination force feed and splash, the pump being driven off the camshaft. It is of the adjustable type. The rear axle is of the semi-floating type and full elliptic springs are utilized in the rear, with semi-elliptic at front.

The maker calls special attention to the question of economical fuel consumption, and states that all material employed is high grade, carefully treated and machined. Nothing is left to be desired in the matter of equipment and the rims are demountable. The standard color is gray striped in black, with fenders, hood and running boards in black enamel. Lighting is by gas and oil lamps. The wheelbase is 115 inches.

**MERCER MODEL O.**

**Has Easy Riding Qualities, Ample Power and Is Roomy.**

The Mercer type 35, Series O, is a high grade two-passenger car designed to meet the demand for a

large, easy riding runabout. The body lines are very attractive and the upholstery deep and comfortable. The motor is the well known Mercer design and before passing inspection must show a dynamometer pull of 58 horsepower at 1700 revolutions a minute.

Ignition is by a two-spark Bosch magneto, two sets of spark plugs being utilized. The clutch is a multiple disc and the gearset, selective, providing three forward speeds and a reverse. The rear axle is of the full floating type, and throughout the material and workmanship are in keeping with the high grade characteristic of the product of the Mercer Automobile Company of Trenton, N. J. The tires are 34 by four inches.

**VULCAN SPEEDSTER.**

**Big Mileage from Fuel and Minimum Cost of Upkeep Are Emphasized.**

Among the qualities emphasized in the Vulcan speedster, made by the Vulcan Manufacturing Company, Painesville, O., is that every part is made in the factories of the company and that each is subjected to rigid inspection before being assembled. The company states that by producing in large quantities and eliminating distributors, etc., it is able to manufacture a strictly high grade machine at a popular price.

The power plant is noticeable for its simplicity and is conservatively rated at 27 horsepower. Flexibility, quietness and economy of fuel are particularly prominent. The cylinders are cast en bloc and the motor, cone clutch and transmission are a unit. The maker calls especial attention to the design of the clutch, stating that the leverage is so proportioned as to make for easy release.

The gearset is of the selective type, providing three forward speeds and

a reverse, and control is by a cane handle lever which is mounted on the transmission housing. The rear construction is sturdy, the differential employing five pinions instead of two and these are of nickel steel, phosphor bronze bushed. The rear axle housing is liberally ribbed and the gears are very accessible for lubrication and inspection. The body is attractive, having full fore doors and the finish is strictly high grade. The Vulcan speedster comes completely equipped.

**MONARCH.**

**Five-Passenger Touring Model, Fully Equipped, Including Wire Wheels.**

Wire wheels, a Renault type radiator and a complete equipment, including electric lighting and motor starting, are among the features of the Monarch car, made by the Monarch Motor Car Company, Detroit. But one body, a five-passenger touring, is fitted. The fuel tank is located in the cowl dash.

Cooling is by thermo-syphon, assisted by a two-bladed fan. The water tank on the top of the radiator is shaped to conform to Renault outline of the hood. Cooling is further assisted by a scoop shaped shield in front of the radiator, which deflects

the air upward so that it will pass through the cooling coils. The unit power plant is suspended on a sub-frame. The rear springs are full elliptic and are mounted in a slightly inclined position on rigid frame brackets.

**LOCATION OF DRIVER.**

The growing tendency to place the driver at the left with centre control is noticeable in the new models. There are exceptions, however, makers of the Monarch and the Metropal locating the driver at the right. The new Mercer models continue the practice of placing the driver at the right.

Despite the claims made regarding the advantages of the lighting battery for ignition purposes, the magneto continues to predominate, only one new car utilizing batteries.

Electric lighting and motor starting are standard equipment with the higher priced new four-cylinder cars. Some makers of machines selling for \$1000 underlist the equipment as extra, and the majority provide a Prest-O-Lite gas tank and call attention to the efficiency of the type of headlights fitted. It will be noted that the lighting is not defined with some models.

**MAXWELL 35-4.**

**Designed to Accommodate Five Large Persons and for a Family Car.**

The Maxwell "35", manufactured by the Maxwell Motor Company, Inc., Detroit, was designed to meet the de-

mand for an ample powered car, capable of seating five large persons and to be operated at a minimum cost. It may be termed a family car in that ample room is provided both in the driver's compartment and tonneau, and the upholstery is deep and comfortable. The equipment is complete and includes electric lighting and motor starting. The accessories are strictly high grade. Jiffy curtains are standard equipment.

The cylinders of the motor are cast en bloc and the horsepower rating of 35 is said to be conservative. The valves are liberal in diameter, fully enclosed and very quiet in operation. Cooling is by a centrifugal pump with a large tubular radiator. The Splitdorf dual system of ignition is standard equipment.

**LOZIER.**

**Five-Passenger Model with Auxiliary Folding, Disappearing Seats.**

The Lozier Motor Company, Detroit, is offering a new four-cylinder model with the cylinders cast en bloc, and the company states the horsepower production is 56. The four cylinders and upper part of the crankcase are an integral casting and the clutch and transmission are a unit. One of the features of the motor is the elimination of the usual intake manifold, it being cast with the cylinders. The very general use of the silent chain drive is noticeable, it being employed with the electric motor starter and lighting dynamo.

Cooling is by pump and ignition by a Bosch high-tension magneto. The fuel is fed by pressure, the tank being located at the rear of the chassis. The pressure system of lubrication is utilized. By using auxiliary seats, which fold into a recess in the back of the front seat, provision is made for accommodating seven passengers. Besides touring bodies a two-passenger design will be produced. The equipment is very complete.

**VULCAN.**

**Designed to Meet the Demand for a High Grade Family Machine.**

The Vulcan five-passenger touring car, made by the Vulcan Manufacturing Company, Painesville, O., lists

complete at \$100 more than the speedster, and with the exception of the rear springs, frame, etc., and those parts necessary to care for the additional weight of three passengers, the mechanical details are similar to those of the smaller machine. The wheelbase is 115 inches.

The machine was designed for a family car and the maker states that from 26 to 39 miles to a gallon of fuel may be obtained in average service. This is held to be due to the efficiency of the motor and the use of over sized ball bearings. One of the qualities claimed for the Vulcan is that it can be turned in a 30-foot radius, due to the unique method of attaching the steering lever to the knuckle.

**HENDERSON DE LUXE.**

**Large Tires, Wire Wheels and Bi-Fuel Carburetor Among Features.**

The Henderson Motor Car Company, Indianapolis, Ind., is offering for the season of 1914 a new chassis termed the De Luxe, to which will be fitted five-passenger touring, two-passenger roadster, sedan and coupe bodies. The De Luxe motor has a bore of 4.125 inches and stroke of 5.5, and the company's rating is 46 horsepower. Cooling is by thermo-syphon with large intake and outlet water manifolds which, with a large size honeycomb radiator, assure proper temperatures under the severest service.

A cone clutch is employed, and the gearset located on the rear axle provides the three conventional forward speeds and a reverse. The rear axle is a Stutz. The driver is placed at the left with centre control. One of the features of the equipment is the option of a Rayfield or Harroun bi-fuel carburetor, the latter employing gasoline and kerosene.

The usual emergency brake lever is eliminated, the left pedal actuating the clutch and service brakes while

the right serves the emergency brakes. De Luxe is over tired, 35 by five-inch Goodyear tires being utilized. Wire wheels are regular equipment with wood optional. The fuel tank is located in the dash and the upholstery is deep and luxurious. The standard colors are dark olive and gray, at the option of the purchaser. The equipment is complete and includes electric lighting and motor starting.

**WAHL.**

**Four-Passenger Touring Car with Ample Reserve Power.**

The Wahl five-passenger touring car, manufactured by the Wahl Motor Company, Detroit, was designed to meet the growing demand for a light, popular priced family vehicle. The body is roomy and well upholstered and there is plenty of leg room both in the driver's compartment and in the tonneau.

The cylinders of the motor are cast in pairs and their dimensions place them in the long stroke class. Economy of fuel, silence and accessibility are qualities emphasized by the maker. Lubrication is by the constant level splash system, a gear

pump maintaining the proper height of the oil in the crankcase. The frame is provided with a double drop, making for a low centre of gravity, and the front of the frame is inswept, providing a short turning radius for operation in narrow streets. The Wahl comes completely equipped. Lighting is by gas and oil lamps.

**FAVOR DISC CLUTCH.**

The disc type of clutch is gaining adherents, judging from the use made of both the dry plate and lubricated forms in the new models announced for 1914. Of 21 new designs, 12 favor the disc while nine use the cone. One friction type appears in the Crown.

The use of the selective type of gearset is practically universal with two exceptions, that of the Cameron and Saxon. The former employs its patented Cameron transmission, while the Saxon is to be equipped with a two-speed progressive gearset. The Lozier and Cameron provide four forward speeds, the balance being fitted with the conventional three forward speeds with direct drive on the third.

**MERCER MODEL M.**

**Five-Passenger Car Designed for Maximum Comfort and Speed.**

The Mercer Automobile Company, Trenton, N. J., is offering a roomy, five-passenger touring car known as

type 35, Series M. The new design has a wheelbase of 124 inches and its equipment leaves nothing to be desired, including, as it does, electric lighting and motor starting.

The same mechanical construction which has proven so satisfactory in speed contests and other service, has not been materially changed. No changes have been made in the motor, which is of the T head type, with the cylinders cast in pairs. The bore and stroke are 4.5 by five inches, respectively. The body design is very attractive, being noticeable for straight line effects and deep upholstery. The seats are 22 inches deep from front to rear and the cushions are nine inches thick.

**FLYER.**

**Light Two-Passenger Roadster with Wire Wheels.**

The Flyer, manufactured by the Flyer Motor Car Company, Elizabeth, N. J., is a light, two-passenger roadster having a long stroke motor, rated at 12.10 by the S. A. E. formula, although the maker states it will develop 23. Cooling is by the thermo-syphon principle and the clutch is a disc. The transmission is of the selective type, providing the conventional number of speeds.

The driver is placed at the left and the steering column is set at a comfortable angle, giving the machine a racy appearance. The body design is attractive, a sloping deck extending from the rear of the driver's seat to the rear of the chassis. The wheelbase is 100 inches. Wire wheels are included as standard equipment. The Flyer comes completely equipped and is designed for those desiring a popular priced car capable of meeting the requirements of every day service at a low cost of maintenance.

An electric lighting and motor starting system, a Ward Leonard, is also offered, being listed at \$100 extra.

# FEATURES OF NEW SIX-CYLINDER CARS.

## **PATHFINDER.**

### **Leather Stocking Model Has Two Body Styles.**

The Motor Car Manufacturing Company, Indianapolis, Ind., has joined the ranks of makers favoring

the V shaped radiator, the construction being utilized on its new Pathfinder model, termed the Leather Stocking. Two bodies are fitted, a seven-passenger touring and a six-passenger berline. Both are fully equipped.

The cylinders of the motor are cast in triplets and have bore of 4.125 inches and stroke of 5.25. Splash lubrication is utilized, with plunger pump and positive feed to the three main bearings. The fuel feed is by gravity from an 18-gallon tank. The clutch is a dry disc and the gearset provides four forward speeds with direct on the third.

## **CHANDLER.**

### **Light Weight, Big Mileage and Complete Equipment Among Features.**

The Chandler light weight six, made by the Chandler Motor Car Company, Cleveland, O., is stated to weigh less than 3000 pounds when fully equipped, and its designers, who have long been identified with the automobile industry, claim 16 miles to a gallon of fuel and 700 miles to a gallon of lubricant. The motor is constructed in the factory of the company, and is of the L head type with the cylinders cast in triplets. It is in the long stroke class and is held to operate efficiently at three miles an hour on the high speed and to be capable of propelling the car 55 miles an hour. One of the features of the power plant is the use of extensions from the crankcase, which extend to the frame, obtaining weather proof qualities and eliminating the usual undershield.

The oiling system is contained within the motor, a rotary pump located in the engine pan pumping the lubricant to all main bearings and working parts. The individual trough system is utilized. The transmission is a three-speed, selective,

enclosed within the case housing the multiple disc clutch, and all bearings are F. & S. imported annular. The last named are used throughout.

The lighting and motor starting system is a Westinghouse. In addition to a five-passenger car, a two-passenger roadster, five-passenger limousine, five-passenger sedan and three-passenger coupe are marketed. The equipment is in keeping with the high grade material and finish.

## **DAVIS 6-50.**

### **Is Equipped with Five and Six-Passenger Bodies.**

The George W. Davis Motor Car Company, Richmond, Ind., offers the Davis 6-50 with two body styles, five and six-passenger types, and these are noticeable for the streamline effect, large flush doors and high grade finish. The motor is a Continental with enclosed mechanism and three point suspension, which forms, with the clutch and transmission, a unit power plant.

Ignition is by a Mea magneto, carburetion by a Stromberg, and the selective type gearset provides four

forward speeds and the usual one reverse. The electric lighting and starting system is a Gray & Davis, separate units. The full floating rear axle is of liberal proportions and the brakes are ample in size.

The radiator has a rounded front, and the tool box is concealed in a dust shield, which connects the running board with the body. The trimming of the car is nickel and black, and the equipment is high grade, including every convenience.

## **MOTOR FEATURES.**

Of the 31 new six-cylinder models tabulated, it will be noted that 14 are of the en bloc type of casting, a decided gain over 1913, when this method of casting was confined largely to four-cylinder cars. That casting the units in pairs is favored by some is evidenced by five makes, these including the Buick, Haynes, Jeffery, Pathfinder and de Soto. Triplet units are seen in the Abbott-Detroit, Chandler, Howard, Hudson, Imperial, Marlon, Moon, Palmer-Singer, Pullman, S. & M. and Velle. The L head type of motor predominates. The Continental motor has been adopted by a number of makers, and the bore of 3.75 inches and stroke of 5.25 is employed in 14 different models.

## **HUDSON 6-40.**

### **Weights Under 3000 Pounds—Has Three Body Styles.**

Fourteen to 17 miles to the gallon is claimed for the Hudson 6-40, made by the Hudson Motor Car Company,

Detroit. It is a light machine, weighing 2940 pounds with the phaeton body. It is seven inches longer than the Hudson 33, which had a wheelbase of 116 inches, and 30 per cent more power is claimed for the motor, which has bore of 3.5 inches and stroke of five.

A new radiator has been adopted, its top being rounded, and there is a sharp corner where the vertical sides meet the top section. Another feature is the use of a coping-over edge. In variance with former practise, the flywheel is partially enclosed. The Delco ignition, lighting and starting system is employed. There are three body styles.

## **VELIE 6-50.**

### **Three Body Styles, Including Roadster, for New Chassis.**

The Velle line, manufactured by the Velle Motor Vehicle Company, Moline, Ill., is increased by the addition of a new model known as the 6-50. It is equipped with a Continental motor, which is stated to be the only component not a Velle product. It is of the long stroke type and is rated at 33.75 horsepower by the S. A. E. formula. The wheelbase is 126 inches and the tires are 27 by 4.5 all around. Lighting and starting are by the Gray & Davis system.

The bodies are of the straight line type with clean running boards. Among the features are the sloping hood with the long undercut cowl and crown fenders with flat strips at the edge. Another is the double overlaid hinge of the bonnet, which makes for strength, it being claimed that the weight of an ordinary man will not deflect it noticeably. The roadster presents novel features, having a sloping deck with doors on either side to accommodate two suit cases. The top equipment has a ratchet holder, making for rigidity on rough roads. Equipment is complete.

**PALMER-SINGER.****Roadster and Touring Models Noticeable for Refinements in Detail.**

The Palmer & Singer Manufacturing Company, Long Island City, N. Y., is offering a new car termed the

model K, which is fitted with three types of bodies, these having two, four and five-passenger capacities. The finish is Brewster green with a light green stripe. Auxiliary seats are obtainable with the four.

The motor is rated in excess of 45 horsepower and the cylinders are cast in triplets. Two independent ignition systems are provided and carburetion is by a C. R. G. The clutch is a multiple disc, built into the flywheel. The driver is placed at the right with control levers inside of the body. The wheelbase is 128 inches, tires 36 by 4.5 inches, and the equipment includes electric lighting and motor starting. The upholstery is in keeping with the high grade material and workmanship of the design.

**ABBOTT-DETROIT.****Belle Isle Model, a Light Six, with Wire Wheels.**

A six-cylinder model, termed the Belle Isle, has been added to the 1914 line of the Abbott Motor Company, Detroit. The motor is a late type Continental having bore and stroke of 3.75 and 5.25 respectively, and is rated by the maker at 60 horsepower. The reciprocating parts are light, making for smooth operation, and the lightening of the components is said to increase the horsepower by 15 per cent, as compared with a motor having the same dimensions.

It is of the L head type and in connection with the gearbox, provides a unit power plant construction. It is lubricated by the Continental's latest system, which is a circulating splash arrangement with a new type of circulating pump. The clutch is a multiple dry disc, and the diameter of the plates has been increased over that of previous models. The rear axle is full floating, and the gearset provides four forward speeds with direct on the third and with the fourth geared up 25 per cent.

The fuel tank is mounted at the

rear, and the wheels are equipped with demountable rims and 36 by 4.5-inch tires. The lighting and starting system is an Auto-Lite. A six-passenger body is fitted to the chassis, also a roadster, which is supplied with wire wheels as standard equipment. The company states that the new model is the best balanced car yet brought out under the Abbott name. The equipment leaves nothing to be desired.

**PULLMAN 6-48.****Features Electric Gearshift and Wire Wheels.**

A Vulcan electric gearshift, wire wheels and a power tire pump driven off the flywheel of the motor, are among the many features of the Pullman 6-48, made by the Pullman Motor Car Company, York, Penn. The motor is of the L head type with the cylinders cast in triplets, and is rated at 38 horsepower at 1500 revolutions a minute. The oiling system is a combination force feed and splash with a constant level. The multiple disc clutch comprises 21 discs covered with Raybestos, and forms a part of the unit power plant.

The electrical equipment comprises four independent systems for ignition, starting, lighting and gear-

shifting. The cranking motor is geared to the flywheel and the teeth on the wheel serve as a driving medium for the tire pump, the driven gear being swung into mesh at the option of the driver.

**CARBURETION.**

At the New York shows last year it was noted that several makers had replaced gravity feed by the pressure, a method much in vogue several years ago. It was freely predicted that in 1914 it would become general practice to mount the fuel tank at the rear of the chassis and supply the carburetor by pressure feed. The method has several advantages. It permits locating the carburetor in proximity to the water jackets of the cylinders, the heat of which assists in raising the temperature of the fuel and makes for easier starting on the present grade of fuel, in that opportunity for condensation with a long intake pipe is avoided.

Some makers hot water jacket the intake manifold and the majority also utilize the heat of the exhaust for increasing the temperature of the air supplied to the carburetor. With the fuel tank at the rear it is held that a better balance is obtained. Practically every machine is provided with means for regulating the air.

**HENDERSON.****Four Attractive Body Designs Are Offered with New Model.**

Listing wire wheels as regular equipment, optional with wooden members, the Henderson Motor Car

Company, Indianapolis, Ind., claims to have been the first concern in this country to offer choice to the purchaser. The motor of the new six is noticeable for its compactness and clean lines of exterior. Although rated at 33.75 by the S. A. E. formula, the company states it has developed 54 in block tests.

Cooling is by thermo-syphon, fuel feed by gravity and ignition by an Elsemann magneto. The clutch is a highly perfected cone and the gearset provides three forward speeds. The driver is located at the left with centre control, and as with the four-cylinder model, the emergency brake lever is eliminated, the clutch pedal actuating the service brakes.

The upholstery and equipment are fully in keeping with the high grade material and construction.

**JEFFERY.****Adopts En Bloc Motor and Four-Speed Gearset.**

Another entrant to the six-cylinder field is the Thomas B. Jeffery Company, Kenosha, Wis., well known to the industry as the maker of the Rambler cars. This name, however, has been dropped, and the new products of the company will be known as the Jeffery. The cylinders are arranged in pairs and have bore and stroke of 3.75 and 5.25 inches respectively. One of the motor features is the water jacketing of the intake manifold. The undershield is eliminated, being replaced by plates extending from frame to crankcase.

Between the gearset and cone clutch is a leather universal coupling, consisting of six rings about six inches in diameter and .1875 thick. It is employed to care for any misalignment, and it is stated that shocks and stresses are avoided in clutch action. The wheelbase is 128 inches and the tires are 36 by 4.5 inches. Four bodies are fitted, five and six-passenger touring, sedan and limousine. The equipment is complete.

**MARION G.****All Four Body Styles Are Listed at Same Price.**

The Marion Motor Car Company, Indianapolis, Ind., has been added to the list of six-cylinder makers, the

company announcing a chassis to which is fitted four body types, a two-passenger roadster, five-passenger touring, four-passenger coupe and a five-passenger sedan. The cylinders are of the L head type, cast in triplets, and have a bore of 3.75 inches and stroke of 4.5. The maker claims a rating of 50 horsepower.

A feature of the oiling system, which is a combination of pressure feed to the main bearings and automatic level splash, is the elimination of the usual breather pipe. The crankcase compression escapes through openings directly into the valve mechanism pockets, lubricating the mechanism. The company has adopted the left hand drive, and the new model is completely equipped.

**HAYNES MODEL 27.****Features Vulcan Electric Gearshift on All Models.**

The Haynes Automobile Company, Kokomo, Ind., is featuring the Vulcan electric gearshift with its new models, comprising two chassis to which are fitted a number of attractive and high grade bodies. The operation of the electric gearshift is simple. In place of the usual lever, a neat, small dial of push buttons, known as the selector switch, is located in the centre of the steering wheel. There are seven of these buttons and those numbered 1, 2 and 3, control the three forward speeds, while the reverse is marked "R" and neutral "N". The starter and horn are designated by letters "S" and "H".

The selector switch is arranged with a mechanical lock so that only one button can remain in position at a time. These buttons control the operation of a set of electro-magnets, or solenoids, there being one for each speed. The speed is selected by the driver pushing down a button, and, upon depressing the clutch pedal fully, and releasing it, the desired

gear is automatically meshed. The clutch is then engaged in the usual manner. Other changes of speeds are made in the same manner and all are accomplished instantly. It is impossible to make any errors as the construction may be termed fool proof. Its advantages in operation, especially in traffic, are obvious.

**HOWARD.****Long Stroke Motor and Wheelbase Are Features.**

The model D Howard is a five-passenger touring car and is manufactured by the Howard Motor Car Company, Connersville, Ind. The cylinders of the motor are cast in triplets and have a bore of 4.125 inches and stroke of 5.25. According to the S. A. E rating the output is 40.90, but the maker states that block tests have shown a considerable increase over this rating.

The carburetor is a late type Stromberg, and ignition is by a Bosch high-tension magneto. Cooling is by pump and the radiator is of ample capacity. Cooling is further assisted by an adjustable fan. An improved type of cone clutch is utilized and easy engaging qualities are emphasized in the construction, which is fully protected from foreign ele-

ments. The gearset is of the selective type.

A feature of the chassis is the use of large tires, 36 by 4.5-inch shoes being used front and rear. The driver is placed at the left, and starting and lighting is by electricity. The wheelbase is 132 inches. The equipment is most complete and the accessories in keeping with the high grade of finish.

**CLUTCHES, GEARSETS.**

The disc type of clutch does not appear to have lost ground as 17 models are fitted with either dry or lubricated plates. The cone is utilized in 10 models, while two makers favor the band, these being the Haynes and Apperson.

The gearsets are all of the selective type, as was to be expected. It would appear that the advocates of the four-speed gearbox are gaining, as 13 show this form, and in the majority of instances the third speed is the direct drive, with a fairly large step-up on the fourth. Twelve makes retain the three-speed gearbox.

The electric gearshift is standard equipment with two makers, the Haynes Automobile Company and the Pullman Motor Car Company. This applies only to the new sixes and does not take into consideration other models continued from last season.

**MAXWELL 50-6.****High Grade Car with Every Convenience.**

The leader of the Maxwell line, made by the Maxwell Motor Company, Inc., Detroit, is the 50-6, which

is fitted with a touring body for 5-7 passengers, richly upholstered and leaving nothing to be desired in the matter of equipment and accessories making for comfort and convenience. The motor is cast en bloc and the rating claimed by the company is said to be conservative. Flexibility and economy of fuel are among the qualities emphasized in the power plant, which is noticeable for its simplicity and compactness.

Throughout the best of material and workmanship is incorporated, and all components are ample in size. The wheelbase is 130 inches, tires 36 by 4.5, front and rear, and the electric lighting and motor starting units are separate. The carburetor is a special Maxwell design, and large mileage is held to be obtained.

**BUICK MODEL B 55.****Maker Adopts Delco Lighting and Starting System.**

The Buick B55, made by the Buick Motor Company, Flint, Mich., is a five-passenger touring car with streamline body and having a deep cowl dash. Overhead valves are features of the motor, it being held that the type not only makes for maximum power, but economy of fuel. The bore and stroke of the cylinders, which are cast in pairs, are 3.75 by five inches. The rating according to the S. A. E. formula is 33.75 horsepower, but the company claims considerably in excess of this.

Demountable rims are standard equipment, and the wheelbase is 130 inches. The rear axle is of the full floating type.

The Buick Motor Company is now equipping its product with the Delco system, which provides ignition, lighting and starting. The clutch is a cone, the gearset selective, providing three forward speeds, and the tires are 36 by 4.5 inches, front and rear. The equipment is most complete, including every convenience.

**IMPERIAL MODEL 44.****Five-Passenger Touring Car Fully Equipped.**

The Imperial Automobile Company, Jackson, Mich., has replaced one of its four-cylinder models with a new

six, which is termed the 6-44. It is fitted with a Continental motor having a bore of 3.75 inches and stroke of 5.25, and the maker rates it at 48 horsepower. The cylinders are cast in triplets, ignition is by a Splitdorf dual system, and a force feed constant level system of lubrication is employed.

The clutch is a disc, 13 plates faced with Raybestos, and the gearset is selective with the usual three forward speeds. The rear axle is a full floating design, the wheelbase is 126 inches and 36 by 4.5-inch tires are fitted both front and rear. The electric light and motor starting system is a North East. The touring body is very attractive in appearance.

**NATIONAL SIX.****Attractive Line of Bodies Feature of New Model.**

The new National six, built by the National Motor Vehicle Company, Indianapolis, Ind., is a car of striking appearance, with its long, low body lines described as a one-piece design. There is a smart slope from the cowl to the radiator cap. From the radiator to the rear of the car is one continuous harmony of converging lines. Throughout the mechanical details are fully in keeping with the high grade characteristic of this concern. The touring car accommodates five passengers; the torpedo toy tonneau, four.

The motor is cast en bloc and the cylinders have a bore of 3.75 inches and stroke of 5.5. Lubrication is by splash with pressure feed to the main bearings and timing gears. The ignition system is dual, magneto and battery. The cooling system has been improved and the radiator is smaller than with previous models, but is fully as efficient. The fuel feed is by pressure, the tank being located at the rear of the chassis. The cone clutch may be removed without dis-

turbing the transmission, this feature being obtained by the use of a double universal in the short shaft between the clutch and the gearset. The equipment is most complete and includes electric lighting and motor starting. The wheelbase is 132 inches and tires are 36 by 4.5, mounted on Firestone demountable rims, with one extra rim.

**HAYNES MODEL 27.****Seven-Passenger Limousine Is Richly Appointed.**

The Haynes sixes, made by the Haynes Automobile Company, Kokomo, Ind., are known as models 26 and 27, and to these chassis are fitted a number of attractive bodies which were designed to provide the utmost comfort. The cowl is made from one sheet of metal and comes down to a graceful curve to meet the hood, and the hinges are concealed. The doors are extra wide and are upholstered in the leather. The standard color is Indiana blue for the body, with black gears and wheels.

The motors of both chassis have a bore of 4.25 inches and stroke of 5.50. Ignition is by a Simms magneto, carburetion by a Stromberg and cooling by pump. The electric gear-

shift provides three forward speeds. The tires are 36 by four inches, and the driver is placed at the left. The equipment includes electric lighting and starting, a power tire pump and many other high grade accessories.

**DRIVER'S LOCATION.**

As was noticeable last season, the practise of placing the driver at the left has gained many adherents, and it may be said to be universal, insofar as the new sixes are concerned. Twenty makes locate the operator at the left with centre control, while two place the driver at the right, the Palmer-Singer and de Soto. The Maxwell Motor Company, Inc. is the only maker who gives option.

It is interesting to note that the practise of using different sized tires has been abandoned and the use of the same sized casings both front and rear has been due to the adoption of the demountable rim. The 36 by 4.5-inch shoe is utilized by 11 makers, while nine cars are equipped with odd sizes; that is, the diameter. The largest diameter casings are noted in the American models, which are 38 inches. When the weight of the chassis, body and equipment are considered it is noticeable that the manufacturer has over tired his product, reducing cost of maintenance.

**APPERSON 6-55.****Chassis Is Fitted with Two Attractive Bodies.**

The Apperson Bros. Automobile Company, Kokomo, Ind., is offering two six-cylinder chassis, termed the

6-45 and 6-55, and, with the exception of wheelbase, motor and tires, they are similar. The 6-45 is equipped with an en bloc motor having a bore of 3.75 inches and stroke of five, while the cylinder dimensions of the 6-55 are 4.25 by five inches. The last named motor is rated at 43.80 horsepower by the S. A. E. formula.

The band type of clutch is continued and a selective form of gearset is utilized. The tire sizes are as follows: Model 6-45, 36 by four; 6-55, 37 by 4.5 inches. The driver is placed at the left and the wheelbase of both chassis is 128 inches. The bodies accommodate two and five passengers. The equipment includes electric lighting and starting and those accessories accompanying a high grade machine.

**MOON.****Six Body Styles, All Electrically Equipped.**

The new six-cylinder car manufactured by the Moon Motor Car Company, St. Louis, Mo., is fitted with six body types, having passenger capacities of two, four, five, six and seven, and wire wheels are supplied at a cost of \$100 extra. The motor is of the L head type and although the bore is but 3.75 inches and stroke 5.25, the maker rates it at 50 at 1300 revolutions a minute.

A Delco system provides ignition, starting and lighting. The clutch is a dry disc and the gearbox provides four forward speeds with direct on the third. Fuel feed is by pressure, the wheelbase is 129 inches, and the tires are 35 by 4.5, front and rear. The power tire pump is driven off the flywheel of the motor. An interesting feature of the Moon chassis is a centrifugal oil draining device inside the wheel hub, preventing any lubricant reaching the brakes and impairing their efficiency. Electric lighting and motor starting are included in the equipment, which is leaves nothing to be desired.

**OAKLAND 48.****En Bloc Motor Has Removable Cylinder Head.**

The Oakland model 48, made by the Oakland Motor Car Company, Pontiac, Mich., may be termed a small

six in that its motor has cylinder dimensions of 3.5 by five inches, giving a horsepower rating of 29.4 according to the S. A. E. formula. The wheelbase is 123 inches. The exhaust manifold is of the double-way type, it being claimed that the construction prevents heating and carbonizing of the exhaust valves, as two successive explosions do not pass the same valve opening.

The Oakland features are continued, a cone clutch being used, and the circulation oiling system. Drive to the axles is through an unenclosed shaft, parallel to which is the torque arm, the front end of which is supported by a cushion spring. The fuel is fed by pressure and the tank has a large filler cap and gauge. The tire carriers are of special design and are said to be rattle and chafe proof.

**AMERICAN 666.****Features Underslung Suspension and Roomy Body.**

The American Motors Company, Indianapolis, Ind., is featuring three new six-cylinder models for 1914, having in the past confined its efforts to the production of fours. The new models include the 642, a two-passenger car; 644, a four-passenger body on the same chassis; 646, a six-passenger car, and the 666, a six-passenger car, known as the Big Six.

The bore and stroke of the cylinders of the 666 are 4.5 by six inches respectively, and the S. A. E. horsepower rating is 48.60, which is the largest of the new sixes announced up to the present time. The cylinders are cast en bloc and are of the T head type. Accessibility and compactness are noticeable in the design.

Lubrication is by splash for the cylinders and pressure feed to the main bearings, connecting rods, etc., the splash level being maintained by a gear pump. A feature of the cooling system is that the lower water connection from the cylinders to the pump is cast in the upper part of the crankcase. To provide for unequal

heating there is an expansion coupling between the water jackets and the crankcase.

Another feature is the use of a double water connection from radiator to cylinders, one connection going to each upper corner of the radiator instead of the conventional single connection to the centre. The fan adjustment is novel, a slotted base in the fan pillar providing means for regulating the distance between the pulley centres.

**CRESCENT.****Long Stroke En Bloc Motor and Wheelbase Featured.**

The Crescent model Royal is a five-passenger touring car which is manufactured by the Crescent Motor Car Company, Carthage, O. The motor is rated at 38 horsepower by the S. A. E. formula, the cylinders having a bore of four inches and stroke of six, which places the engine in the long stroke class. The cylinders are cast en bloc, and the power plant is very compact.

Carburetion is by a late model Schebler and the fuel is fed by the pressure system, a large capacity tank being featured. The Briggs system of ignition is standard equipment, it providing dual ignition, a magneto and dry cells. Cooling is by

pump, and the radiator is of such capacity as to insure proper temperatures under all conditions of service.

The clutch is of the disc type and the conventional selective form of gearset is utilized. The car is over tired, 34 by 4.5-inch shoes being fitted to all four wheels. The wheelbase is 132 inches and electric lighting and motor starting are standard equipment.

**COMPLETE EQUIPMENT.**

Last season was termed an equipment year and, while it appeared that the manufacturer left nothing to be desired in the way of accessories making for comfort and convenience, the 1914 models reveal several features not noted last year. Electric lighting and motor starting are, of course, standard, but one maker using other than electricity for starting. In the case referred to compressed air is employed.

One of the most practical accessories, and one that is becoming popular with motorists, is the power air pump, and it will be found on a number of new models, as well as those continued from last season with refinements. One-man tops, so called because of their ease of operation, are offered by several makers.

**DE SOTO SIX.****Maker Emphasizes Durability of Components.**

The de Soto Motor Car Company, Auburn, Ind., states that its product is designed to withstand hard service

and that all components of the chassis are built with an ample margin to endure the severest strain. The motor is cast in pairs, and the cylinder dimensions are four by five inches, developing, the maker states, 50 to 55 horsepower.

The clutch is a multiple disc, gearset a three-speed selective and the rear axle of the full floating type. Imported Hess Bright bearings are liberally employed. The maker calls special attention to its frame, stating the double construction utilized is not found in any other car. The wheelbase is 130 inches, and the springs are extra long. Thirty-six by four-inch tires are fitted all around. Electric lighting is included in the equipment, but the motor is started by compressed air, a system providing means for inflating the tires as well. Option is given of electric or an exhaust horn.

**S. & M. 6-48.****Bodies Noticeable for Completeness of Equipment.**

The S. & M., made by the S. & M. Company, Detroit, is a newcomer in the automobile industry and the motor used is known as the Continental light six, rated by the maker at 48 horsepower. The cylinders are cast in triplets and the three point method of suspending the power plant is utilized. The carburetor is of the automatic type and is non-adjustable.

The clutch is a multiple disc, the steel disc alternating with those faced with gray asbestos. Large surface area is provided and the adjusting mechanism is very accessible. The gearset affords four forward speeds. The driver is placed at the left with control levers in the centre.

The wheelbase is 130 inches, tire size 34 by 4.5 inches, and three body types are fitted. All are a modified form of streamline design. The cars are completely equipped, included in which is a Golde patent top.

### NEW ANTI-SKID TIRE.

#### Republic Rubber Company Marketing New Type Termed the Republic "W M".

The Republic "W M" Tread Tire.

The Republic Rubber Company, Youngstown, O., maker of Republic tires and tubes, announces a new type of anti-skid tire called the Republic "W M" tread, which is designed especially for light cars and comes in the following sizes: Thirty by three, 30 by 3.5 and 32 by 3.5 inches. As will be noted by the accompanying illustration the anti-skid tread resembles an M or a W, according to the position of the casing. The same high grade materials and workmanship are incorporated in the new shoe as is characteristic of the products of this company which manufactures the Republic staggered non-skid and plain tread casings. The line of inner tubes includes both the gray and black line. The Republic Rubber Company has branches and agencies in the principal cities of the United States, Canada and Mexico.

### DETROIT'S AUTOMOBILE SHOW.

#### Dealers Claim a Larger Display of Cyclecars Than New York or Chicago.

The importance of Detroit as the centre of the automobile industry is expected to have its effect upon the 13th annual motor car show in that city, Jan. 17-24. The list of exhibitors will include 31 lines of pleasure cars, 11 of trucks and more cyclecars than are to be displayed either at New York or Chicago, according to the information supplied by the management. The display will be held in the new Ford building.

### NATIONAL TELESCOPE PUMP.

#### National Motor Supply Company Announces New Design of Spark Plug Type.

The National Motor Supply Company of Cleveland, O., has just placed on the market a

new pump of the spark plug style, which is termed the National Telescope pump. It is designed along novel lines and differs from those marketed in a number of particulars, as will be noted by the accompanying illustration. The body is made from close grained cylinder iron and is carefully machined inside. A floating piston, containing a metal piston ring, has a brass tube attached to its upper side. As the piston in the engine cylinder moves up and down the compression and suction move the piston in the pump in a like manner, causing the brass tube or piston stem to slide in and out at the top of the pump.

The compression chamber is between the walls of the brass tube and outside body. As the piston moves downward the fresh air is drawn in through the hole in the top of the pump, passes the valves through the piston and enters the compression chamber to break the vacuum, as shown by the arrows. The National utilizes 100 per cent. of the area inside the pump, and the maker claims that in this way as much air is obtained as with pumps twice its size. The new pump is only five inches high. Its compactness and light weight make for easy storing in the car. Another feature of the pump is that it is quickly fitted.

The two parts of the piston head are machined from a solid steel bar, making for durability. The best of material is employed throughout and all parts are machined to very close limits. A feature of the National is a neat wooden handle for tightening or loosening it in the cylinder. The pump comes equipped with 12 feet of woven cover hose and a dial pressure gauge when ordered. A half and .875 - inch nipple is supplied with each, and metric sizes when desired. The pump is moderately priced.

National Telescope Pump.

## WITH THE CYCLECAR MANUFACTURERS.

### A Brief Resume of the Principal Characteristics in Design and Construction with the Models Now Offered by Makers of the Latest Type of Machine in America.

**E**ACH year in the history of the automobile industry has witnessed some particular feature in design or construction which has been

that there are at least 30 such concerns in Detroit alone. An accompanying table gives the general specifications for 33 different makes, work upon which has progressed to a point where the designers feel warranted in making these public. Even with many of these the manufacturer reserves the right to make such changes in design or construction as further road work and experimentation shall deem advisable.

#### Seating Arrangement.

The cyclecar is held to have had its origin abroad, the first machine to which this term was applied having been the Bedelia of France. In France and Continental Europe practically all cyclecars are arranged to seat the passengers in tandem, following the example of the Bedelia in this respect. The Ajax, which for some unknown reason has been classified as an American machine, although made by the Briscoe Freres of Paris (perhaps it is because Benjamin and Frank Briscoe are Americans and were so long identified with the American automobile industry), departs from this rule, and arranges

Front, Side and Plan View of Pioneer, with Staggered Seating.

sufficiently prominent to be classed as distinctive in a measure. Present indications would seem to suggest that 1914 is to be a cyclecar year. Insofar as the American industry is concerned, the latter part of 1913 has been a period of preparation, and it is expected that the advent of spring will see a comparatively large number of these little machines ready for the market.

As yet, there is some difficulty in determining the exact point where the line of demarcation must be drawn between the cyclecar and the small car, for with the remarkable interest which has been manifested by the public in machines of these types, several new small four-cylinder cars have made their appearance, as set forth elsewhere in this issue. In a broad sense, however, a cyclecar is taken to mean an automobile constructed on the simplest possible lines.

No less than 47 different manufacturers have made public announcement of their intention to place a cyclecar on the market. This probably falls far short of the total number of experimenters, since it is stated

Plan and Side View of Trumbull Chassis and the Completed Car.

**The Imp Has Tandem Seating with the Driver Located in Front.**

to seat its two passengers side by side.

Of the 33 makes listed, 16 have adopted the side-by-side method, 11 have tandem seating, two give an option in this respect and four employ a staggered arrangement of seats.

It would appear that the designers were about evenly divided upon the question, and there is quite as much diversity of opinion as to the location of the driver. With cyclecars seating the passenger side by side, the driver is located at the left in a majority of instances, but a few place him at the right, while with the tandem machines the driver is in front with all except the Davis, De Cross and Stickney.

#### **Wheelbase.**

The wheelbase varies from 80 inches for the Trumbull to 108 for the Puritan. A mean average

for the 33 makes is 98 inches, but the De Cross, Victor and Woods are the only ones to adopt this mark, while eight have wheelbase of 96 inches and six of 100. It might be supposed that the tandem cars would have the longer wheelbase, but this does not always hold true. The Puritan, with longest wheelbase of all, seats its passengers side by side, while the shortest tandem machine is the Davis, with 93 inches.

#### **Tread.**

Some attempt has been made to classify cyclecars according to tread. This plan undoubtedly is based on the fact that practically all foreign cyclecars have a tread of less width than standard, this applying in Great

**The Falcon Is an Example of Side-by-Side Seating with Driver at Left.**

Britain, where the majority of these machines have side-by-side seating, as well as in Europe. If this rule were strictly adhered to in this country, it would be necessary to eliminate the Cornelian and Downing, as both have standard tread of 56 inches.

The narrowest tread of all is 30 inches, on the Woods. On the Continent, what might be regarded as the standard cyclecar tread is 36 inches. Twelve American designers have decided upon that figure, while the Twombly comes pretty near it with 38. In Great Britain the average is 42 or 44, and America has one of the former and five of the latter.

#### **Weight.**

A few manufacturers lay great stress upon the weight, while others have not considered this of sufficient importance to make

**The Los Angeles Also Seats Side by Side, but with Driver at the Right.**

public. American cyclecars weigh from 325 for the Falcon, to 1150 for the tandem Car-Nation. The mean average for the machines the weight of which is known is about 600 pounds, and the Brown, Imp, LaVigne and Zip tip the scales at exactly that figure.

#### Motor.

The power plant is an important feature, and one upon which there is some little difference of opinion among engineers. An automobile built along the simplest lines has been taken by some to mean the use of motorcycle parts so far as practicable. This has

The Underslung Suspension Is Particularly Noticeable with the Mercury.

continue to disagree for some time. The advocates of the two-cylinder power plant point to the motorcycle as an example of the efficiency of this type of motor in hill climbing and similar work.

The Car-Nation Offers an Option Between Tandem and Side-by-Side Seats.

undoubtedly had its effect upon the selection of a two-cylinder motor of the motorcycle type in many instances. Generally, however, it has been found desirable to redesign the engine so as to make it particularly adaptable to cyclecar service.

#### Two vs. Four Cylinders.

Since road conditions are not the same in America that they are abroad, the question of power has given rise to the difference of opinion mentioned above. Some engineers hold that a two-cylinder engine is quite suitable for town driving and for work where the country is comparatively level, and that a four-cylinder motor will be found more desirable where hills and poor roads are to be encountered. This is a point concerning which it is expected that engineers and owners will

Twenty American cyclecar manufacturers list a two-cylinder motor only, but it is known that several of these are experimenting with four-cylinder engines and expect to be in a position to offer an option in this respect. Three makers already offer such an option. Ten stand committed to the four-cylinder engine from the start. The horsepower rating—and the figures given are those of the manufacturer in each instance—ranges from eight to 19. Cooling, Etc.

Of the 24 two-cylinder motors listed, all are air-cooled, and generally these are V type. One

Still Another Design with Tandem Seating Is That of the Twombly.

**The Fenton Follows the Roadster Design with Rear Deck for Luggage.**

four-cylinder motor is air-cooled, but the other 10 are water-cooled. Information concerning the lubrication system is somewhat meager, but the choice seems to be divided between pump circulation and gravity. Except in a few instances, where the Atwater Kent Unisparker system is employed, ignition is by high-tension magneto.

#### **Location.**

The location of the power plant follows general automobile practise in most instances, in that it is placed in front, usually under a hood. The Imp and Pioneer leave the motor somewhat exposed, the hood being so arranged as to deflect the air currents about the engine in front of it. A notable exception to the general rule is found in the Cricket, which carries its two-cylinder engine at the right side of the car, entirely exposed.

The transmission system is divided between friction, selective sliding gear and planetary. The Twombly offers an option in this respect, its two-cylinder model having a friction transmission and its four-cylinder a selective gearset. Sixteen makers employ the friction type, nine the selective and seven the planetary. Several of the friction driven machines are fitted with some means for limiting the number of speeds, al-

though it is possible to secure any number of speeds with this type of transmission. Some of those employing the selective type also limit the number of forward speeds to two.

#### **Rear Construction.**

Drive to the rear wheels is by belt, chain or shaft. This naturally leads to the question of rear axle, and in this particular the cyclecar may differ materially from the automobile. The Cricket

has no rear axle, and several have no front axle. A large majority have no differential.

#### **Spring Suspension.**

Designers have striven to produce a machine with low centre of gravity, believing that it is possible in this manner to overcome any tendency toward tipping or leaving the road when travelling at high speeds. For this reason many machines have some type of underslung springs.

**The Malcolm Machine Presents Decidedly Novel Body Lines.**

While the terms semi-elliptic, quarter-elliptic, three-quarter elliptic, cantilever, etc., are used in this connection, it does not necessarily follow that these have exactly the same meaning as with the ordinary automobile.

There is greater diversity with respect to the spring suspension than with any other one point in the design of the American cyclecars. Several concerns utilize their own special type of spring, which has been made the subject of application for patent rights. This also explains the fact that many machines are without the customary front axle. To attempt to describe each method of spring suspension in detail would require more space than has been allotted to this entire subject, but it may be dismissed briefly with the statement that the front springs are so arranged in combination with the steering

**The Woods Moblette Has Narrowest Tread of All—30 Inches.**

mechanism as to afford not only a spring suspension of the body, but the proper relation of the front wheels to each other. This also applies in a measure with respect to the rear wheels on some cyclecars.

#### Wheels and Tires.

The wheels usually are of wire, motorcycle type, the two exceptions in the tabulation being the Detroit and the Duryea, which are of wood. This also indicates that the tires are of the motorcycle type, in a majority of cases 28 inches in diameter, with cross section of 2.5, 2.75 or three inches. This is held to be an important factor in the cost of maintenance. The weight of the machine and the simplicity of its construction are expected to make for economy in fuel consumption and tire

The De Cross Cy Car Is One of the Three with Driver at the Rear.

Downing, Imp, Pioneer, Trumbull, Victor and Woods. Means for starting from the seat are provided with the Falcon, Pioneer and Trumbull, and these, with the Car-Nation, also provide for electric lighting. The possibilities of using the cyclecar as a parcel delivery vehicle also have been considered by some designers, and

bodies of this type are supplied by the Economycar, Imp, Stickney and Woods. It is possible that other concerns than those mentioned have considered the starting, lighting and delivery body propositions, but the information given is that which is at hand at the present writing.

#### Still Experimenting.

But few manufacturers are as yet able to make deliveries, at least in anything like the quantity which appears to be necessary

to meet the demand for the cyclecar. This branch of the industry is hardly more than six months old, insofar as America is concerned. There are numerous problems which must be met by the designers and engineers before the actual work of manufacturing can be begun. Some of these can be determined only after a satisfactory period of road tests, which are now under way.

The Little Pri ncess Is Another Machine with Distinctive Body Design.

wear. The size of the tires makes for minimum first cost, as well.

#### Equipment.

The prices given are for the machine with standard equipment, and, of course, the amount of equipment included in that term varies. Other fittings are considered as extras. Usually, however, standard equipment includes lamps and horn, tire repair outfit, pump and such small tools as may be required. Sometimes the top, windshield and side curtains are added; at others these are considered as extras.

It is maintained that the possibility of utilizing a top gives the cyclecar a decided advantage over the motorcycle and sidecar, and among the makes with which a top is furnished, either as standard or extra equipment, are the Detroit,

## ANNUAL IMPORTERS' AUTOMOBILE SALON.

**D**EALERS representing imported automobiles in New York City are divided in their opinion as to the American demand for light cars of foreign manufacture. Perhaps it is due to the fact that the new tariff has been in force a short time only, but the importers state that it has not as yet made any appreciable effect upon their business. These factors are to be borne in mind when considering the annual Importers' Automobile Salon, to be given under the auspices of the Importers' Automobile Alliance in the grand ball room of the Hotel Astor, New York City, Jan. 2-10.

The list of exhibitors this year is a record one, both as to number of makes of cars and countries represented. There are 13 of the former and six of the latter, with a strong probability that these will become 14 and seven, respectively. In addition, the work of two body makers will be shown as separate displays. A distinct innovation this year is an accessory division, in which five makers of tires and two of accessories will be represented.

The Importers' Automobile Alliance departed from its usual custom last year in admitting cars of American manufacture. The United States will be one of the six or seven nations represented this year, the cars being the S. G. V. and the Simplex. The foreign machines that will be shown are: De Dion-Bouton, Delaunay-Belleville and Peugeot from France; Benz and Minerva from Germany; Fiat, Isotta-Fraschini and Lancia from Italy; Bugatti and Minerva from Belgium, and Marshall-Arter from England. It is expected that Spain also will be represented by the Hispano-Suiza, an agency for which is about to be established in New York.

Four nations are listed among the exhibitors of tires, these being France with the Gaulois and Faure, Great Britain with the Dunlop, Belgium with the Englebert and Russia with the Prowodnik. Dunlop wire wheels also will be displayed in this section, and A. J. Pickard will present a very complete line of supplies and fittings produced abroad.

The tariff will have at least one important bearing upon the forthcoming Salon, because by its terms cars and accessories may be admitted free of duty for exhibition purposes during the period of six months. This is expected to have a decided effect upon the number and character of the models shown, since under the terms of the old law the exhibitor was forced to pay a duty of

45 per cent. on each chassis and body, whereas now he has only the freight to consider. The variety of imported bodies to be seen at this display therefore promises to be somewhat wider than heretofore, although the Importers' Salon always has been noted for the body appointments revealed.

Although the grand ball room of the Hotel Astor provides over 20,000 square feet of floor space, it is anticipated that this will be taxed to its utmost. As heretofore, there will be no attempt to add to the beautiful decorations of this interior, which furnishes such an ideal setting for the cars. The committee in charge of the event plans to make it just as much of a drawing room affair as its predecessors and everything necessary will be done to create the atmosphere of social exclusiveness, particularly as it is believed by the importers that this appeals to the class of people who are interested in the foreign machines.

It may be added that the Bugatti and Marshall-Arter cars are entirely new to America, as of course is the Hispano-Suiza, although the reputation of the last named is somewhat well known in this country. The Belgian and English products are light cars. The former has been on the market since 1910 and has played a prominent part in racing events on the Continent. The Marshall-Arter is made in several models, ranging in horsepower from 8-10 to 12-14, with two and four-cylinder motors.

It also is stated that one, and perhaps two, cyclecars will be shown. It is practically certain that the Peugeot is one of these. This is termed a Baby Peugeot and is rated at six horsepower, with four-cylinder motor, cast en bloc, having bore of 55 mm and stroke of 90 (2.16 by 3.54 inches). The wheelbase is 72 inches and the two passengers are seated side by side.

---

At its annual meeting in the Lexington hotel, Chicago, Dec. 17, the Chicago Garage Owners' Association elected the following officers: President, J. A. Cameron; vice president and chairman of the electric division, H. J. Murphy; vice president and chairman of the gasoline garage division, W. C. Bode; vice president and chairman of the livery division, Fred M. Johns; vice president and chairman of the associate members' division, P. R. Higgenbotham; treasurer, John W. Morsbach; secretary, H. S. Gilbert.

# EFFECT OF CROPS ON AUTOMOBILE SALES.

(By J. J. Cole.)

**A**N ANALYSIS of crop conditions in the United States for 1913 discloses abundant evidence of the prosperity of the nation and holds forth an optimistic future for the automobile industry. Figures compiled by the federal Department of Agriculture show that the total wealth produced from farm lands during the current year amounts to approximately \$9,000,000,000.

Since upon our agricultural conditions depends largely the general prosperity of the country, it is only logical that automobile men should look forward to an exceptional trade. When the vast crops are finally turned into money, and this wealth put into general circulation, the motor car business will, in the natural course of events, participate in the prevailing prosperity.

Comparative figures give a comprehensive idea of the increase in crops. They show the steady manner in which greater wealth is being produced from the ground each year. The fact that crops alone show an increase of \$182,054,000 over 1912, when there was an unusually large yield all over the country, is proof of the further development of the resources of the country.

The following table is taken from Secretary Houston's report:

| Crop                 | 1911 Value      | 1912 Value      | 1913 Value      |
|----------------------|-----------------|-----------------|-----------------|
| Corn .....           | \$1,565,285,000 | \$1,520,454,000 | \$1,692,092,000 |
| Cotton .....         | 660,566,000     | 780,224,000     | 797,841,000     |
| Hay .....            | 784,926,000     | 856,695,000     | 797,077,000     |
| Wheat .....          | 543,063,000     | 555,280,000     | 610,124,000     |
| Oats .....           | 414,663,000     | 452,469,000     | 439,596,000     |
| Potatoes .....       | 233,778,000     | 212,550,000     | 227,902,000     |
| Tobacco .....        | 85,210,000      | 104,063,000     | 121,587,000     |
| Barley .....         | 139,182,000     | 112,957,000     | 95,731,000      |
| Rye .....            | 27,557,000      | 23,636,000      | 26,220,000      |
| Sweet potatoes ..... | 41,202,000      | 40,264,000      | 42,884,000      |
| Sugar beets...       | 27,843,000      | 30,406,000      | 34,420,000      |
| Rice .....           | 18,274,000      | 23,423,000      | 22,090,000      |
| Flaxseed .....       | 35,272,000      | 32,202,000      | 21,399,000      |
| Buckwheat ...        | 12,735,000      | 12,720,000      | 10,445,000      |
| Totals.....          | \$4,589,556,000 | \$4,757,343,000 | \$4,939,408,000 |

Despite the fact that 1912 recorded one of the most wonderful farm yields in America's history, the increase shown this year is considerably greater than that of 1912 over 1911. In 1912 there was a total increase of \$167,787,000 over the 1911 harvest. The increase this year over 1912 amounts to \$182,065,000.

Investigation reveals the fact the highest prices in years now prevail. This condition, of course, indicates even greater prosperity for the numerous classes engaged in producing and selling crops. We find that in instances where any shortage in production occurred, the prevailing prices more than made up for the poorer yield.

This year recorded the greatest wheat production in the country's history. Cotton, tobacco, rye, corn, potatoes, sugar beets and sweet potatoes—all ranked among America's leading crops—brought considerably greater value than last year. General conditions considered, there is every reason to hold an optimistic brief for the future. Crop conditions, steadily increasing orders and the general increase in prosperity hold forth a bright hue for those engaged in the automobile business.

The South and Southwest offer wonderful possibilities. Crops in these sections have been unusually abundant.

Prices are considerably higher than has been the rule. These districts will absorb a great deal more than their share of the 1914 output.

During the first quarter of the present season, more cars by thousands were shipped than in the same period of the previous season. Our

sales, for instance, showed an increase of more than \$1,000,000 over the same period of the 1913 season. I can see no good reason why the same conditions should not obtain later.

By studying the report of farm land wealth quoted above, one can readily see the general prosperity in the country. And with this evidence of wealth, I can see no reason why the remainder of the season should not be equally prosperous. The majority of automobile manufacturers never have been able to take care of the spring demand.

Taking the season to date as a whole, it has been a prosperous one. I am sure that when spring and summer sales have been totalled the same truth will hold. I am sure that the 1914 season will go down in automobile history as being a very successful and a very prosperous one.

J. J. Cole, President, Cole Motor Car Company.

### A GOOD BUSINESS YEAR.

#### President Kissel Finds Much Reason for Optimism as to the Future.

President George A. Kissel of the Kissel Motor Car Company, Hartford, Wis., finds that, in spite of many disquieting predictions to the contrary, the year 1913 has been an excellent one in the automobile trade. He adds that there is nothing in the present situation that does not justify satisfaction with the past and optimism as to the future. Concerning KisselKars, he says:

We have achieved some splendid results this year. We have increased the business of most of our 11 factory branches over 1912—in one case as much as 105 per cent.—and added materially to our list of agents in 18 states, while our total representation decreased in only four.

During the year the Pacific KisselKar branch was formed with a capital stock of \$500,000, and the strongest organization in the far West. This company succeeded the Standard Motor Car Company, an old and very stable concern of the highest reputation. Another event of much importance was the opening of the Chicago service building at Wabash avenue and 26th street, the largest structure in the West devoted to the sale and care of one make of car.

We operated both of our factories continuously through last summer, something quite extraordinary in the automobile business, but entirely justified by the early demand for new models. During the 12 months we never closed our doors, excepting for the December inventory.

Besides the many domestic agencies added to our list, we have been enabled for the first time to bid for foreign business, with the result that KisselKars are now gracing the roads of eight other countries. Strong representation has been secured in Hawaii, New Zealand, Sweden and Chili, to which lands we have shipped several carloads of both pleasure cars and trucks. We are looking for a big spring business and preparing accordingly.

### SEVEN BIG RACES.

#### Contest Board Grants Sanctions for Important Events During 1914 Season.

At a meeting of the contest board of the American Automobile Association in New York City earlier in the month, sanctions were issued for seven important races during the 1914 season, as follows: May 30, 500-mile event, Indianapolis speedway; July 3-4, road races, Tacoma, Wash.; July 4, 300-mile race under the auspices of the Sioux City Auto Club and Speedway Association; July 13-14, race meet on Seattle speedway; Aug. 28-29, road races, Elgin, Ill., under the auspices of the Chicago Automobile Club; Sept. 9, road race, Corona, Cal., and some time in November, the exact date to be determined later, road race from El Paso, Tex., to Phoenix, Ariz., under the auspices of the El Paso Automobile Club.

Because of the marked enthusiasm with re-

spect to the cyclecar, it was the sense of the meeting that in the modification of the contest rules for 1914, suggestions be invited from the manufacturers of this type of machine, in order that classifications and regulations governing events for these might be included. The registration fee for drivers was increased from \$2 to \$3, and that for mechanics was placed at \$2.

### TO INSTALL ELECTRIC STARTERS.

#### Maker of Jesco Equipment Establishes Service Station for Owners in Chicago.

The large demand from owners of cars manufactured prior to the days of electric starting and lighting equipment is opening a new field of work for concerns who make it a business to sell car owners appliances of this character. The Jones Electric Starter Company, Chicago, maintains that the Jesco electric starter-lighter, made by it, is particularly well adapted for installations of this kind and is establishing a chain of Jesco installation and service stations throughout the country. Among the first agencies of this kind is that located in Chicago, where work of this character will be handled by the Chicago Electric Specialties Company, 1508 Michigan avenue. A large space, to accommodate as many as 30 cars at one time, has been leased by this concern for this purpose.

### CINCINNATI SHOW PLANS.

#### Automobile Trade Association to Make Display in Union Central Building.

The Cincinnati Automobile Trade Association, composed of fully two-thirds of the dealers in that city, has selected the Union Central building as the site for its annual show, Feb. 7-14. This is said to be one of the finest fireproof structures in the world, and it will afford floor space of 30,000 square feet. The display will comprise pleasure cars, motor trucks, cyclecars, motorcycles and accessories and supplies, and it is anticipated that it will be one of the most comprehensive in every respect that has been held in this city.

The committee in charge of the arrangements is composed of the following: Chairman, Raymond Hendrickson; L. C. Denison, Robert C. Crowthers, A. L. Pachoud, Claude Wilson, Leonard G. Schreiber and L. F. Ballman. Mr. Crowthers is secretary and his address is 1815 Reading road, Cincinnati, O.

## MANY INNOVATIONS FOR NEW YORK SHOW.

**Fourteenth Annual Display Under New Management in Grand Central Palace---  
Largest Number of Makes Ever Assembled Under One Roof in the Me-  
tropolis---Cyclecars, Motorcycles and Accessories to Share the Interest.**

**F**OURTEEN years ago, the first national automobile show in New York City was held in Madison Square Garden. During those 14 years the industry has witnessed many changes. But for the first time in its history New York is to have but one national show this year and Madison Square Garden has been entirely eliminated, though not forgotten.

The 14th annual national automobile show in New York City will be held in the new Grand Central Palace, Jan. 3-10, under the auspices of the Automobile Chamber of Commerce and

under the management of Samuel A. Miles. The show committee is composed of Col. George Pope, chairman; H. C. Smith and Wilford C. Leland. About the only name that sounds familiar in connection with the New York display is that of Col. Pope, who was connected with the show committee of the old Association of Licensed Automobile

Manufacturers, and its immediate successor, the Automobile Board of Trade.

One of the statements made above needs a lit-

tle amplification. The Automobile Board of Trade had but one show last year, but it was held in two buildings, Madison Square Garden and Grand Central Palace. In fact, an independent exhibition of cars was made in the latter building in 1912. So that the Grand Central Palace has been identified with the national automobile show previous to this year.

The Automobile Chamber of Commerce is a new name for the old National Association of Automobile Manufacturers, and was selected upon the amalgamation of that organization with the

Automobile Board of Trade early in the year. It is understood that a movement is under way to change this name yet again, so that it is expected that it soon will become the National Automobile Chamber of Commerce.

Samuel A. Miles has been general manager of the national organization of automobile manufacturers for years, and is even better

known in the the Middle West as manager of all the national automobile shows held in Chicago. This is practically his first appearance as a show

**Grand Central Palace, Scene of 14th Annual National New York Display.**

manager in the East, but his experience in this respect has been such as to warrant the forecast that the exhibition will prove a success, insofar as he is able to bring this about.

Samuel A. Miles, General Manager,  
New York Show.

Examination of the advance list of exhibitors indicates that the forthcoming display will afford the people of New York City an opportunity to see the largest number of makes of motor vehicles ever assembled under one roof. In this respect, the New York exhibition

never has equalled the Boston show, but taking the number of makes shown in two buildings last year as a basis of comparison—and that was the largest number ever seen in the Metropolis—this year's list already comes within six of equalling that event. There were 87 makes in 1913 and there will be at least 81 in 1914.

These 81 makes comprise 70 gasoline, six electrics and five cyclecars. Two hundred and fifty-three makers of these machines are listed today, of which 185 are producing gasoline pleasure cars, 21 electric pleasure cars and 47 cyclecars. Probably the list of cyclecar makers is by no means complete, and it may be added that this will be the first opportunity the public has had to investigate the merits of the new type of vehicle in a display of this character. In this respect, also, the 14th annual national automobile show in New York City will be different than all of its predecessors. There also will be 12 exhibitors of motorcycles.

It is practically impossible to make prediction concerning the accessory division, for the reason that many new names always are added immediately preceding the opening of the exhibition. Thus far the list would appear to be below that of last year, when 322 separate displays were made. At present there are but 253 for 1914.

A large number of tire concerns and others prominent in the accessory field have withdrawn

from all shows this year. This has had a decided effect upon the total number of exhibitors in this section. However, this has enabled the management to allot space to many concerns which have not made display heretofore. Visitors will no doubt appreciate this opportunity to examine some of the newest fittings making for comfort, convenience or economy.

Automobiles will be staged on the first and second floors, and all of the wall spaces on the third and fourth floors have been reserved for them. Electric vehicles will be shown in the centre of the second floor, cyclecars on the third and motorcycles on the fourth. Accessory exhibits will be located on the two upper floors only. The arrangement has been with a view to encouraging a visit to each floor, so that accessory and motorcycle exhibitors will secure an added advantage in being placed close to car displays.

The interior of the new Grand Central Palace has been so designed that any elaborate decorative scheme would be entirely out of place. For this reason General Manager Miles has decided that very little special ornamentation is necessary. A simple arrangement of signs will denote the different exhibition spaces and the cars will be shown amid a floral setting that will add to rather than detract from the beauty of the building itself.

Following a plan which was inaugurated early in the history of automobile shows, Wednesday will be known as "Society Day". In recent years it has been the custom to thus set aside two days on which

the admission price was doubled. With the crowded condition of the aisles in Madison Square Garden it was found desirable to secure the advantage of limited attendance in this manner, but Grand Central Palace affords many thousand feet of extra floor space and it is not believed

will be necessary in consequence. The show will be for one week only, and confined solely to the passenger vehicle end of the industry.

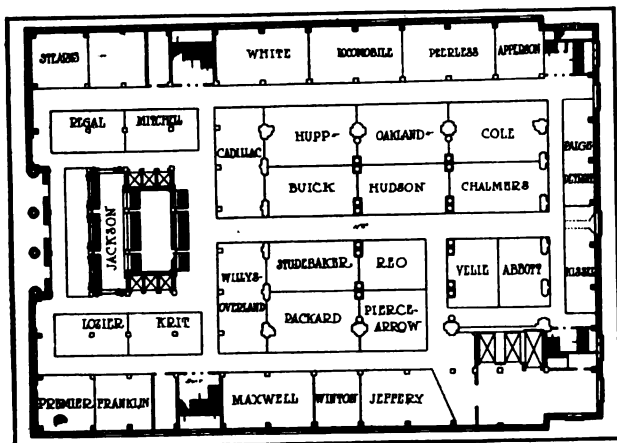

Col. George L. Pope, Chairman, New  
York Show Committee.

## CLASSIFIED LIST OF NEW YORK SHOW EXHIBITORS.

## GASOLINE PLEASURE CARS.

- A 23 Abbott-Detroit—Abbott Motor Co., Detroit, Mich.  
 D 14 Allen—Allen Motor Co., Fostoria, O.

Main Floor, Section A, Gasoline Cars Only.

- A 2 Apperson—Apperson Bros. Auto Co., Kokomo, Ind.  
 B 17 Auburn—Auburn Auto Co., Auburn, Ind.  
 A 15 Buick—Buick Motor Co., Flint, Mich.  
 A 11 Cadillac—Cadillac Motor Car Co., Detroit, Mich.  
 D 13 Cameron—Cameron Mfg. Co., West Haven, Conn.  
 B 28 Cartecar—Cartecar Co., Pontiac, Mich.  
 B 22 Case—J. I. Case T. M. Co., Racine, Wis.  
 A 17 Chalmers—Chalmers Motor Co., Detroit, Mich.  
 C 5, 6 Chandler—Chandler Motor Car Co., Cleveland, O.  
 A 14 Cole—Cole Motor Car Co., Indianapolis, Ind.  
 C 10 Davis—Geo. W. Davis Motor Car Co., Richmond, Ind.  
 C 21 Empire—Empire Automobile Co., Indianapolis, Ind.  
 B 15 Fiat—Fiat Automobile Co., Poughkeepsie, N. Y.  
 A 29 Franklin—H. H. Franklin Mfg. Co., Syracuse, N. Y.  
 B 2 Garford—Garford Co., Elyria, O.  
 B 5 Great Western—Great Western Auto Co., Peru, Ind.  
 C 11 Havers—Havers Motor Car Co., Port Huron, Mich.  
 B 23 Haynes—Haynes Automobile Co., Kokomo, Ind.  
 B 7 Henderson—Henderson Motor Car Co., Indianapolis, Ind.  
 B 20 Herreshoff—Herreshoff Motor Co., Detroit, Mich.  
 A 16 Hudson—Hudson Motor Car Co., Detroit, Mich.  
 A 12 Hupmobile—Hupp Motor Car Co., Detroit, Mich.  
 B 11 Imperial—Imperial Automobile Co., Jackson, Mich.  
 A 18 Jackson—Jackson Automobile Co., Jackson, Mich.  
 A 32 Jeffery—Thos. B. Jeffery Co., Kenosha, Wis.  
 C 18 Keeton—Keeton Motor Car Co., Detroit, Mich.  
 C 2 King—King Motor Car Co., Detroit, Mich.  
 A 8 Kissel—Kissel Motor Car Co., Hartford, Wis.  
 B 21 Kline—Kline Motor Car Corp., Richmond, Va.  
 A 25 K-R-I-T—K-R-I-T Motor Car Co., Detroit, Mich.  
 A 4 Locomobile—Locomobile Co. of America, Bridgeport, Conn.  
 A 24 Lozier—Lozier Motor Co., Detroit, Mich.  
 B 29 Marlon—Marlon Motor Car Co., Indianapolis, Ind.  
 B 1 Marmon—Nordyke & Marmon Co., Indianapolis, Ind.  
 A 30 Maxwell—Maxwell Motor Co., Detroit, Mich.  
 C 8 McIntyre—W. H. McIntyre Co., Auburn, Ind.  
 B 9 Mercer—Mercer Automobile Co., Trenton, N. J.  
 C 4 Metz—Metz Co., Waltham, Mass.  
 A 10 Mitchell—Mitchell-Lewis Motor Co., Racine, Wis.  
 B 30 Moline—Knight—Moline Automobile Co., East Moline, Ill.  
 C 14 Mondex—Magie—Aristos Co., New York, N. Y.  
 B 3 Moon—Moon Motor Car Co., St. Louis, Mo.  
 B 4 National—National Motor Vehicle Co., Indianapolis, Ind.  
 A 13 Oakland—Oakland Motor Car Co., Pontiac, Mich.  
 D 2 Ohio—Crescent Motor Co., Cincinnati, O.  
 B 8 Oldsmobile—Olds Motor Works, Lansing, Mich.  
 A 19 Overland—Willys-Overland Co., Toledo, O.  
 A 26 Packard—Packard Motor Car Co., Detroit, Mich.

- A 7 Paige—Paige-Detroit Motor Car Co., Detroit, Mich.  
 C 20 Palmer-Singer—Palmer & Singer Mfg. Co., Long Island City, N. Y.  
 C 13 Partin-Palmer—Partin Mfg. Co., Chicago, Ill.  
 B 14 Pathfinder—Motor Car Mfg. Co., Indianapolis, Ind.  
 A 5 Peerless—Peerless Motor Car Co., Cleveland, O.  
 A 27 Pierce-Arrow—Pierce-Arrow Motor Car Co., Buffalo, N. Y.  
 A 28 Premier—Premier Motor Mfg. Co., Indianapolis, Ind.  
 B 6 Pullman—Pullman Motor Car Co., York, Penn.  
 A 9 Regal—Regal Motor Car Co., Detroit, Mich.  
 A 21 Reo—Reo Motor Car Co., Lansing, Mich.  
 B 13 Speedwell—Speedwell Motor Car Co., Dayton, O.  
 A 1 Stearns-Knight—F. B. Stearns Co., Cleveland, O.  
 B 24 Stevens-Duryea—Stevens-Duryea Co., Chicopee Falls, Mass.  
 A 20 Studebaker—Studebaker Corp., Detroit, Mich.  
 B 10 Stutz—Stutz Motor Car Co., Indianapolis, Ind.  
 C 22 Vaughan—Vaughan Car Co., Kingston, N. Y.  
 A 24 Velle—Velle Motor Vehicle Co., Moline, Ill.  
 B 12 Westcott—Westcott Motor Car Co., Richmond, Ind.  
 A 3 White—White Co., Cleveland, O.  
 A 31 Winton—Winton Motor Carriage Co., Cleveland, O.

## ELECTRIC PLEASURE CARS.

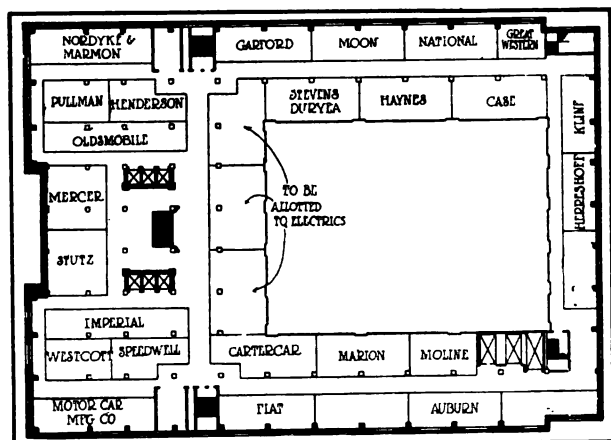

- B 27 Baker—Baker Motor Vehicle Co., Cleveland, O.  
 B 26a Detroit—Anderson Electric Car Co., Detroit, Mich.  
 B 27a Ohio—Ohio Electric Car Co., Toledo, O.  
 B 25a Rauch & Lang—Rauch & Lang Carriage Co., Cleveland, O.  
 B 25 Ward—Ward Motor Vehicle Co., New York City.  
 B 26 Waverley—Waverley Co., Indianapolis, Ind.

## CYCLECARS.

- C 7 Ajax—Briscoe Freres, New York, N. Y.  
 C 12 Cornelian—Cornelian Co., Kalamazoo, Mich.  
 C 8 Imp—Imp Cyclecar Co., Auburn, Ind.  
 C 1 Lomax—Lomax Motor Car Co., Lomax, Ill.  
 C 15 Twombly—Twombly Car Corp., New York, N. Y.

## MOTORCYCLES.

- D 151-153 Dayton—Davis Sewing Mch. Co., Dayton, O.  
 D 165-168 Emblem—Emblem Mfg. Co., Angola, N. Y.  
 D 154-159 Excelsior—Excelsior Motor Mfg. & Sup. Co., Chicago, Ill.  
 D 132-136 Flying Merkel—Miami Cycle & Mfg. Co., Midletown, O.

Second Floor, Section B, Gasoline and Electric Cars.

- D 160-164 Harley-Davidson—Harley Davidson Motor Co., Milwaukee, Wis.  
 D 190-192 Henderson—Henderson Motorcycle Co., Detroit, Mich.

- D 124-131 **Indian**—Hendee Mfg. Co., Springfield, Mass.  
 D 193-195 **Pope**—Pope Mfg. Co., Hartford, Conn.  
 D 148½-150 **R-S**—Reading-Standard Co., Reading, Penn.  
 D 171-172 **Schickel**—Schickel Motor Co., Stamford, Conn.  
 D 187-189 **Thor**—Aurora Auto. Mch. Co., Chicago, Ill.  
 D 183-186 **Yale**—Consolidated Mfg. Co., Toledo, O.

### ACCESSORIES.

#### Accessory Jobbers.

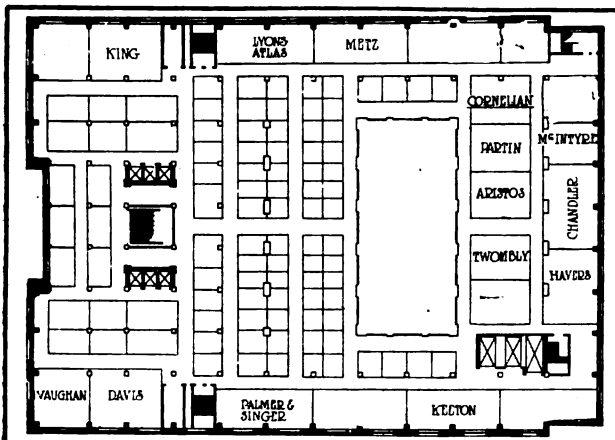

- D 66a—W. Smalley Daniels, Detroit, Mich.  
 D 31—Chas. E. Miller, New York, N. Y.  
 D 209—Ralph Walcott, New York, N. Y.  
**Axles, Transmissions, Etc.**  
 C 66—Brown-Lipe-Chapin Co., Syracuse, N. Y.  
 D 9a, 9b—Thos. Prosser & Son, New York, N. Y.  
 D 85—Torbensen Gear & Axle Co., Newark, N. J.  
 C 51—Warner Gear Co., Muncie, Ind.

#### Ball and Roller Bearings.

- D 34a—Bock Bearing Co., Toledo, O.  
 D 113, 115—Marburg Bros., New York, N. Y.  
 D 65, 66—Rhineland Machine Works Co., New York, N. Y.

#### Batteries.

- C 96, 97—Edison Storage Battery Co., West Orange, N. J.  
 C 50—Electric Storage Battery Co., Philadelphia, Penn.  
 D 84—Philadelphia Storage Battery Co., Philadelphia, Penn.  
 C 110—Vesta Accumulator Co., Chicago, Ill.

Third Floor, Section C, Cars, Cyclecars and Accessories—  
 Motorcycles and Other Cars and Accessories on Fourth  
 Floor.

- C 75, 77—Willard Storage Battery Co., Cleveland, O.  
**Bodies.**  
 D 196, 197, 198—Edward G. Budd Mfg. Co., Philadelphia, Penn.  
 C 27—Hayes Mfg. Co., Detroit, Mich.  
 C 112—Springfield Metal Body Co., Springfield, Mass.

#### Boxes, Metal.

- C 51—Globe Machine & Stamping Co., Cleveland, O.  
 C 107—Sparks, Withington Co., Jackson, Mich.

#### Brakes and Brake Lining.

- D 105a—Asbestos & Rubber Works of America, Trenton, N. J.  
 D 49, 50—H. W. Johns-Manville Co., New York, N. Y.  
 C 55, 56—Royal Equipment Co., Bridgeport, Conn.  
 D 175—Standard Woven Fabric Co., Framingham, Mass.  
 D 70, 71, 72—Thermoid Rubber Co., Trenton, N. J.

#### Bumpers.

- D 180—Essex Rubber Co., Trenton, N. J.  
 C 102, 108—J. H. Sager Co., Rochester, N. Y.

#### Carbon Removers.

- D 55, 56, 57—Cox Brass Mfg. Co., Albany, N. Y.  
 D 24a—G. B. Sales Corp., New York, N. Y.

#### Carburetors.

- C 89—Breeze Carburetor Co., Newark, N. J.  
 C 59—Byrne, Kingston Co., Kokomo, Ind.  
 D 69—Elker Carburetor Co., New York, N. Y.  
 C 98, 99—Findelsen & Kropf Mfg. Co., Chicago, Ill.  
 D 121—Schoen-Jackson Co., Media, Penn.

- C 64—Stromberg Motor Devices Co., Chicago, Ill.  
 C 41—Wheeler & Schebler, Indianapolis, Ind.

#### Castings, Etc.

- C 78, 79—American Bronze Co., Berwyn, Penn.  
 C 43—Wm. Cramp & Sons Sh. & Eng. Bldg. Co., Philadelphia, Penn.  
 C 92—Doehler Die Casting Co., Brooklyn, N. Y.  
 D 8, 8a—H. H. Franklin Mfg. Co., Syracuse, N. Y.  
 D 43—Peter A. Frasse & Co., New York, N. Y.  
 C 52—Light Mfg. & Fdy. Co., Pottstown, Penn.  
 C 80—Manufacturers Fdy. Co., Waterbury, Conn.  
 D 121—National Lead Co., New York, N. Y.  
 C 53—National Tube Co., Pittsburgh, Penn.

#### Concealed Hinges.

- D 39—Soss Mfg. Co., Brooklyn, N. Y.

#### Chains.

- D 111—Herbert F. L. Funke, New York, N. Y.  
 C 111—Link-Belt Co., Philadelphia, Penn.

#### Fire Extinguishers.

- D 54—David Kahnweiler's Sons, New York, N. Y.  
 D 61—Pyrene Mfg. Co., New York, N. Y.

#### Gasoline Gauges.

- D 49—Schaefer Sales Corp., Detroit, Mich.

#### Gear Shifters.

- D 11—Gray Pneumatic Gear Shift Co., New York, N. Y.

#### Horns and Signalling Devices.

- D 29, 30—Automobile Supply Mfg. Co., Brooklyn, N. Y.  
 C 69, 71—Dean Electric Co., Elyria, O.  
 D 36a—Fitzgerald Mfg. Co., Torrington, Conn.  
 C 44—Gabriel Horn Mfg. Co., Cleveland, O.  
 C 115—H. W. Johns-Manville Co., New York, N. Y.  
 D 112—Nonpareil Horn Mfg. Co., New York, N. Y.  
 C 90—Randall-Falchney Co., Boston, Mass.  
 D 119—Sireno Co., New York, N. Y.

#### Ignition Devices.

- C 87—Atwater Kent Mfg. Works, Philadelphia, Penn.  
 D 177—Electric Spark Appliance Co., New York, N. Y.  
 C 108—Heinze Electric Co., Lowell, Mass.  
 D 200—Herz & Co., New York, N. Y.  
 D 143—Holtzer-Cabot Co., Brookline, Mass.  
 D 207—K-W Ignition Co., Cleveland, O.  
 D 113, 114, 115—Marburg Bros., New York, N. Y.  
 C 101—Motsinger Devices Co., Lafayette, Ind.  
 C 54—National Coil Co., Lansing, Mich.  
 D 68—New York Coil Co., New York, N. Y.  
 C 36—Remy Electric Co., Anderson, Ind.  
 C 91—Simms Magneto Co., New York, N. Y.  
 C 60, 73—Splittorf Electrical Co., Newark, N. J.  
 D 142—Western Electric Co., New York, N. Y.

#### Jacks.

- C 49, 50—Hartford Suspension Co., Jersey City, N. J.  
 C 74—Oliver Mfg. Co., Chicago, Ill.

#### Lamps.

- D 174—B & L Auto Lamp Co., New York, N. Y.  
 C 46—Badger Brass Mfg. Co., Kenosha, Wis.  
 C 116—C. Cowles & Co., New Haven, Conn.  
 C 51—Edmunds & Jones Mfg. Co., Detroit, Mich.  
 D 206—Hawthorne Mfg. Co., Bridgeport, Conn.  
 D 26—Reynolds Browne Co., Chicago, Ill.  
 D 25—Roffy-Grace Corp., New York, N. Y.  
 D 19—Rushmore Dynamo Works, Plainfield, N. J.

#### License Brackets.

- D 37—Perkins-Campbell Co., Chicago, Ill.  
 C 109—Rose Mfg. Co., Philadelphia, Penn.

#### Lighting Systems.

- C 94, 95—Apple Electric Co., Dayton, O.  
 C 104, 105—Detroit Electric Appliance Co., Detroit, Mich.  
 C 68—Dyneto Electric Co., Syracuse, N. Y.  
 D 86—Electric Auto-Lite Co., Toledo, O.  
 C 26, 28—Gray & Davis, Boston, Mass.  
 C 49, 50—Hartford Suspension Co., Jersey City, N. J.  
 D 143—Holtzer-Cabot Co., Brookline, Mass.  
 D 106a—Kemco Electric Mfg. Co., Cleveland, O.  
 D 30a—North East Electric Co., Rochester, N. Y.  
 C 23, 25—U. S. Lighting & Heating Co., New York, N. Y.  
 D 28—Ward Leonard Electric Co., Bronxville, N. Y.  
 D 18—Westinghouse Electric & Mfg. Co., East Pittsburg, Penn.

#### Lubricants.

- C 58—Adam Cook's Sons, New York, N. Y.  
 C 38—Jos. Dixon Crucible Co., Jersey City, N. J.  
 C 88—A. W. Harris Oil Co., Providence, R. I.  
 C 85—Geo. A. Haws, New York, N. Y.  
 D 47—Indian Refining Co., New York, N. Y.  
 C 114—International Acheson Graphite Co., Niagara Falls, N. Y.

- C 45**—New York & New Jersey Lubricant Co., New York, N. Y.  
**D 103**—Platt & Washburn Refining Co., New York, N. Y.  
**D 98, 99**—L. Sonneborn Sons, New York, N. Y.  
**C 37**—Vacuum Oil Co., Rochester, N. Y.  
**C 63**—White & Bagley Co., Worcester, Mass.  
**Lubricators, Grease Guns, Etc.**  
**D 27**—Daim Oil Cushion Spring Insert Co., Chicago, Ill.  
**D 123**—Detroit Lubricator Co., Detroit, Mich.  
**D 31a**—Frazer Lubricator Co., Chicago, Ill.  
**C 99**—Randall-Falchney Co., Boston, Mass.  
**D 95**—S. P. Townsend & Co., Orange, N. J.  
**D 34**—Universal Lubricating Co., Cleveland, O.  
**Machinery and Machine Tools.**  
**D 60**—Baush Machine Tool Co., Springfield, Mass.  
**D 142a**—Houppert Machine Co., New York, N. Y.  
**D 33a**—Universal Machine Co., Bowling Green, O.  
**D 10**—Westinghouse Machine Co., New York, N. Y.  
**Motometers.**  
**D 77**—Motometer Co., New York, N. Y.  
**Motors.**  
**D 84**—Buda Co., Harvey, Ill.  
**D 214**—Model Gas Engine Works, Peru, Ind.  
**D 201**—F. W. Spacke Mch. Co., Indianapolis, Ind.  
**Motor Starters.**  
**C 94, 95**—Apple Electric Co., Dayton, O.  
**D 120**—Gemmer-Detroit Starter Co., Detroit, Mich.  
**C 26, 28**—Gray & Davis, Boston, Mass.  
**C 49, 50**—Hartford Suspension Co., Jersey City, N. J.  
**D 143**—Holtzer-Cabot Co., Brookline, Mass.  
**D 88**—Ignition Starter Co., Detroit, Mich.  
**D 33**—Jones Electric Starter Co., Chicago, Ill.  
**D 30a**—North East Electric Co., Rochester, N. Y.  
**D 7a, 7b**—Thurber Rotary Starter Co., Detroit, Mich.  
**C 23, 25**—U. S. Light & Heating Co., New York, N. Y.  
**D 28**—Ward Leonard Electric Co., Bronxville, N. Y.  
**D 18**—Westinghouse Electric & Mfg. Co., East Pittsburgh, Penn.  
**Motorcycle Accessories.**  
**D 217**—F. A. Baker & Co., New York, N. Y.  
**D 117**—Fentress-Newton Mfg. Co., Chicago, Ill.  
**Motorcycle Clutches, Etc.**  
**D 145, 146**—Eclipse Machine Co., Elmira, N. Y.  
**Mufflers, Cut-Outs, Etc.**  
**D 15**—Yale Steel Stamping Co., Oostburg, Wis.  
**Paints and Varnishes.**  
**C 42**—Valentine & Co., New York, N. Y.  
**D 25a**—C. A. Willey & Co., Hunter's Point, N. Y.  
**Piston Rings.**  
**D 210**—McQuay-Norris Mfg. Co., St. Louis, Mo.  
**D 85**—Wasson Piston Ring Co., Hoboken, N. J.  
**Polishes, Soaps, Etc.**  
**D 140**—N. B. Arnold, Brooklyn, N. Y.  
**D 101**—Baum's Castorine Co., Rome, N. Y.  
**D 46**—J. Eavenson & Sons, Camden, N. J.  
**D 36**—International Metal Polish Co., Indianapolis, Ind.  
**D 60a**—A. R. Justice & Co., Philadelphia, Penn.  
**D 48**—John T. Stanley, New York, N. Y.  
**Portable Garages.**  
**D 21a**—Metal Shelter Co., New York, N. Y.  
**D 15**—Taylor Mfg. Co., Montclair, N. J.  
**Pumps.**  
**D 215**—Brown Co., Syracuse, N. Y.  
**D 206**—Hawthorne Mfg. Co., Bridgeport, Conn.  
**D 199**—Kellogg Mfg. Co., Rochester, N. Y.  
**Radiators.**  
**D 213**—Mayo Mfg. Co., Chicago, Ill.  
**Recorders.**  
**D 24**—American Taximeter Co., New York, N. Y.  
**C 40**—Veeder Mfg. Co., Hartford, Conn.  
**Rims.**  
**D 33a**—E-Z Rim Co., Boston, Mass.  
**D 6b, 7**—Newmastic Co., New York, N. Y.  
**D 35**—Presto Inter-Rim Co., Boston, Mass.  
**C 34**—Standard Welding Co., Cleveland, O.  
**Shock Absorbers.**  
**D 96, 97**—Aristos Co., New York, N. Y.  
**D 89**—J. W. Blackledge Mfg. Co., Chicago, Ill.  
**D 179**—Ernst Flentje, Cambridge, Mass.  
**C 49, 50**—Hartford Suspension Co., Jersey City, N. J.  
**D 67**—Hudson Export & Import Co., New York, N. Y.  
**D 59**—J-M Shock Absorber Co., Philadelphia, Penn.  
**D 26a**—Le Telesco Shock Absorber Co., New York, N. Y.  
**D 38**—Mechaley Auto Co., Stamford, Conn.  
**D 75**—C. N. Peacock & Co., New York, N. Y.  
**C 102, 108**—J. H. Sager Co., Rochester, N. Y.  
**D 59**—Universal Shock Eliminator, Inc., New York, N. Y.  
**D 10a**—Westinghouse Air Spring Co., New York, N. Y.  
**Sidecars.**  
**D 8b, 9**—Majestic Mfg. Co., Worcester, Mass.  
**Spark Plugs.**  
**D 90**—Benford Mfg. Co., Mount Vernon, N. Y.  
**C 106**—Champion Ignition Co., Flint, Mich.  
**D 12**—Champion Spark Plug Co., Toledo, O.  
**D 62, 63, 64**—Emil Grossman Co., Brooklyn, N. Y.  
**D 81**—Hartford Machine Screw Co., Hartford, Conn.  
**C 59**—A. R. Mosler & Co., Mount Vernon, N. Y.  
**C 90**—Randall-Falchney Co., Boston, Mass.  
**D 178a**—Silvex Co., New York, N. Y.  
**Specialties.**  
**D 55, 56, 57**—Cox Brass Mfg. Co., Albany, N. Y.  
**D 52, 53**—Donnelly Motor Equipment Co., New York, N. Y.  
**D 107**—Englisch & Mersick Co., New Haven, Conn.  
**D 81**—Garage Equipment Co., Milwaukee, Wis.  
**D 176a**—Hall-Thompson Co., Hartford, Conn.  
**D 50**—Stewart & Co., New York, N. Y.  
**Speedometers.**  
**D 202**—Corbin Screw Corp., New Britain, Conn.  
**C 61**—Hoffecker Co., Boston, Mass.  
**C 84**—Standard Thermometer Co., Boston, Mass.  
**C 29**—Stewart-Warner Speedometer Corp., Chicago, Ill.  
**Springs.**  
**D 178**—Detroit Steel Products Co., Detroit, Mich.  
**D 204**—Perfection Spring Co., Cleveland, O.  
**Stampings, Metal.**  
**D 74**—Metal Stamping Co., Long Island City, N. Y.  
**Steering Wheel Warmers.**  
**D 35a**—Warm Hand Steering Wheel Corp., Poughkeepsie, N. Y.  
**Storage Systems.**  
**D 141a**—American Pump & Tank Co., New York, N. Y.  
**C 47, 48**—S. F. Bowser & Co., Ft. Wayne, Ind.  
**D 1a**—Hydraulic Oil Storage Co., New York, N. Y.  
**C 113**—Janney, Steinmetz & Co., Philadelphia, Penn.  
**D 93, 94**—Wayne Oil Tank & Pump Co., Ft. Wayne, Ind.  
**Tires and Tubes.**  
**D 106**—Braender Rubber & Tire Co., Rutherford, N. J.  
**D 40**—Cataract Rubber Co., Boston, Mass.  
**D 45**—Columb Tyres Import Co., New York, N. Y.  
**D 78, 79**—Double Fabric Tire Co., Auburn, Ind.  
**D 11a**—Marathon Tire Sales Co., New York, N. Y.  
**D 1**—Miller Rubber Co., Akron, O.  
**D 23**—Overman Tire Co., New York, N. Y.  
**D 70, 71, 72**—Thermold Rubber Mfg. Co., Trenton, N. J.  
**D 102**—United & Globe Mfg. Co., Trenton, N. J.  
**D 80**—Voorhees Rubber Mfg. Co., Jersey City, N. J.  
**Tire Accessories.**  
**D 83**—J. L. G. Dykes Co., Chicago, Ill.  
**D 142**—Julian H. Faw, New York, N. Y.  
**D 141**—National Rubber Co., St. Louis, Mo.  
**D 216**—Stevens & Co., New York, N. Y.  
**D 100**—Chas. O. Tingley & Co., Rahway, N. J.  
**Tire Gauges.**  
**C 82, 83**—A. Schrader's Sons, New York, N. Y.  
**D 212**—U. S. Gauge Co., New York, N. Y.  
**Tire Protectors.**  
**C 62**—Leather Tire Goods Co., Niagara Falls, N. Y.  
**Tops and Top Materials.**  
**D 91, 92**—F. S. Carr Co., Boston, Mass.  
**C 72**—L. C. Chase & Co., Boston, Mass.  
**D 12a**—Cleveland Hardware Co., Cleveland, O.  
**D 181, 182**—Golde-Patent Mfg. Co., New York, N. Y.  
**D 22**—Wm. R. Laidlaw, Jr., New York, N. Y.  
**D 208**—L. J. Mutty Co., Boston, Mass.  
**C 32, 33**—Pantasote Co., New York, N. Y.  
**D 27a**—P. Reilly & Son, Newark, N. J.

## DYNETO LIGHTING SYSTEM FOR FORD.

**T**HE Dyneto Electric Company, maker of lighting systems for motor cars, is manufacturing a lighting equipment for the model T Ford automobile, which is a complete outfit, including as it does the generator, storage battery, battery box, reflectors, bulbs, tail light, wiring, terminals, etc. The maker states that the system is not only moderately priced, but is installed easily, as complete instructions are supplied.

The dynamo is located on the left hand side of the motor, as will be noted by the accompanying illustration. A bracket is supplied for

Showing Installation of Dyneto Generator on Ford Car and Method of Drive.

supporting the generator, also for retaining it, and is placed with the belt pulley forward. Every part is made to fit and it is stated that the dynamo may be installed in an hour. Drive is by a one-inch endless belt, which replaces the usual fan belt, and the tension is regulated by the Ford fan belt adjustment.

The Dyneto generator weighs about 23 pounds, and combines in one apparatus a slow speed direct current generator and automatic switch, also automatic means for controlling the output to meet requirements. The automatic switch connects the generator with the storage

battery when the output of the former is sufficient to charge the cells, and disconnects the dynamo when the speed is too low for charging. The dynamo is cut in at a car speed of about 12 miles an hour and at higher ratios the output is automatically controlled. Below car speeds of 12 miles an hour and when the engine is inoperative, the battery supplies current for lighting.

A dash indicator is provided, which shows at all times whether the cells are being charged or discharged, and the switch is a Briggs & Stratton, providing the usual combinations and a dimming attachment. The switch button is in the form of a plug which can be removed to prevent tampering with the system.

A six-volt LBA battery is utilized, this being carried in a pressed steel box on the running board and it is stated that its capacity is such as to supply current for 10 hours of lighting with the motor inoperative. The wiring is very complete and is supplied to make connections without cutting or alterations. The ends of the leads are fitted with terminals for attachment to the posts for which they are designed. Two reflectors with bulbs are supplied, also a complete tail light, showing a white light over the number plate and a red to the rear. The company will supply a pair of nine-inch headlights, black enamelled, and fitted with either 16 or 20 candlepower bulbs at an additional cost. The complete Dyneto lighting system for Ford cars weighs about 75 pounds when packed for shipment.

Georges Boillot and Jules Goux, the former winner of this year's Grand Prix in France, and the latter the victor in the Indianapolis 500-mile race, are soon to visit this country, according to information received recently in American racing circles. It is understood that both men will make entry for next year's international sweepstakes on the Indianapolis speedway.

Several factories at Southington, Conn., engaged in the manufacture of motor car parts, fittings and accessories, are working overtime to fill orders. Business is reported to be unusually good for this season of the year. One forging concern is running three nights a week.

## HARROUN KEROSENE CARBURETOR.

**D**ETAILS of the kerosene carburetor invented by Ray Harroun, the former racing driver, have been made public by the Harroun Company of Indianapolis, Ind., which concern consolidated recently with the Electric Renovator Manufacturing Company of Pittsburg. Eventually the carburetor will be produced in a new plant which is being erected in Pittsburg.

The construction and operation of the Harroun carburetor is shown in an accompanying illustration, and it will be noted that part of the exhaust is forced through the space around the venturi, which heats the corrugated surface to a cherry red. This venturi passage is in the form of a spiral, and as the dense atomized fuel is drawn through by the suction of the piston of the motor the heavier particles are thrown to the outside against the heated surface by the centrifugal force, and the more volatile portion of the fuel remains in the centre.

The fuel, as it is sprayed from the nozzle and comes in contact with the hot surface, is turned into a vapor. This vapor is partially mixed with air which comes through the bottom of the venturi and is further diluted with cold air which comes through the secondary air valve.

The fuel opening in the nozzle is automatically opened and closed by the action of the secondary air valve. There is but one adjustment, that operated from the driver's seat through a suitable connection to the lever A on the side of the carburetor. This raises or lowers the fulcrum of the rocker arm G, which is inside of the carburetor, and raises and lowers the needle B as it is actuated by the air valve E.

One of the features of the carburetor is that of taking a small portion of the exhaust gas back into the charge through the air valve opening. It is maintained by the designer that a part of the exhaust gas mixed with the charge eliminates the disagreeable pound which is always more noticeable with kerosene than gasoline. Water has been used a great deal to accomplish this result, but it is stated that it involves complications; is hard to regulate, and is not suitable for cold weather. The designer states that this gas mixing feature is an advantage even with gasoline, as it will positively eliminate a carbon knock and has other advantages which are held to be as follows:

There is supplied with the carburetor a means of regulating the amount of exhaust utilized, by the butterfly valve C. This may be operated from the dash and provides regulation of the maximum expansion period in relation to the piston travel under varying running con-

ditions. For example, it is known that the fuel consumption a horsepower-hour ranges from one-half to three-quarters of a pound at about 1000 feet a minute piston speed and increases very rapidly, both as the piston speed increases or decreases from this point, consuming sometimes as much as 1.5 pounds at about 500 and 1600 feet a minute piston speed.

This is an undesirable condition and is due to the fact that the speed at which a correct mixture will burn happens to be just right, at 1000 feet piston speed, to give its maximum pressure at the moment the crank arm and connecting rod are at right angles to each other, and the leverage the greatest. Therefore, any agency that will retard this burning speed without retarding the spark timing at slow motor speeds will increase the thermo efficiency. Under actual running conditions an automobile motor is rarely pushed to its maximum or even a normal load.

Atmospheric conditions, such as altitude and temperature, also affect this burning speed of the charge and it seems reasonable that there should be some means of control of this condition, and this method seems to solve this problem in a very satisfactory manner. The mileage on a gallon of fuel is very much increased and

**Sectional View of Harroun Kerosene Carburetor, Which Utilizes Heat of Exhaust for Increasing Temperature and Vaporizing the Fuel.**

strange to say the more of this exhaust element that is taken back into the motor the cooler it will run.

The Harroun carburetor is designed to operate on either kerosene or gasoline and without any change of adjustment. It is claimed that the mileage obtained is 10 per cent. greater when using kerosene and that tests have shown it will haul one ton one mile for one-third of a cent. The carburetor is now being marketed by the Harroun Company.

At the annual meeting of the Stevens-Duryea Company, Chicopee Falls, Mass., the following officers were elected: President, W. H. Whiteside; vice president, J. Frank Duryea; clerk, W. M. Remington. I. H. Page retired as treasurer.

## WORLD'S MARKET FOR AMERICAN CARS.

### Conditions Which Must Be Met in Order to Secure Export Business—How Last Year's Shipments Were Distributed—Possibilities in the Several Countries.

**F**EW motorists appreciate the magnitude of the automobile industry, either at home or abroad. It is barely 17 years since the first gasoline propelled road vehicle was imported into America. Last year the manufacturers of cars in the United States shipped automobiles to other countries to the value of \$25,000,000. Basing the estimate on the ratio of increase evidenced in the figures thus far available the valuation of cars exported will reach a total of approximately \$28,000,000 for year ending Dec. 31, 1913.

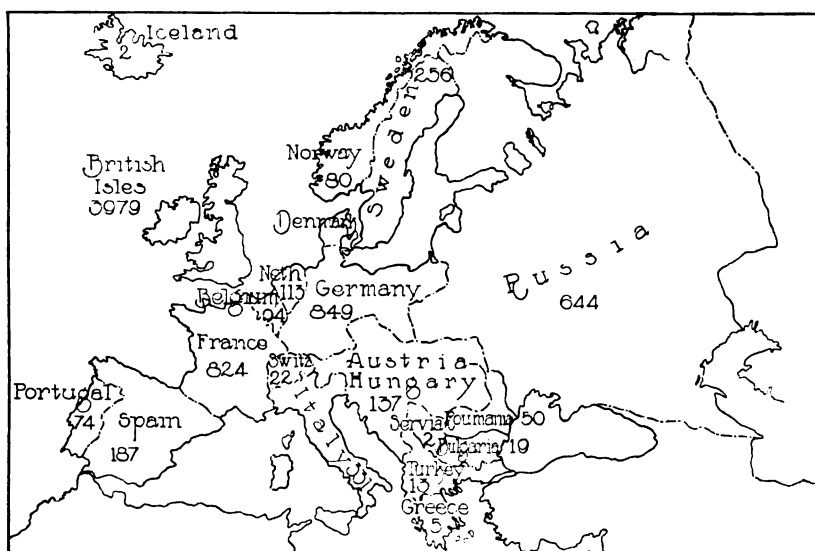

**Government's Figures for Last Fiscal Year.** It will be understood that the above statements apply to the calendar year, while an interesting tabulation presented herewith indicates the

consideration of the subject that the table becomes very largely a record of actual accomplishment. It is the purpose of this discussion to present some of these conditions as viewed by American exporters who are in constant touch with the situation in the various fields.

#### Monthly Comparison of Exports and Imports.

The Department of Commerce, Washington, D. C., issues a monthly summary of commerce and finance, which gives in addition to other information, a comparative compilation of exports and imports for each succeeding month and for that portion of the current calendar year which has already expired. This compilation is entirely separate and distinct from the statement issued after the close of the fiscal year. The last monthly summary available presents statistics for first nine months of 1913, in comparison with the same period in 1911 and 1912. These figures are reprinted herein.

From these it is learned that the exports of automobiles have increased a trifle over 84 per cent. in two years, while the imports have decreased approximately 38 per cent. during the same period. The average value of the cars exported in 1911 was \$1029, in 1912 \$992 and in 1913 \$1017. That for the machines imported in 1911 was \$2136, in 1912 \$2278, and in 1913 \$2342. It is much too early to determine whether or not

Map of Europe, Showing Number of Cars Shipped to Each Country.

number and value of both commercial and pleasure vehicles shipped to individual countries for the governmental fiscal year, ending June 30, 1913. It will be noted that the total for that period—\$26,012,934—exceeds that for the calendar year of 1912, but this apparent discrepancy is easily explained when it is remembered that the fiscal year comprises the last half of 1912 and the first half of 1913.

This tabulation is of particular interest, in that it is of valuable assistance in judging the possibilities of the foreign market. However, there are so many conditions entering into the

the change in tariff rates, admitting chassis at 30 per cent. duty instead of 45, will have any appreciable effect upon the import figures.

#### How Export Business Must Be Transacted.

The exportation of \$25,000,000 or \$28,000,000 worth of cars is not brought about without careful attention to details. Some manufacturers maintain direct factory branches in certain foreign countries from which the cars are re-shipped to their destination. Others have formed separate exporting companies in this country. A few do business direct, while a majority look to

the export houses on the Atlantic and Pacific Coasts for assistance in this respect.

Where an attempt is made to do business direct with the dealer in a foreign country, it usually becomes a question of receiving the cash before the goods are shipped. This has its disadvantages, because the dealer may have difficulty in securing the ready money, either to establish a drawing account in America or to pay for each car when ordered. As a result the sale of machines is retarded.

When the manufacturer is able to be represented abroad by a direct factory branch or through a subsidiary export company, the matter of extending credit to the dealer is assumed by these. This does not materially change the conditions, however, except insofar as the foreign representative has more ready access to the sources of information concerning the applicant for credit. When the dealer is located at a substantial distance from the branch or exporting company, the same general rule applies as when he seeks to do business with the factory direct.

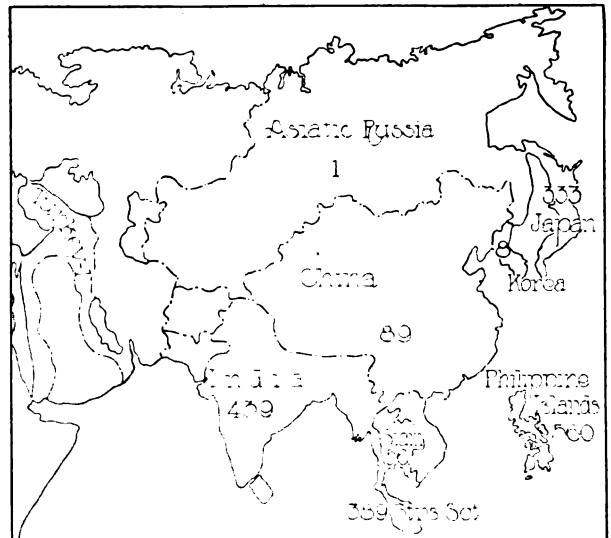

In doing business with an outside export house, the factory deals with that house alone. It is free to extend credit or demand cash, as the case may be, and it is stated that the same rule, of cash before delivery, usually applies in this instance. The export house has the advantage of dealing in a wide variety of articles—practically everything that is produced in America—and is in a position, through its confidential agents in the several commercial centres, to make its own terms with the local dealer. It follows that the general rule is to pay cash for the car upon delivery in New York, Philadelphia, Seattle, San Francisco or other port, and either extend credit or demand cash from the dealer as the circumstances appear to warrant from the knowledge of the situation supplied by its representatives.

**Necessary Expenses of** Only one condition  
**Exportation Methods.** has been considered in the above. Obviously the exportation of one or a number of cars is not without expense to the manufacturer. When business is done through an export house the car is sold by the manufacturer at the regular dealer's price, at which price, plus the freight, and the duty if any, it is resold to the dealer in the foreign country. The export house secures its remuneration from a commission on the sale, paid by the manufacturer.

It may readily be understood that the expense of maintaining a factory branch in a foreign country is considerable, although it may be conceded, at least for the sake of argument, that

some of this might be passed along to the dealer. The subsidiary export company also has its expenses, and much the same may be said concerning these. In dealing direct, the cost of securing business is governed very largely by the manufacturer himself, and may be much or little as the possibilities seem to indicate is desirable.

**Actual Conditions of the Market at Present.** For the purpose of securing reliable information concerning the world's markets for automobiles, the writer recently interviewed a number of men who are in close touch with the actual conditions in various world centres. These included representatives of export houses, who either have just returned from the country in question or were in receipt of recent reports from their confidential agents in the field. Some of them have been exporting

How Cars Were Distributed in Asia.

automobiles since 1902, and are still making periodical business trips into sections of the globe concerning which few Americans are at all familiar, even as tourists. There can be little doubt that the resume which follows presents actual conditions as they exist in the several countries.

**The Situation in the Dominion of Canada.** It will be noted, from the accompanying tables, that America's best customer for motor vehicles is its nearest neighbor on the North. Canada took over \$8,000,000 worth of the \$26,000,000 exported during the last fiscal year, or nearly one-third of the whole. There has been a slight falling off both in the number and valuation of cars shipped to Canada this year, as compared with the same period in 1912. Many American motor car manufacturers maintain branch factories in that

country, and the competition with British and other foreign made machines is somewhat more keen than in the States. Two conditions have developed within the past year, which under ordinary circumstances should make for better business. One is the enactment of a measure permitting the use of automobiles three days a week in the province of Prince Edward Island, where the operation of cars had been prohibited since 1908. The other is the repeal of the former stringent regulations in the province of Nova Scotia. Much highway improvement work has been under way in the western part of the Dominion, and this ought also to have its influence

Indicating the Market in South America.

upon the sale and use of machines in that section, especially during the next few years.

**Improved Roads Work in United Kingdom.** The United Kingdom took \$3,000,000 worth of cars during the fiscal year, and it would appear that the market was still good, since during the first nine months of 1913 over \$2,900,000 worth of machines were exported to England, Scotland and Ireland. Considerable road work has been done in various sections of Great Britain, and this is also true of Ireland. It does not appear that American cars have been sold in any large number in Ireland, as yet, however.

**Conditions Applying in France and Germany.** Continental Europe contributed \$3,300,000 of the total, and it is possible that a portion of this figure rightfully belongs under other heads, as many machines were exported to France, for example, which were later re-exported to other countries—probably to dealers in Asia and Africa. It is explained that it is difficult to secure representation in France, except on a credit basis, and for this reason those familiar with conditions in that country urge that American manufacturers establish agencies or branches, well supplied with spare parts, etc.

In Germany, which is listed for \$728,000 as against France's \$625,000, the demand for American cars appears to be increasing, despite reports of a very determined opposition on the part of German manufacturers. The number of cars in use in various sections of that country has increased very materially during past two years.

**Situation Offers Good Opportunity in Russia.** American cars are well represented in Russia, which invested \$520,000, according to the table. The government has given valuable assistance by contracting for motor trucks and pleasure cars made in the United States. The makes registered during the past year included: American, 17; French, 15; German, 13; British, 10; Italian, two, and Austrian, one. There appears to be little probability that there will be any decided competition from Russian made machines, at least for the present, since business men receive little financial encouragement to form companies of this character. Continental manufacturers are said to be making sales on a basis that is not regarded as entirely safe by Americans, and some European concerns are establishing branch factories in that country. Almost every large city and town has its automobile agent, but the chief difficulty lies in the inability to secure spare parts quickly. The road conditions are far from ideal in many sections, particularly in the interior.

**Dealers Have Criticism in Italy and Austria.** There is a consistent demand for good, medium priced American cars in Italy, but some criticism is offered because of their appearance. Dealers maintain that they easily could secure more money if more attention were given to the finish. Criticism is also made against the practise of American manufacturers in fitting tires using the inch measurement, and speedometers calibrated for miles instead of kilometers. It is suggested that the best method to pursue with dealers is to establish a general agency, say in Paris, from which

point spare parts might readily be secured.

The terms offered by the American manufacturer do not appeal to Austrian dealers, and it is explained that very few of them will give consideration to a proposition for payment in advance. In fact, the general impression seems to be that the manufacturer should make a first hand endeavor to get an opening where he can show what he has for sale rather than expect buyers to come to him. This is a condition which cannot easily be overcome at present.

#### Prejudice Contributes

#### Difficulties in Spain.

A few low priced, one-cylinder American machines sold some years ago in Spain are still remembered in that country, and there is a certain prejudice against being known as the owner of a "cheap" car. However, the demand for American automobiles has increased somewhat during the past two years. Some criticism is offered because of inability to secure spare parts, even when a general agency is located on the Continent. Local agents are quite prone to seek a large profit on their investment, often increasing the selling price to double what it is in the United States. Extreme care is necessary in the selection of a representative. The Spanish government lends every encouragement to home industry wherever possible.

#### Conditions Seem Good

#### for Danish Business.

About one-third of the 7000 or 8000 automobiles in Denmark are of American manufacture. There is very little sale for a high powered car. Machines ranging between 12 and 18 horsepower have been found most suitable for Danish roads, and the saving in gasoline and tires is a matter that has considerable weight with the people. Many physicians and professional men are using three-wheeled machines, made in Germany, largely because of the peculiar requirements of the motorizing regulations, which are not so severe for vehicles of this type. Cyclecars also are meeting with success in Denmark for this same reason.

#### Portugal Must Meet

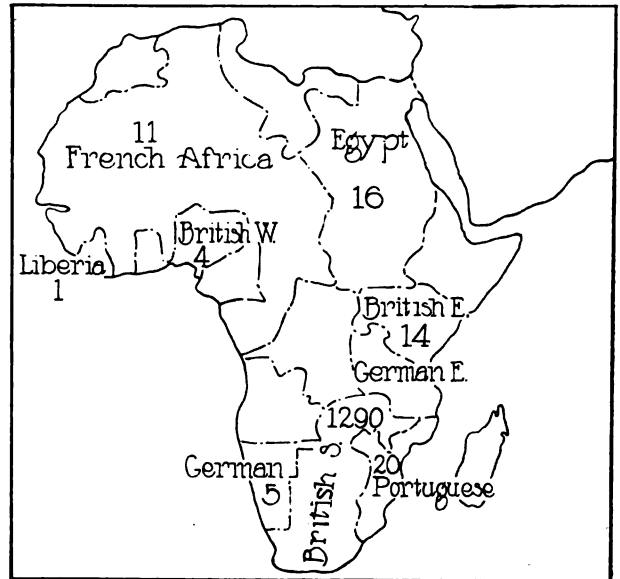

#### Heavy Freight Charge.

Cars must be strongly built and well able to climb hills in order to meet with success in Portugal. Many fine stretches of macadam road have been built, but these are often interspersed with badly rutted ways. The heavy freight charges from New York are a serious handicap for the American manufacturer, in view of the nearness of the Continental factories. American machines are regarded with favor, but the manufacturer must expect to be governed by the trade requirements of the country, and dealers will demand credit.

#### Other European Countries Problematical.

Norwegians prefer the low priced American cars, but when high priced machines are considered, they patronize French, German and English concerns. The same thing applies in a large measure to Sweden. In Switzerland there is some complaint on the part of the dealers because the selling price is fixed in advance by the manufacturer and because the commissions are not as large as with some Continental makes.

The Balkan war had an appreciable effect upon the sale of automobiles in the smaller European states, but it also served to call direct attention to the merits of motor vehicles for various purposes. The market for cars and trucks

American Cars Exported to African States.

undoubtedly will see a number of changes in that section during the next few years.

#### Conditions Which Apply to South America.

The importance of South America as a market for automobiles is only partially understood by residents of the United States. It undoubtedly is true that European manufacturers have sold more cars in this territory than Americans, but the figures for the fiscal year show that machines valued at more than \$3,000,000 were shipped to the South American republics.

Opinions regarding the people of South America have undergone a decided change during the past few years. This applies more particularly to the automobile industry, but it also has its application to every line. The country is rich in natural resources, and many large cities have

grown up along the coast. The people are accustomed to buying the best.

Contrary to the accepted view in the United States, the Latin Americans have no political feeling against this republic—at least, any such feeling that they may have is not such as to interfere with commercial intercourse. There is a belief among them that, whenever they desire to purchase the best, they must go to Europe for it, not because high grade products are not manufactured in this country, but because South America never sees them. They maintain that when they order such goods from America they invariably receive poor treatment.

### Why Development Has Been Retarded.

Numerous examples are cited to bear out the assertion that the United States considers South America a suitable dumping ground for goods that are entirely unsalable in this country. The development of the automobile market in Brazil, Argentine, Chile, etc., undoubtedly was delayed much longer than necessary by the fact that certain concerns failed to realize the importance of the initial orders.

One case will prove sufficient to illustrate the point. A well-to-do Brazilian was visiting in New York City and had opportunity to judge of the merits of a high grade American car. Before returning home he placed an order for one of these machines, paying some \$8500 in cash. When the car arrived in Brazil it was found to be minus certain parts essential to its use. A cablegram resulted in the shipment of parts for another and an older model, which could not be applied to the car in question. The purchaser never was able to use his machine, and over \$8500 was expended for nothing.

It might be contended that this was an isolated case, but exporters assert that they are continually hearing similar stories, making it exceedingly difficult to interest parties in certain localities. Of course, many good American cars have been shipped to South America during the past two years, and these are giving excellent satisfaction. It is noticeable, however, that when a high priced machine is desired, the choice usually falls to a car of European make.

### Argentina Undergoing Financial Depression.

Argentina purchased \$1,250,000 worth of American automobiles during the fiscal year. Much road work has been done in this republic and conditions in this respect are improving very rapidly. Just at present the country is undergoing a financial depression, and it is stated that several

hundred thousand dollars worth of cars are being held in storerooms and warehouses, there being no demand for them at present. This is, of course, a temporary condition, which undoubtedly will be overcome in due time.

**Market Conditions in Brazil and Uruguay.** In Brazil, which took cars valued at \$1,100,000, road conditions are by no means as good, outside some of the larger cities. The market seems to be good for low and medium priced machines, but it is extremely difficult to interest the people in American high priced cars. The same conditions apply in a large measure to Uruguay, which contributed \$290,000 to South America's total.

Much road work is under way in other South American republics, particularly in Venezuela, which has proved to be a very good market for American machines. The demand for automobiles of any character is still limited in some of these countries, but the work now being done by American manufacturers, their representatives and the exporting houses is believed to be such that when it is possible to do business on a larger scale the United States will get its share.

### EXPORTATION OF AMERICAN AUTOMOBILES FOR FISCAL YEAR ENDING JUNE 30, 1913.

### Situation in Asia and the Oriental Lands.

Asia purchased cars valued at \$1,425,000. It will be understood that of the millions of people in Asia, only a comparatively small percentage can be considered as possible purchasers of automobiles. It is true here, as in South America, that the wealthier class usually considers only the European product when in the market for high grade machines. The reason is somewhat different, however. For several years the only American machines seen in many of these countries were those having one and two-cylinder engines, and while these gave good service they helped to convey the impression that all American cars were of this type. In the meantime, British and European interests, with whom many of the governing classes were more closely identified, were engaged in developing the market.

In Asia proper, British India was the best market for American machines during the fiscal year. This was due largely to the fact that several cars of American make rendered good service during the Durbar at Delhi, and many of the

Indian officials and business men became interested as a result. Road conditions are improving slowly. The market is limited to some extent by the percentage of people who may be regarded as well-to-do and therefore able to own cars.

**Straits Settlements and Siam Business.** The Straits Settlements also purchased a large number of American cars. It has been suggested repeatedly in British motoring prints that there was an excellent market for motor trucks in this district. It undoubtedly is true that motor trucks would be of invaluable service to the planters, but the present price of rubber probably will have the effect of postponing action until the financial situation improves.

Many of the so-called native houses in Siam are owned by Chinese, several of whom may be regarded as very wealthy. Some of these might be interested in motor trucks, but it would be necessary to work the territory systematically and render a service, with respect to spare parts, etc., that would permit of no delay. The road conditions are such that the small cars are considered by few the best sellers.

**Road Conditions Bad in Japan and China.** In Japan, financial conditions are such at present as to make it a little more difficult to interest the people in automobiles. The government is not in a prosperous condition, and this has a decided effect upon business generally, as financial operations depend somewhat largely upon the government's expenditures for internal improvements, etc. The roads are narrow, and must be rebuilt for automobile use in some instances.

China is looked upon as a favorable market, but business conditions cannot be regarded as settled just now. It is probably true that such Chinese as are able to afford automobiles will be more kindly disposed toward them under the new regime. The scarcity of roads of any description worthy the name will influence the sale of machines in many sections, however.

**Africa and Australia Offer a Good Market.** Africa is rightfully considered a new country. Americans are not free to compete here on equal terms with all other countries. The Continent took \$1,217,000 worth of American machines during the fiscal year, and in many instances American manufacturers have been able to place orders in advance of any other maker. This is particularly true of British South Africa, which contributed \$1,167,000. Road conditions are improving rapidly, and the market undoubtedly will keep pace.

Australia, Tasmania and New Zealand purchased nearly \$3,000,000 worth of American machines, and the people are very favorably disposed toward them. The road conditions are ideal. These islands are so far from the country of origin in any event that Americans are not handicapped in this respect. It is possible to secure reliable agents in both Australia and Africa.

The other islands of the Pacific offer their own particular problems. The Philippines are regarded as an export field, although under United States supervision. The market for American machines is growing very rapidly.

**Question of Selecting Route for Shipment.** Exporters to the Philippines and Asia are compelled to consider the advisability of shipping by way of the Atlantic or Pacific ports. Time is saved by the

there is said to be a growing demand for a light weight machine of limited horsepower for town use. The importers in New York City are divided in their opinion with respect to this point, however.

E. Lascaris, who is regarded by importers and dealers in American cars in New York City, as best informed respecting the market for foreign machines, states as his opinion that the demand for small cars among those desiring the imported product is not large, and that the big car is the real seller. He adds that he does not believe the reduction in tariff will have any appreciable effect on this branch of the industry.

### OPENS CINCINNATI BRANCH.

The Auto Parts Company, Providence, R. I., maker of the well known Apco Ford specialties, announces that it has opened a distributing branch at 806 Race street, Cincinnati, O. This is the heart of the automobile district in that city, and the branch will be in charge of John Wilson, Jr., a vice president of the concern.

The Apco line is one of the most comprehensive manufactured in this country, embracing practically every accessory that makes for the comfort of Ford owners, and the wide distribution of Ford cars throughout the country has impelled the company to adopt this method of

serving the public. Branches also have been established in Boston, Philadelphia, Chicago, Los Angeles and San Francisco. The officers of the Auto Parts Company are: President and treasurer, Thomas F. Wilson; vice president, John Wilson, Jr., and secretary, William M. Wilson.

The Thompson-Carroll Company, Leader-News building, Cleveland, O., is mailing to the trade a neat brochure calling attention to its establishment of an advertising agency in that city. The members of the organization include Clyde S. Thompson, George A. Schneider, Charles F. Carroll, L. Z. Stone and Fred S. Tuerk. Mr. Thompson is well known to the industry, and was for two years advertising manager of the Diamond Rubber Company.

| Total.....                   | 670    | \$1,450,222  | 616    | \$1,403,174  | 388    | \$908,799    |  |

latter route, but the expense is greater. This is due to the overland freight charges. Shipments from New York, for instance, to Manila by way of the Suez canal occupy from 55 to 60 days, while they will go by way of the Pacific in 40 to 45. It is probable that the opening of the Panama canal will have a decided effect with respect to all shipments going to the Orient.

#### The American Market for Foreign Machines.

By far the largest proportion of machines imported into this country are handled by importers in New York City. The market is decidedly limited, both because of the price and because Americans believe that it is possible to secure as good a grade of car in this country as abroad. Among those who prefer a foreign article, no matter what the price,

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Boston Tail Light Detector.**

The Harding Specialties Company, Inc., 755 Boylston street, Boston, is manufacturing the Boston tail light detector, a device that will be appreciated by automobilists who motor in cities where the ordinance governing the use of the rear signal is strictly enforced. The Boston is neat and compact; is mounted on the dash in plain view of the driver, and upon the tail light becoming extinguished, flashes a red light. One of its qualities is that it may be installed by the novice in five minutes. Provision is also made for connecting up the speedometer or dash lamp if desired. A quality of the detector is that series wiring is eliminated with the special three-volt lamps. Standard lamps are employed. The Boston is made of heavy brass and comes in black-nickel, brass, oxidized-black and nickel finishes. Special finishes are supplied at a slight extra cost.

**Sure Start Electric Vaporizer.**

The United Motor Equipment Company, Chicago, is marketing through its sales agent, W. E. & J. H. Dodson, the Sure Start electric vaporizer, which is a compact device weighing 10 ounces, and which increases the temperature of the fuel by the use of electricity. It is at-

porated in the fuel line and prevents the entrance of water and other foreign elements to the carburetor. One of the features of the filter is that petcocks are eliminated. The strainer is very compact and the maker states there are no joints to become loose and cause loss of fuel. The Mosler strainer is inexpensive and the best of material and workmanship are incorporated.

**F. S. & D. Foot Warmer.**

The F. S. & D. foot warmer is produced by the F. S. & D. Manufacturing Company, 15 Genesee street, Syracuse, N. Y., and the warmer proper is a neat, compact design, which may be located in both the driver's and rear compartments of the car. It is designed to replace the foot rail and is highly polished. The exhaust of the motor is utilized for heating and valves are incorporated for controlling or cutting out the supply as desired. The exhaust is led to the warmer through asbestos covered pipes, thence to the outer air.

**Dann Oil Cushion Spring Insert.**

The Dann oil cushion spring inserts are manufactured by the Dann Oil Cushion Spring Insert Company, Chicago, and are made of a special soft, ductile metal, .015625 inch thick, rolled to standard spring widths, and perforated

Kellogg Engine Primer

tached in proximity to the intake manifold, this being tapped to connect a tube conveying the vapor, which is drawn into the cylinders in the usual manner. A small switch is mounted on the dash and controls both the supply of fuel and the electricity which is taken from a six-volt battery. The maker states it requires but a few seconds for the current to increase the temperature of the fuel to a point making for rapid evaporation.

**Brown Jr. Tire Pump.**

The Brown Company, Syracuse, N. Y., maker of Brown tire pump, has brought out a new design termed the Brown Jr., which is moderately priced and designed particularly for the owner of the small car. It is identical in all respects save the size and length of hose and is not equipped with a gauge. The pump operates on the compound principle, inflating the tire with pure, cool air, and it is stated that a shoe can be pumped up to a pressure of 60 pounds in three minutes, or to 150 if desired. The cylinders are of gray iron, bored and reamed on special machines, and the finish is two coats of gray enamel. The same high grade material and workmanship characteristic of the product of the concern is incorporated in the new design. For \$1.50 extra the company will supply its Q. D. spark plug and special attachments, including a pump connection.

**Mosler Ball Check Strainer.**

A. R. Mosler & Co., Mount Vernon, N. Y., maker of the well known Spitfire spark plugs, is marketing the Mosler ball check gasoline strainer, which is incor-

porated in the fuel line and prevents the entrance of water and other foreign elements to the carburetor. One of the features of the filter is that petcocks are eliminated. The strainer is very compact and the maker states there are no joints to become loose and cause loss of fuel. The Mosler strainer is inexpensive and the best of material and workmanship are incorporated.

**Kellogg Engine Primer.**

The Kellogg Manufacturing Company, Rochester, N. Y., is marketing a novel form of engine primer which differs from the conventional designs in that the dash vessel is of the self-filling type. The container is of glass and is provided with two knurled nuts or valves, the upper being utilized to fill the vessel while the other controls the flow of the priming fluid to the motor. The fuel supply is obtained by turning the top knurled member to the left, the gasoline being forced from the tank to the glass member by the vacuum created by the suction of the intake stroke of the piston of the motor. It will be noted that two small pipes are attached to the dash vessel, and these are run through each arm of the intake manifold, thence directly over the intake valves of the engine. Operating the lower knurled nut permits the fuel to flow over the valves and at the same time the fluid is mixed with the incoming air drawn in through the carburetor when the engine is cranked. This assures a rich mixture for starting and one of the qualities of the primer is that the flow may be so controlled as to provide a slightly rich mixture until the engine is warm enough to operate on the normal mixture. The company also manufactures a model for pressure feed fuel systems.

 gress of March 3rd, 1879.

**CONDITIONS IN NEW YORK.**

Being nearer Wall street, it may be assumed that the market served by the New York dealers is more easily influenced than others by any tendency toward business or financial depression. Investigation of the conditions confronting these dealers reveals a situation that is decidedly encouraging.

As set forth in greater detail elsewhere, there is a disposition among these men to feel that the present dullness is manufactured—that there is no real reason why business should not be good. They have found a decided upward movement during the past few weeks, and anticipate normal conditions after the show. The situation is particularly reassuring and should go far toward dispelling any suggestion that 1914 is not to be

a good year for the sale of cars, accessories and fittings.

An especially interesting feature is the very apparent recognition of the fact that the selling of automobiles has reached a point where it must be conducted on strictly business principles. New York dealers have done much toward reorganizing the sales force and system of doing business. There can be no doubt that these men are building for the future, and that strict adherence to this policy, supported as it will be by the manufacturers, must make for greater stability and success.

**HOME AND FOREIGN MARKETS.**

From time to time the question arises as to how many cars are in use in America. There are some 100,000,000 people in the United States, basing the estimate on the figures of the last census. A year ago, practically 1,000,000 cars were registered in the several states. The American industry has produced 450,000 machines during 1913. Assuming that, with the withdrawals of old cars, half of these must be added to the previous total, and there are today some 1,250,000.

Governmental figures indicate that there will have been something like 28,000 cars shipped abroad during 1913. At an average of \$1000 a car, this will make a total of \$28,000,000, as compared with a total of \$25,000,000 for 1912. The exportation of automobiles has increased 84 per cent. in two years. Undoubtedly it will be increased substantially in the future.

It would prove of interest to learn the number of people in the United States whose incomes are such that they could afford to own a car, but who have yet to purchase their first machine. A little thought concerning this phase of the situation will suggest that the percentage must be high.

Each manufacturer must decide for himself which market he shall exploit. Very few have as yet sought to inaugurate an energetic foreign campaign. There would appear to be plenty of opportunity for business at home, if the field were worked systematically and thoroughly. It becomes very largely a matter of expense, and this is a point that must be considered by every branch of the industry, from the manufacturer to the dealer.

## TOURING IN PREHISTORIC AMERICA.

**An Interesting Account of an Automobile Visit to a Section of the Country Rich in Relics of a Race Whose Existence Antedates Every Known Period.**

By James A. Harris, Jr.

**S**'TRANGEST of all Indian peoples, living practically the same as their tribal ancestors lived before the Mexican exploration, the Pueblos of northern New Mexico and the Navajos and Moquis of Arizona, with their wierd and wonderful communal houses built in a wilderness of ruins of a prehistoric civilization, furnish scenes of stirring, gripping interest to the tourist who explores this mystic region in a motor car.

Here are tribes who are civilization proof. Here are ruins of Spanish missions and villages built as long ago as the Mexican conquest. Here is the stamping ground of the famous frontiersman, Kit Carson, and the scene of innumerable invasions, conquests, rebellions, and Indian uprisings. The canyon walls that were once the haunts of the cliff dwellers, the awe inspiring depths and grandeur of the Grand Canyon of the Colorado, the lava beds of extinct volcanoes, the Painted Desert and the Petrified Forest are all accessible to the motor tourist.

He may leave his car and explore the cells and passageways through solid rock, wrought by a race whose existence can only be computed in units of a thousand years. Or, he may drive to the very edge of abysmal chasms and gasp with amazement. Such was the experience of a party of motorists who set out to prove or disprove the recurring rumors of a race still faithful to the customs and mysterious legends of medieval times and a region of prehistoric ruins and natural wonders.

### Following the Santa Fe Trail.

Late in September, a White Six was shipped to Pueblo, Col., where the trip started. Picking up the historic old Santa Fe trail out of Pueblo, skirting the Rampart range of the Rockies and the towering Spanish Peaks, snow-bound and cloud-covered, the first day's ride brought the party into the Colorado coal fields and ended at

Trinidad. The recent miners' strike was then at its height. Dozens of strikers' tent colonies were visible in the hills. Villages were deserted except for a few vigilant mine guards, heavily armed. The following morning, still on the Santa Fe trail, they crossed Raton pass, from whose heights it was possible to make out, far to the west, the snow white line of the Sangre de Christo range. The descent from the pass was rapid, with many sharp twists and steep inclines, from which the tourists could look down upon the city of Raton.

South of Raton they took a branch trail veering off to the west over a plain leading to Cimar-

**The Cliffs at Puye Are Honeycombed with Cliff Dwellings and Cave Entrances as Far as the Eye Can See.**

ron canyon. A typical eyelash road winds along a little mountain stream, and passes the lofty Palisades, whose cliffs are curiously weather-beaten. Leaving the canyon, they crossed another level plain and commenced the ascent of the Taos mountains to Taos pass, whose altitude is over 9000 feet. Although the trail was through deep adobe mud, and there were many long steep grades, the White Six easily climbed the mountains without heating.

At Taos the tourist begins to wonder whether he has made a mistake and crossed the border into Mexico. It might just as well be Mexico, for

**The Walls of the Canyon de Chelly Rise Straight from the Sands to Heights of 1000 Feet, the Crevices Being Filled with Ruins of Cliff Dwellings.**

Taos is the most un-American place in America. The low adobe buildings, dating back for many generations, still surround the old Plaza. The population is almost entirely Mexican. Being far from the nearest railroad, the influences of modern times have left little impression on this secluded town. In a typical Taos saloon, just two pictures adorn the walls. One is a portrait of Diaz, the other of Madero.

#### **Kit Carson's Old Home.**

On a narrow street leading from the Plaza the tourists found the old home of Kit Carson, the most conspicuous figure in the frontier history of the southwest, while in a little cemetery on the edge of the town they found his simple grave. On one corner of the Plaza is the house in which Governor Bent was killed by the Mexicans and Indians during the Pueblo uprising at the close of the Mexican war. In fact, every house in Taos is closely linked with the stirring drama of the early days of the frontier.

While the tourists were in Taos, the Indians, the most independent and medieval of all tribes, were celebrating the day of their patron saint, San Geronimo, and practising wierd ceremonies at their pueblo three miles from town. Redskins from the entire surrounding country were on hand. Even the Apaches from the distant Jicarilla reservation and a few Navajos from Arizona were there.

From Taos, the White party started south along the headwaters of the Rio Grande, passing many villages whose low adobe houses were festooned with countless strings of chili, the

bright red of the peppers making a vivid contrast to the dull brown of the adobe walls. The road along the Rio Grande has many arroyos or gulleys of deep sand, requiring constant watchfulness. It is laid through half a dozen Mexican towns and an equal number of Indian pueblos all close to the river and all maintaining their ancient tribal customs and dress.

#### **Rocks of Fantastic Shapes.**

At Pojauque the trail leaves the river and runs up the side of a valley that is notable for the scenery, even if there were no strange villages and peoples to be seen. Far in the background the massive walls of the valley slope up, sharply topped by jagged rim rock in fantastic shapes. The valley itself is one vast confusion of mesas and arroyos, with a particularly impressive formation, the Black Mesa of San Ildefonso, towering high above the river. On top of this mesa the Indians made their last stand during the Spanish reoccupation under DeVargas in 1692. Winding around mesa after mesa and crossing dozens of arroyos, they finally reached the high land to the east of the river and drove the last few miles into Santa Fe over a beautifully scenic high road from which the entire surrounding country could be seen.

#### **In the Pueblo Country.**

And then they came to quaint old Santa Fe itself, a true relic of old Spanish colonization days, with adobe houses built right out to the edge of the streets. Through an occasional open doorway one can catch glimpses of delightful little placitas or courtyards. Stretching along one entire side of the Plaza is the old governor's palace in which the long line of Spanish, and later Mexican, governors held sway. Here it was that the Spaniards made their last stand before being driven out of the country by the Pueblos in 1680. After that it became the palace of Indian poten-

**Pueblo of the Taos Indians, the Most Independent and Medieval of All the Pueblo Tribes.**

**Making Friends with the Apache Nomadic Indians in the Heart of Their Reservation.**

tates for 12 years until it was recaptured by the same DeVargas who stormed the heights of San Ildefonso. It stands today practically the same as the Mexicans left it, but it is now occupied by the archaeological and historical societies.

One can spend many interesting days in Santa Fe delving into the early history of New Mexico. A delightful day's trip is eastward through Apache canyon, Canyoncito and Glorieta pass, to Pecos river and the ruined pueblo city of Pecos, whose entire population was wiped out by pestilence, but which was one of the most powerful in the days of the Spanish. Here are ruins of a church built in 1617 under the direction of the Franciscan monks. Reluctant to leave the Pecos ruins, the tourists retraced their route until they reached a road to the ruins of another ancient pueblo at San Cristobal, several miles south of Lamy. The ground was covered with pieces of broken pottery and stone utensils, indicative of semi-civilization. On a boulder strewn cliff near the ruins were many curious pictures and symbols, the picture writing of the ancient inhabitants.

#### **Relics of a Forgotten Age.**

One should not leave Santa Fe without visiting the Puye cliff dwellings in the Jemez plateau. To reach this point the White Six was driven northwest from the city over creek bottoms, meza tops, sandy arroyos and high cliff roads. The Puye cliffs were literally honeycombed with cave entrances. Leaving the car they climbed a rocky trail and explored the caves. Then, with the aid of ladders left there by the Archaeological Society, they climbed to the top of the cliff and found the ruins of an enormous communal stone city, covering many acres.

These ruins are but one of hundreds that are to be found in the Jemez district—relics of a race whose existence antedates every historical

record. From Santa Fe they headed south for Albuquerque. A drive of 20 miles over a good stretch of road ended abruptly at La Bajada hill, where there is a sheer drop of many hundreds of feet into the valley below. The road down the side of the cliff is new, but not designed for cars of a long wheelbase. It was necessary to use the reverse gear on every one of the turns, and also necessary to have powerful brakes, a feature of the White Six that was often appreciated by the occupants of the car.

Crossing the valley and continuing southward they passed the pueblos of Santa Domingo, San Felipe and Sandia, and then fringed the foothills of the Sandia mountains until they reached Albuquerque. Westward from Albuquerque are the pueblos of Isleta and Laguna, built along the railroad, accessible to tourist travel and looking much the worse on account of it. At El Moro, or Inscription Rock, one can see the names and dates of early Spanish explorers carved in the rock with the sword's point. The trail leads to one of the largest Indian settlements in the southwest, the pueblo of Zuni, and here the tourist may see all that remains of the fabulous Seven Cities of Cibola, which inspired the first Mexican exploration of this region. From Zuni the trail leads southwest to St. Johns and Springerville over a fairly good road.

Two days were spent in making trips out of Springerville to the White river country, driving through the tall pines of the Apache forest reservation to Fort Apache, situated in the heart of the reservation. The Apaches differ absolutely

**The Haystacks, Curious Rock Formations in the Black Creek Valley East of St. Michaels.**

from the Pueblos. They are nomadic, living in little huts built of boughs and mud, and are more or less dependent upon government bounty. The

**Kit Carson's House in Taos, the Old Headquarters of the Famous Frontiersman.**

night was spent at the fort, and the following morning they returned to Springerville and St. Johns, where they turned north with the Little Colorado river toward Holbrook. A few miles east of Holbrook they entered the Petrified Forest national monument, a strange formation covering many acres, with giant petrified trees lying, half covered with sand, in utmost confusion.

#### **Evidence of Extinct Volcanoes.**

From Holbrook the car was driven west to Winslow and Flagstaff, at which point it was headed north along the lofty San Francisco mountains, and through a nest of extinct volcanoes. The ground was covered with malapai rock, or broken lava, and here and there the black lines of ancient lava flows were plainly visible. Finally they emerged from the volcanic belt and entered the cooling shade of the Tusayan Forest reserve, whose giant pines border the southern line of the Grand Canyon.

The first glimpse of the canyon was obtained from Grand View, 15 miles east of the canyon station. The car was driven out on Grand View point, and the occupants looked down into the great chasm which extends many miles. The first view of this greatest of natural wonders can never be forgotten. The sense of realization is completely overwhelmed by its vast depths and formations. Only a small part of it can be seen at one time. Even pictures fail to depict its grandeur, but, insufficient as they are, the photographs give some idea of this incomparable canyon. Two of the best side trips from Grand Canyon station are the drive along Hermit Rim road and the descent of Bright Angel trail into the depths of the canyon.

After a day of frenzied excitement, the tourists returned to Holbrook and struck north

across the Painted Desert to the trading post at Ganado in the Navajo Indian reservation. During the drive across the desert they encountered a great deal of heavy sand and many bad washes, where a car less powerful than the White Six might have difficulty. But the vivid hues of the Painted Desert with its fantastic mesa formations terraced against the horizon, more than compensated for the difficult travel. The desert is one tremendous sweep of color with every shade of red, brown and yellow outlining the various rock strata of the mesa cliffs. It was dark when the car pulled into Ganado. The party was cordially received by John Lorenzo Hubbell, one of the earliest Indian traders, who is famed for his hospitality and his activities in the frontier life of that region.

#### **Defying the Quicksands.**

Continuing the trip from Ganado the following morning, the tourists turned east to Gallup, where several days were spent in making side trips. Chief among them was a region concerning which wonderful stories had been told. Far north in the Navajo reservation are the Canyons de Chelly and del Muerto. Situated a hundred miles from the railroad they have been practically undiscovered by the tourist. No automobile had ever entered the canyon because of the quicksand.

Starting from Gallup the car was driven up the Black Creek valley to Fort Defiance, where the trail, gradually rising, enters a forest reserve and then drops rapidly down a rough and rocky road to Chin Lee, a trading post only a short distance from the canyon. The astonished traders at Chin Lee doubted that the car would be able

**Ruins of the Old Exchange Hotel, the Terminus of the Santa Fe Trail in the Early Frontier Days.**

to get into the canyon but, with their assurance that a searching party would start out if the White Six did not return by dark, the tourists

resumed the trip. It was a hard pull. The sand was the worst ever encountered by anyone in the party, but by deflating the rear tires a little they managed to reach the mouth. Once inside they proceeded slowly and cautiously, keeping a sharp lookout for the inevitable quicksand. They found plenty of it, but managed to keep the White Six out of it.

#### Home of the Cliff Dwellers.

The walls of the canyon are close together, and rich red in color, rising absolutely straight up from the sand to heights of a thousand feet. The crevices are filled with ruins of cliff dwellings and ornamented with picture writings. One particularly impressive cliff, five miles up the canyon, known as La Casa Blanca, or The White House, is so well preserved that it looks as if it might still be inhabited. How the dwellings were ever reached by human beings without wings is a puzzle. Many of them are built hundreds of feet up in the face of the cliffs with nothing but an absolutely smooth perpendicular wall above and below.

By following the bed of the stream eight miles further they reached a giant monolith of stone, known as El Capitan, rising a thousand feet in the air from the bottom of the canyon, a most impressive monument to the wonderful workings of nature. In fact the entire Painted Desert country from the Grand Canyon on the west to the Canyon de Chelly on the east is almost beyond conception, on so great scale has nature designed it.

From El Capitan the tourists returned safely to Chin Lee with the distinction of being the first motorists to enter the depths of the marvellous Canyon de Chelly. The next day they returned to Gallup, completing a 2500-mile trip through our little known southwest, nearly every mile of which is unrivalled by any part of the globe.

In the Christmas number of *The Haynes Pioneer*, published by the Haynes Automobile Company, Kokomo, Ind., Elwood Haynes contributes the sixth of a series of articles on his life and inventions. In this article Mr. Haynes recalls his early experiences with the "horseless carriage", including an account of the occasion when he was ordered off Michigan boulevard in Chicago in 1895.

#### WILL EXHIBIT AT NEW YORK.

#### Lyons-Atlas Company to Display Lyons-Knight Car at the Grand Central Palace.

The Lyons-Atlas Company, Indianapolis, Ind., maker of Lyons-Knight automobiles, will exhibit its product for the first time in the national show at New York City in January. The company has secured space in the Grand Central Palace, and in addition to four complete models will exhibit a number of parts.

The new machines are expected to attract considerable attention, as they have a number of interesting features, including a Knight sleeve valve motor and a worm-driven rear axle, this combination being made for the first time in this country and one making for silent operation.

**The White Six Descending La Bajada Hill, a New and Winding Grade with Many Hairpin Turns.**

The models to be displayed include five and seven-passenger touring, five-passenger Sedan and seven-passenger Berlin bodies. In addition to these, two complete model K4 Lyons-Knight motors will be shown.

Because of recognized efficient and loyal service to the Studebaker Corporation, Detroit, the following men have been elected to high official positions: First vice president, A. R. Erskine, also retaining his position as treasurer; vice president in charge of engineering and production, James H. Heaslet, formerly chief engineer; vice president in charge of automobile distribution, Ernest R. Benson, formerly sales manager; sales manager of automobile division, Arthur I. Philip, formerly assistant sales manager; assistant treasurer, Charles D. Fleming; auditor, H. E. Dalton.

## HINTS FOR NEW CAR OWNERS.

### Operation and Adjustment of Clutch Brake on Hupmobile---Components of K-R-I-T Multiple Disc Clutch and Attention Necessary---Cadillac Steering Gear.

ONE of the causes of the difficulty in changing speeds with the sliding type of gearset transmission is spinning of the main shaft. Some makers fit a brake or clutch stop which, when adjusted properly, produces sufficient friction to slow the clutch so that the desired gears may be meshed.

A clutch stop is fitted to the model H Hupmobile and this device comes into operation automatically when the pedal is depressed slightly beyond the point necessary to disengage the clutch. The action of the brake is shown in an accompanying illustration. When the clutch is disengaged, the throw-out moves up against an annular friction disc which is secured to the

work the oil between them, after which the housing should be drained and refilled with lubricant.

#### ADJUSTING K-R-I-T CLUTCH.

A smoothly operating clutch is desirable, and when it bites or slips it should be inspected and adjusted if necessary. With the multiple disc type the lubricant should be removed from time to time, the discs flushed with kerosene and the oil supply renewed. This type rarely gives trouble if properly cared for, but if foreign elements work into the lubricant the plates are likely to become cut.

The K-R-I-T clutch comprises 10 large steel discs and 11 smaller members, as shown in an accompanying illustration. While it will appear that the large discs are similar, four are left hand and six are right hand. The reason for this construction is obvious. By placing one disc on top of the other it will be noted that the small springs cut in the edge of the disc do not bear together, and that the 11 smaller discs C are interleaved between each of the 10 larger members. The latter fit onto three pins securely fastened to the flywheel and the small discs are secured to the clutch drum or body A, which revolves freely on the end of the crankshaft, and to which the gear K is fitted.

The discs are held in place on the drum by the three adjustable eye bolts D. To these are secured the toggles E E, one end of which bears against the disc plate F, the other end of the toggle bearing against the cone G, in the bore of which is located a strong spring H. The action of this spring against the cone toggles, etc., is to keep the large and small discs together. The clutch pedal is connected to the clutch by means of a shaft and two pawls which fit into a groove I, and when the pedal is pushed forward or depressed its motion pulls the cone G back, thereby releasing the pressure from the 11 small discs, permitting the flywheel to revolve the large discs without rotating the small ones and subsequently revolve the gear K.

The discs operate in oil and should the clutch slip should be flushed with a gallon of kerosene. Depress and release the clutch several times and crank the motor to allow the oil to work in be-

Clutch Brake or Stop Utilized on Model H Hupmobile and Parts Employed in Adjustment.

clutch follower plate bearing. The last named makes contact with the clutch brake, thereby creating between the parts sufficient friction to reduce the speed of the clutch shaft so as to permit the meshing of the desired gears.

If the clutch brake does not make contact with the clutch follower plate bearing when the pedal is fully depressed, an adjustment should be made. This is performed by moving the adjusting nut in an anti-clockwise direction, as shown by the arrow in the drawing, until a contact is made between the brake member and plate.

Efficient operation of the clutch will be obtained by occasionally flushing the plates with kerosene, engaging and disengaging the discs to

tween the plates. Remove all kerosene and replace with fresh lubricant.

To adjust the clutch the pedal is fully de-

**Steering Gear of 1913 Cadillac with Components Lettered to Make Easy the Work of Eliminating Lost Motion.**

pressed, which will bring the cone G towards the bearing J. To hold the clutch out place a stick against the pedal or place some object between the cone G and the hub of clutch D at X. Remove the pin passing through the eyebolt D and make one turn to the right. Replace toggle pin and adjust the next toggle in the same manner, also the third member.

### CADILLAC STEERING GEAR.

Owners of new cars will do well to comply fully with the instructions of the maker as to care and maintenance, and this applies particularly to the steering mechanism and its linkage. The steering gear is not only well designed and constructed of a high grade material but, as with any mechanism subjected to friction, requires lubrication and attention. The maker of the 1913 Cadillac provides two places for the insertion of the lubricant and these are indicated at A and C in an accompanying illustration, which shows a sectional view of the steering gear.

When the owner neglects to lubricate the mechanism wear naturally follows, resulting in end play of the steering column and lost motion in the wheel. Any play should be removed and provision is made for adjustment.

To eliminate end play loosen the jamb nut and set screw B, and remove the plug C. This will permit of reaching with a screw driver the adjusting collar, which is provided with a number of recesses, into one of which the screw mem-

ber B is inserted for locking purposes. This collar should be adjusted carefully and the column tested for free movement. It is best to jack up both front wheels in making adjustments to the steering gear and its linkage.

Wear of the worm D and sector E is compensated for by rotating a pair of eccentric steel bushings in which the sector has its bearings. To obtain access to the bushings, remove the two set screws F, which are on either side of the sector. But one is shown in the drawing. This will enable the bushings G to be seen. By means of a wrench the hex heads on bearing bushings are turned forward, moving the sector toward the worm, one notch of the bushings or more as may be necessary. Usually one notch will be sufficient. It is important that both sides be turned exactly alike, otherwise the gear will be thrown out of alignment. H and J are set screws for limiting the range of movement of the steering gear and front wheels; that is, they may be so set that the maximum movement of the wheels will not permit of the tires touching the springs. For lubricating the steering mechanism the maker recommends oil and flake graphite.

At the 28th regular monthly meeting of the Metropolitan Section, Society of Automobile Engineers, in New York City, Dec. 18, papers were presented on two subjects: "Graphite as a Lubricant for Automobiles" and "Lubricating Greases for Automobiles".

The following concerns have been elected to membership in the Motor & Accessory Manufacturers: Dunlop Wire Wheel Corporation, 2130 Broadway, New York City, maker of wire wheels; Grant-Lees Gear Company, 6901 Quincy avenue, Cleveland, O., gears; Sulzberger & Sons Company, 41st street and Ashland avenue, Chi-

**Showing K-R-I-T Multiple Disc Clutch Disassembled to Make Clear the Operation of Parts and Method of Adjustment.**

cago, curled hair; American Gear & Manufacturing Company, South Park avenue, Jackson, Mich., automobile axles.

## IN THE COMMERCIAL VEHICLE FIELD.

### White Wagons Give Excellent Economy in Department Store Delivery Service-- Tractor for Work on Small Farm--Boston's General Utility Machine.

**S**EVEN White machines, made by the White Company, Cleveland, O., in service with the Sterling & Welch Company, of that city, have given excellent satisfaction. The concern operates a large department store, dealing in furniture, carpets and household furnishings. The first cars were purchased in May, 1910, these being with capacity of 3000 pounds. Others were added in May, 1911, and in April, 1912. Three are 1500-pound wagons and the remainder of the larger capacity. The entire equipment is shod with pneumatic tires.

Immediately after deciding upon the adoption of motor delivery, the concern selected horse drivers and trained them in the operation of the automobiles. It established a garage and fitted

uring depreciation at 20 per cent. a year. The pneumatic tires have averaged 4000 miles each.

The wagons are driven an average of 62 miles daily and make 65 stops. The company's officials believe that from 40 to 45 horses would be necessary to do the work now done with the trucks.

#### TRACTOR FOR FARM WORK.

**Holmes Little Giant Is Designed to Replace Horses Wherever Practicable.**

The success which has attended the use of mechanical tractors on the large farms of the Middle West and Canada has impelled designers to turn their attention to the production of ma-

Four of the Seven White Wagons in Service with a Large Department Store in Cleveland, O.

it with such equipment as was necessary to maintain or repair the machines, and employed a man whose duty it was to see that they were at all times in condition for service. Although this garage is located near the White factory, none of the wagons has ever been sent to the maker for work.

Concerning their economy, it is stated by the owner that in November, 1912, three of the machines, which had been driven approximately 40,000 miles each, were overhauled and completely restored after 2.5 years' service at a cost of about \$100 each. One of the wagons first bought was recently overhauled, after having been driven 65,000 miles, in 3.5 years, and the cost of parts used in restoration was \$35, despite the fact that it had been in use for 70 per cent. of its life, fig-

chines of this character which shall be adaptable to the small farm. The Holmes Tractor Company, Port Clinton, O., is producing the Holmes Little Giant tractor, shown in an accompanying illustration, which is intended to replace horses in work of this character. It may also be utilized as a power plant for husking, shredding, pumping, grinding, sawing and, in fact, for any service for which a stationary engine may be required.

The capacity of the tractor is maintained to be equal to that of two two-horse teams for field work, and on the road it is stated that it will haul more than two double teams when trailers are used. The design is exceedingly simple and the mechanism is very accessible, so as to minimize care and attention.

**Holmes Little Giant Tractor Hauling the Plow.**

The length over all is 138 inches, the width 72 inches and the height 54. The weight is 4400 pounds. The chassis frame is of channel steel, with sturdy cross members, and this is mounted at the forward end on an I section axle, which carries a triangular bracket, at the apex of which is a trunnion on which the axle may swing, so that with one front wheel elevated or depressed there is no strain on the chassis. The rear end of the frame is mounted on springs, and the drive from the rear axle is through radius rods.

The motor is of the conventional four-cycle, water-cooled, two-cylinder opposed type, with bore of 5.5 inches and stroke of five. This is rated at 12 horsepower by the maker. It is mounted longitudinally in the frame, with the crankshaft extending transversely, and on this, outside the flywheel, is the driving sprocket and power transmission gearset, of the planetary type. The drive to the jackshaft is by a chain from the engine shaft, the chain extending to a differential gear mounted on a sleeve.

The front wheels are 36 inches in diameter and have steel rims five inches wide, in the centre of which is a ring that extends around the circumference to prevent side slip. The rear wheels are 40 inches in diameter and the steel rims are 10 inches wide, these being fitted with diagonal affording traction on cleats across the face, any yielding surface. The hubs and spokes are of steel, with the

latter set in two series, separated practically the width of the hub and closer together when fitted in the rims.

### NOVEL COMBINATION WAGON.

**Interesting Experiment Which Has Proved Entirely Practicable in Boston.**

The city officials of Boston have been experimenting with a Peerless three-ton truck chassis and combination body installation with results which may suggest decided possibilities for smaller cities and towns. It was not thought that any one of the odd jobs for which it was planned to use the truck would afford sufficient opportunity to keep the machine busy all of the time, and the combination arrangement was decided upon in consequence.

When first purchased the chassis was fitted with a dumping body and power hoist, and this was utilized by the health department for the collection of ashes, refuse and garbage. To provide for the needs of the street department, a 900-gallon steel tank was added and with this was supplied a rotary pump to afford such pressure as was necessary for the distribution of both oil and water.

The tank is carried on a cradle of angle steel and connection is made with systems of piping so that when desired oil may be forced under a predetermined pressure through a header carried directly beneath the end of the tank. The flow of oil is controlled by a lever that is operated from a seat mounted at the rear.

For water sprinkling a larger curved header is mounted back of the oil header, and the temporary seat is removed. The water outlet to the header may be closed and another outlet connected to a two-inch hose, through which the pump will force a stream a considerable distance.

**At Left, Peerless Combination Vehicle as an Oil Spreader; at Right, Fighting Fires.**

## CORRESPONDENCE WITH THE READER.

**Cadillac Valve Dimensions.**

(1679)—To settle an argument and to save the trouble of removing the parts from the car, will you publish the dimensions of the valves fitted to the Cadillac 30 automobile?  
CADILLAC OWNER.

Jackson, Fla., Dec. 8.

The dimensions of the valves utilized on the Cadillac 30 motor are given in the drawing at Fig. 1, which was supplied by the engineering department of the Cadillac Motor Car Company of Detroit.

**Magneto Trouble.**

(1680)—What is the cause of my motor operating after I have thrown the switch lever to the "off" position? I have two different ignitions, a battery and a distributor, and a high-tension magneto. I start on the battery, then switch to the magneto, but sometimes when the lever is moved to "off" the motor keeps running, and I have to stop it by stalling it.

Hartford, Conn., Dec. 20.

Fig. 1—Cadillac Valve and Stem.

chassis. When the lever is moved to the "off" position, a path is completed for the primary current of the magneto, the electricity flowing from the instrument to the metal or ground. This diverts it from the secondary windings, as previously explained.

Examine the connections carefully and make sure that the circuit is closed when the switch is moved to the "off" position. It is not necessary to stall the motor when the switch is inoperative. By taking a piece of metal, a screw driver blade for example, and making a connection between the terminal on the circuit breaker and any metal of the car, the primary current will be diverted.

**INFORMATION.**

The fault is presumably in the switch or connections thereto. With the true high-tension magneto, the primary and secondary current are generated in the instrument itself, the first named being diverted from the secondary windings when it is desired to stop the operation of the motor. A wire is led from a terminal on the circuit breaker housing of the magneto to a switch, and another lead is from the twitch terminal to a metal part of the

**Parts for Maxwell.**

(1681)—Is it possible to obtain parts for a two-cylinder Maxwell runabout, the type made several years ago by the Maxwell-Briscoe Company?  
Media, Penn., Dec. 15.

The Maxwell Motor Company, Inc., Detroit, announces that it is able to supply parts for the car mentioned within 48 hours from the receipt of the order. The company has a stock of parts for over 150 different models of machines made by the former United States Motor Company and they may be ordered direct or from any recognized dealer or repairman.

**Boiling Point of Kerosene.**

(1682)—1. What is the cost of sulphuric ether and of oxygen? 2. What type of nozzle breaks gasoline up into the finest spray? 3. What is the boiling point of kerosene? 4. Would the exhaust gases of a motor be sufficiently hot to boil kerosene? 5. Will it do an E-M-F car any harm where the transmission is geared so high that the second speed must be used about half the time, the second speed being about 4:1? Will the fact that it is not direct on the second make any difference?  
W. J. B.

Washington, D. C., Dec. 9.

1. The price of sulphuric ether and oxygen can be obtained at any chemical house or wholesale druggist.

2. The best type of nozzle is a matter of opinion. This is evidenced by the standard designs employed.

3. The boiling point of kerosene ranges from 302 to 572 degrees Fahrenheit at a specific gravity of .753 to .864.

4. The temperature of the exhaust of a motor would be sufficient to boil kerosene, as it is several times that necessary.

5. Continued use of the second speed of the gearset will result in wear of the gears and bearings, and with the ratio mentioned is likely to impose stresses upon the motor, etc., not obtained with conventional gearing. That originally installed by the maker is to be preferred to higher ratios unless the machine is to be utilized for racing purposes.

**Autocar Wheel Bearings.**

(1683)—Are the front wheel bearings of the two-cylinder Autocar runabout of the roller or ball bearing type and adjustable?  
SUBSCRIBER.

Washington, R. I., Dec. 16.

The car mentioned was constructed both with roller and plain bearings and neither are adjustable. With the last named design the parts have to be bushed.

**Bothersome Missing.**

(1684)—I own a four-cylinder car of ancient vintage. It has given good service until recently, when it

Wyoming, R. I., Dec. 17.

Remove the cover and have someone crank the motor with the ignition cut out, and observe the action of the roller. If the timer is loose or wobbles with the motor operating, adjust the bearings, or if of the plain type fit a new bushing. Timers are not expensive and it may be cheaper to purchase and install a new one. Always keep a commutator clean and well lubricated.

(1685)—Who makes the four-cylinder motor used in the Corbitt car? What is the timing of the motor; that is, the opening and closing points of the intake and exhaust valves? CORBITT OWNER.

Binghamton, N. Y., Dec. 14.

The timing diagram is presented at Fig. 2, with the opening and closing points marked off, also the piston travel in inches. This will permit of timing both by the flywheel and piston travel methods.

(1686)—I note that the Prest-O-Lite tank I placed on my car recently does not register as high as it did when I bought it from the service station; that is, after placing it on the machine it showed less capacity than in the store. The tank was not used. I tested for leaks but could not find any. What causes the difference?

W. L. D.

**Boston, Dec. 17.**

The difference is due to the change in temperature, as will be noted by placing the tank in a warm room after it has been exposed to the cold. It does not, however, affect the capacity, as there is as much service to be obtained as under normal conditions.

## Motor & Accessory Manufacturers Will Have Three Busy Days in New York.

Following its custom of holding the annual meeting during the progress of the annual na-

Tuesday, Jan. 6—Executive committee meeting, association's office, 17 West 42nd street, 10 in the morning; board of directors, 10:30; banquet committee, immediately following the board of directors; finance committee, 2:30 in the afternoon.

Wednesday, Jan. 7—Eleventh annual meeting at Waldorf-Astoria, 3 in the afternoon; sixth annual banquet at the same hotel, 7:30 in the evening.

Thursday, Jan. 8—Meeting of board of directors at the association's office, 11 in the morning.

**Goodyear Company Announces a New Product  
Designed Particularly for Tourist Work.**

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, is announcing a heavy tourist inner tube, which will be 30 per

**Fig. 2—Timing Diagram of Hazard Motor Used with Corblitt Car.**

cent. thicker than the ordinary tube. It is also stated that the rim side is reinforced, being 50 per cent. thicker than the balance of the tube, which is held to protect it from rim rust and chafing and to reduce pinching to a minimum.

The new Goodyear tube is made of pure Para rubber, a factor of no little importance in fulfilling the requirements necessary in a tube capable of giving long service. It is pointed out that the use of this material makes necessary a special process of vulcanization, which is also held to be of further value to the owner.

The December number of the Bulletin, a publication devoted to the interests of the Manhattan Automobile Club of New York City, contains a number of timely articles, several of which deal with legislative subjects.

## SPLITDORF ANNOUNCES NEW MAGNETO.

**T**HE Splitdorf Electrical Company, Newark, N. J., is marketing a new magneto, termed the EU4, which is of the true high-tension type

**Splitdorf EU4 True High-Tension Magneto.**

and designed to meet the demand for an instrument providing a hot spark at all motor speeds, as well as to make starting easy.

The new instrument is water and dust proof and is constructed throughout on a principle of strict utility combined with a neat appearance, and has sufficient

reserve energy for a 30 horsepower high speed motor. The design embodies an aluminum base to which the pole pieces are secured, and between the latter revolves the armature on two annular ball bearings. The armature, after being wound, is impregnated with a heat and oil proof compound which the maker states renders it practically indestructible. Mounted over the armature is the condenser, this being clamped between two metal plates, which are secured to the pole pieces. The function of the condenser is to increase the intensity of the spark and to reduce the wear of the platinum contact points of the circuit breaker.

The magnets are of the best grade tungsten steel and straddle the pole pieces. Water, dust and oil proof qualities are obtained by fitting a cover over the end plates. The circuit breaker is attached to the armature shaft as shown in the illustration and revolves with it. Owing to centrifugal action the platinum points come in contact in a positive manner at high speeds, thus permitting of the utilization of a spring with light tension, a construction reducing wear of the cam to a minimum. These and other similar refinements are stated to be the subject of patents and exclusive Splitdorf features. The break in the primary circuit is obtained by a roller coming in contact with a steel cam, separating the platinum points.

The high-tension winding on the armature is connected to a collector ring or segment, imbedded in a spool mounted on the driving end of the armature shaft. From the brass segment a carbon brush leads the current through a water proof brush holder, having a detachable plug, to which the cable leading to the spark plug is connected.

The cam holder may be shifted to the extent of 23 degrees, enabling a liberal advance or retard of the spark in timing. A pin, suitably located on the rim of the cam holder, comes in contact with the cover spring when the cam holder is in the extreme retarded position, thus grounding the primary current and stopping the operation of the motor.

Special care has been taken in the manufacture of the Splitdorf instrument to prevent leakage of the high-tension current in the connections and cables leading to the spark plugs. Among the qualities emphasized in the new instrument are easy installation and inspection. As is the case in all true high-tension types the wiring is simplified, there being but one lead, in addition to the high-tension cables.

### J. H. S. FORD SHOCK ABSORBERS.

In the description of the new J. H. S. shock absorbers for model T Ford cars, made by the J. H. Sager Company of Rochester, N. Y., appeared an illustration showing the J. H. S. attached to a car having platform springs. It should have been the J. H. S. fitted to the front springs of a Ford machine. The correct illustration is shown herewith and the simplicity of attachment will be noted. The

**J. H. S. Shock Absorber as Attached to Front of Ford Cars.**

The J. H. Sager company is making a special offer to owners of Ford cars and the guarantee accompanying the absorbers is unusually liberal.

## MECHANICAL NOTES FOR OWNERS.

### Suggestion for Installing Priming Cup on Dash--Lubricating Spark and Throttle Connections--Removing Dust from Electric Headlights--Heating the Carburetor.

THE adoption of the electric motor starter has not wholly solved the problem of starting a motor when cold. The system fulfills its function of spinning the crankshaft, but unless the cylinders be provided with an inflammable mixture the engine will not start. The new owner should bear this in mind when attempting to start his motor after it has been exposed to very low temperatures and for a considerable length of time. The most practical method is to carry a cup of priming fluid and inject a little through the petcocks before attempting to utilize the electrical equipment. This will not only save time, but will husband the storage battery.

While some makers provide attachments for heating the carburetors others do not have such an arrangement, although means are included for enriching the mixture for starting. The following suggestion is contributed by a reader whose car is fitted with an electric motor starter. He states that it can be installed easily and at a slight cost, and that it has given perfect results in cold weather.

Noting that you have published suggestions from readers, I am inclosing a priming device that I worked out and fitted to my machine, which has an electric starter. I found that in extreme cold weather I could not start the motor without priming, and as it was troublesome to lift up the hood, open and prime through the petcocks, I devised the plan shown in the accompanying sketch.

I secured a suitable length of annealed copper tubing to reach from the intake manifold to the dash. You will note that I made a coil in the pipe to eliminate opportunity of breakage through vibration, a plan used in gasoline systems. I tapped the intake manifold to screw in a connector to which I fitted one end of the tubing. The other end was carried through the dash and anchored. To this end was fitted an elbow to take a priming cock.

When I wish to start on a cold day I open the petcock and pour in a mixture of gasoline and ether, which I carry in a ground glass stopper bottle. The fluid flows to the walls of the intake pipe, making a rich mixture and one that will start the engine easily when the motor starter is operated.

The device has another advantage in that it permits me to use a slightly rich mixture, for by opening the petcock I can supply auxiliary air. The plan can be employed on cars not fitted with motor starters and I trust you will publish the drawing, as it will be of assistance to other owners who experience trouble in starting on cold days.

#### A LUBRICATION HINT.

Few motorists give the linkage of the spark and throttle connections attention, which generally results in lost motion. When these are of the ball and socket type they should be cleaned

with gasoline to remove all foreign elements and lubricated. The writer has obtained excellent results by making a thick mixture of grease and powdered graphite, forcing it into the socket. In preparing the mixture use as much graphite as the grease will take.

#### CLEANING ELECTRIC HEADLIGHTS.

When electric reflectors are fitted to the gas headlights, more or less dust will find its way into the lamp unless the doors are absolutely tight. To clean them satisfactorily it is desirable to remove the reflectors from the lamps and

Suggestion of a Reader for Priming Intake Manifold from Dash.

blow out any dust which may have collected in them. The reflectors can be cleansed by dipping a small piece of absorbent cotton in alcohol and wiping the surfaces lightly, and always from the front to the back. Care must be taken not to use any material which will scratch the faces of the mirrors.

#### A STARTING HINT.

J. D. E. of Pittsburg, Penn., contributes the following suggestion for starting a cold motor in the garage:

I am contributing the following suggestion for starting a cold motor in the unheated garage. I use my machine in my business and store it in a building which is not heated. Before breakfast I place a drop light in proximity to the carburetor and turn on the electric current. I cover the hood and radiator with a blanket and by the time I have finished breakfast the carburetor and intake pipe are warm enough to make starting fairly easy.

## SUGGESTIONS FOR THE REPAIRMAN.

### Constructing Grinding Attachment for the Lathe Adaptable for Either Internal or External Work and Eliminating Floating Countershaft---Drilling Holes in Glass.

THE equipment of the modern repair shop includes a grinding machine, as it is recognized as an indispensable tool. In some establishments, however, such an equipment is not always installed and the work is sent out to another concern. Some machinists display considerable ingenuity in building grinding attachments for the lathe and an accompanying illustration presents a plan, the inventor of which was awarded the weekly prize by the Commercial Motor, an English publication. It will be noted that the design does not employ a floating countershaft. With it the inventor claims he is able to grind hardened steel spindles, camshafts, crankpins, valves, cylinders, etc., and states that in planning the attachment considerable thought was given to have the equipment as rigid as pos-

Grinding Attachment for Lathe, Permitting of a Variety of Internal and External Grinding.

sible and that all parts operated on it should be ground quite circular.

The maker states that the attachment can be used either for grinding internal or external work and that it can be fitted easily to the ordinary lathe. The left hand figure shows the end elevation, and that at the right the grinding spindle and method of attaching it to the tool clamp of the top portion of a compound slide rest. The smaller figure shows a plan of the grinding arm itself, which is somewhat after the style of a Landis grinder. The attachment can be made fairly easily, but if desired can be purchased. For internal work it is provided with a long arm, but for external work the latter is only about three inches in length.

A small pulley for driving the arm is seen located between two bearings, so that it will be realized that there is no overhang to set up vibration. The method of driving the spindle consists of a pair of hangers placed in front of the ordinary overhead shop shaft, and about central with the lathe, so that the attachment can travel about six inches on either side without materially altering the relative position of the driving belt.

The driving drum consists of two 12-inch diameter pulleys about two inches wide. These are placed about three feet apart, and then lagged with strips of wood one inch in width, these being placed lengthwise and attached to the pulleys by means of set screws. The whole is then skimmed up in a lathe, and it will be found that this makes quite a nice light overhead drum, which gives nearly three feet of travel over the grinding wheel. The small pulley is so arranged that it may be driven off the existing cone pulley on the overhead shaft which drives the lathe. By this means a good increase of velocity is given by the emery wheel.

The cut is put on by means of a cross fed screw in the lathe saddle. If a taper movement is required the top rest is of course set to taper just as if one were going to machine taper in the ordinary way. The maker of the attachment states that he considers the rig simple; that it will provide accuracy in grinding, and can be fitted by any average machinist.

### DRILLING HOLES IN GLASS.

Holes of any desired size may be drilled in glass by the following method: Take a small three-cornered file and grind the points from one corner and the bias from the other and set it in a brace, such as employed in boring wood, etc. Lay the glass in which the holes are to be bored on a smooth surface covered with a blanket or some other similar material, and begin to bore the hole. When a slight impression is made on the glass, place a disc of putty around it and fill with turpentine to prevent heating by friction. Continue boring the hole, but do not press too hard on the brace when drilling.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**T**HE Kellogg Manufacturing Company, Rochester, N. Y., maker of the Kellogg four-cylinder air pumps, is marketing the Kellogg

**Kellogg Electric Motor Driven Garage Pump.**

electric motor driven garage pump shown in an accompanying illustration. As will be noted, the pump, electric motor and storage tank are mounted as a unit.

The pump is a heavy duty, water jacketed four-cylinder unit, powerful and compact, and may be connected direct to

the tire or to the tank, where air can be stored at a pressure of 150 to 200 pounds a square inch. A water tank is provided, the fluid circulating around the head of the cylinders of the pump, thence to the reservoir on the thermo-syphon principle. The bearings of the pump are of babbitt and the connecting rods of bronze. The pistons are of anti-friction metal, made leak proof by the company's exclusive cup washer construction. The cams are drop forged steel, carefully ground to size. Lubrication is by splash.

The electric motor is .25 horsepower capacity and drive is by silent chain. A knife switch regulates the operation of the motor, and connected with this is a simple automatic air release, which permits the motor to attain full speed before receiving the full load. The maker states that this eliminates fuse troubles.

Two gauges are provided. One, conveniently located, indicates the exact air pressure in the storage tank, which is tested under 500 pounds pressure to the square inch, and the other is incorporated in the tire line.

The platform on which the equipment is mounted is fitted with rollers, permitting it to be moved about the garage or to the sidewalk when a tire is to be inflated with air stored in the tank. As previously mentioned, shoes may be inflated from the pump direct if desired.

The motors are supplied for either alternating

or direct current, and when the former is to be used it is essential to state the number of cycles. In considering the installation of the equipment the maker states that it is important that the voltage be known and that the motor must receive its full number of volts if efficiency is desired. The Kellogg equipment comes complete or without the tank. The Kellogg Manufacturing Company will supply complete details on request.

### ALUMALUX.

The Alunalux Company, Sidney, O., is marketing Alunalux, a solder especially compounded to unite aluminum with aluminum without the aid of a blow torch.

### EASTERN GASOLINE FUNNEL FILTER.

The Eastern Oil Tank Company, 146 Fletcher street, Lowell, Mass., is manufacturing the Eastern gasoline funnel filter, a part sectional view of which is shown herewith, also the inside strainer. The maker states that the design is very efficient in separating water and other foreign substances from the fuel and that its construction permits of easy disassembly and replacement.

As will be noted by the illustration the gasoline is filtered through a mesh and an inside strainer is included, the latter catching all water. The maker states that the funnel can be used in rainy weather without any water reaching the tank and that splashing of fuel is prevented. The

**Eastern Gasoline Funnel Filter for Separating Water and Other Foreign Substances from the Fuel.**

funnel filter is made to be carried easily in the car, assuring the use of clean fuel when purchased on the road, etc.

## EISNER-LENK COMPANY EXPANDING.

**T**HAT a successful business can be built up by prompt service, careful attention to details and fair dealings is demonstrated by the con-

engineering experience Mr. Eisner founded the present concern, which has received the indorsement of the Eisemann Magneto Company, which appointed the Eisner-Lenk Company its New England official repair and service depot. In addition the Boston concern represents Marburg Bros., importer of the Mea magneto; the Simms Magneto Company, the Gilbert Manufacturing Company and the Geiszler Bros. Storage Battery Company. The Eisner-Lenk Company is also agent for a number of manufacturers.

The company is particularly well equipped to give prompt and economical service to its patrons, as it not only carries in stock the numerous parts of magnetos, coils, etc., but has an extensive laboratory fitted with machinery and special apparatus for repairing and testing. Much

of the equipment utilized in this work is the design of Mr. Eisner and has made possible the easy location of troubles requiring considerable time by the usual methods.

The business end of the company is looked after by Oscar C. Lenk, treasurer, who is well qualified for the position, having formerly been connected with the Boston Plate & Window

stantly increasing number of patrons of the Eisner-Lenk Company, the ignition and electrical specialist, located at 1074 Boylston street, Boston. Although primarily a New England concern, it has obtained an enviable reputation among owners and the trade throughout the East by solving and correcting puzzling ignition troubles, as well as all electrical difficulties.

The corps of electrical experts is headed by Harry Eisner, the president of the concern, who has been identified with the automobile industry since the first application of electricity to the internal combustion engine. He learned his trade as an electrician in Vienna, Austria, and with that thoroughness required of experts abroad. His experience with foreign magnetos and ignition systems proved invaluable in this country, where he has been identified with the Albert Champion Company, one time maker of magnetos, coils and electrical devices.

After years of practical and

**Section of General Office of Eisner-Lenk Company, Ignition and Electrical Specialist of Boston—The Company Is Opening Branches in Leading Cities of New England.**

**The Laboratory of the Eisner-Lenk Company Is Equipped with Special Machinery and Apparatus for Locating, Correcting and Repairing Electrical Equipment.**

Glass Company as office manager. He was also co-partner in a large agricultural proposition in which he disposed of his interests to become identified with the Eisner-Lenk Company.

The growing demand for the services of electrical experts in connection with the equipment of the modern automobile has led the Boston company to open branch agencies, and these will be established in all of the principal cities in New England as soon as thoroughly experienced and competent men can be secured to handle the business.

### **METZ SPEEDSTER.**

#### **Company Announces New Model of Racy Lines, Nicely Finished and Appointed.**

The Metz Company, Waltham, Mass., maker of the well known Metz friction drive car, has brought out a new model termed the Speedster, which is shown in an accompanying illustration. It was designed for those who desire a departure from conventional body lines and is very attractive and racy in appearance, the seats being low and set at a comfortable angle, as is the steering column. Another distinctive feature is a 23-gallon oval fuel tank placed at the rear of the seats and provided with a large nickel plated filler cap. All parts are nickelled, these including the steering column, centre control shifting lever, pedals, radiator cap and binding of the floor and running boards. An innovation is the locating of the electric headlights in the front fenders.

The chassis carries a four-cylinder motor, with the cylinders cast en bloc, rated at 22.5 horsepower. Ignition is by a Bosch true high-tension magneto, carburetion by a float feed automatic type and cooling by thermo-syphon. The lubrication system is of the constant level splash type, the oil being circulated by a gear pump. Friction drive, 90-inch wheelbase, wire wheels, two sets of brakes, left hand drive and centre control are among the features of the model.

The equipment is very complete and the speedster is held to be capable of making from five to 55 miles an hour on the high speed. Economy of fuel and minimum cost of maintenance are qualities emphasized in the Metz product.

### **NON-FLUID OIL.**

#### **Maker Is Calling Special Attention to Its Sprocket Wheel Trade Mark.**

It is maintained by the New York & New Jersey Lubricant Company, New York City, that in the mind of nearly every motorist Non-Fluid oil is accepted as the refinement of the common lubricant known as grease and that it is not without a certain amount of pride that most men insist upon the former when in need of this form of lubricant. It is added, however, that what many motorists do not realize is that the excellent reputation which has been established for Non-Fluid oil was not built up by a class of lubricants known as non-fluid oils. On the contrary this reputation is held to have sprung from the exceptional qualities of a specific lubricant which bore the trade marked name Non-Fluid oil

**New and Attractive Metz Speedster, Built on Racy Lines and with Electric Lights Set into Front Fenders.**

long before such designation had ever been wrongfully applied to other lubricants.

This particular lubricant is the product of the New York & New Jersey Lubricant Company, which urgently invites the trade, as well as owners, to view its exhibit at the forthcoming New York show, in order that they become thoroughly familiar with this product. The company intends to call special attention to its sprocket wheel trade mark and to warn the public against the purchase of Non-Fluid oil in any package except the distinctive orange colored cans which bear this trade mark and the name of the sole manufacturer. It may be added that an interesting proposal has been prepared for the dealer, to induce him to discriminate during the 1914 season when purchasing Non-Fluid oil and offering it for sale, and this will be explained fully at the New York Show.

## GENERAL NEWS OF THE INDUSTRY.

### Reo Motor Car Company Will Market Its Product Direct—Peerless Concern Makes Decided Change in Its Sales Policy—C. P. Henderson Becomes Regal Official.

**A**NNOUNCEMENT is made that the Reo Motor Car Company, Lansing, Mich., will market the Reo car direct in the future, the selling arrangement with R. M. Owen & Co., New York City, having been discontinued. It is explained, however, that the change is not quite as radical as might be assumed from the foregoing statement, inasmuch as it is added that the entire sales organization of the Owen concern is to be taken over by the Reo company and continued in charge of R. C. Rueschaw as head of the sales department.

In connection with the above report, it is added that R. M. Owen has severed his connection with the Reo Motor Car Company, of which he was vice president. Mr. Owen, and R. E. Olds, the designer of the Reo car, have been associated in a business way since the days of the curved dash Oldsmobile, when Mr. Olds was at the head of the Olds Motor Works. When the latter retired from the Olds Motor Works to form the Reo Motor Car Company, Mr. Owen assumed the responsibility of marketing the product of the new concern.

It is explained by the Reo company that the purpose of this change is to eliminate the middleman or jobber, allowing the producing end of the business to deal direct with the agent, thereby developing to the utmost the efficiency of the organization as a whole and permitting increased value to the customer. It is further stated that the change has been contemplated for some time.

#### SECURES BIG CONTRACT.

#### Continental Motor Manufacturing Company to Produce 10,000 Saxon Engines.

The Continental Motor Manufacturing Company of Detroit and Muskegon, Mich., announces that it has been awarded the contract to produce 10,000 small four-cylinder motors for the Saxon Motor Company, Detroit, the organization of which to produce a light car was announced recently. These engines will be manufactured in the Muskegon plant, which is particularly well adapted for handling four-cylinder motors in large quantities.

The new motor is of the water-cooled type, with bore of 2.625 inches and stroke of four, giving an S. A. E. rating of 11 horsepower, although it will develop 14.7 horsepower on brake test at 2000 revolutions a minute. This will give a ratio of approximately one horsepower to each 50 pounds, as against a minimum of one horsepower to 75 for the larger cars. All material and workmanship entering into its manufacture will be strictly up to the Continental standard in every respect.

#### CHANGES SELLING PLANS.

#### Peerless Motor Car Company Disposes of Branches in New York and Chicago.

Announcement is made by the Peerless Motor Car Company, Cleveland, O., maker of Peerless cars and trucks, that, in order to reduce the overhead expense incident to using a large building exclusively for the sale of one car, an arrangement has been made whereby the C. T. Silver Motor Company in New York and the McDuffee Automobile Company in Chicago will take over the entire business and equipment of the Peerless branches in those cities. It is understood that the men connected with the branches in each city will become identified with the new agencies. E. J. Kulas, general manager of sales for the Peerless company, makes the following explanation:

It is our aim in taking this step to readjust the proportions between selling and manufacturing expense in Peerless cars. We have found that selling expense generally in the high grade motor car business has been too high. And so far as the Peerless Motor Car Company is concerned we are going to correct that condition if we can.

Because of its high quality and necessarily high price the sales of Peerless cars are naturally somewhat limited. When the cost of operating and maintaining a large sales and service building in a desirable location falls only on those sales it is a very considerable item. But if many other cars are sold with the same equipment, the overhead cost is much reduced.

This new arrangement will enable the buyer to select from a larger stock of automobiles the one most desirable for his purpose, as each of these companies will carry in stock gasoline cars of lower price, and the Chicago house also has a line of electrics. It is well known that the dealer's margin of profit on automobiles is lower than would be considered fair in any other retail business.

Conditions have changed in the motor car business. The big demand has been supplied and it now becomes necessary for the dealer and manufacturer to meet these changes in conditions. The plan adopted by the Peerless Motor Car Company is a step in the right direction and will be copied by others.

A reduction in price is not thought of. In fact, it is entirely impossible. The Peerless car is the most expensive to build of any manufactured either in America or Europe. It includes costly features of design adopted to secure maximum efficiency without regard to price.

During the past few years the Peerless company has been developing, through researches in its metallurgical laboratories and advanced heat treating processes, a line of motor car steels which it uses exclusively and which in strength and wearing quality are far superior to any previously known in the industry. Those steels have greatly increased the life of the Peerless car, but they have also increased the cost of production. This year, manufacturing cost has been increased further by the addition of nearly \$400 worth of equipment.

This steadily mounting manufacturing cost has made necessary a reduction in expense somewhere. And it seemed to us that the selling overhead, which in no way affects the satisfaction of the purchaser in his car, was the place to make it.

### SILENT AMERICAN MOTOR.

**Company Bearing That Name Is Organized in Toledo for Experimental Work.**

A number of men prominent in the automobile industry in Toledo, O., have organized the Silent American Motor Company, with initial capital of \$10,000. Among those interested are the following: President, Charles Turner of the Morton Truck Company; vice president, Thomas J. Kehoe, Kinsey Manufacturing Company; secretary, J. R. Ford, Ford Realty Company; treasurer, J. W. Hawk, Kinsey Manufacturing Company; general manager, S. F. Sawyer; directors, the above and S. L. Kelly, Electric Auto-Lite Company, and B. C. Gamble, Gamble Motor Car Company.

It is understood that the original capital will supply the necessary finances for experimental work on a new type of patented noiseless automobile engine. If these tests should bear out the claims of the inventor, as is expected, the capital will be increased to \$300,000.

### EMPLOYEES SHARE IN PROFITS.

**King Motor Car Company Makes Christmas Presents Equal to One-Tenth of Salary.**

Employees of the King Motor Car Company, Detroit, maker of the King car, were very pleasantly surprised Dec. 20, when each received, as a Christmas present, a check amounting to one-tenth of his salary as his share of this year's profits. This gift was in fulfillment of the policy adopted by the officers and stockholders, who believe that all those engaged in the production of King cars should share in its success.

At noon, the employees were assembled in one of the large rooms of the factory, where one of the officers made the presentation, announcing

that the company had passed through an unusually successful year and was now shipping 10 cars a day. The rapid development of the business was one of the surprises of the year. After the checks had been distributed a lunch was served to all.

### HENDERSON WITH REGAL CAR.

**One of the Indianapolis Brothers Becomes Vice President—Haines Is President.**

Unusual interest attaches to the announcement that Charles P. Henderson of Indianapolis has been elected vice president of the Regal Motor Car Company of Detroit. The other officers of the company are: President, Fred W. Haines; secretary and treasurer, Harold H. Emmons, and sales manager, F. L. Pierce.

Mr. Henderson's election followed closely

The Hendersons of Indianapolis: C. P. at the Left; R. P. at the Right.

upon his taking charge of the sales and advertising for the Regal company, Dec. 1, and has created some surprise because of his connection with the Henderson Motor Car Company of Indianapolis. It is understood, however, that he will retain his financial interest in the latter concern, although leaving the active management to his brother, R. P. Henderson.

### ADDS CARTER CARBURETOR.

**H. W. Johns-Manville Company Will Act as Its Selling Agent in the Future.**

The Carter Carburetor Company, St. Louis, Mo., maker of the Carter multiple-jet carburetor, announces that it has entered into an agreement with the H. W. Johns-Manville Company, New York City, whereby the latter concern acquires the exclusive sale of all models of this product.

Vice President Hugh H. C. Weed of the Carter company has become manager of the carburetor department of the New York concern.

The many branches of the H. W. Johns-Manville Company throughout the country afford it an exceptional opportunity to represent the manufacturer in this manner, and the Carter carburetor is still another addition to the long list of automobile accessories, the sale of which it has acquired during the past few weeks.

### FORD'S ANNUAL REPORT.

#### Officials of the Company Make Public Statement of Financial Condition.

The Ford Motor Company, Detroit, Mich., maker of Ford cars, has made public its annual statement of its financial condition at the close of the fiscal year, Sept. 30, as follows:

|                                  | Assets       | 1913         | 1912         |
|----------------------------------|--------------|--------------|--------------|
| Real estate and machinery.....   |              | \$10,669,968 | \$5,815,787  |
| Merchandise .....                |              | 9,183,370    | 6,387,541    |
| Cash and debts receivable.....   |              | 15,180,581   | 8,226,842    |
| Total.....                       |              | \$35,033,919 | \$20,430,171 |
|                                  | Liabilities. |              |              |
| Capital stock .....              |              | \$2,000,000  | \$2,000,000  |
| Accounts payable .....           |              | 4,774,746    | 2,136,507    |
| Floating debt .....              |              |              | 1,426,297    |
| Surplus and profit and loss..... |              | 28,259,173   |              |
| Surplus .....                    |              |              | 14,867,366   |
| Total.....                       |              | \$35,033,919 | \$20,430,171 |

It also is reported from Detroit that the Ford Motor Company has adopted a new method of paying creditors, depositing the amount due them to their credit in one of the Detroit banks, instead of drawing checks for such amounts as in the past.

### R-C-H BID IS CONFIRMED.

#### Reported That Business Will Finally Be Disposed of as a Going Concern.

At a hearing Dec. 20, Lee Joslyn, referee in bankruptcy, confirmed the guaranteed bid of \$295,000, made by the Todd-Frank-Friedeberg Company, for the assets of the R-C-H Corporation of Detroit. Creditors presented an offer for \$300,000, but the referee explained that the increase was not sufficient to warrant his reopening the bids.

It is understood that an attempt will be made to dispose of the plant as a going concern, and that the company may be reorganized. It is the intention of the purchaser to utilize all the parts now in stock for the production of cars, during

which time an effort will be made to interest eastern capital. Through these methods, and by the liquidation of the real estate, it is expected that a substantial sum will be netted for the creditors.

### WAVERLEY HAD GOOD YEAR.

#### Annual Report Shows Surplus and Undivided Profits Aggregating \$950,000.

The report of the Waverley Company, Indianapolis, Ind., maker of Waverley electric cars and trucks, issued to the stockholders, shows that the business for the past year has been very satisfying. The gross business for the year was \$1,312,815.94 on a capitalization of \$190,000. The surplus and undivided profits for the period amounted to \$950,000.

The officers and directors elected at the annual meeting are: President, William B. Cooley; vice president, Herbert H. Rice; secretary, Wilbur C. Johnson; treasurer, William Kothe; directors, Hugh Daugherty, Joseph C. Schaf, Alexander C. Ayres, Hugh M. Love.

### REMOVES TO DOWNINGTOWN.

#### Rowe Motor Manufacturing Company Leaves Its Rented Building in Coatesville, Penn.

The Rowe Motor Manufacturing Company, formerly of Coatesville, Penn., has removed to Downingtown, same state, where it has purchased 14 acres of land and buildings, which are being improved to meet the requirements of the company. The concern manufactures Rowe motor trucks, and has been occupying rented quarters in Coatesville for some little time.

President Samuel J. Rowe states that the plant will be first class and thoroughly modern in every respect, and that the location is far superior to the old one for handling the rapidly increasing business of the company.

### SHOWS LARGE PROFITS.

#### Statement of United States Rubber Company to Stock Exchange Committee.

In its statement to the listing committee of the New York Stock Exchange, when making application for the listing of its new \$9,422,000 eight per cent. non-accumulative first preferred stock, the United States Rubber Company gives the following consolidated balance sheet for the period ending June 30, 1913, partly estimated for

three months, except as to companies whose fiscal year ended Dec. 31, 1912, and whose statement is for six months:

Operating profits, \$6,105,600; other income, net, \$412,347; total income, \$6,517,948; insurance, freight, selling, general expenses and taxes, \$2,363,892; balance, \$4,154,056; interest, \$1,076,194; surplus, \$3,077,861; dividends, \$1,775,014; surplus for periods as above, \$1,302,847.

The surplus on March 31, 1913, as per United States Rubber Company's report, \$16,735,736. Adjustments of surplus in order to bring statements of all above companies to end June 30, and covering dividends received from said companies during quarter ending March 31, \$1,764,098. Surplus June 30, 1913, \$16,274,486. Estimated earnings in excess of dividends for quarter ending Sept. 30, 1913, \$597,954.

### STUDEBAKER HEAD RETIRES.

**Clarence H. Booth Resigns as General Manager of Studebaker Corporation.**

Frederick S. Fish, president of the Studebaker Corporation, Detroit and South Bend, Ind., announces the retirement of Clarence H. Booth, who was general manager of the automobile division of that concern. It is understood that Mr. Booth will leave early in the new year for an extended trip abroad, after which he will devote his time to other interests. The bulletin making the above announcement reads as follows:

It is with regret that we announce the resignation of Clarence H. Booth, general manager of the automobile division of the Studebaker Corporation, to take effect Jan. 1, 1914. Mr. Booth was under contract for a term of years, but in order to carry out plans of his own he has been released at his own request. Mr. Booth carries with him the best wishes of the management for his future success in the undertakings he has in contemplation.

### WITH MOLINE COMPANY.

**Well Known British Knight Engine Expert Becomes Chief Inspector.**

President W. H. Van Dervoort of the Moline Automobile Company, East Moline, Ill., announces the appointment of A. F. Marshall of Coventry, England, as chief inspector for the production of the new 50 horsepower Moline-Knight motor, with which this line will be equipped in the future. He is well known in Great Britain, where he has been identified with the motor car industry since its inception. For the past 10 years he has been associated with the English Daimler company.

Mr. Marshall is thoroughly familiar with every detail of the Knight motor. He represented the Daimler concern during the Daimler-Knight motor test conducted by the Royal Automobile Club of Great Britain, in 1911. Before Moline-

Knight engines are placed in the chassis each one will be personally inspected and passed by the new expert.

### POPE PROPERTY IS APPRAISED.

**Report Filed with Connecticut Superior Court Shows Assets of \$2,034,899.90.**

The appraisers appointed to inventory the property of the Pope Manufacturing Company, Hartford, Conn., now in the hands of Col. George Pope, as receiver, have filed their report with the clerk of the superior court for Hartford county. It is explained that the inventory on raw materials and supplies, finished parts, etc., was cut exactly in half, while, with respect to the accounts receivable, it is explained that there are on the books 797 outstanding claims, aggregating \$224,519, but as some are old and doubtful, these have been deducted. The appraisal follows:

|  |                       |
|--|-----------------------|
| Land on Capitol avenue.....            | \$84,750.00           |
| Buildings on this property .....       | 634,375.00            |
| West works lot .....                   | 47,200.00             |
| Buildings on this property.....        | 62,800.00             |
| Equipment at main plant.....           | 107,000.00            |
| Machinery for manufacturing .....      | 369,877.71            |
| Standard small tools .....             | 46,822.00             |
| Patterns for automobile parts.....     | 2,600.00              |
| Main office furniture, etc.....        | 3,500.00              |
| Equipment of West works .....          | 14,875.50             |
| Machinery, tools, etc.....             | 11,795.50             |
| Fifty-five second hand cars.....       | 40,000.00             |
| Forty-three cars in process.....       | 81,300.00             |
| Raw material, finished parts, etc..... | 331,542.85            |
| Accounts collectible .....             | 181,461.34            |
| <b>Total.....</b>                      | <b>\$2,034,899.90</b> |

Francis R. Hoyt, Cleveland, O., consulting engineer, has removed his offices from that city to Staunton, Va., in order to be in intimate touch with the early production of the Falcon cyclecar, of which he is designer. The Falcon Cyclecar Company is now erecting machinery in its new plant at Staunton and expects to be under quantity production by Feb. 15.

Additional licensees under the so-called Canfield spark plug patent, which is held by A. R. Mosler & Co., Mount Vernon, N. Y., are announced by that concern as follows: Splitdorf Electrical Company, Newark, N. J.; Standard Company, Torrington, Conn.; Bosch Magneto Company, New York City, and Auburn Ignition Company, Auburn, N. Y.

H. T. Gardner is manager of the annual show of the Syracuse Automobile Dealers' Association, which will be held in the state armory, Syracuse, N. Y., Feb. 24-28.

## GROWTH OF MOTOR PARTS COMPANY.

THE remarkable opportunities for successful business in Boston and New England are particularly well exemplified by the history of the Motor Parts Company, which took over the distribution of Bosch magnetos and plugs in that territory about a year ago. The concern was well established in Philadelphia, where it had been engaged in supplying the trade with these and other products, but was wholly unknown in the new field. And while it attributes an important portion of its success to the fact that its name was linked with that of the Bosch Mag-

neto in January, but March 1 saw the company without its machinery and equipment. This did not deter Mr. Wilkenning from pursuing his well designed plan for becoming acquainted. Well stocked displays at the Boston motor boat show in February and the Boston automobile show in March aided very materially in bringing the advantages of dealing with this company to the attention both of the trade and the owners.

The growth of the business since March 1 has been somewhat phenomenal. Not only has it been found necessary to establish eight supply

**Illustrating Some of the Departments of the Boston Branch of the Motor Parts Company, Distributor for Bosch Products, Leak Proof Piston Rings, Zenith Carburetors, Mohawk Tires, Etc.**

neto Company, it is now also well known throughout New England as factory representative for a number of other lines, included among which may be mentioned the Leak Proof piston rings, Zenith carburetors, Mohawk non-skid tires, etc.

Under the management of F. W. Wilkenning, the concern leased quarters at 185-187 Columbus avenue in December, 1912, and at once began a carefully arranged campaign of publicity, in which announcement cards were mailed to the trade, these being followed by personal calls. The building was to have been ready for occupancy

stations in various sections of the territory, but a well stocked branch was located in Springfield, at 143 Chestnut street, early in the summer.

Insofar as the Boston house is concerned, the departments of the company are conducted systematically, the details being looked after very carefully. The entrance is at 187 Columbus avenue and a large portion of the ground floor is devoted to the Bosch laboratory. There are two laboratories and a large number of expert mechanics and electricians are employed in the overhauling work and remedying of magneto troubles, many of which are the result of too

much inquisitiveness on the part of motorists who experiment unwisely with the instruments. The machinery equipment is most complete and the workmen are at all times away from outside influences.

While the work incidental to the distribution of Bosch products and satisfying owners of such equipment is considerable, it will be noted by the accompanying illustration that other details of the business are such as to require much time and attention. The extent of the tire department

is indicated by the photograph, which also shows the method of displaying Bosch magnetos and other products.

The general offices are large, light and well ventilated. In these, a large corps of employees is kept busy caring for the constantly increasing volume of correspondence with all sections of New England. This, in itself, is an important commentary on the possibilities of this section of the country with reference to the automobile industry and its other allied interests.

## LEECE-NEVILLE FORD MOTOR-GENERATOR.

**T**HE Leece-Neville Company, Cleveland, O., maker of electric dynamos and motors for automobile lighting and starting, has brought out a system for the model T Ford car, which has been subjected to severe road tests before being announced. It is a unit system, that is, the generator and motor are combined, and the same attention has been given to details as with the equipment manufactured by this concern for larger machines. The Leece-Neville system is standard equipment on several well known makes.

An accompanying illustration shows the Ford system installed and with its components numbered. The motor-generator 1 is mounted in a cradle under the steering column between the crankcase of the engine and the body frame. The cradle is retained securely by bolts, these being fastened to the crankcase and frame, and the installation does not require any fittings or alterations, as the old holes are utilized. New and longer bolts are provided, however, as they are employed to retain the cradle.

The chain case 2 is mounted on the front cross frame member by displacing the front end bearing of the engine, the case being provided with a bearing. The old bolts are used to retain the new bearing cap and case to the cross member. The shaft 3 extends through the hole from which the starting crank has been removed and is coupled direct to the engine shaft. The shaft from the motor-generator runs under the radiator and above the front cross frame member, and to this shaft is keyed a small sprocket. The large or driving sprocket is also keyed to the shaft 3.

Drive is by a one-inch silent chain which operates in lubricant, insuring quietness, the mechanism being protected by the chain case cover 4, which has a hole 6 to which is fitted the screw cap 5. The mounting is not only neat and

the equipment easily installed, but all components of the system are accessible.

The motor starter is operated by simply pushing a button, it cranking the engine at a speed of 150 revolutions a minute. Upon the engine starting the motor functions as a dynamo, supplying energy for lighting and charges a storage battery. The designer of the system states that the starter is so constructed that the car motor cannot stall at any speed, as the electric motor has sufficient output to propel the car on the high speed.

**Leece-Neville Ford Light and Motor Starting System.**  
a Motor-Generator Employing a Silent Chain Enclosed in a Casing.

All lamps are lighted by electricity from the battery, which is kept in a properly charged condition by the dynamo, assuring a steady light irrespective of whether the car is inoperative or travelling at high speeds. The motor-generator weighs 47 pounds, the battery 70 and the fittings about 15. All parts are supplied complete and so arranged as to make installing an easy matter. All wires come cut to the proper length. The accessories are strictly high grade.

### NEW FORD PLUG.

#### Splitdorf Electric Company Brings Out Special Type for Model T Motor.

The Splitdorf Electrical Company, Newark, N. J., which is marketing a true high-tension magneto for the model T Ford motor, has brought out a spark plug designed especially for this engine, which is shown in an accompanying illustration. It is constructed to withstand the burning effect of magneto currents and high voltages of induction coils, the electrodes being constructed of a heat resisting material.

Splitdorf  
Ford Mag-  
neto Plug.

The plug embodies the same principles as the Common Sense plug made by this concern, the centre electrode being protected by a lateral winding of white India mica over which is a protector of special porcelain. The last named is hexagon shaped.

Gas tight features are obtained by the use of a copper and asbestos gasket and a vulca-bastian gasket. The sparking points are extra heavy, and one of the qualities emphasized in the design is that the gap is not increased by the intense heat of the magneto spark.

The plug is provided with proper length of barrel and the sparking points so project into the combustion chamber as to obtain maximum efficiency from the mixture, a quality making for economy of fuel as well as eliminating the usual spark plug troubles.

### EDISON BATTERY DISPLAY.

#### Special Attention Will Be Drawn to the New A-5 Type for Vehicle Service.

The Edison Storage Battery Company, Orange, N. J., will exhibit the Edison alkaline nickel-iron storage battery for ignition, lighting and traction, at the forthcoming New York show. During the past year a new size has been added to the line of vehicle batteries, to which special attention will be drawn. This is known as the A-5, having a rated capacity of 187.5 ampere-hours. It is intermediate between the A-4 (150 ampere-hours) and the A-6 (225 ampere-hours), and is used in passenger vehicles, in 1000-pound delivery wagons, in baggage, freight and industrial trucks and for other services where the A-6

would be more than ample. Batteries for ignition and lighting of gasoline cars will be shown in two capacities, 40 and 80 ampere-hours. They are made up in 6.5-volt sets, assembled in steel boxes or wooden trays.

It is pointed out that Edison batteries are made today in practically the exact form that they were five years ago, and a peculiarity of the nickel-iron battery is that this same type is used for all services, stationary and traction. No compromises or modifications are held to be necessary to obtain the desired result in all classes of work, so that identically the same elements may be used in both light and heavy traction, or for the operation of lighting plants in country homes. All Edison equipments, therefore, are maintained to be uniformly reliable, and it is possible to include a complete assortment of the different sizes at the automobile shows.

### NEW WIZARD VULCANIZER.

#### National Motor Supply Company Marketing New Model of Portable Steam Vulcanizer.

The National Motor Supply Company, Cleveland, O., well known maker of vulcanizers, is manufacturing a new model known as the Wizard automatic steam vulcanizer. It has a hollow body partly filled with water and sealed at the factory. A fire box filled with asbestos packing is cast in the bottom of the vulcanizer, and upon pouring a predetermined amount of gasoline in the receptacle, the fuel is absorbed by the packing. When the fluid is ignited, it burns with a blue flame and no smoke, a series of draft holes being open to the firing chamber, as will be noted by an accompanying illustration which shows the Wizard attached to a casing. As the temperature is automatically controlled, the vulcanizer requires no attention after lighting, and it is stated that perfect vulcanization can be easily obtained in five minutes.

Wizard Steam Vulcanizer.

The Wizard has a vulcanizing face six inches long and three wide. It is curved to conform to a

casing against which it is clamped by an adjustable chain held by special retainers. When tubes are to be repaired a plate is employed. The Wizard permits of repairing shoes without removing them from the wheel. The entire equipment is nickel plated and highly polished and is very complete, including rubber, cement, shears, instructions, etc., packed in a neat wood box with slide cover. The Wizard is moderately priced.

### CONDITIONS IN INDIANAPOLIS.

#### Business Interests of the City Outline Industrial Situation as They See It.

Because of the importance of the automobile factories in Indianapolis, Ind., some little interest attaches to conditions arising from the recent strikes of street car employees and teamsters in that city. The business interests have prepared a statement for general circulation, in which these troubles have been reviewed at some length. The conclusions drawn from this statement are the following:

The effort to unionize the teamsters followed the street car trouble, and was looked upon by the business men as a part of a general programme of organized labor to make Indianapolis a closed shop city. The determined resistance of the business men first resulted in the resignation of Mayor S. L. Shank, after he had failed to control rioting at the time of the first strike. Harry R. Wallace, the city comptroller, automatically succeeded to the office and entered into the fullest co-operation with the business men's organization to the end that there was little disturbance in the streets when the teamsters' strike was called.

Through the initiative of the Employers' Association, practically all of the concerns in the city employing teamsters or drivers, were brought together in an organization known as the Commercial Vehicle Protective Association and a regular defensive campaign was inaugurated. On the first day no effort was made to move commercial vehicles, but the organization work was sufficiently completed the second day so that many trucks and drays were delivering goods. Some of these were escorted by policemen, but in the main they were guarded only by private employees with police powers.

The result of this co-operative programme between the city officials and the business interests was that within four days after the strike was declared traffic had been restored to nearly a normal basis. The union had been able to enlist but a comparatively small percentage of the teamsters, and the great majority of firms was ready to operate with their regular drivers as soon as protection was provided. While the strike has not been called off officially, all members of the union have been advised to seek work, the suggestion being made that they have verbal agreements with employers as to wages and that permission be obtained to wear the button. No pretense at a demand for general recognition of the union is now being made.

### PITTSBURG'S ANNUAL SHOW.

#### Space in Exposition Hall Already Has Been Taken for 72 Makes of Cars and Trucks.

It is maintained that the selection of the Exposition hall for the annual Pittsburg automobile

show, Feb. 14-21, will give general satisfaction because of its central location and accessibility both for out-of-town visitors and residents of the city. The display will be under the auspices of the Pittsburg Auto Show Association.

Already, space has been taken for the display of 72 makes of automobiles and business wagons, and it is expected that cyclecars will figure prominently among the exhibits, a special department having been set aside for them. The decorations will be somewhat more elaborate and pretentious than heretofore, it being stated that 10,000 feet of continuous paintings will screen the walls.

### INDIAN INNER TUBE.

#### B. F. Goodrich Company's New Product Recalls Sling Shot Days of Youth.

The B. F. Goodrich Company, Akron, O., maker of Goodrich tires, is placing a new inner tube in the market,

which is said to possess a number of distinctive features. It is termed the Indian, and it is explained that it

New Goodrich Indian Inner Tube.

gets this name from the fact that it is a reddish brown in color.

The new tube is slightly heavier than the gray tube made by this concern, and it is stated that, by reason of a new process in curing, it has sufficient tensile strength and elasticity to withstand the constant road jars. The maker claims that in matter of elasticity it will remind the motorist of the sling shot days of his boyhood, in that it appears to possess the ability to stretch unduly and still return to its original form.

The second annual Maritime motor show will be held in the new armory, St. John, N. B., under the auspices of the New Brunswick Automobile Association, Jan. 14-21. E. M. Wilcox of Toronto, who acted as manager last year, will have charge again this year. The show will attract patronage from New Brunswick, Nova Scotia and Prince Edward Island.

# IN THE REALM OF THE MOTORCYCLIST.

## Savannah's Christmas Day Grand Prize Race Postponed on Account of Rain--Plans for Display at New York Show--News of the Clubs and Manufacturers.

**B**ECAUSE of heavy rain, it was found necessary to postpone the running of the 300-mile Grand Prize race planned for Christmas Day under the auspices of the Savannah Motorcycle Club, Savannah, Ga. A later dispatch says the event was won by a Bosch equipped Excelsior machine. The entrants were:

C. H. Sudduth, J. M. Davis, E. G. Baker, L. G. Mene-witz, E. G. Steiner, Jr., H. F. Kuck, Jr., L. G. Buckner, H. C. Gould, W. D. Mott, B. Schrivalle, J. H. Kelly, Charles Balke, Paul Warner, J. U. Constant, T. E. Dedge, M. C. Gregory, R. E. Emmonds, Gray Sloop, Z. D. Kelly, Frank Hart, Harry Glenn, Indians; M. Gardner, C. F. Goudy, Robert Perry, M. Schroeder, J. E. Hodge, Clifford Walker, C. C. Adams, A. J. Chapple, A. A. Rahner, Excelsiors; J. Yerkes, J. S. Caslere, J. E. Mosher, J. W. Gregorie, George

man of the competition committee, and to receive no referee fee for services rendered, from the F. A. M."

In article 3, section 2, add: "An amateur may have his expenses paid by others than himself while attending and actually competing in national championship races".

In article 5, section 2, add: "Amateurs are prohibited from riding ported machines in any event except those of international competition".

In article 6, section 2, add: "In events characterized as sidecar races, machines having an engine not exceeding 61 cubic inches or 1000 cubic centimeters piston displacement may be used on half-mile dirt tracks".

In article 17, section 7, after the words "who have been injured while riding on motorcycle race tracks", insert the words "in a regularly sanctioned event".

### The New York Show.

Elsewhere in this issue is presented a detailed list of the exhibitors at the forthcoming New York show, which is to be held in the Grand Central Palace, Jan. 3-10. Twelve makers of machines will be represented, and the accessory list includes a number of concerns which make a feature of motorcycle equipment. The two-wheel mounts will be displayed on the fourth floor, but the committee in charge has sought to arrange the exhibits of pleasure cars so as to attract visitors to each floor in turn, and by this plan it is expected that motorcycle makers will reap greater benefit than formerly has been true with reference to the New York show.

The makes of machines which will be seen at this display include: Flying Merkel, Thor, Yale, Dayton, Emblem, Excelsior, Harley-Davidson, Indian, Pope, R-S, Schickel and Henderson. All of these were shown at the Chicago show in November, and have been briefly described in these columns. Particular attention will be

drawn to self-starting features. The first machine to be fitted with a motor starter was the Flying Merkel, which announced a model thus equipped during the New York display a year ago. The success which has been met by this company as a result of the innovation apparently has had its influence upon other makers, who are announcing self-starting models this year.

### Good Service from Merkel.

Herewith is presented an illustration of Benjamin Finkbone of Middletown, O., who has been using a Flying Merkel motorcycle, made by the Miami Cycle & Manufacturing Company of that

**Benjamin Finkbone, Middletown, O., and Merkel He Has Ridden 8400 Miles at a Repair Expense of \$1.60.**

Sorenson, F. H. Camplejohn, G. J. Cleary, Thors; G. A. Porter, F. T. Laid, Yales; H. M. Gilbert, Crane-Atlanta, and three Merkel riders, names of which have not been announced.

### New Competition Rules.

The following changes in the competition rules of the Federation of American Motorcyclists, as voted by the competition committee at its recent meeting in Chicago, have been made public by the secretary:

In article 2, section 2, add: "Where meet is promoted by an affiliated club, whether the public is charged admission or not, the charge will be \$7 for each calendar day". Also add: "The charge for a sanction for a closed run, shall be \$2 per calendar day; the referee to be appointed by the club, subject to the approval of the chair-

city, during the past two years, to assist him in going to and from his work. He also has been on a number of long distance tours. All told he has ridden the machine 8460 miles and the total cost for repairs, etc., has been \$1.60.

#### Harris Oils for Motorcycles.

A number of prominent automobile racing drivers on the Pacific Coast have been using Harris oils, made by the A. W. Harris Oil Company, Providence, R. I., and of late several motorcycle riders of national reputation have adopted this product. Paul C. Derkum, known as "Dare-Devil" Derkum, won the recent San Diego-Phoenix motorcycle road race, using an Indian machine lubricated with Harris oil. He covered the 441 miles of desert route in 16:04:00, defeating his nearest rival by 3:29:00. At the conclusion of the race he wired the Harris company as follows:

The engine in my Indian, with which I won the San Diego-Phoenix race, was running perfectly at the finish, and sounded better than ever. It always has the kick when wanted and I give Harris oil the credit for this and for the fast time. You can say anything you want that is good about Harris oils and I will back it up, as I gave it the hardest test any oil has ever had in a long distance motorcycle race.

#### Bosch Sues Baker Company.

The court action, which was expected as the result of the recent notification of the Hendee Manufacturing Company and the Splittdorf Electrical Company, by the Bosch Magneto Company, New York City, alleging infringement of patent rights, took an unexpected turn earlier in the month, when the Bosch company filed suit against the F. A. Baker Company of New York City, distributor for Indian machines in that territory. The complaint alleges that in the defendant's establishment infringements have been committed through the selling of motorcycles embodying inventions belonging to the Bosch Magneto Company and that the defendant has infringed upon the letters patent No. 974,967, of which the Bosch Magneto Company is the exclusive owner, by making or causing to be made, using or causing to be used, and selling or causing to be sold, motorcycles embodying the inventions set forth in the claims of the Bosch patent, without consent of the plaintiff.

#### Jones Speedometer Reduced in Price.

The recent agreement between the Jones Speedometer Company and the H. W. Johns-Manville Company, both of New York City, has brought about a change in price for the Jones motorcycle speedometer, so that the rider is permitted to secure one for \$8 less than formerly. This instrument has a steady indicator hand,

large readable speed figures and is equipped with trip and season odometer.

To insure the motorcyclist the best possible service for every mile used, the H. W. Johns-Manville Company will equip all of its 49 branches as service stations, and will also establish other stations throughout the country. At each of these an expert mechanic, familiar with every detail of speedometer construction, will be on duty at all times, and a complete stock of repair parts will be ready for instant use.

#### Run on New Year's Day.

The Portland Motorcycle Club, Portland, Ore., is planning a 324-mile endurance run for Jan. 1. The event will be begun at midnight New Year's Eve and continue until 6 in the evening. This is the first time that a contest of this character has been held in that section during the winter, and considerable interest is being manifested in the outcome. The route will lie from Portland to Gresham and return. The following riders have entered:

Edward Barrett, Harley-Davidson; C. A. Hunt, Excelsior; H. E. Meeds, Thor; Harry Brandt, Thor; Carl Rose, Excelsior; D. Boone, Excelsior; Gus Peppell, Thor; A. Welch, Excelsior; B. Hadderly, Harley-Davidson; Peter Irvine, Dayton; A. Rife, Harley-Davidson; Vern Maskell, Indian; Victor Carlson, Harley-Davidson.

## FOR 1914

### MODELS AND PRICES

|   |          |

320 Hanover Street

MIDDLETOWN, OHIO, U. S. A.

New England Branch  
315 Dwight Street Springfield, Mass.

### First Motorcycle School.

In the Riverside motorcycle school, recently established by G. E. Woods at 533 West 110th street, New York City has the distinction of having the first institution of this character in the country. The course is composed of three lessons, each of which costs the pupil \$5. The first lesson includes how to ride, how to operate the magneto, carburetor and brakes, and how to oil, and an explanation of the driving regulations. The next teaches how to adjust and repair a carburetor, magneto, clutch, brakes, chains, pedals, valves, and care of same; putting on tires, repairing inner tubes and the general

**Flying Merkel's New England Branch at 315 Dwight Street, Springfield, Mass.**

care of a motorcycle. The third consists of instructions in taking down and overhauling a machine, removal of carbon from the cylinder, grinding valves, grinding in new pistons, putting in bushings, connecting rods, crankshafts, driving shafts, flywheels, etc.

### Trip Around the World.

F. J. Redman, Wichita, Kan., and J. B. Grosenbick, Denver, Col., are taking a motorcycle trip to San Francisco by way of Europe. They will first ride to San Antonio, Tex., and then follow the coast to New York, from which point they will sail for Europe. After touring

on the Continent they will return to America by way of the Pacific. They plan to reach San Francisco in time for the 1915 exposition.

### Stewart Motorcycle Speedometer.

The Stewart-Warner Speedometer Corporation, Chicago, Ill., states that motorcycle owners are showing a great deal of interest in the recent announcement of the Stewart motorcycle speed and mileage indicating instrument. This is a front drive motorcycle speedometer, in which it is claimed that the objectionable features of such mounting have been eliminated. The new instrument is meeting with pronounced success, according to the maker, and is being sold rapidly wherever the two-wheel mount is used.

### Merkel's New England Branch.

An accompanying illustration presents the New England wholesale branch recently opened at 315 Dwight street, Springfield, Mass., by the Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel motorcycles. The branch is in charge of C. A. Van Doren, as manager, and his experience with this make of machine in this and other territories is such as to indicate that the business of the company will receive a decided impetus as the result of this latest move.

### In Postoffice Work.

The postoffice at Louisville, Ky., has purchased three motorcycles that will be used in the morning to deliver the mail to the carriers at the starting point of their routes. At other times they will be used in the collection of the mail. Some time ago the authorities tried the automobile for this service, but it has been decided that the motorcycle will be much more serviceable, especially in the congested districts.

The postmaster at Norfolk, Va., is trying out the motorcycle for collecting mail, to take the place of the horse and wagon. It is his belief that the machine can do the work of two horse drawn vehicles and save both time and money.

According to tests made in the postoffice at Omaha, Neb., it has been shown that parcel post packages can be delivered by motorcycles cheaper than by regular carriers. In the test 428 packages were delivered on the machines at a cost of \$10.80, or 2.5 cents a package, while five carriers delivered 657 packages at a cost of \$17.98, or 2.75 cents a package.

John F. Palmer, a postal messenger boy connected with the postoffice in New Haven, Conn., finds his motorcycle a big help in his work. He says that he can travel four times as far and deliver three times as many messages as with a bicycle. The purchase of this machine was an ex-

periment, which has resulted so satisfactorily that it is expected several others will be acquired in the near future. Palmer reports that he covers between 50 and 65 miles a day, and uses only one gallon of gasoline. He delivers about 125 messages each day, besides handling a number of emergency calls.

#### Rider as Life Saver.

Frank Emery, San Francisco, Cal., recently saved the life of Mrs. Marion Bennett of that city, through the aid of his motorcycle. Emery was riding in the vicinity when he learned of the serious condition of Mrs. Bennett, resulting from poisoning. He helped the stricken woman onto the front of his machine and rushed with her to the hospital, where the doctors were able to save her life.

#### Club Notes, Here and There.

The Fitchburg Motorcycle Club has been organized in Fitchburg, Mass., by a number of enthusiastic riders in that city, who expect to have a membership of 50 in a short time. The following officers have been elected: President, Thomas B. Matthews; vice president, W. K. Phillips; treasurer, M. J. Tapply; recording secretary, W. F. Bedard; financial secretary, George Dilley.

The New Britain Motorcycle Club, New Britain, Conn., is arranging for a bowling tournament during the winter season. Three teams have been selected thus far, these being captained as follows: Harleys, Richard Gustafson; Indians, Howard Bunce, and Excelsiors, Walter Faulk.

The Chicago Motorcycle Club, Chicago, Ill., has elected the following officers: President, Mark Gelder; vice president, F. E. Yates; treasurer, James Barry; secretary, C. J. Schipplock; financial secretary, A. J. Ensenbacher; captain, Edward La Vollette; lieutenant, P. Lobidan; sergeant-at-arms, O. Persons; directors, C. H. Lang and F. E. Wallace.

The Quaker City Motorcycle Club, Philadelphia, Penn., has chosen the following officers for the ensuing year: President, John H. Black; vice president, John O. Kelker; secretary-treasurer, William Thomson; captain, Marshall Sneyd; first lieutenant, Herbert Banner; second lieutenant, J. Kelker.

Daniel C. Joseph delivered an interesting talk on the early history of the self-propelled road vehicle, at the December meeting of the Maryland Motorcycle Club, Baltimore, Md.

The Fremont Motorcycle Club, Fremont, O., has elected the following officers: President, U. B. Lust; vice president, George Hefflinger; secretary-treasurer, Cyril C. Babione; captain, Urban Gompert; first lieutenant, Elton Barringer; second lieutenant, Lloyd Beck.

Earl Kenning of Hannibal, Kan., is trying to organize a club among the 10 riders in that city.

The Peoria Motorcycle Club has been organized in Peoria, Ill., with nearly 100 members. The following officers have been elected: President, John Bybee; vice president, William Herman; secretary-treasurer, J. A. Olsen; captain, Verne Runyon; trustees, Harold Luke, S. F. Weber, Edward Eaton; membership committee, Paul E. Gott, William Voss, Walter Ricker, C. Howland; entertainment committee, C. C. Howland, E. Gutche, Edward Voss, Harold Luke, Edward Eaton, S. W. Weber; house committee, William Stately, Verne Runyon, Adolph Krueger.

At the December meeting of the West Side Motorcycle Club, Philadelphia, Penn., the following officers were elected: President, Fred Ulmer; vice president, Frank Morton; secretary, Stanley Milne; treasurer, D. F. Hopkins; captain, Stanley Milne; first lieutenant, F. Morton; second lieutenant, C. Tyson.

The Pittsburgh Motorcycle Club, Pittsburgh, Penn., has elected the following officers for the ensuing year: President, S. J. Martin; vice president, A. J. Thompson; secretary, H. E. Simon; assistant secretary, R. Davis; treasurer, H. Neville; director, A. Hayes.

Harry Wheat, one of the local dealers in Wheeling,

W. Va., recently entertained the members of the Wheeling Motorcycle Club with a banquet at its club rooms.

The annual endurance run of the Imperial Motorcycle Club, Brooklyn, N. Y., has been set for Jan. 11. The distance will be about 150 miles and the prize a silver medal.

The Alton Motorcycle Club has been formed by riders in Alton, Ill., with the following officers: President, Oscar Pence; vice president, Walter Gabriel; secretary, Clyde Herrin; treasurer, Emil Budde; captain, Ernest Jacoby; first lieutenant, Joseph Davis, Jr.; second lieutenant, Roy Maxfield.

The Gadsden Motorcycle Club, Gadsden, Ala., has affiliated with the Federation of American Motorcyclists as No. 422, with 12 members.

The Bay Ridge Motorcycle Club, Brooklyn, N. Y., has removed its club rooms to 3621 Fort Hamilton avenue, where they are more centrally located.

The Milwaukee Motorcycle Club, Milwaukee, Wis., has elected the following officers: President, Charles Greer; vice president, W. H. Parsons; secretary, J. H. Emde; assistant secretary, Robert Hayden; treasurer, Charles T. Martin.

The Chicago Indian Motorcycle Club, Chicago, Ill., has elected the following officers: President, A. C. Hartel; vice president, C. C. Posvic; financial secretary, A. C. Hertzner; recording secretary, W. W. Bohnsack; treasurer, J. Collins.

The Beloit Motorcycle Club, Beloit, Wis., has selected the following officers for the ensuing year: President, Arthur Sheveland; vice president, Claude Hirst; secre-

Party of Riders Negotiating Poor Roads Off Beaten Path.

tary, R. G. Talbot; treasurer, Herbert Yonkers; captain, Claude Smith.

The riders in Indiana City, Mich., have organized the Michigan City Motorcycle Club with the following officers: President, Bert Ross; vice president, Floyd McKinley; secretary, Otto Palm; treasurer, Slater Craft.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

**Wheeler Elam Company**, Valparaiso, Ind.; \$15,000; to deal in automobiles; W. G. Elam, R. W. Elam, R. S. Wheeler.

**American Motor Truck Company**, Detroit; \$10,000; A. H. Reinhold, W. K. Ackerman, John D. MacKay.

**Tri-City Motor Car Company**, Charleston, W. Va.; \$10,000.

**Heck-Smith Company**, Camden, N. J.; \$5000; George L. Heck, David E. Smith and others.

**Dart Motor Truck Company**, Boston, Mass.; \$5000; Walter F. Magill, Gertrude A. Magill, Stephen J. Richards.

**Arlington Motor Car Company**, Kearney, N. J.; \$100,000; general automobile business.

**F. R. Boice & Co.**, Red Bank, N. J.; \$25,000; automobiles; L. S. Thompson, F. R. Boice.

**Utah-Idaho Auto Company**, Logan, Utah; \$25,000.

**Bristol Motor Car Company**, Attleboro, Mass.; \$3000; John H. Nerney, Dolly B. Nerney, Carlton H. Nerney, Paul H. Nerney.

**Aero Motor Vehicle Company**, Brooklyn, N. Y.; \$10,000; Herbert Lovinger, 789 Elsnmere place.

**Patch, Griffen & Caulfield Company**, Boston, Mass.; \$15,000; E. A. Patch, A. A. Caulfield, C. B. Jackson.

**C. A. Martin Manufacturing Company**, Chicago, Ill.; \$2000; C. A. Martin, George T. Glover, William Schulze.

**Luxmore Differential Company**, Chicago, Ill.; \$7500; accessories and machinery; Edbert Robertson, Lazarus Krinsky, John L. Anderson.

**Wisconsin State Rubber Company**, Milwaukee, Wis.; \$10,000; tires and accessories; Harold D. Detienne, Mrs. Wallis, Mrs. Detienne.

**Dreadnought Tire & Rubber Company**, Orangeville, Md.; \$1,000,000; to manufacture tires.

**Lock Robe-Rail Company**, New York City; \$5000; accessories; C. W. Crow, W. G. Grichton, R. W. Johnson.

**Kardell Bros. Company**, Utica, N. Y.; \$20,000; supplies.

**Blowers-Rheubottom Rubber Company**, Wilmington, Del.; \$500,000; to manufacture tires; W. R. Blowers, Toronto, Can.; A. Rheubottom, Pittsburg, Penn.; G. D. Hopkins, Wilmington.

**Vaughn-Harris Company**, Vermillion, S. D.; \$25,000; manufacture an automobile truss.

**Merchants Motor Sales Company**, New York City; \$120,000; B. Cukor, H. V. Radonitz, C. J. Quinn.

**Knight Motor Repair & Sales Company**, Cleveland, O.; \$5000; A. House, F. R. Kyle, F. X. Schuat, C. L. Allen, W. H. Buckins.

**Silent Eyler Motor Company**, Chicago, Ill.; \$15,000; to deal in motorcycles and accessories; W. M. Melling, A. H. Doorfler, F. Doorfler.

**Detroit, Barton Auto Top Company**, Lansing, Mich.; \$10,000; manufacture accessories; Albert Barton, George S. Field, Ida M. Willis.

**Tacoma Transit Company**, Tacoma, Wash.; \$30,000.

**Missouri Southern Route Association**, Washington, Mo.; \$25,000; J. H. Dickbrader.

**Commercial Auto Body Company of Richmond**, New York City; \$12,000; William Herz, Casper A. Scheiper, Arthur W. Owen, 208 West 69th street.

**E. O. Proctor Company**, Ayer, Mass.; \$50,000; president and treasurer, Edw. O. Proctor; G. L. Donahue, W. L. Preble.

**United States Auto Supply Company**, Detroit, Mich.; \$10,000; to deal in automobiles; Daniel Alpert, Robert Washman and others.

**Ontario Motor Company**, Detroit, Mich.; \$10,000; to deal in automobiles; E. F. Garber, Charles L. Mann and others.

**Convertible Automobile Body Corporation**, New York City; \$250,000; L. Lewkowitz, E. I. Gottlieb, M. Kaplan.

**Automobile Remodelling Works**, Birmingham, Ala.; president, Charles S. Sibley; vice president, Kenneth Underwood; secretary-treasurer, Frank Brown Cornell.

## GARAGE AND DEALER.

**R. L. Brewster**, formerly foreman of the service department of the Independent Auto Company, has opened

a service and repair station at 916 Walnut street, Des Moines, Ia.

**J. M. Frederick** of the Frederick Auto Company, Elkhart, Ia., has opened a garage and agency on Walnut street, Des Moines, Ia.

**H. D. Gorby**, Pasadena, Cal., has opened a garage and repair shop at 29 South Lake avenue.

**The Bockelman Garage**, Beecher, Ill., has recently been opened.

**The Agency & Repair Store**, Three Rivers, Mich., has been opened by A. P. Yorrton and L. A. Yorrton of Jackson, Mich.

**Erickson & Bastedo**, New Brunswick, N. J., has opened a garage at 127 Church street.

**T. J. Walton**, St. Louis, Mo., formerly superintendent of the police garage, will open a repair shop at 2007 Locust street.

**Herbert Dowling**, Ann Arbor, Mich., is interested in a new company that will open a garage at Littleton, N. H. Mr. Downing will come East to look after the business.

**Henry Dean Bourne** and John Stone, Manchester, N. H., will open a new garage on Hanover street. It will be fitted with modern equipment and Chevrolet cars will be handled.

**The Art Auto Repair Company**, Toledo, O., has been opened on Madison street by Frank Schwind and Harold Stout.

**Elmer Denmab**, Bakersfield, Cal., is to open a garage at Yuba City, Cal.

**Mabel E. Hubbard**, Buffalo, N. Y., has petitioned the common council for permission to conduct a public garage at 486 Cornwall avenue.

**William E. Coleman**, Marlboro, Mass., has opened an automobile repair shop at 390 Maple street.

**John E. Braley**, Leominster, Mass., has opened a garage at 12 Manning street.

**Hunt & Magee**, Glendora, Cal., has established a new garage business under the name of the Central garage and will carry a full line of accessories and handle the Reo cars.

**Harry E. Blodgett**, Pasadena, Cal., is now operating the Park garage at 48 Orange place.

**Kratochville & Nehring**, Houston, Tex., has opened a garage on West Fourth street.

**A. E. Oliver**, Oneonta, N. Y., has leased the shop formerly owned by John A. Dowsett, and will open a garage and repair shop.

**Clifford Cadrom**, De Witt, Ia., has leased quarters and will open a repair shop.

**Boudinot & Cuthbert**, New Brunswick, N. J., has opened a garage at 3 Schuyler street, and will have the agency for the Studebaker, Hupmobile, Marion and American cars.

**The Dann Oil Cushion Spring Insert Company**, Chicago, Ill., has opened a service and spring repair department at 2246 South Indiana avenue.

**Dillon Stallcup**, Alliance, O., is to open a garage.

**Michael Buckley**, New York City, has leased property at 152 West 56th street and will open a garage.

**C. R. Yanington** is planning to enter the garage business at Stockdale, Tex.

**R. F. Flahburn**, Tucson, Ariz., local agent for the Vellie line, has opened a garage.

**Louis Bleick**, Appleton, Wis., has opened a salesroom at the corner of Washington and Morrison streets. He will handle the Mitchell and Detroit cars.

**The Iowa Motor Sales Company**, Des Moines, Ia., has been formed to act as distributor for the Vellie cars in central Iowa. N. A. Cruzan, formerly a dealer, is manager of the new company, which has located at 909 Walnut street.

**Joseph Judge**, who was formerly with the Pope-Hartford company and for the past three years manager of the Mogul Auto Company at Newburg, N. Y., has re-entered the trade for himself. He has secured the distribution of the Ford and Reo cars and will maintain headquarters in Spring Valley, with a branch at Haverstraw.

**The Athens Automobile Company**, Athens, Wis., has been formed by F. F. Chesak, Fred Lonsdorf and Frank Hubing.

**J. S. & E. C. Morrison**, El Paso, Tex., has taken over the agency for Hupmobile cars in that city. O. H. Baum,

**"American Made for American Trade"**

# **NEW DEPARTURE --BALL BEARINGS--**

**T**HE complete success of New Departure Ball Bearings in meeting the demands of the American car manufacturer for a bearing of quality, capacity, efficiency and durability, is attested by the fact that *two thousand skilled mechanics are operating ten and a half acres of modern machinery, producing ten thousand guaranteed bearings per day.*

May we send you catalog?

Western Branch, 1016-17 Ford Bldg., Detroit

When Writing to Advertisers, Please Mention The Automobile Journal.

former agent, will confine his activities to the Chalmers and Peerless lines in the future.

**E. S. DeTamble** and **Carl H. Pine**, Los Angeles, Cal., have opened a salesroom at 825-827 South Olive street, where they will handle the Partin-Palmer cars.

#### WITH THE MANUFACTURER.

**The Maccarr Automobile Company**, Allentown, Penn., is planning to remove its factory to Scranton, Penn., locating in the old Cliff works building.

**The Westinghouse Air Spring Company**, Pittsburg, Penn., maker of a new air spring for automobiles, has opened factory branches at 244 West 48th street, New York City; 98 Massachusetts avenue, Boston, Mass.; 380 Elliott street, Cleveland, O., and other cities.

**The Meteor Motor Car Company**, Shelbyville, Ind., is planning to remove its factory to Piqua, O., and reincorporate under the laws of Ohio with a capital stock of \$50,000.

**Phineas Jones & Co.**, Newark, N. J., will locate a branch factory for the production of automobile wheels on South Los Angeles street, Los Angeles, Cal., and will incorporate in that state under the name of Phineas Jones & Co. of California. Latest machinery will be installed.

**The Goodyear Tire & Rubber Company**, Akron, O., is now occupying a plant that covers 50 acres and has a floor space of 1,550,605 square feet, or about 35 acres,

**Kingston Forbes**, engineer for the Palmer & Singer Manufacturing Company, New York City, has resigned his connection with the company.

**A. J. Interrieden**, sales manager for the Jones Speedometer Company, has resigned and is to join his old associate, **A. P. Warner**, in the latter's mining interests in New Mexico.

**W. O. Kennington** of the engineering department of the Remy Electric Company, Anderson, Ind., maker of the Remy starting, lighting and ignition apparatus, is in Europe for a two months' visit.

**Percy D. Stubbs**, who has been assistant sales manager of the Hudson Motor Car Company, Detroit, is to take complete charge of the Hudson sales west of Salt Lake City.

**George Wright**, formerly with the Gomery-Schwartz Motor Car Company as manager, and more recently secretary of the Cole Motor Company at Philadelphia, Penn., has been appointed branch manager for the Chevrolet Motor Company with headquarters at 332 North Broad street, Philadelphia, Penn.

**Charles Fisher** has been appointed district manager for the Mogul Motor Truck Company, St. Louis, Mo. His headquarters will be in New York City and he will cover the territory east of Chicago.

**William H. Stillwell**, who has been with the J. S. Bretz Company, New York City, has become sales manager for **Joseph Schaeffers**, Cleveland, O.

**The Chase Motor Truck Company**, Syracuse, N. Y., has placed on the market a kerosene motor roller farm tractor, designed for the severe condition of soil and topo-

General View of the Entire Plant of the Goodyear Tire & Rubber Company, Akron, O.

giving employment to 6500 people. It is possible for the Goodyear company to produce 10,000 automobile tires a day, in addition to the immense quantity of motor truck, motorcycle, bicycle and carriage tires that are turned out regularly. An accompanying illustration shows the entire plant of this concern.

**The Invader Oil Company**, New York City, announces that it has concluded arrangements with the Electric Appliance Company, New Orleans, La., to handle its complete line of Invader oils and greases, and I-O-C gear oils for the territory embracing Louisiana, Mississippi, the southern part of Alabama, the western coast of Florida and a small part of Arkansas and Georgia.

**The Frontier Specialty Company**, 728 Main street, Buffalo, N. Y., is issuing a patent warning to the trade, calling attention to the fact that it has secured the control of all rights under letters patent No. 642,167, granted Jan. 30, 1900, to F. R. Simms, for spark plugs for explosive engines. It is maintained that this patent covers the construction of the All-in-One spark plug, made by this concern.

**The Chevrolet Motor Company**, Flint, Mich., has erected a branch factory in New York City, where assembling work will be undertaken, as well as the preparation of cars for exportation.

**A. L. Longton**, who for the past 11 years has been in the employ of the Knox Automobile Company, Springfield, Mass., in various capacities from timekeeper to assistant superintendent, foundry superintendent, and latterly as manager of production and costs, has resigned.

graphy existing throughout the eastern United States. This tractor furnishes all traction and belt work required by the farmer.

**The Detroit Wagon Works**, Detroit, is making a new type tractor, which will be announced soon.

**The Detroit Steering Wheel & Windshield Company**, Detroit, has changed its name to the Metalwood Manufacturing Company. The change affects the name only.

**The General Vehicle Company**, Long Island City, N. Y., maker of G. V. electric and G. V. Mercedes gasoline trucks, has removed to its new five-story factory. The new building is one of four which are to be erected by the company, and when these are finished the concern will have one of the largest motor truck plants in the country.

**The Drigible Headlight Company**, Salt Lake City, Utah, recently incorporated with capital of \$10,000, has acquired a factory site at 325 South West Temple street, and it is expected that manufacturing will be begun with about 50 men in the near future. The officers of the company are: President, **Charles Dale**; vice president, **L. P. Amtoft**; treasurer, **E. R. Madsen**; secretary, **Frank Dale**.

**The Cox Brass Manufacturing Company**, Albany, N. Y., has opened a factory branch at 1216 Van Ness avenue, San Francisco, Cal., in charge of **Charles M. Weaver** as manager.

**The Monahan Vehicle Company**, Providence, R. I., has installed in its painting department a new compressed vapor cleaning system for cleaning cars before painting.

## COMING EVENTS.

## January.

- Jan. 2-10—Importers' Salon, Hotel Astor, New York City.  
 Jan. 3-10—Pleasure car show, Grand Central Palace, New York City.  
 Jan. 4-8—Winter meeting, Society of Automobile Engineers, New York City.  
 Jan. 5-10—Show, Los Angeles, Cal.  
 Jan. 10-16—Show, Milwaukee, Wis.  
 Jan. 10-17—Show, Cleveland, O.  
 Jan. 10-17—Show, Philadelphia, Penn.  
 Jan. 10-21—Show, Brussels, Belgium.

## MOLINE-KNIGHT TEST.

## Unofficial Reports Indicate New Motor Is Showing Satisfactory Horsepower.

While the official test of the Moline-Knight motor, which was begun by the Automobile Club of America in its laboratory in New York City, Dec. 19, will not be completed until Jan. 3, unofficial information states that the engine has been developing not less than 38 horsepower, with a maximum of 38.8. The maker, the Moline Automobile Company, East Moline, Ill., states that the motor is a four-cylinder unit, with bore of four inches and stroke of six, which would give a rating under the S. A. E. formula of 25.6 horsepower. Complete details of the test, with the official results, are expected in time for publication in the Jan. 10 issue of The Automobile Journal.

## TRI-PHOON AIR PUMP.

## Compact Three-Cylinder Unit Adaptable to Used Cars Operating on Novel Principle.

That the power tire pump meets with the approval of the motorists is noted by the growing tendency of the manufacturer to include it as standard equipment on the new models. There are, however, many owners who desire the convenience and to meet this demand the Green & Swett Company, 737 Boylston street, Boston, has brought out the Tri-Phoon three-cylinder air pump shown herewith. Some idea of its compactness may be obtained from its dimensions, which are: Height, 5.5 inches; diameter, 3.5, and weight, five pounds.

The pump was constructed especially for the used car, although adaptable to all makes. It differs from conventional designs in that the three reciprocating pistons are driven by a high powered rotary cam, and are controlled on the cam surface by means of roller bearings. The last named and the cam are constructed from the finest quality of steel, hardened and ground. In place of leather washers, specially constructed metal piston rings are utilized. The lubrication system is simple and efficient; in fact, the maker states that it is impossible for the pump to get out of order. The guarantee is liberal, the company replacing free of charge within one year any defective or faulty construction.

Tri-Phoon Three-Cylinder Air Pump.

One of the qualities of the Tri-Phoon is its adaptability to the motor of a car, the company being prepared to supply brackets and fittings, which make its installation a simple and easy matter. It is also stated that an instance is yet to be recorded where the pump cannot be fitted and successfully operated. Drive may be taken from any convenient shaft by gears or silent chain. The pump is placed in service by a unique shifting lever. The maker lays great emphasis on its efficiency, stating that at 800 revolutions a minute it will deliver a steady flow of pure, fresh air equal to a pressure drawn from an air tank charged 115 pounds to the square inch. Suitable length of high grade hose and a pressure gauge are included.

## HARTFORD ANNOUNCES ELECTRIC BRAKE.

**T**HE process of electrifying the gasoline car has advanced another step, for the electric brake has arrived. E. V. Hartford, of the Hartford Suspension Company, Jersey City, N. J., has made public details of the E. V. Hartford electric brake, which he states is the result of three years' study and experimentation. The device is manually controlled, the hand controller being so mounted under the steering wheel that it can be operated by the driver without removing the hands from the wheel. It is stated that the lever may be actuated to obtain any desired friction effect and that a pressure several times that possible with ordinary methods is obtainable.

The system comprises a small, high speed electric motor mounted on a suitable base, bolted to the frame and preferably under the rear seat.

**Hartford Electric Brake, Comprising Drum Actuated by Electric Motor, and Controlled by Lever Under Steering Wheel—It Is Stated That Any Desired Braking Effect Can Be Obtained with Movement of Finger.**

A non-reversible worm on the end of the armature shaft actuates a spiral gear mounted on a shaft carried transversely to the motor shaft. This transverse shaft carries a steel drum upon which a steel cable is wound, one end of the cable being secured to the drum, while the other is connected with the emergency brake lever. The cable, in other words, replaces the usual rod connecting the brake lever with the equalizer or brake rods.

Between the drum and the worm gear drive, inside of the case enclosing the mechanism, is an adjustable friction clutch which provides sufficient pressure to transmit the maximum braking efficiency. Beyond a certain point, however, the clutch will slip. This eliminates undesirable stresses upon the cable, etc., preventing breakage.

Upon a slight movement of the control lever forward, the electric motor is energized and movement imparted to the drum, winding the cable, etc. By a maximum movement of the control lever the brakes may be locked instantly. It is claimed that as nice a braking effect may be obtained as by manual application. Two releases are provided, one being progressive, similar to the braking effect obtained on the first contact, and the other a full release which acts instantly.

Current for operating the device is obtained from the storage battery of the lighting and starting system, and the braking motor is wound for six, 12 or 24-volt batteries. It is stated that the controller may be operated by one finger; that it may be installed so as to be used by both the driver and occupants of the rear seats, and that the friction clutch may be adjusted to any predetermined pressure. It is also held that the clutch prevents excessive stresses being placed upon the braking mechanism.

### MAXWELL SERVICE POLICY.

**Company Is Prepared to Furnish Spare Parts for 244 Models of Old Cars.**

Although it is somewhat common practise for concerns, when succeeding other bankrupt companies, to dispose of the repair parts business to those who are willing to contract for the supply of such parts to owners, the Maxwell Motor Company, Inc., Detroit, which succeeded the old United States Motor Company, has decided upon an entirely new policy in this respect. This concern announces that it has concentrated the entire spare parts business in one plant at Newcastle, Ind., where it is prepared to furnish replacement fittings to 122,000 owners of 244 models of old cars, these including Stoddard-Daytons from 1905 to 1914, Columbia gasoline and electric machines from 1906 to 1914, Everitt cars of any model and Brush, Sampson and Courier cars.

With a very few exceptions, every part required can be supplied immediately, and J. E. Burns, head of the service plant, states that 95 per cent. of the orders received are filled within 24 to 48 hours. It is estimated that the Maxwell Motor Company carries an investment of \$1,750,000 in plant, machine tools and repair parts at this Newcastle factory. The time and labor expended in this project has also been considerable.

# EISEMANN

## The Eisemann Magneto Co.

Sales and General Offices

BUSH TERMINAL - - BROOKLYN, N. Y.

### THE WISE AUTOMOBILE BUYER WILL BUY CARS "EISEMANN" EQUIPPED

It's service that counts—and the ignition equipment is vital to the service of any car—whether on a pleasure trip or a hard road race—

#### 11 OUT OF 19 CARS

which finished the Indianapolis to Pacific tour with perfect scores were "EISEMANN" equipped—

#### 45 PER CENT. OF ALL CARS

shown at the recent Olympia Show in London were "EISEMANN" equipped—

**More Than 73 Car and Truck Mfrs.** are today using "EISEMANN" standard products.

#### WHY? BECAUSE SERVICE COUNTS

Since moving our general offices from New York City to our present home, the EISEMANN CO. has established a new service station in New York City at 123 West 52nd St., in charge of Mr. James Rohde.

No Exhibit at the Shows—  
Customers will be welcomed at our factory.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

**Mezger Plug becomes****J-M (Mezger)  
SOOT-PROOF  
SPARK PLUG**

In future the famous Mezger Soot-Proof Plug will be known as the J-M (Mezger) Soot-Proof Spark Plug, and sold exclusively by this company.

This is the only absolutely soot-proof Spark Plug on the market—the only plug that actually cleans itself. Therefore the only plug that cannot short-circuit.

Soot can not accumulate at the firing point because the heat of the porcelain "petticoat," which extends to the end of the plug, burns up carbon as fast as it settles.

The porcelain used in this plug is proof against rapid changes of temperature. Even when heated red hot and thrown into water it will not crack—a much severer test than would be encountered in actual service.

**GARANTEE**—If any plug does not give satisfactory service we will supply a new one or refund purchase price.

Shipped direct from our nearest Branch if your dealer can't supply. Price \$1.00. Write nearest Branch for interesting, illustrated booklet.

QUALITY WILL TELL

THE OIL IN THE DUCK CAN

EASY TO CARRY  
EASY TO POUR

CAN AND  
GALLON OF  
ALDING OIL

75c

DELIVERED anywhere in New England—65c at our store.

"ALDING" Oils are manufactured from Pennsylvania Crude, which by reason of its high fire test and high viscosity, low gravity and purity produces the finest lubricants known to science.

The principle of lubrication of Gas Engine Cylinders is very much the same, BUT the construction of the various types of cars and the different methods of introducing the Oil to the part requiring lubrication DIFFER, so that no one density of Oil is suitable for every make. Therefore we produce ALDING OIL in Light, Medium and Extra Medium consistency, to suit your make of car.

OUR REGULAR 75c

SPARK PLUGS

50c

To every reader of this advertisement—  
Just send us the coupon below and 50c—  
Additional Plugs at Same Rate.

Suitable For All Cars—  
Especially Serviceable  
For Fords.

ALDING PORCELAIN  
PLUG

Equal in service to any \$1.25 Plug on the market.

ALDING Porcelains are made to our own formula from the best imported clays and are hand-turned. ALDING Porcelains are as near heat-proof as porcelain can be made. ALDING Porcelain that has been cracked by heat, will be replaced without charge. Gives results at all times and on all types of engines. Easily interchangeable parts. The most satisfactory porcelain plug ever produced. Half-inch Thread, Metric Thread, A. L. A. M. Standard Thread, Long Half-inch, Long Seven-eighth Thread. Extra porcelains, complete, ready for replacement, 25 cents each. 5,000,000 in use.

OUR GUARANTEE

Any person purchasing an ALDING SPARK PLUG and not finding it satisfactory, can return same for replacement—

## Winter Lubrication

If you plan to keep your car in service through the cold weather you especially need

because it is impervious to change in temperature. It lubricates as perfectly at zero as in warm weather.

If you are planning to house your car for the winter, it will pay you to clean out all the bearings and gears and repack them with NON-FLUID OIL. This lubricant does not dry or gum when the car is idle and will not cause the slightest corrosion of balls and rollers

NON-FLUID OIL excludes moisture and prevents rust.

Ask your dealer for these lubricants packed in orange-colored cans bearing the above trade-mark.

### Accessory and Garage Journal

EACH MONTH

You can secure your monthly audience with all buying and selling heads in all concerns in every branch of the automobile industry through the Accessory and Garage Journal. Such interests must know what you have to offer. All are logical prospective purchasers. They constitute your market and are always looking for lines of merit.

In this magazine the large and small manufacturer has equal opportunity to reach the whole trade and can secure a service equal to that of a trade mailing list and better than can be secured through any other medium.

100 Per Cent. Quantity—100 Per Cent. Quality—Circulation Value.

Every order carries with it a positive guarantee of service stated, and this in any form requested.

Ask how we give concern and product listing under proper classification in Buyers' Guides that have a distribution of more than 1,100,000 copies yearly. This service is free. Our trade mailing list is 100 per cent. active—Do you need it? Details gladly furnished on request.

Next issue Jan. 15th.

# DELCO

ELECTRIC CRANKING LIGHTING IGNITION

## A Delco Equipped Car Has Won the World's Greatest Automobile Honors

An American motor car equipped with the Delco Electric Cranking, Lighting and Ignition System has been awarded the famous Dewar Trophy by the Royal Automobile Club of England.

The Delco system itself did not win this highly prized trophy, but it was so severely tested in the trials, and the record it made was so remarkable that some facts regarding it are bound to be of interest to motor car owners.

The trials that determined the award of the Dewar Trophy involved driving 1,000 miles over all sorts of roads at an average speed of 19.5 miles an hour. *This is somewhat misleading, however, as an exceptionally high rear axle gear ratio was used throughout the trial and the actual speed at which the electric generator was driven was the equivalent of only 13.2 miles per hour with a standard rear axle.*

During the entire trial which lasted 66 hours and 17 minutes, or more than three days and two nights, all electric lights were burned continuously.

Actual driving time, however, was only 51 hours. For over 15 hours all lamps were burned while no current was being generated.

The cranking device was used 130 times; an average of once every 30 minutes during the entire 66 hours.

And at the end of the trial the batteries were still suffi-

ciently charged to crank the engine 1,000 compressions and burn the side, tail and speedometer lights 20 additional hours.

In other words, in spite of the heavy and continuous drain on the batteries for over 66 hours, while the generator was being run at unusually low speed for only 51 hours, the battery was still well charged at the end of the trial.

Another very gratifying phrase of the Committee's report is found in the statement that—"IT WAS OBSERVED AND NOTED THAT THE IGNITION WAS PERFECT THROUGHOUT THE TRIAL."

And yet while this entire performance of the Delco equipment is very wonderful, it is not at all surprising to drivers of Delco equipped cars.

More than 75,000 automobile owners are duplicating, day after day in their own driving, the experiences of the Royal Automobile Club Committee.

## WINTER LUBRICATION

Suppose an oil meets a low cold test.

Will it be safe for winter use?  
Will it be safe for year-'round use?

Not necessarily. Oils that will not congeal in cold weather are common. But cold-tests alone are not safe guides to an oil's efficiency.

Added to that, our analyses and practical tests of 273 current models show that 113 of these cars operate most efficiently in summer with a grade of oil not best suited to winter conditions.

Different cold-weather problems are presented by the pressure type, the semi-force-feed and the direct-feed lubricating systems. They must be considered in connection with the other points of difference in the motor construction.

The summer oil meets your car's demands on hot summer days. The winter oil meets its

cold weather requirements. Some cars require the same grade of Gargoyle Mobiloil summer and winter.

These specific recommendations for different seasons and different cars naturally involve technical study and extra manufacturing effort.

We certainly would not undertake this laborious work if correct lubrication could be supplied without it.

The sooner the motorist comes to realize that efficient lubrication is not guess work, the sooner he will eliminate unnecessary wear and tear, and secure the best efficiency from his car.

A booklet on lubrication, which contains our complete lubricating chart, covering all American and leading foreign makes, will be mailed on request.

The various grades, refined and filtered to remove free carbon, are:

Gargoyle Mobiloil "A"  
Gargoyle Mobiloil "B"  
Gargoyle Mobiloil "D"  
Gargoyle Mobiloil "E"  
Gargoyle Mobiloil "Arctic"

**GARGOYLE**  
  
**Mobiloils**  
For correct automobile lubrication

In buying Gargoyle Mobiloil it is safest to order a barrel, a half barrel, or a *sealed* 5-gallon or 1-gallon can. *All are branded with the Gargoyle, which is our mark of manufacture.*

# The Varnish That Defies Soap

Our exhibit at the automobile shows of an automobile wheel revolving in soapy water is a startling demonstration of our Vanadium Chassis Finishing, a varnish which is absolutely unharmed by the caustic action of automobile soap.

Six of the spokes of the wheel are finished with the best automobile gear varnishes heretofore made. They cannot withstand soap, and turn gray and lose their lustre. The other six spokes are finished with

## Valentine's Vanadium Chassis Finishing

These spokes stand up absolutely unharmed after weeks of exposure to soap and water. This is the varnish for the hood, fenders, and underparts of your car. It resists mud, road oil, grease, and the heat from the motor as well as it resists soapy water. It will keep the finish of these parts of your car in perfect condition many months after the ordinary varnish would be destroyed.

You will be interested in a new booklet we are issuing, "The Care of the Car." It tells all about how to preserve the finish of the car, and will, we are sure, prove of value to you. It describes Vanadium Chassis Finishing. We should like to send it to you, free of charge of course. Just fill out the coupon.

FOUR  
SPEED  
DIRECT  
DRIVE

### Individuality

Producers of moderate priced cars in their desire to market a product at a low cost have all followed along the beaten path. Sheep-like they have all produced machines that offer nothing but sameness—in other words bulk at small cost. Stock parts gathered here and there, assembled in haste, is a story now familiar to the purchasing public.

THE CAMERON 4 STANDS AS THE MOST DISTINCTIVE LOW-PRICED CAR BUILT IN AMERICA. Its mechanical superiorities stamp it as the CAR OF INDIVIDUALITY. Built in our own factory, under personal direction of our own skilled engineers and designers, everything that typifies motoring perfection is incorporated into its make-up. It is the sturdiest and most economical automobile constructed.

### Cameron Features

#### FOUR SPEED DIRECT DRIVE

The problem of delivering maximum power at minimum cost has been solved by the use of the CAMERON FOUR SPEED DIRECT DRIVE TRANSMISSION. This type is absolutely the only one that permits of direct drive on all speeds, and DELIVERS 35 PER CENT MORE POWER THAN ALL OTHER MAKES.

#### THE MOTOR

The long stroke CAMERON motor cast en bloc is as distinctive as the transmission. Valves located in centre of combustion chamber gives highest efficiency to motor and the valve mechanism entirely enclosed insures quietness and freedom from wear.

THE CAMERON 4 has been constructed with a principle in view not a price. A MODERATE PRICED CAR—STURDY, COMFORTABLE, POWERFUL YET SIMPLE AND ECONOMICAL IN OPERATION.

THE CAMERON MFG. CO.

NEW HAVEN, CONN.

# That Moline-Knight Test

Over 44,000,000 Sparks Without a Miss

# BOSCH

## MAGNETO and PLUGS

Held under the supervision of the Automobile Club of America Testing Laboratories, from Dec. 19, 1913 to Jan. 2, 1914. A continuous run of 336 hours.

The performance of the ignition system in this remarkable test was more than would be required by the average motorist in two years of most strenuous driving.

**THAT** unprecedented test of the Moline-Knight Engine was made possible by the rather astonishing performance of the **BOSCH MAGNETO** and the **BOSCH PLUGS**. For two weeks—day and night—without a stop—without an adjustment of any kind, the Bosch Magneto—a type DU 4 Duplex—fired the gas charges without a miss.

44,352,000 from  
the Magneto

## Real Hot, Intense BOSCH Sparks

11,088,000 across  
each Plug

The Bosch Plugs—the standard type with three crescent electrodes and the Bosch Steatite insulator—withstood the extraordinarily high compression, the extra lubrication and the extreme heat, with their usual resistance—not a miss—and still in perfect condition to repeat the performance over again.

FIVE-PASSENGER

**\$2400**

FOUR-CYLINDER

**More Power****More Endurance**

## Shatters World's Records for Power and Endurance

For 336 hours the Moline-Knight motor has been on the testing block in the laboratory of the Automobile Club of America, under the supervision of A. C. A. Officials.

During this test it ran without a stop, or an adjustment of any kind to the motor, carburetor, spark plugs or magneto—a feat never before equalled in the history of the motor car industry.

It ran for two weeks, day and night, at 1100 revolutions per minute, averaging 38 H. P.—the A. L. A. M. rating requiring only 29.16 H. P. at this number of revolutions.

At the end of 336 hours the speed was increased to 1682 revolutions and developed 53.6 H. P., A. L. A. M. rating, justifying our claim of guaranteed 50 B. H. P.

In its world record breaking feat the Moline-Knight motor travelled the equivalent of 14,700 miles on level at the rate of 45 miles per hour and steadily climbed an 8 per cent. grade 10,000 miles long at the rate of 27 miles per hour, which is equal to 14 trips between New York and Chicago or 5 trips from the Atlantic to the Pacific.

### **\$10,000 CHALLENGE**

To all makers of Poppet Valve Motors, regardless of price, piston displacement, horse power or number of cylinders (Sixes preferred) we challenge you to place your motor in the laboratory of the A. C. A. and duplicate the World's Record made by the Moline-Knight, under the same conditions.

**The "Four" that makes the "Six" unnecessary**

## Paige—Mechanically A Marvelous Motor Car

For the year 1914 the Paige line of motor cars will still be without competition.

A year ago, when the Paige line was exhibited at the Automobile Shows, it was freely predicted by the wisecracks in the trade that the cars could never be manufactured and sold at the price—that either the prices must go up or the quality go down.

A careful comparison with the best competing makes showed Paige cars to be at least two to three hundred dollars underpriced.

But these predictions proved to be without foundation. The public took all of the Paige cars the factory could produce and called for more.

Now, the Paige 1914 line will show even greater extra value.

It will be even still further ahead of competition than ever.

Check over some of these improvements that have been made and you will realize why this must be so.

To the Glenwood has been added a beautiful, up-to-date streamline body. No finer appearing body is put on any car at any price.

The large unit Gray & Davis starting system will be used. No car at anywhere near the Paige price is provided with this equipment.

A genuine rain vision, bottom ventilating windshield has been added. The arrangement of the dash has been changed to make it still more convenient to the operator. The operation of the starter has been simplified—one shove of the foot plunger—that's all. A new 5-bow top is to be used.

Then think of the big Paige extra value features that will be continued.

The silent chain drive for the motor shafts. Cork insert multiple disc clutch. Bosch Magneto, etc.

Nowhere in the world is there a car made that combines these features with the beauty and mechanical

excellence of the Paige and sells at anywhere near Paige prices.

To the Paige "25" Brunswick has been added even more sensational improvements.

A complete electric lighting and starting system and a new up-to-date streamline body has been added and yet the price still remains under a thousand dollars. This is the first car ever made equipped with electric lighting and starting system and selling at so low a price.

From the standpoint of the dealer, one of the most attractive features of the Paige line is its completeness. Here you will find cars to meet every kind of service and every individual fancy.

On the Paige "36" chassis are mounted the Glenwood touring car body, the Westbrook roadster body, the Newport seven-passenger limousine and the Montrose four-passenger coupe. Besides these, a new body has been added to the line—the Speedway—a snappy, racy-looking roadster that looks the part of a racer better than any other car produced and yet combines this appearance with practically all of the comfort and convenience of a regular roadster body.

On the "25" chassis is mounted the Brunswick five-passenger touring car body and the Kenilworth three-passenger roadster body.

Dealers everywhere throughout the world realize that with their beauty, their mechanical excellence and their variety Paige cars are profitable to handle and that a Paige contract is an exceedingly valuable asset. There is some territory still open. For further information write or wire

# Why The Austin Is Superior

It is the only car with a **two-speed axle** and **six cylinder** motor. It also has the new "**Austin**" **hydraulic spring controllers** and many other special and exclusive features.

A careful study of the editorials and many statements showing the merits and many advantages of a **two-speed axle** also of a **six cylinder motor** will prove conclusively that a really **superior car** must have **both**.

With the **Austin two-speed axle** and **six cylinder** motor, the special high direct drive will be used most of the time for both city and country driving, the regular or low direct drive being desirable mostly for hills, bad roads and crowded traffic. This will not, normally, amount to over one-tenth the total travel.

**Long life and durability:** Austin cars have always been noteworthy for their long life and durability. While this has always been a very desirable feature, the rapid improvement in design and construction has, heretofore, eliminated much of its real value, as most owners of real high grade cars have sold their old cars (while mechanically as good as new) at a very material loss because they wanted the new and improved features of the later models.

We have, however, a sufficient number of owners who have used our cars continuously for many years at such a low cost for repair as to warrant the statement that the cars we are now building will give at least ten or twelve years of satisfactory service and at such a very low cost for operation and general upkeep as to make the total cost very much cheaper for that length of time than it would be for most any of the lower priced cars.

Having all the latest improvements now used on other cars, and many special and exclusive features obtainable only with the Austin, they are now so absolutely complete, in every desirable respect, that any future changes must be limited to details of minor importance. And it should be many years before the owner will feel any desire or inclination to make any change whatever.

The assurance of being able to use this car for so many years of satisfactory service, has now become of such great value as to warrant the extra initial cost of a car which is sure to give such complete satisfaction in every way.

**Personal supervision:** We have been making only strictly high grade cars for the past twelve years and limit our production to three cars per week. This enables us to give the necessary personal supervision to the details of construction, to assure the highest quality of workmanship and perfection in every feature, which would be impossible in a larger output. This also enables us to give special attention to the desires and requirements of each individual customer.

We will be pleased to answer any questions relative to the construction and merits of our special and exclusive features, and to give any further information that may be desired.

# The Pioneer of the Past—and of the Future

**THE OLDEST**, and yet the newest car at the Automobile Show was the Maxwell "25."  
**NO NAME DATES FARTHER BACK** in this industry—and yet if you noticed where the crowd blocked the aisle, you'll agree that visitors considered the latest Maxwell—the "25-4"—the newest of them all.

**TO SAY** this \$750 car was the "sensation" of the 1914 Show would be trite—tho true. It is more than that.

**IT IS REVOLUTIONARY.**

**REVOLUTIONARY**, because, never before has it been possible to obtain a car of such size, such capacity, such power, such performance and of such quality throughout as you will see in this Maxwell "25" at the price—\$750 fully equipped.

**REVOLUTIONARY, TOO, BECAUSE**, maintenance cost has been reduced to the minimum, by putting in this car the best steels known to science—thus making it light, yet practically indestructible. So you can now not only afford to buy, but to keep an automobile.

**WE CALL IT** an engineering triumph. And you'll agree we are justified when you recall that for years hundreds of thousands have been looking, hoping, waiting, for such a car at the price.

**WE SAY THIS CAR** was the Oldest car in the Show—because more years of experience; more combined engineering skill; more know-how have gone into it than ever went into any other automobile at the price.

**AND, BACKING UP** that experience; that skill; that know-how; is as much money as ever backed an automobile concern.

**ADD TO THIS**, honesty of purpose, pride, and a desire to make good and to deserve well at the hands of every owner—and you have the elements that combined have produced the car that was the wonder of the Show—that blocked the aisle in front of the exhibit and thereby proclaimed the Newest as well as the Oldest car in the Show. The Pioneer of the past—and of the future—the Maxwell "25."

**THE "25-4" TOURING CAR**

Everything you have a right to expect in an automobile. Ample leg room, seating capacity for 5 full grown adults. So light that it will cut down the tire bills, and strong enough to withstand all the rough usage you are going to give it. Stream-line body design, left hand steer and other features you look for in the highest priced car specifications. (Send for the Book.) Price \$750, fully equipped.

## PUBLISHERS' COMMENT.

**The Issue of The Automobile Journal for Jan. 25** will be a special Philadelphia number. Particular reference is made to the complete review of the Philadelphia automobile show, in connection with which will be presented interesting information relative to the conditions respecting the industry in that section as revealed by the dealers of the city. It will prove of decided interest as supplementing the other numbers in this series which already have appeared.

**New Owners and Prospective Purchasers**, particularly those who are interested in small cars, will find the suggestions in the department devoted to the care and maintenance of these machines particularly valuable during the coming year. The subjects treated will be those which most often cause trouble for the novice, and every effort will be made in the preparation of the discussions to deal with the matter in simple, non-technical language, readily understood by those who are not mechanically versed.

**The Importance of Accessory Equipment** was never better demonstrated than during the New York show. Readers of The Automobile Journal were able to appreciate the value of the different products displayed through the intimate knowledge of the various supplies, parts and fittings gained by carefully following the special New Accessory Department, which appears in each issue of this magazine. Particular attention is directed to page 32 in this issue, as indicating the manner in which these new products will be handled during 1914.

**The Buyers' Guide on Pages 87-96** contains the names and addresses of reliable concerns engaged in the manufacture and sale of pleasure and commercial cars, their accessories, parts and fittings, and should always be consulted when in need of anything new.

# The Dawn of a New Era!

WITH the New Year of 1914, comes a new era in motordom. For twenty years the automobile has passed through the experimental stages in design—in materials—in methods of manufacture—in sales and in service. Now comes the Lyons-Knight as the first car of a new era. Because of its many better features it is important that you see and know its value before you buy *any* car. Here are reasons:

## A Great Change for the Better

The automobile industry has worked toward this great change for years. The history of other automobile factories proves it. The million motorists of America have learned to know the features that go to make automobile value.

One group of men, backed by ample capital, foresaw this change. They secured one of the greatest manufacturing institutions of America. They brought to their organization the most experienced engineers and production managers. For two years they studied to produce the car to satisfy the experienced motorist. They designed and erected machinery to construct such a car. They anticipated the dawn of the new era.

The result is the Lyons-Knight—a car that is different and better than any other high class car.

This car is backed by a service—by a broad-gauge, business-like sales policy that has secured the finest dealers from the old days of the automobile.

This great, new, live, strong, aggressive organization ushers in the first car of the new era.

## What the Lyons-Knight Proves

"The Car of Silence" is proof of this new era in automobile design, manufacture and value. One ride in it will convince you that its makers have produced something different and better.

The Lyons-Knight is no more a 1914 car than it is a 1918 car or a 1924 car. So staunchly and truly is it built that years of use but make its operation smoother and more efficient.

The lines of the bodies are such that this car will be a standard for years to come. Nothing radical this year or next—always pleasing and up-to-date.

The Lyons-Knight engine is the finest power plant ever placed in any American car. Its makers guarantee its performance to surpass that of any four-cylinder poppet-valve engine of equal size—to surpass a six-cylinder poppet-valve engine of larger size even in the points of

smoothness and flexibility as well as power.

Worm drive brings to this big 130-inch wheel base car an added smoothness and balance—freedom from vibration and sounds the death note of the grinding gears which marked the finest cars of the old era.

Point after point adds to the proofs that this car is representative of a new order.

## Before You Buy

You will find the great, growing, multiplying Lyons-Knight organization reaching out over the entire country. Its representative in your city is one of the most experienced men you can find. He will put you in touch with the new era in motordom that means greater value out of every dollar you invest.

Lyons-Knight cars will be on display at the Chicago Automobile Show.

Full information about the great organization and descriptions of the cars themselves will be mailed you on request.

Know about them—before you buy.

## NEW YORK SHOW A SPLENDID SUCCESS.

**Attendance Larger Than at Any Previous Display in That City--Comprehensive Exhibit of Cars and Accessories Representative of the Industry's Progress.**

**A**CCORDING to the statements issued by those in charge of box office receipts, the number of paid admissions to the 14th annual national New York automobile show in the Grand Central Palace was larger each day than for any corresponding day of any previous display held in that city. This would seem to indicate that the interest in motor cars and their equipment is by no means at low ebb. And those who visited the exhibition were privileged to witness one of the most comprehensive displays of cars and accessories yet held in New York City.

Grand Central Palace possesses certain very obvious disadvantages over Madison Square Garden as a place in which to hold a show of this character. The crowds which visited the building were most largely distributed over the two

lower floors. The accessories and supplies were all displayed on the third and fourth floors, and, despite the presence on these floors of numerous cars, cyclecars and motorcycles, the number of visitors was much smaller in comparison, with the single exception of Thursday, which saw the largest attendance of the week.

No attempt

**General View of Main Floor in Grand Central Palace During the Progress of the New York Show.**

Overland Cars and Stripped Chassis Grouped in Front of Main Entrance.

will be made here to discuss the different exhibits in detail. It is sufficient to state that there was quite as much of interest to motorists and prospective purchasers among the accessory displays as was shown on the cars themselves. Those who failed to visit these booths missed an exceedingly important portion of the exhibition. The products of the various makers could be displayed much more advantageously than in the basement at Madison Square Garden, but for some unaccountable reason many visitors declined to venture beyond that second floor.

Grand Central Palace does not permit of the elaborate decorative schemes for which the New York shows have been noted, but the show committee, composed of Col. George Pope, W. C. Leland and H.

considered elsewhere. In one respect there was failure to meet the prophecies of a year ago, when it was insistently proclaimed that the 1914 show

The Glidden Trophy Occupied the Centre of the Metz Display.

would find a majority of the cars fitted with wire wheels. Eighty-five makes of machines were represented in Madison Square Garden and Grand Central Palace in 1913, and 11 of these were equipped with wire wheels. This year there were 75 different makes, and 19 were fitted with this type.

Accompanying tables set forth certain facts concerning the show, and present some evidence respecting the motor situation. Last year there were 49 makers who displayed six-cylinder machines and 64 who exhibited fours. Of these, 18 presented sixes only and 36 fours only. This year there were 48 exhibitors of sixes and 54 of

The Vette Exhibit Featured a Touring Car Finished in White.

fours, of which 20 displayed sixes only and 28 fours only. There were 26 makers who exhibited last year who were not represented this, and 15 manufacturers made display this year who did not last. Eight of those who exhibited fours exclusively in 1913 have added a six this year, while one maker of sixes exclusively a year ago has added a four, and another has dropped the six and taken up the four. Insofar as the two

New York shows are concerned, therefore, it would appear that the advocates of the six-cylinder motor had made a substantial gain.

Makes of cars not shown last year included

Where the Marmon Line Was Displayed on the Second Floor.

er are not new makes at a New York show, and the same holds true in a measure of the Crescent, which is a new name for the old Ohio gasoline car. The Cameron has been made for a number of years, but this was its first appearance with a water-cooled motor. Several other makes were represented by new models, in some of which there was little change from previous design, while there was a radical departure with a few.

One of the most interesting features, in connection with the gasoline machines, was the use of non-poppet valve motors. The first appearance of the Knight in a New York show was in 1912, when the Stearns, Columbia and Stoddard-Dayton

were presented. Last year, the number was increased to four by the addition of the Edwards, and the Speedwell's rotary valve model made the total non-poppet designs five. The Columbia

Two Members of the Imp Family in the Cyclecar Division.

the following: Allen, Apperson, Briscoe, Cameron, Car-Nation, Chandler, Crescent, Great Western, Lyons-Knight, McIntyre, Metropal, Palmer-Singer, Partin-Palmer, Saxon and Vulcan. The Willys-Knight practically was new in name only, since it was shown last year under the name of Edwards-Knight. This compilation does not include the car shown at the booth of the Fischer Motor Corporation, which was stated to be a body of special construction, presented solely for the purpose of calling attention to the Magic motor, made by this company and installed as regular equipment in one of the Palmer-Singer models.

The Apperson, Great Western, McIntyre and Palmer-Sing-

White Cars Were Shown in a Simple and Attractive Setting.

**The Vacuum Mobiloil Booth Transplanted from the Paris Salon.**

and Stoddard-Dayton are no longer being produced, and the Edwards has become the Willys. This year, however, the number of makes fitted with non-poppet valve motors was increased to seven, as follows: Stearns, Willys, Lyons and Moline with the Knight; Speedwell with its rotary valve type, Palmer-Singer with the Magic, and Great Western with the Carter piston valve design. This list does not include the car at the Fischer Motor Corporation's booth for the reason stated above. Several other new motors, of the poppet valve type, also were shown, as pointed out in detail elsewhere.

For the most part, however, it continues to be true that automobile construction may be regarded as conventional and standardized to a certain degree. The greatest difference between the models produced this year by a majority of the concerns and those shown a year ago was to be found in the body lines and the nature of the equipment. Two makes featured the electric gearshift—the Haynes and the Pullman—and two the two-speed rear axle—the Austin and the Cadillac. The use of electric starting is even more general than a year ago, as was to be expected from the announcements made during the year. Other new features are discussed fully in another place.

Special show bodies were by no means as numerous as in other years, although there were several interesting examples of the coach maker's art among the exhibits of the gasoline car makers. The electric vehicle section was particularly noticeable in this respect, how-

ever. The number of makes on display was but six, as follows: Baker, Detroit, Ohio, Rauch & Lang, Ward and Waverley. Of these, the Ward is entirely new.

Four models of the Baker were shown, one of these being finished in green and another in taupe, with gray and old rose trimmings. The Detroit also was represented by four models. The Ohio presented three coupes and a chassis, the Rauch & Lang two closed cars, and the Ward, a coupe and chassis. The Waverley exhibited three of its

models, one of which was finished in gold leaf, one side being removed to direct special attention to the interior seating arrangement.

An entirely new feature this year was the cyclocar section, although the number of exhibits in this division was by no means as large as had been expected. There were but five makes on display—Car-Nation, Imp, LaVigne, Trumbull and Twombly, although the Zip came over the road from Chicago and virtually was represented at the show during the last few days of the week. An Imp machine also was driven over the road from Detroit. Each of these machines was surrounded by a crowd of interested people a large portion of the time.

If the Zip be included, there were four makes shown with four-cylinder motors and two with two. In the former class were the Car-Nation, LaVigne, Trumbull and Twombly, while the Imp and Zip were in the latter. It will be noted that the name Car-Nation also appears in the

list of automobiles. This machine is made in three models, two of which seat two passengers and the third four. The last named is styled a touring car, and while it is difficult to classify cyclecars, the distinction in this instance has been made in the matter of tread, and both of the two-passenger machines of this make have tread of 48 inches. However, only one of the cyclecar models was displayed.

Considering only those models on exhibit, the makes were evenly divided as to seating arrangement, Car-Nation, Imp and Twombly being shown as tandem machines and the LaVigne, Trumbull and Zip with seats side by side. All of these have been described in these columns, but it is of interest to note that the Twombly is now made in the four-cylinder model only, as model C, utilizing the Twombly piston valve motor originally installed in the model B.

In some respects it almost might be said that the show was an accessory display, for it is true that the equipment on the cars played an important part in that division, and the exhibition

of accessories, supplies and fittings by concerns in that field was most complete in every detail. There were a large number of new things at the spaces on the two upper floors, and for this reason the accessory division was even more interesting than in previous years.

The Bosch Magneto Company, New York City, is calling special attention to the performance of the Bosch magneto and plugs utilized on the Moline-Knight engine, a report concerning the test of which appears elsewhere in these pages. Advertising Manager A. H. Bartsch has done some figuring in this connection and finds that during the 336-hour test over 44,352,000 sparks were produced by the magneto and 11,088,000 sparks passed across the electrodes of each of the four plugs. It took 88,704,000 separate movements of the magneto contact breaker to produce these sparks. The official report says that the regularity of the firing was notable throughout. None of the plugs was disturbed or adjusted during the test.

# MOTOR SITUATION AS REVEALED BY NEW YORK SHOW.

## FOUR-CYLINDER MOTORS.

|                | Type    | Cast   | Bore  | Stroke | Ratio  |

## INNOVATIONS AT IMPORTERS' SALON.

**T**WO important innovations marked the holding of the annual Importers' Automobile Salon in the Hotel Astor, New York City, this year. One of these was the appearance of two American makes of cars, and the other was the special section devoted to an exhibition of accessories, largely composed of tires, and American manufacturers also were well represented there. The attention directed to light cars—virtually cyclecars—was another feature of the display.

Twelve makes of cars were shown, as follows: Simplex and S. G. V. from America; De Dion-Bouton, Delaunay-Belleville and Peugeot from France; Benz, Mercedes and Bugatti from Germany; Fiat, Isotta-Fraschini and Lancia from Italy; Minerva from Belgium and Marshall Arter from England. With the exception of the Bugatti and Marshall Arter, the foreign machines have all been seen at previous exhibitions in this building. However, the De Dion-Bouton line was new in the sense that only the eight-cylinder model was displayed, and the Peugeot line was augmented by the presentation of the Lion Peugeot and the Baby Peugeot.

The eight-cylinder De Dion motor is in no sense an experiment. It was exhibited at the European shows a year ago, and is said to have demonstrated its practicability to the satisfaction of the maker in road service extending over a much longer period. The Lion Peugeot does not differ from the regular Peugeot except in the fact that the models are equipped with bodies built by the chassis maker.

Light cars, or cyclecars, were represented by the Baby Peugeot, Bugatti and Marshall Arter. It may be said that these attracted quite as much interest on the part of the visitors at the salon as did the American cyclecars at the Grand Central Palace display. The first named has been seen on New York streets for some months, and to some extent in other sections of the country. For this reason it did not occasion quite the same amount of interest as the other two.

The Bugatti was shown in three models, each seating three persons, two side by side in front and a third at the rear between them. The wheelbase is 94.5 inches and the tread about 36, and,

as may readily be appreciated, there is very little waste space after the three persons are seated. The Marshall Arter was presented in the chassis only, although it was explained that in Great Britain this is fitted with a body seating two persons side by side. The wheelbase is 105 inches and the tread 43.

Cars were displayed in the grand ball room and in the retiring rooms at either end, as well as in the hotel corridors. The accessories were arranged in the retiring rooms at the side of the ball room, and the exhibitors included: Gaulois Tire Corporation, Gaulois tires; Englebert Tyre Company, Englebert tires; Otto Braunwarth, Inc., Dunlop detachable wire wheels and Dunlop tires; Columb Tyres Import Company, Prowodnik tires; A. Faure, Faure tires, and A. J. Picard

Interior of the Hotel Astor Grand Ball Room, During the Importers' Salon—  
Photo by J. F. Lloyd.

& Co., A. V. shock absorbers, motometers, Vacuum Mabiloils, Edison Mazda lamps, Warner speedometers, Knight tires, Gray & Davis lamps, Klaxon horns, Waltham watches, Allen tire cases, Ajax trunks, etc.

At the Gaulois tire booth, attention was directed to the Crown Prince pressed steel demountable wheels, made by Max Bachem, 845 Jefferson avenue, Detroit. These are held to be lighter and cheaper than either wood or wire wheels, and to be 200 per cent. stronger than wood.

It was rumored during the New York show that Henry Ford and Thomas A. Edison had formed a combination for the manufacture of a light electric pleasure vehicle to be known as the Edison-Ford. It was stated that complete details concerning the new car would be announced in the near future.

## MANUFACTURERS PERFECTING DETAILS.

**General Effort Toward More Silent and Flexible Motors, Greater Efficiency and Lower Cost of Maintenance---Equipment Provides Comfort and Convenience.**

**T**HE general impression created by the New York show was that the manufacturer was seeking to relieve the operator of all manual labor except that of driving.

The observing visitor noted that while the tendency was to provide every comfort and convenience, the designer also has been perfecting minor mechanical details in construction which involve economy in the upkeep of the vehicle.

This is particularly true of the power plant, in which, if the few non-

poppet valve motors be excepted, practically no radical changes have been made—nor were they anticipated. The object sought by the designer has been to produce a silent motor, and one obtaining the greatest efficiency with the least possible consumption of fuel and lubricant. With many makers the fuel question has been given serious consideration and in several instances it has resulted in the redesigning of intake manifolds and utilizing means

for raising the temperature of the gasoline.

One striking feature of the show was the number of manufacturers who have departed from the custom of building several chassis, or making a number of models

Statistics show that approximately 45 per cent. of the makers are concentrating their efforts upon one chassis to which a number of body styles are fitted. This standardization means a lower cost of production, better workmanship and better results as a whole.

Those who predicted that the 1914 machine would be cheaper may be pleased to learn that the average cost is about \$150 less than last year, but on the other hand the statements made that the present year would see a flood of low priced machines are not borne out by statistics. According to figures the \$2500 car is the popular class, 59 makes being thus listed, while 47 are catalogued in the \$1500 division. Thirty-three makes of what is termed the \$1000 class are noted, while a large number of machines sell in the neighborhood of \$4000. The statistics for 1913 show that there were 79 makes of \$2500

cars and a like number in the \$1500 division.

This increase in the number of \$2500 cars is largely due to the new sixes added. Some manufacturers have discarded the four and taken up the six, while others have augmented their line with a new model. That the advocates of the six-cylinder

Centralized Control of Stearns-Knight.

Haynes Control of Electric Gearshift.

Flush Mounting of Control Units, a Method Favored by Many Makers—The Fuel Filler Cap Is Shown at the Extreme Right.

Power Tire Pump on Cole Car.

Driveshaft Speedometer Connection.

power plant have gained in numbers during the past year is demonstrated by the fact that 34 makers are building sixes, while 55 continue fours exclusively. About 20 manufacturers continue their line with practically no changes.

The demand of the buying public for economy in upkeep has had its influence to a certain extent in the horsepower rating and the high powered motor appeals only to a very few. While there are instances of ratings of 50 horsepower and more, the general average of the six-cylinder motors is three less than in 1913.

As was expected and emphasized by the early announcements of new models, the casting en bloc has grown in favor, particularly among the makers of four-cylinder cars. About 50 per cent. follow this method, while about 44 retain the pairs and only six per cent. the casting of separate cylinders.

While a large number of manufacturers have adopted the en bloc method of casting sixes, the majority favor the triplet construction, about 34

**Compact Grouping of Instruments on Control Board Makes for Convenience in Operation.**

slide valve motor, and the Great Western Automobile Company offers the Carter piston valve engine as an option. This represents a substantial gain over last season.

The valve-in-the-head design appears to have lost adherents, there being about four per cent. less makers utilizing it. A new construction is the Premier Weidely motor, which is described and illustrated elsewhere in this issue, as are the various types of non-poppet valve engines.

In their effort to obtain increased efficiency from the motor the use of larger valves is noticeable, and in the majority of instances a two-inch valve is utilized. In keeping with the policy of economy many makers

have adopted tungsten steel for valve material, a metal requiring less grinding and productive of better wearing qualities.

Enclosed valves are generally employed, at least 75 per cent. of the cars being fitted with some form of cover. As a rule two plates are utilized to cover the valve mechanism, and with all, means are provided for removing and replacing these parts with a minimum of effort.

**Instances of Compact and Convenient Grouping of Control Instruments: At Left, Hupmobile; Centre, National; Right, Studebaker.**

per cent. of the sixes listed using this form. Pairs are used by 32 per cent., the makers pointing out that they are more easily handled by the repairman than the en bloc casting. Only two per cent. employ cylinders cast separately.

With the en bloc casting the L head type of motor is generally favored and the number of makers placing all of the valves on one side has increased considerably since last season. That the T head design is considered good practise is evidenced by the fact that fully as many makers are utilizing this construction as formerly.

The non-poppet type motor shows a gain over the past year, the Knight motor having been adopted by the Moline Automobile Company, the Willys-Overland Company and the Lyons-Atlas Company. The Palmer & Singer Manufacturing Company has taken up the Fischer-Magic

**The Location of Controls of Marmon Differs from General Practise, and the Dash Equipment Is Neatly Grouped.**

**Casting the Cylinders in Pairs Is Favored by Some Makers of Six-Cylinder Cars.**

One of the noticeable features of the new motors is the placing of the valves with the L head type of motor at the right. This is due to the fact that left hand drive is practically universal. With the steering column located at the left, and with the addition of motor starters, generators, power tire pumps, etc., the right hand location makes for convenience.

It may truthfully be said that the new types of motors are not only more silent than formerly, but they are better balanced. Vibration has been practically eliminated by balancing the relation of the reciprocating parts. Lighter pistons are the rule rather than the exception, but the reciprocating parts are heavier.

Fewer piston rings appear to be used and there is a tendency to place these nearer the top of the piston. The use of four rings, three above the wristpin and one below it, is an exception. Improved machinery and better material and workmanship have enabled the motor manufacturer to obtain efficiency with a smaller number of rings. That friction is reduced is obvious.

Crankshafts are made stronger and there is a tendency to utilize larger bearings, especially the rear main bearing. This is explained by the

**Unit Power Plants with Cylinders Cast En Bloc and Removable Heads Are Gaining Advocates—The Designer in This Instance Combines the Generator and Motor Starter with the Gearset, Thereby Distributing the Weight.**

maker as being necessary with the motor starter. Plain bearings are the rule and the advocates of the ball bearings are holding their own.

Cooling by water is favored by all but 2.5 per cent. of the makers, the air-cooled advocates having lost one in the Cameron car, which was air-cooled last season. The pump is the most popular method of circulating the cooling fluid, 72 per cent. of the makers utilizing it, while 24 favor the thermo-syphon. The latter method is more noticeable in the new four-cylinder cars and in the majority of instances the machines are classified as of the popular price type. Cellular type radiators are practically universal, but some makers continue the honeycomb design.

In the matter of lubrication it is estimated that fully 90 per cent. of the 1914 cars are equipped with a combined pressure and splash method of lubrication. In the majority of systems the lubricant is forced by some form of pump to the main bearings, whence the oil over-

**Illustrating Casting of Cylinders in Triplets and Method of Driving Water Pump, Tire Pump and Magneto.**

flows into troughs into which the connecting rods dip, splashing lubricant to the cylinder walls, pistons, gears, etc. The constant level form of splash is included, the oil being maintained at a predetermined level.

A feature of the lubrication systems is the use of accessible oil gauges or indicators, improved breathers and more convenient drain cocks. The manufacturer has at last appreciated the difficulty experienced in draining a crankcase of oil through small petcocks.

Pressure feed is still employed and is likely to be for some time to come. There are several excellent examples of this form of lubrication, among which may be named that employed on the Moline-Knight. This is an all-pressure system, there being no splash and the oil is fed in proportion to the motor speeds.

The large and unsightly dash sight oil feed has been eliminated and when an indicator is located on the instrument board it is neat and com-

pact, although the general practise is to do away with it entirely. With the improved lubricating methods and with the oil reservoirs entirely contained within the crankcase, there appears to be no reason for the use of indicators.

The use of single ignition is gaining many adherents, and this is especially noticeable of cars selling in the neighborhood of \$2500. Last year 10 per cent. of the makers in this division favored the single ignition. This year about 33 per cent. have adopted it. The dual system of ignition predominates, over 59 per cent. of the makers continuing its use, but it is very evident from the above figures that the single method will be more favored in 1915 than it was this season.

This is explained by the use of the motor starter, which rotates the flywheel at a speed to permit of the production of sufficient electrical energy from the magneto to start, or, in other words, it is possible to spin the motor and armature shaft of the magneto fast enough to obtain a hot spark. The use of single ignition also eliminates, according to some makers, a complication of wires.

That Compactness Is Sought by the Designer Is Noticeable in the Max-well Power Plant.

popular several years ago, and before the magneto was generally adopted, has made its reappearance, due to the use of electric lighting systems. Several makers have adopted a generator with the distributor as a unit, taking current from the battery or from the dynamo itself. The Delco is an exemplification of the use of the dynamo current, and the practicability of this system has been proven by its adoption by several prominent car makers. Several concerns manufacturing electric lighting dynamos produce units with distributors and it would appear that the advocates of this form of ignition are gaining in numbers. Synchronization of the spark is obtained by improved distributing methods, as well as compactness in design. On the other hand, the advocates of the magneto state that the high-ten-

Several Makers Are Eliminating the Conventional Under Pan or Shield, a Construction Made Possible by the Unit Power Plant with Enclosed Flywheel.

sion instrument is too firmly intrenched; that its durability and efficiency have been demonstrated by years of service.

The multiple disc type of clutch, including the lubricated and dry forms, continues to predominate in number, nearly 52 per cent. of the 1914 cars being equipped with it. The cone clutch is favored by 42 per cent. of the makers, but the band, both contracting and expanding forms, has gained two per cent. since 1913.

As was expected the adoption of the unit power plant has resulted in a decrease in the number of makers placing the gearset amidships. This has lost over 13 per cent., while only 16 per cent. locate the gearbox on the rear axle.

The unit power plant with the flywheel enclosed has found many advocates during the past year and in some instances the under pan or shield has been eliminated. This method has its advantages in that the draughts of air passing under the lower crankcase assist in lowering the temperature of the lubricant. The upper half of the crankcase, cylinders, magneto, carburetor, etc., are protected from mud and water by the use of pans or covers extending from the crankcase to the frame.

Despite the arguments brought to bear against the adoption of the four-speed gearset, it is noticeable that its advocates have gained over

Keeton Method of Carrying Spare Wheel and Suspension of Fuel Tank.

**Auxiliary Seats Are Now of the Disappearing Type, Folding into Recesses in Back of the Front Seats.**

seven per cent., nearly 30 per cent. of the makers having adopted it. The three-speed predominates, 67 per cent. of the cars being fitted with the conventional form, while two utilize the two-speed.

With the four-speed gearset the general practice is to employ a direct drive on the third and utilize a step-up for the fourth. With the lighter motor the advocates of the four-speed gearset emphasize flexibility and economy. The selective type of gearset may be said to be universal. Referring once more to the use of the unit power plant and the general adoption of left hand location for the driver, it has eliminated the unsightly quadrant and linkage and enabled the placing of the levers on the transmission housing.

While statistics show that the pressure feed is favored by four per cent. less makers than in 1913, the decrease is due to the use of the cowl dash and gravity feed. The last named system permits of mounting the carburetor higher, but deducting the number of makers employing this system, the pressure feed has really gained. In some instances the fuel is forced by pressure to an auxiliary tank and the gasoline is supplied to the carburetor by gravity.

The use of a low grade gasoline and the motor starter has resulted in an improvement of carbureting methods. The carburetor is now carried higher than formerly and in proximity to the water jackets of the cylinders, where the heat aids in raising the temperature of the fuel. Several makers have adopted water jacketing the intake manifold, and when this method is not utilized the heat of the exhaust is employed. As a result the intake manifolds have been redesigned, being shorter and freer from bends, a construction reducing opportunity for the condensation of the mixture and making starting easier in low temperatures.

Water jacketing both the intake and exhaust manifolds is becoming more popular and with the thermo-syphon system of cooling the manifold and water head are cast in one piece. Detachable cylinder heads have appeared on several motors, being particularly noticeable on new cars.

Electric lighting systems including a generator are now favored by nearly 90 per cent. of the makers and the equipment is found on cars selling as low as \$900. While minor improvements are noted in the dynamos, the most striking feature is that the manufacturer has provided for a greater output at low motor speeds to take care of operating conditions in traffic. The output at higher ratios is cared for by the usual regulation and in some instances the maximum output of the generator is about 15 miles an hour car speed.

Transmitting the energy of the electric motor starter to the flywheel by gearing is favored by 62 per cent. of the makers, while about 15 per cent. utilize a gear and silent chain. The balance employ a silent chain to the crankshaft or drive through the timing gears. A few have installed the motor starter in proximity to or with the

**Carburetors Are Being Located Near the Water Jackets, and the Intake Manifolds in Several Instances Are Water Jacketed—The Heat of the Exhaust Is Utilized by a Large Number of Makers to Raise Temperature of Fuel.**

transmission. The control of the motor starter is varied, including a lever, pedal or push switch on the floorboard or instrument board, or having the control member conveniently placed on the steering column.

The use of heavier frames is noticeable, the channel sections being made deeper, heavier and more liberal gusset plates being fitted and more attention paid to the work of riveting. Brakes are now fitted to the rear wheels and with a very few exceptions the transmission type has been abandoned. Tire sizes are practically the same, but when it is considered that the motors are lighter, and that improved manufacturing methods have made possible the lightening of motor equipment, the average car may be said to be properly tired and in some instances over tired.

The adoption of the left hand control has made necessary the grouping of the control and indicating instruments at the left, and in many instances this has been accomplished in a very neat and compact manner. Flush mounting predominates. In the matter of control, it is noticeable that the gearshift and emergency brake levers have been shortened and their movement more restricted than formerly. This permits of easy operation, especially when a robe is utilized.

One of the features of the 1914 equipment is the adoption of a power tire pump by several manufacturers. While it was conceded that the demountable rim, with extra rims carrying spare tires, was a long step toward solving the tire changing problem, the power pump appeals to the owner as a most necessary convenience and a labor saver. In the majority of installations drive is by gear through a shaft and several makers have placed the pump between the water pump and the magneto. Service of the tire pump is obtained by the movement of a small lever which meshes a driving and driven gear. One or two instances are noted where the drive for the pump is taken from the flywheel.

The equipment is more complete than formerly and demountable rims are universal. Wire wheels have not made the gain predicted, but several makers list them as optional. One of the reasons advanced for the small number of wire

wheels employed is that the car makers have been unable to obtain them in quantities.

One-man tops, so called because they may be raised and lowered by one person, are now standard equipment with a number of makers. Inside curtains and those which roll up with the top are now fitted to the popular priced machine.

A departure from conventional practise in auxiliary seats is the use of the disappearing type, which folds into a recess in the back of the front seats or into the floor. Several constructions are shown in accompanying illustrations, and it will be noted that when closed the seats are practically unnoticeable. The design also provides additional room in the tonneau when not in service.

Crowned fenders, that is, slightly so, are meeting with favor, the effect being to give a more solid structure and at the same time to add to the attractiveness of the car. The body work of the

Illustrating the Progressive Steps in Utilising Auxiliary Seats, the View at the Left Showing the Advantage of Design When Not in Service.

1914 American car is decidedly better than with previous designs. The streamline form has been highly developed, and with this design there is an unbroken line beginning at the top of the radiator and continuing rearward to the end of the cowl. The line of the latter blends gradually into the line running along the side of the body, and the absence of abrupt lines is noticeable.

The upholstery of the new machines leaves very little to be desired in the way of comfort, and it is possible to accomplish long tours without fatigue. The divided seat, which has long been discarded, appears to be making a bid for popularity in at least one model, the maker of which utilizes a form of roll which is very attractive. The enclosed types of bodies are equally distinctive in appearance and many makers offer a variety to meet individual requirements.

## RESULT OF MOLINE-KNIGHT MOTOR TEST.

THE official report of Herbert Chase, laboratory engineer for the Automobile Club of America, at the conclusion of the 336-hour test of the Moline-Knight engine, which came to an end in the club's laboratory at 7 the evening of Jan. 2, shows this to have been a most remarkable test of a remarkable motor. The results are set forth below, and it is only necessary to add that this was the second motor of this type made by the Moline Automobile Company, East Moline, Ill., and was a standard stock model, as indicated by an affidavit filed with the club by the manufacturer. The test is by far the longest ever given any automobile motor in this country or abroad.

Particular attention is drawn to the fact that, at the completion of the original test, in which the motor showed an average horsepower of 38.3 at a crankshaft speed of 1117 revolutions a minute, it was run for another hour at a speed of 1682 revolutions a minute, at which it developed 53.6 horsepower. The rating of the engine under the S. A. E. formula is 28.16. The motor also was given a five-hour fuel economy test, in which it was run at an average speed of 1114 revolutions a minute, developing an average of 39.8 horsepower and consuming .63 pound of gasoline a brake horsepower-hour.

Some idea of the work accomplished by this motor during this test may be gained from the statement that it was equivalent to driving a Mo-

line-Knight car at a rate of 45 miles an hour, continuously for 14,700 miles, or about 41 miles a day for every day in the year.

Otherwise the story is told in the following extracts from the official report and the accompanying charts and table:

### Endurance Run.

**Power**—The motor ran without any stop whatever for 336 hours with wide open throttle and set spark at an average speed of 1117 revolutions a minute. During this period the average brake load at one foot radius was 180 pounds, giving a resultant average brake horsepower of 38.3. The lowest horsepower reading for any 15-minute interval during the entire 336 hours was 36.4. At the end of this period, without stopping the motor, the speed was increased, and the motor developed an average of 53 brake horsepower for a period of one hour, while averaging 1678 revolutions a minute.

**Fuel**—The total fuel supplied during the run of 336 hours was 10,645 pounds, or 1744 gallons. It was found at the end of the endurance test, however, that a small hole had been worn through the fuel supply pipe at a point where the latter chafed, due to vibration, against a joint on the crankcase. The leakage of fuel from this hole was not discovered because of the rapid vaporization brought about by the blast of air used to cool the crankcase. By observation of the fuel curve as given in its chart, it is evident that the rate of fuel consumption gradually decreased for the first 160 hours, and thereafter increased to the end of the test, indicating that the leakage started at or about the 160th hour, and gradually became greater thereafter. The average consumption an hour for the first 160 hours was 31.5 pounds. For the last 10 hours of this 160-hour interval it was 30.8 pounds an hour. The actual consumption for the remaining 177 hours of the test is questionable because of fuel leakage. The gasoline used was taken from the same supply regularly delivered for use in the club's garage, and gave an average Baume reading of 61.6 degrees at 60 degrees Fahrenheit, equivalent to 0.733 specific gravity.

**Oil**—The total quantity of oil put into the motor during 337 hours running in the endurance test was taken from 34 sealed five-gallon cans, giving a total supply of 170 gallons. A total of seven quarts was taken from

\*Leak in gasoline pipe probably started at this point. Fuel readings thereafter probably in error, i. e., too high.

the motor during and following the test, leaving a net supply of 168.23 gallons. Throughout the test oil was overflowing from the flywheel bearing. In 15-minute runs prior to and following the endurance test, the average overflow was found to be about .87 pint an hour. Assuming that the average rate of loss throughout the endurance test was the same as the average loss in the short runs before and after, the total loss in 337 hours would be 36.6 gallons, leaving a net total consumption of 131.6 gallons (967 pounds), or .39 gallon an hour. The oil used was supplied by F. H. Floyd of Detroit, who states that it was compounded from Russian and domestic stock.

#### Short Runs.

Prior to and following the endurance run, a series of short runs was made—with wide open throttle and spark set for maximum power—to determine the power, friction and fuel consumption of the motor at various speeds. The same carburetor setting employed during the endurance run was used in these runs. The maximum brake horsepower shown in these tests was 53.6 at 1682 revolutions a minute.

**Special Fuel Efficiency Test**—In order to demonstrate the ability of the motor to run with a lower fuel consumption than that shown in the endurance run, and other runs mentioned above, the carburetor was readjusted, and the motor thereafter subjected to a five-hour run at an average speed of 1114 revolutions a minute, and a series of short runs at different speeds. The aver-

#### Cooling and Exhaust.

During the test thermo-syphon cooling was obtained by connecting the motor to a tank of water placed in approximately the same relative position to the motor as the radiator on the Moline car. Sufficient cold water was added to the warm water in the tank to maintain an average temperature of 85 degrees F., of water entering the motor. The average temperature of water leaving the motor was 166 degrees F.

The exhaust from the motor was discharged into a short length of 2.5-inch standard pipe, and thence into an expansion chamber, from which it escaped to atmosphere through a long three-inch vent pipe. The exhaust was slightly smoky during a portion of the test.

A blast of air, having a velocity of about 34 miles an hour, was directed against the crankcase of the motor during the endurance and other runs in which the motor was developing power.

#### Atmospheric Conditions.

There was a wide variation in atmospheric conditions during the test, the temperature of the air blowing on the motor varying from 37 to 71 degrees F., with an average of 57 degrees, while the barometer varied from 28.95 inches to 30.19 inches of mercury, with an average of 29.83 inches. It was noted that the power of the motor increased and decreased as the barometer rose and fell.

#### Condition of Motor.

The motor was dismantled before and after the tests here reported to permit careful inspection. At the end

age brake horsepower for the five-hour run was 39.8, and the average fuel consumption .63 pound (equivalent to .103 gallon) a brake horsepower-hour.

**Volumetric Efficiency Test**—Following the fuel efficiency test the carburetor, with no change in adjustment, was enclosed in an air box, which was clamped between the carburetor flange and the inlet manifold. The sole air inlet to this box was piped to a Venturi meter, and the air consumption of the motor measured under the following conditions:

- Carburetor in place, motor running under own power.
- Carburetor in place, motor driven by dynamometer.
- Carburetor removed, motor driven by dynamometer.

#### Adjustments.

The only adjustments made on the motor during the endurance run had to do with the fan and its driving belt. At the 131st hour the fan stopped, due to heating from slipping and gummy oil. The fan was removed, bearing cleaned and fan and belt replaced. At the 179th hour the belt was so loose that it hit the fan blades and jumped off. In applying a new belt the thin outer rim of the V pulley was broken and the belt removed. The fan (which is one piece with pulley) was removed at the 182nd hour. During the 326th hour a new fan and belt was put on, but the belt jumped off after about 10 minutes running, and was not replaced until after the endurance run.

of the test the parts of the motor were, without exception, in excellent condition. There was no perceptible wear on the bearings, sleeves or other parts. The slight irregularities in the sleeves were built up with carbon to form close fitting, glossy surfaces. The ports in the sleeves were not burnt, and there was only a very slight deposit of carbon on the port edges. The cylinder heads and the tops of the pistons showed only a very thin coating of carbon, and only small quantities of carbon were found elsewhere. No shake could be felt in any bearing, and there was every indication of perfect lubrication. There was not a single ring in either piston or cylinder head which was not perfectly free at the end of the test. The running of the motor as regards noise and vibration was not appreciably different at the end of the test from that at the start and early hours.

#### Ignition and Carburetion.

The carburetor employed was a 1.5-inch nominal size, model R Schebler, which has a tapered needle whose position in the nozzle is controlled, through a lever connection, by the position of the air valve. No changes in the carburetor setting were made during the endurance test.

Ignition was furnished by a Bosch DU model 4A Duplex magneto. Four Bosch plugs with heavy three point electrodes were put in at the start of the test, and none of these was taken out of the cylinder or otherwise disturbed until after the endurance test was completed. The electrodes were partly burned away, so that the gap was increased, but the regularity of firing was noticeable throughout.

## NEW ACCESSORIES FOR THE MOTORIST.

### BRIDGES FORD LOCK.

**Secures Starting Crank to Spring by a Shackle.**

The Bridges Ford lock is manufactured by the Cochran Pipe Wrench Company, 7800 Woodlawn avenue,

Chicago, and the maker states that it absolutely locks the machine, preventing starting of the motor with the crank, or by use of a jacked up rear wheel.

The device comprises a padlock, having a special nicked steel shackle of proper proportions to encircle the car spring and the starting crank when the latter is pushed back into engagement with the crankshaft of the motor. The lock and shackle are combined, and when not in service are removed from the spring, a design requiring no drilling or fitting to utilize. Each lock is equipped with two keys and it is stated that there are no duplicate sets. The Bridges lock is moderately priced.

### MASTER SPARK PLUG.

**Constructed to Meet Demand for a High Grade Plug.**

Believing that there is a demand for a high grade spark plug, the Hartford Machine Screw Company, Hartford, Conn., is manufacturing what is termed the Master plug, which is to be marketed at a moderate price because of a production in quantity. The porcelain is made extra heavy and the company states that the design will withstand strains which break down ordinary insulators.

The seat for the porcelain is very wide and well cushioned, and ample margin is provided for the effects of expansion and contraction. One of the qualities emphasized in

the Master plug is that it may be easily and quickly disassembled and the parts replaced without interfering with their efficiency. Throughout the best of material and workmanship are incorporated.

The Master is made in standard threads and with varying lengths of base to meet the requirements of varying motor design. The company is licensed under the Canfield patent, and calls attention to its facilities for manufacturing in large quantities. The plug is moderately priced.

### REX SHOCK ABSORBERS.

**Made in Various Forms for Different Suspensions.**

The Rex shock absorber is manufactured by the Rex Shock Absorber Company, New Rochelle, N. Y., and Stamford, Conn., and is designed for use on front and rear springs and for varying suspensions. A feature emphasized by the maker is the use of a double volute spring in such manner that it absorbs the upward and downward movements, and with the use of but one adjusting nut.

The frame or shackle is made in

one piece, and the inner fork is similarly constructed. The last named has a compact guide inside the outer frame, an arrangement that the maker states makes for great strength as well as eliminates wear of the mechanism. The absorber spring is contained in a grease and oil tight cover.

The Rex shock absorbers are made in different sizes and for all types of cars. The company is manufacturing a new design, similar to the Rex, but utilizing an air cushion.

### ELECTRIC LIGHTING.

That the convenience of electric lighting appeals to the owner of the used car is demonstrated by the increasing number of equipments designed especially for this service. Several makers include brackets for mounting the generator, and generally the equipment is complete. Several concerns are also marketing motor starters for the used vehicle.

### LICENSE NUMBER FRAME.

**An Attractive Holder for Retaining Number Plate.**

License number plates with cracked or broken enamel detract from the appearance of the car and to protect

and secure them the Auto License Number Frame & Supply Company, 1409 Turks Head building, Providence, R. I., is manufacturing an attractive frame, which is constructed in a variety of materials and finishes.

The number plate is inserted and held securely by screw bolts, preventing vibration, and the combination attached to the regular holder, provision being made to fit varying designs. The frame is constructed of highly polished aluminum, bronze and yellow brass. The last two named materials are also supplied with a nickel plate finish. One of the qualities of the aluminum frame is that it is very light.

### STARTING CRANK HOLDER.

**Designed for Ford Cars and is Also Made with Lock.**

A practical accessory which will appeal to the owners of model T Ford cars, is the starting crank holder being marketed by the Auto License Number Frame & Supply Company, Providence, R. I. It is made in two styles, one including a revolving lock with a detachable key. Both designs are attached in a few minutes by removing the nuts securing the spring clip bolts, slipping the holder frame over, and replacing the nuts. One of the qualities of the holder is that it can be moved instantly upward and out of the way of the starting crank when the use of the latter is desired. The crank is securely held in an upright position, preventing rattling. The lock proper is well designed.

**CUSHIONET SHOCK ABSORBER.**

**Ford Design Clamps to the Axle and the Spring.**

The Walker-Moore Manufacturing Company, Racine, Wis., is marketing the Cushionet shock absorbers, which

are stated to be a practical solution of the shock absorber problem for the model T Ford automobile. They are made for both the front and rear springs, and no adjustment, fitting or alterations are necessary. They are quickly attached by hooking the top arm over the spring, then forcing the lower arm downward, and bolting a clamp to the axle. This, the maker states, provides the proper tension. It is also claimed that a set of four can be fitted to the car by a novice in less than 30 minutes. The Cushionets are made of crucible steel with drop forged fastenings.

**TULITE AUTO BULB.**

**Employs Two Filaments, One of Which Is for City Driving.**

One of the features of the electric lighting equipment of the 1914 models displayed at the New York show was the dimming attachment, a construction permitting of so reducing the candlepower of the headlight bulbs as to eliminate glaring effects. The Tulite Auto Bulb Company, Detroit, is manufacturing the Tulite bulb, which obtains the dimming effect, and a quality of the design is that but a single bulb is employed in the headlight.

Two filaments are utilized, these being so arranged that the use of the smaller does not impair the efficiency of the other. A standard four candlepower light is provided for city work, and a 20 candlepower member for country driving. The first named provides sufficient illumination for ordinary driving at low speeds in the country, but does not have the undesirable glaring effect noticeable with

lamps of larger candlepower. One of the qualities of the Tulite bulbs is that they may be utilized on a car equipped with electric lights by connecting the side light circuit to the small Tulite filament.

**MAYO PUMP SPARK PLUG.**

**Quick Detachable Type for Use with Power Pump.**

The Mayo Manufacturing Company, Chicago, maker of the Mayo power tire pump, has brought out the Mayo quick detachable spark plug for service with its product. It comprises an adapter, which is permanently installed in the cylinder, a connection for attachment to the lower end of the pump, and a part which is threaded into the adapter and which acts as a lock nut for tightening either the spark plug or pump into the adapter.

The lock nut has milled slots into which the spark plug proper is inserted until projections rest on a shoulder in the adapter beneath the lock nut. By giving the lock nut handle a quarter turn, the parts are locked. The Mayo pump is attached in a similar manner, by slipping it

into the slots in the adapter, and giving the pump a quarter turn, then applying the lock nut by a quarter turn to the left. Old style pumps can be equipped with the extra connection.

**CARBON REMOVERS.**

The motorist who attends to his own repairs is naturally interested in any accessory which lightens his labor and saves time. Carbon and other deposits are present in more or less quantities and the labor involved in removing these requires considerable time with the average motor; consequently, a large number of fluids have been marketed for this work.

During the past three months a number of moderately priced carbon removing equipments employing the oxygen process has been announced. Heretofore, the use of the method has been restricted to the repair shop and garage, owing to the initial cost of the outfit. Several manufacturers are now listing an equipment designed for the private garage.

**C-S REAR NUMBER LAMP.**

**The Culver-Stearns Is a Compact Electric Unit.**

The Culver-Stearns Manufacturing Company, Worcester, Mass., and Detroit, is marketing the style K rear

number light, which is designed to meet the demand for a lamp which will properly illuminate the rear number plate, and the maker states that the rays are so diffused that the numbers can be read easily at a considerable distance. While not made for a tail light, it is equipped with a small, but powerful, red lens.

The company is also making the style D combination dash and trouble lamp, which is so constructed that the lamp proper may be easily and quickly detached and employed as an inspection light. Suitable length of cord is provided, and the combination unit may be easily installed.

**GOODYEAR DETACHABLE TIRE.**

**Detachable Tread Securely Held by Inflation of Tire.**

The Goodyear Tire & Rubber Company, Akron, O., has brought out a novel tire, consisting of a regular tire carcass and a detachable tread. When the tire is deflated, the tread can be removed easily, yet when properly pumped up, the two parts have the qualities of a one-piece shoe. This makes it possible to replace either part in a few minutes. The tread is retained by inflation, and a secret construction provides the edges of the tread with a grip that excludes water or dirt. No mechanical fastenings are employed, and it is stated that the resiliency of the shoe is not impaired. The tread is built slightly square on the inside, providing air chambers at the two points of vibration on each side of the centre of the tread. This, it is stated, prevents injury by heating.

**FORD B. & W. CRANK LOCK.**

**Secures Starting Handle to Crankshaft of Motor.**

The Universal Manufacturing Company, Racine, Wis., is marketing the B. & W. crank lock, which is designed

for model T Ford cars, and the maker states that it will positively prevent use of the machine by others than those intended. It comprises a clamp made in two sections, for attaching to the axle, and carrying a hinged shackle. The last named is operated much in the same manner as a pad-lock, differing in that a lock is employed for securing the movable portion of the hinge. When not in use the lock proper is moved downward out of the way of the starting handle. The B. & W. device is provided with two keys, constructed of sturdy material, and comes finished in black enamel. It is moderately priced.

**GLOBE GAS TANK COVER.**

**Made in Two Pieces and Locked by Winged Nuts.**

The Globe Machine & Stamping Company, Cleveland, O., is manufacturing the Globe gas tank cover, which is designed to enclose the Prest-O-Lite gas tank. It is made in two semi-cylindrical sections, which conform perfectly to the contour of the tank, and the material is durable. The sections are hinged, permitting the tank to be inserted and closed, and readily removed. One of the qualities of the design is that the straps are concealed, the only parts showing being the extensions, which are bolted to the running board or body. The two sections of the cover

are locked together by T bolts and wing nuts.

The Globe cover is made for model B and model E Prest-O-Lite tanks. The first named is 20 inches long and 6.25 in diameter, and the E is 18 inches long and 6.25 in diameter. The finish is black enamel, baked on. The company also manufactures a cylindrical form with an open seam at the bottom. Both types save the labor of polishing the tank and add to the appearance of the machine.

**MONARCH WHEEL PULLER.**

**Designed for Removing Wheels of Ford Cars.**

The Benford Manufacturing Company, Mt. Vernon, N. Y., has brought out a wheel puller for the model T Ford automobile which is not only inexpensive, but is guaranteed to remove the most obstinate wheel with ease. The Monarch, as it is termed, is made to screw on the hub flange after the hub cap is removed, and is threaded up snug. The threads of the puller are so cut that it may be fitted by hand, and the maker states it will not stick or bind in service. The puller carries a set screw of

large thread, which is screwed up against the axle until snug. The leverage obtained is said to be very powerful. The Monarch, although light and compact, is designed to withstand severe service. The best of material is employed and each puller is carefully tested before being packed for shipment.

**POWER TIRE PUMPS.**

One of the noticeable features at the New York show was the addition of a power tire pump to the already complete equipment. It is but natural that this convenience should follow the universal adoption of demountable rims. Although the power tire pump was introduced last season, several manufacturers of it announce models adapted to the used car, some of which are moderately priced. The installation on the power plant does not necessarily involve alterations, it generally being possible to obtain the required drive from a convenient camshaft, pump shaft, etc.

**LIFTING JACK FOR FORD CARS.**

**An All-Steel Construction Which Is Very Compact.**

The Walker-Moore Manufacturing Company, Racine, Wis., is producing a special jack for the model T Ford

car, which is constructed entirely of cold rolled steel. One of the qualities of the jack emphasized is that the base and standard, also the rack bar and cap, are electrically welded. The pawls are case hardened and are carried on short, stocky rivets.

The entire mechanism of the jack is operated by a single spring, and the car can be raised by an upward movement of the lever, or lowered by a reverse movement. The maker calls attention to the light weight, compactness and durability of the tool, stating that it will lift easily 1000 pounds dead weight, and that it is capable of raising cars weighing 2000 pounds. The company also makes number holders for Fords.

**FORD DASH OIL GAUGE.**

**Cochran Design Indicates the Amount in the Crankcase.**

The Cochran Pipe Wrench Manufacturing Company, Chicago, is marketing the Cochran dash oil gauge for model T Ford cars. One of the qualities of the device is that it enables the driver to note at a glance the amount of lubricant in the crankcase, and without leaving the seat.

A brass pointer moves over a calibrated nickel scale. The maker states that there is nothing to get out of order and that there are no glasses to break or packing to leak. It is claimed that the equipment can be attached in a few minutes without drilling, etc., and that the best of material is employed throughout.

**EMPIRE FUEL ECONOMIZER.**

**Automatically Regulates Supply of Gas and Air.**

The Brown-Taylor-Greene Company, Chicago, is manufacturing the Empire gasoline economizer, which

differs from the conventional types in that the control of the auxiliary air is automatically regulated in proportion to the speed of the motor. This feature is obtained by the connection of the economizer to the throttle linkage. The maker points out that with some types of carburetors too rich a mixture is supplied at low speeds, and that the Empire so regulates the air and gas as not only to provide efficient proportions, but also to effect considerable economy. Claims of 20 to 80 per cent. in fuel economy are made. The device is very compact, and the control of the air is by suitably proportioned ports, which are uncovered by a piston or plunger.

**J-M MOBILITE SIGNAL LAMP.**

**Indicates to Approaching Vehicles the Course to Be Taken.**

The H. W. Johns-Manville Company, New York City, is marketing a practical compact signalling device, which is utilized to warn approaching vehicles of the direction to be taken by the machine, and provision is also made for notifying the other car when a stop is to be made. The new light is known as the J-M Mobilite signal lamp, and consists of three small electric lamps mounted on an aluminum base finished in ebony black. When the steering wheel is turned to the right or left, a white arrow automatically appears in the corresponding lamp, indicating the direction the car will proceed. When the clutch is thrown out, the word "Stop" appears in red letters in the centre dial of the device.

The signals are operated by self-contained, water proof contact devices attached to the steering gear and the clutch. Each unit comprises a vulcanized rubber socket fitted with a special tungsten bulb and a powerful reflector. The lamps consume but little current, and can be operated economically on dry cells. An illustrated booklet on the lamps will be mailed free on request.

**MASTER POWER TIRE PUMP.**

**Constructed for Large and Small Motor Cars.**

The Hartford Machine Screw Company, Hartford, Conn., is manufacturing the Master power pump, which is constructed in single and double-cylinder forms. One of the qualities of the pump is that no packing is utilized. It is also stated that the design prevents oil or other foreign substances being pumped into the tires.

The pumps are of the air-cooled type, enclosed construction, and the working parts are lubricated by an automatic splash system. The inlet valves are of the flat type, hardened and ground, and the outlet is of the ball design. The pistons are made extra long. The crankcase is an

aluminum alloy, cylinders are of special gray iron, and the connecting rods of bronze. The bearings are bronze lined. The pumps may be efficiently operated at any speed from 350 to 800 revolutions a minute, although one of 600 is recommended. At this speed it is stated that the pump will inflate a 37 by five-inch tire to 100 pounds in less than three minutes. The single-cylinder design is intended for small cars, and both are held to be very efficient.

**FUEL ECONOMIZERS.**

The rapid rise in the price of motor fuel has been largely responsible for the large number of fuel economizers marketed during the past year. The majority of these devices admit and control a supply of auxiliary air to the intake manifold, and many are operated from the dash, providing the convenience obtained with the modern types of carburetors, that of regulating the mixture from the seat.

**REXO II ELECTRIC HORN.**

**New Product of Dean Electric Company is Inexpensive.**

The Dean Electric Company, Elyria, O., which concern has marketed a number of electric signalling devices,

has augmented its line with a new design which is termed the Rexo II. One of the features of the horn is that the retail price is less than \$4. The company has incorporated in the new signal the same high grade workmanship and material for which the product of this concern is noted, and states that the low price is due to the fact that a production of 100,000 is planned.

The Rexo II is finished in black and nickel or black and brass. Two coats of baked enamel are applied by a special process. It has a six-inch bell and is quadruple plated. Suitable length of cord and push button accompany each horn.

**ARNOLD ELECTRIC PLUGS.**

**Heat Coil in Intake Pipe Facilitating Starting of Motor.**

The H. W. Johns-Manville Company, New York City, is now marketing the Arnold electric heating plugs, which are held to solve the starting problem when the motor is exposed to extreme low temperatures. The complete equipment comprises two electric plugs and a resistance coil, the latter being inserted in the intake manifold. The location of the plugs is clearly depicted in the illustration.

By passing a current through the coil a high degree of heat is obtained, resulting in raising the temperature of the mixture to a point for complete and instantaneous combustion. This overcomes the tendency of the fuel to condense in cold weather and makes starting easy. The terminals of the plugs are connected through a switch to a six-volt battery.

## BUSINESS CONDITIONS AVERAGE WELL.

### National Chamber of Commerce Finds the Situation Is Improved at the Close of the Year---How Various Industries Affect the Several Sections.

**W**ITH the close of the year, 1913, there appears to be a generally hopeful situation with regard to business in practically every section of the country, judging from the statements made public by men who are conceded to be leaders in their respective fields. This same optimistic view is reflected in the publications devoted to finance and so-called market conditions. The Wall Street Magazine contends that the period of depression has been passed, and that it is now simply a question of how long it will take for business to resume its normal tendency.

The most elaborate review of the situation during the closing weeks of 1913 is that prepared by the committee on statistics and standards of the Chamber of Commerce of the United States of America. This report is a summary of general conditions, all as of one day, Nov. 29, from facts gathered by a corps of trained and competent observers all over the country. The dependability, accuracy and impartiality of these observers is said to have been thoroughly established by a quarter of a century of experience. The statement is divided by sections of the country that are in general closely related as to natural conditions and resources.

The map accompanying the statement purports to give the condition of business as good, fair and poor, for the entire country. Conditions are described as good in the whole of Maine, New Hampshire and Vermont, and in sections of Pennsylvania, Virginia, North Carolina, Alabama, Mississippi, Tennessee, Ohio, Indiana, Michigan, Wisconsin, Minnesota, Iowa, Montana and Idaho. It will be noted that fair conditions prevail generally and that the "poor" sections are decidedly limited in comparison. A summary of the report follows:

#### **The Pacific Coast.**

Generally fair conditions prevail throughout Oregon, Washington and California. Small grains suffered some damage in eastern Oregon because of drought and hot winds, and in California were seriously affected by lack of rain at a critical time. The yield in Washington was on a parity with 1912. The fruit crop was not so large in eastern Oregon and Washington, but commanded a higher price. The cattle and sheep industry is in fair shape owing to good demand and high prices. This is true likewise of the dairy industry, which is growing fast. Lumber is very quiet, because of low prices and small demand. The salmon pack in Washington and Oregon was both large and profitable. Northern California is entering on a period of great development and is filling with settlers very rapidly. The severe freeze of last season in southern California was in the nature

of a calamity to the citrus growers, but the outlook this season is most excellent.

#### **Rocky Mountain States.**

General conditions in Montana are most promising and the state seems to be entering upon a period of great prosperity and development. The grain crops as a whole were very good. Crops in Utah and Idaho were generally good. Sheep and wool industry is only fair, cattle somewhat better, and the usual story of a poor demand for lumber prevails. The dairy industry runs from fair to good, and while the fruit crops were not so large they have been marketed at good prices.

The situation in Wyoming is generally analogous to that in Idaho and Utah, but the state is slowly recovering from several years of bad crops. Oil industry is in good condition. Conditions in Nevada are only fair as a whole. Agriculture is a comparatively small industry, and the state is slowly recovering from a slump in gold mining.

Grain crops in Arizona and New Mexico, while comparatively small, were very good, and agriculture comes more to the front as irrigation projects are completed. In Colorado, mining was formerly the principal industry, but of late years has been supplanted in importance by agriculture. Grain crops were fairly good, but there were two previous years of shortage to make up. The fruit crop was good as a whole and commanded good prices. Gold mining is fair. Labor strikes have upset the coal mining industry. Lumber and cattle range from poor to fair.

#### **Great Plain States.**

In both North and South Dakota spring wheat, one of the principal crops, was seriously affected by drought last summer. Corn was somewhat less than in 1912. Cattle and sheep in both states are in small supply, but are bringing good prices. Hog raising is suffering seriously from the prevalence of cholera in South Dakota. Fall plowing is being pursued under favorable conditions.

Crops in Nebraska, as a whole, were below the average, with the exception of wheat, which was a large crop. Cattle and sheep industry centres principally in western Nebraska, and the condition ranges from poor to fair. Manufacturing is in good shape and poultry industry flourishing.

Agriculture suffered severely in Kansas and Oklahoma, because of abnormal heat and drought. The Kansas wheat crop was large, but only moderate in Oklahoma. Cattle, hogs and sheep are scarce in both states, having been largely shipped to market because of lack of feed and its high price. Oil industry in northern and eastern Oklahoma is in fine shape. The cotton crop in Oklahoma has proven larger than anticipated. Mining is poor in Oklahoma, but fairly good in Kansas.

#### **The Northwest.**

General conditions in Minnesota and Wisconsin are unusually good. Crop yields were large and profitable. Dairy industry is growing steadily in importance, and is in a most excellent condition. Mining is fair, as is also manufacturing.

#### **The Central West.**

Crops in Iowa suffered largely from drought. Mining is generally good, as is also the poultry and dairy industry. There is a large demand for tile and cement, and it is noticeable that nearly every town and village is laying down concrete sidewalks. One of the serious problems of the state is the very high price of land, and the inability to get good farm land at moderate prices.

Illinois suffered much in an agricultural way from the heat and drought, though the wheat crop was unusually large. Coal mining and manufacturing vary from fair to good. The crops in Indiana were fairly good. The wheat crop was particularly good. Factories, according to the kind and locality, are running from one-half to full time.

Crops in Missouri, outside of wheat, suffered much from drought, but the loss was largely minimized in

many sections by the application of dry farming principles. Cattle and sheep industry is fair, but handicapped by the high price of feed. Peaches were an abundant crop, apples only moderate. The poultry industry continues good. Missouri leads all the states in the value of poultry, the surplus production being something like \$45,000,000 annually, the sale of eggs being something like 150,000,000 dozen.

Ohio was not much affected by the drought, but the effects of the floods in the southern portion have not entirely passed away. As a whole the state is in excellent condition. Michigan conditions are generally very good. Crops last year were better than the average, save that of fruit. The cattle industry is generally good, and this is likewise true of dairying. Canning industry and furniture manufacturing are excellent.

#### New England.

Potatoes, which are an important crop in Maine, are good. Lumbering is fair, and dairy industry good; that is true likewise of stone and marble quarries. Many of the large hardware manufacturers in Connecticut are running from four to five days a week. The shoe industry is good, textile industry is only fair. The conditions are much mixed.

#### The South.

Reports from Maryland as to crops, manufacturing and coal industry are generally good. Coal mining in West Virginia is suffering from strikes, though good in spots. Crops in Virginia are fair. Dairy farming is in good shape, and tobacco industry is excellent. The peanut crop, which is an important one in the southeastern portion, is reported quite good.

Crops as a whole in North Carolina were fair. Truck gardening, which is one of the principal industries in the eastern section, was very good. The yield was excellent and the prices remunerative. The cotton yield in South Carolina, while damaged by rains to some extent, promises larger than in 1912.

Conditions in general in Georgia were much better this year than last. Truck gardening in Florida is good, and the outlook is excellent for a good crop of oranges, lemons and grape fruit. Dairy industry is growing in importance and is in good shape. The cotton yield is in excess of 1912. Crops were good in Alabama.

Mississippi, as a whole, is in much better shape than last year. Cotton yield has been good. Sugar cane production in Louisiana promises to be very good. The rice crop is large. Corn is good and this is also true of cotton.

Crops in Kentucky were seriously affected by drought, wheat being the principal exception. A curious and interesting effect of public sentiment on business is shown by the depression in the Blue Grass region because of the lack of demand for racing stock, due to the fact that laws in many states prohibit betting on races.

Cotton yield in Tennessee is considerably larger than last year. Conditions are much mixed in Arkansas. Cotton yield is larger than last year. Rice industry is in fair shape. Corn as a whole is good. Coal mining is good. Poultry is of most excellent quality, manufacturing varies from fair to good and cattle are generally good. Cotton in Texas is a smaller crop than last year. Sugar cane in eastern portion is in good shape and there is a large crop of pecans. Dairy industry is in good shape and improving.

#### Middle States.

Crops were generally good in Pennsylvania, but the iron and steel industry is suffering from lack of orders. There is a general belief that there will be an increase in demand in the late winter and early spring to replace the fast depleting stocks in the hands of wholesale and retail dealers. Electric manufacturing interests are running on about three-fourths time. Anthracite coal industry seems well employed. Bituminous coal is fair. The oil and gas industry is in excellent condition.

Such crops as were raised in New Jersey were fair

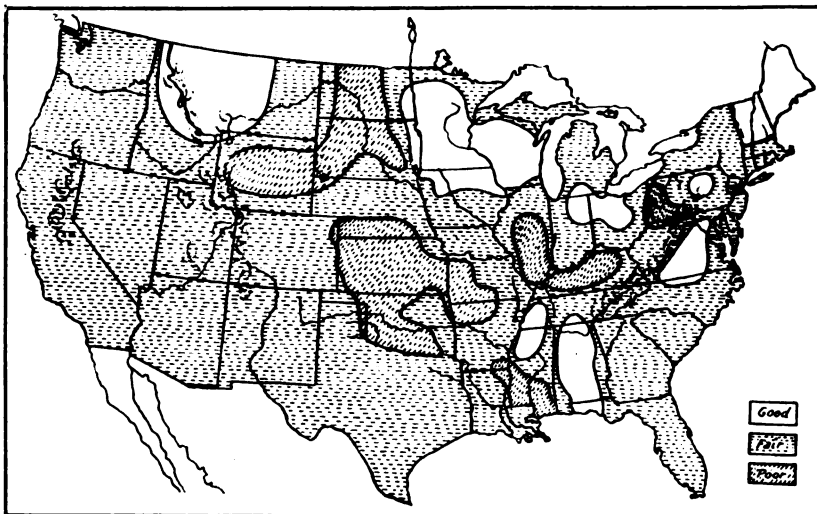

and truck gardening was very good. Silk mills are suffering from strikes and their business is reported as poor. Machine shops vary from fair to good. The extensive leather interests seem to be doing well.

In New York the crops were not up to the average. Fruit, which is a very important industry, was damaged by frost, and other crops by drought. Canning factories are well employed.

#### General Conditions.

Any general statement as to condition of manufacturing throughout the United States would at present be both misleading and inaccurate, since this condition varies according to the locality and the nature of the product. The textile industry is adjusting itself to changed conditions resulting from decrease in tariff rates, but the effect so far does not justify previous apprehensions. The paper manufacturing business is below normal, while shoe manufacturing is good, with a prospect of an advance in prices. This is true likewise of the leather tanning business. All manufacturing connected intimately with the railroad, and with the steel and iron industries, is necessarily feeling the depression of these two great branches of business.

Throughout the central west, despite the drought, there is a general feeling of hopefulness for the future. This seems to be partly due to the very fine prospects of the growing winter wheat and to the hope and belief that many of the serious political and economic questions, that have created such disturbances in the past,

Map Prepared by Chamber of Commerce of United States of America, Showing Business Conditions at Close of Year.

are now in a fair way toward solution. In general it must be remembered that the average man in the small town and on the farm is more interested in local business conditions and their outcome, than in those large national problems which seem of such dire portent to the large interests and to capital.

Throughout the southeastern Atlantic states, mercantile business is in good volume, and this is true in general throughout the West and the South. Business varies much in these sections, according to the locality. Where crops were good, business is fairly active; and in sections where crop returns last year were poor, business is correspondingly quiet.

The Royal Automobile Club of Austria is arranging for a series of automobile races on snow and ice in January and February. Ten classes have been proposed, each to compete in three tests: Driving over frozen stretches on the level and on inclines; driving over an ordinary firm sledging path, and driving over loose snow.

The Society of Motor Manufacturers & Trades of Great Britain will hold an aero, marine and stationary engine exhibition at Olympia, London, March 16-25.

The third annual Tour de France will be held under the auspices of L'Auto de Paris, March 1-25. The distance to be covered is 3750 miles.

## HINTS FOR NEW CAR OWNERS.

### Adjusting Pinion and Gear of Cadillac Rear Axle---Resetting Carburetors on Models 24 and 25 Buick Cars---Timing National Motor.

**N**OISE in the rear axle is generally due to the wear of the bearings, which alters their original relative positions. When these gears are adjusted at the factory unusual care is taken to insure that the large ends of the teeth of one gear will be practically flush with those of the teeth of the other. Extreme care must be exercised in the adjustment of the gears as the most accurately cut forms may be easily spoiled by service when not properly adjusted.

In the rear axle of the 1912 Cadillac provision is made for adjusting the pinion and gear so that their teeth may be correctly meshed, and in an accompanying illustration is presented a

clamp bolt J. With the last named loosened, the adjusting nut K may be rotated until all play is eliminated, but care should be exercised not to have the bearing too tight. It should be borne in mind that Timken bearings will revolve even when adjusted too snugly. They should be adjusted so that a very slight amount of play or looseness may be discerned. If in adjusting it is found that the slots in the locking nut do not match or register with the locking plates, it is preferable to slack off, rather than to tighten. All Timken bearing adjustments have right hand threads.

After adjusting the driving shaft, if it should

be found that further alteration is required to bring the gears into proper mesh, it must first be determined whether it is necessary to move the drive shaft toward the axle or the large bevel gear toward the pinion, or both.

If adjustments are made with the axle removed from the car, as in the overhaul of the chassis, it is suggested that it be placed right side up to conform to the references made herein. By right is meant facing the rear of the chassis.

If the adjustment of the drive shaft does not obtain the proper relative positions between the pinion and large gear, and it is necessary to move the shaft back toward the axle,

loosen the clamp bolt J, remove the locking plate I, then loosen the nuts H. Next turn up the adjusting nut K, a notch at a time, until the proper position of the shaft is secured. The adjusting nuts H are next turned, and the forward nut brought up tight against the lock washer R. Care must be exercised not to adjust the bearings too tightly as previously explained.

The large bevel gear C is attached to the mount D, which has a hub projecting on each side that fits into roller bearings. These bearings are carried in sleeves, E, supported in

Sectional View of Rear Axle of 1912 Cadillac with Components Lettered for Simplifying the Work of Adjusting Gears, Etc.

longitudinal sectional view of the axle with the components lettered. The maker of the axle makes an excellent suggestion for testing the mesh of the gears after adjustment, recommending the use of a crank to rotate the driving pinion shaft A. This permits of correcting any improper adjustment before replacing the axle under the car.

End play of the driving shaft, due to wear of the bearings, may be eliminated by taking off the locking plate I, which covers the opening in the bearing carrier. This will permit access to the adjusting nut K, which is retained by the

the main carrier F. The sleeves are threaded on their inner ends to receive the adjusting nuts GG.

To adjust the gear C, loosen the bolts retain-

Sectional View of Marvel Carburetor Used on Buick Cars, Showing Components for Making Adjustments.

ing the caps M and M, and draw the locking plungers out of their slots in the adjusting nuts GG in the sleeves which support the bearings of the gear mount. The nuts G and G are turned, moving the gear mount with gear in either direction as required. In making these adjustments it is recommended that a certain amount of backlash or play be allowed, to prevent the teeth binding. After completing this work all nuts, etc., should be locked securely.

The set screws LL in the cap should be adjusted so that they will set only very lightly against the edge of the hole in the housing, and locked in this position.

### BUICK CARBURETOR.

Models B 24 and B 25 Buick cars are regularly equipped with the model E Marvel carburetor, which is adjusted at the factory, but generally it is changed or must be altered for climatic reasons, after cleaning, etc. A sectional view of the carburetor is shown in an accompanying illustration, with its components lettered.

To readjust the Marvel, the needle valve A is turned to the right until it seats. Do not exert undue pressure, as the valve is delicate. Next, turn the air adjustment B to the left until closed. With these components closed, begin by adjusting the air, turning the screw B three complete turns to the right, and open the needle valve A two complete turns, rotating it to the left. Start the motor and note its operation.

Generally the fuel adjustment A will have to be slightly altered to obtain proper idling with the throttle closed, and in this respect the posi-

tion of the butterfly valve must be considered. A throttle stop is provided under the throttle lever for this purpose. In cutting down the fuel supply, move the needle but slightly.

After the motor has become warm, rotate the air valve adjusting screw B to the left, a little at a time, until the motor slows down, then turn to the right until satisfactory running is obtained. Rotating the screw B to the right cuts down the supply of air; to the left decreases the tension of the spring and admits more air.

If the adjustments are correct, the exhaust should be free from offensive odors and the motor should respond quickly when the throttle is opened wide. Back firing indicates too little gas and the needle A should be opened.

The choke damper is adjustable by a screw in the lever, and this can be set for any desired relation between the damper and the throttle. Ordinarily the hot air damper should be nearly horizontal when the throttle is closed.

### NATIONAL TIMING DIAGRAM.

The proper method in adjusting the space between the tappets and the valve stems of a motor is to check the opening and closing points of each valve by the marks on the periphery of the flywheel. This is to be preferred to the making of measurements as with a card, for example. An accompanying illustration shows the timing diagram of the four-cylinder motor having a bore of 4.875 inches and stroke of six used on the National M. C. C. touring car. As the opening and

Valve Timing Laid Off on Flywheel of Motor Used on National M. C. C. Touring Car.

closing points are laid off on the flywheel owners of this type of machine should be able to check the timing, as well as to replace camshafts.

## WITH THE MOTORING INTERESTS ABROAD.

### Great Britain Is Much Interested in Electric Vehicle—New Arrol-Johnston Electric Is Announced—Details of 12-Cylinder Sunbeam Motor.

ONE of the results of the official visit of members of the British Institution of Automobile Engineers to this country last summer is the increased interest in electric equipment of all kinds in Great Britain. This has its application to electric lighting and motor starting for gasoline machines, but it also means that more decided attention has been given to the possibilities of the electric vehicle, both for passenger and commercial use.

Just at present there is well defined conviction that an electric car can be used to good advantage in touring the British Isles. It is pointed out by those interested in the proposition that the better road conditions in Great Britain should make for greater success in this respect than in America. The principal handicap is held to be

of those interested will result in a much more general use of electrics within a comparatively short time.

#### ARROL-JOHNSTON ELECTRIC.

#### Interesting Details of New Pleasure Car Chassis Produced by Scottish Concern.

Among the members of the British Institution of Automobile Engineers who visited America last summer was T. C. Pullinger of Arrol-Johnston, Ltd., Dumfries, Scotland. During his stay in this country Mr. Pullinger was particularly impressed by the electric vehicle end of the industry, and shortly after his return to Scotland it became known that Arrol-Johnston was busily engaged upon the construction of an electric pleasure car. Details of this chassis have been awaited with some little interest by Americans.

A plan view of the new chassis is presented herewith. The maker calls special attention to the method of spring suspension. The front members are of the usual semi-elliptic type, but the rear springs are of a special design, termed an inverted cantilever. The long springs are anchored to the side members of the frame at

Plan View of New Arrol-Johnston Electric Car, Made in Scotland.

the limited mileage obtainable from the storage battery, but it is proposed to eliminate this difficulty by the establishment of charging stations in the important centres.

At the same time, a movement is under way, in charge of a body representative of municipal engineers, looking toward a more general use of the electric town car and electric trucks in cities. It would appear that business men in England have given very little study to this phase of the situation, and the object of the present movement seems to be that of conducting a campaign of education, similar in many respects to that which has been conducted in this country by the Electric Vehicle Association of America, and allied interests. It is anticipated that the efforts

of those interested will result in a much more general use of electrics within a comparatively short time. The front ends merely rest upon pads projecting from the frame, and the rear ends upon the rear axle casing. Any lateral movement of the rear axle relative to the car frame is held to be prevented by the parallel motion.

It will be noted that the 60-cell Edison battery is divided into two sections, one being placed in front under a hood of normal appearance and the other beneath the rear of the body. Between the two is a series wound electric motor of the enclosed four-pole traction type, which runs normally at about 1200 to 1400 revolutions a minute. The motor is designed to withstand a temporary overload of 300 per cent.

The continuous torque controller gives five

forward speeds and three in reverse, and an off position in which the car runs free when pushed, but cannot be operated under its own power. Drive to the rear wheels is through a propeller shaft enclosed in a torque tube, and an overhead worm gear attached to the usual differential in the rear axle. There are two independent sets of brakes, both operated by the feet, which act directly on the rear wheels.

### NATIONALISM IN FRANCE.

#### Manufacturers Are Seeking to Establish Demand for French Made Products.

For some years there has been a decided tendency on the part of British motor car manufacturers and others to urge that the people of Great Britain shall demand British made products. The Spanish and Italian governments have carried the plan of encouraging home industry into the awarding of contracts, etc. It now appears that the French manufacturers are behind a movement in that country toward the nationalization of the production of all parts for the automobile.

This action is believed to have had its inception in the desire of French motor car makers to overcome the so-called American invasion. About a year ago several representatives of automobile manufacturers in France visited factories in the United States in order to obtain first hand information regarding American methods of production, and later it was declared that there was no practical means by which it was possible to compete successfully with American manufacturers in the production of low and medium priced cars, although a few makers announced that they were prepared to produce machines on the American plan.

Still later, it was announced that the French government had passed a measure calling for a special duty on all articles fitted to foreign cars which had their origin in France. That is to say, whenever an American car, for instance, was imported into France fitted with tires or other accessories bearing the name and made under patents held by French concerns, the special tariff would apply, even though the article in question actually were made in the United States or other country outside of France.

The latest move includes the establishment of French factories for the production of parts, accessories and equipment, heretofore purchased outside that country. A specific instance is that of wire wheels, which formerly were purchased from British makers, but are now being manufac-

tured by a French concern. The same thing applies to magnetos formerly purchased in Germany. Some motor car makers go so far as to maintain that nothing enters into the production of their machines unless it is made in France.

#### GENERAL NOTES FROM ABROAD.

An accompanying illustration presents a line drawing of the new 12-cylinder Sunbeam engine, which has been designed by the Sunbeam Motor Car Company, Ltd., Wolverhampton, Manchester, England, to attack the worlds records on the road in France. The cylinders have bore of 90 mm and stroke of 150 mm (3.5 by 5.9 inches), and it is expected that the motor will develop a speed of 140 miles an hour. The two pipes leading to the rear of the car outside the frame are oil leads from and to the tank carried in the rear of the single-seated body. Dual rear tires will be fitted.

Those in charge of the arrangements for the annual North of England motor show in Manchester, Jan. 9-17, were confronted by a serious handicap last month, when the Exhibition hall, in which these shows have been held since 1911 and in which it was proposed to hold this year's display, was completely destroyed by fire. The Society of Motor Manufacturers & Traders immediately secured the City Exhibition hall, which is a much smaller building, for the forthcoming display.

An association of road engineers has recently been

**Twelve-Cylinder Sunbeam Engine, with Which New World's Records Are Expected.**

formed in Switzerland, the object being to make a specialty of road construction and to work in co-operation with the Swiss Automobile Club for improved highway conditions.

A recent report of the number of motor vehicles registered by the London county council gives the following figures: Pleasure cars, 101,198; heavy vehicles, 6345; motorcycles, 27,324; driving licenses, 303,021.

The Royal Automobile Club of Belgium has decided that the 1914 Grand Prix race in that country shall be a two-day event, the first day being reserved for large cars and the second for small machines. The dates have been fixed for July 26-27.

According to figures compiled by the Automobile Club of Canada, there were 44,278 motor cars and motorcycles in use throughout the Dominion, Nov. 1, as against 31,865 on the same date in 1912, an increase of over 12,000 in 12 months.

Entries at the original fee for the 1914 Tourist Trophy race of the Royal Automobile Club of Great Britain on the Isle of Man, closed Dec. 1, at which time the following cars had been entered: Minerva, three; Humber, three; Straker-Squire, two; Sunbeam, three; Star, two; Vauxhall, three; Martini, one; Adler, three; Pipe, three. Entries at double fees will be received until March 31.

In France the motor car tax for 1913 was paid on 90,959 vehicles, as against 76,771 in 1912. The cars mentioned are all of the private type, cabs, buses and commercial vehicles not being included.

## THE KNOX MODEL E KEROSENE CARBURETOR.

**F**OLLOWING exhaustive experimentation covering a period of nearly three years, supplementing an engineering knowledge developed

The Knox Kerosene Carburetor, Showing the Construction from Either Side.

by years of practical work, the Camden Anchor-Rockland Machine Company, Camden, Me., has perfected a carburetor designated as model E, which is designed to use with kerosene fuel in all internal combustion engines. The company has manufactured carburetors more than 12 years and half that time has experimented with kerosene carburetion, the possibilities of economies through the use of that fuel having prompted unusually careful investigation.

The company, three years ago, because of the demand from its foreign trade, began the production of a carburetor designed to use either kerosene or gasoline, and in practical service this instrument gave excellent satisfaction. The increasing cost of gasoline and the comparatively smaller price of kerosene prompted further investigation, with a view of utilizing the latter fuel constantly, aside from starting, and early in 1911 E. P. Lamb, the company's experimental engineer, began development of a carburetor that would be equally efficient for automobile and tractor motors and stationary and marine engines. The results obtained have been in every way gratifying, and such efficiency has been realized in continued service that the company has made plans for producing the instrument to meet any demand that can be

reasonably anticipated for hydrocarbon engines.

The carburetor is so designed that the engine may be started with gasoline, which insures operation in coldest temperatures, and then kerosene is used that is gassified by heating the base of the instrument from the exhaust. An explanation of the operation of the carburetor is given by the company's engineer as follows:

The fuel is admitted to the carburetor in the usual manner. In the base of the carburetor is a conical shaped heating chamber. The heat is derived from the exhaust line and the temperature is regulated by a damper or valve in the exhaust pipe that is shown in the accompanying illustration. This damper is controlled from the dash. As the chamber in which the fuel is heated is of such capacity that the fuel will flow over the cone, which is made of soft copper and has a large heating surface, no accumulation of kerosene follows and the fuel is transformed to gas as it passes the needle valve, which is maintained to be the only correct method of carbureting kerosene.

The needle valve and the nozzle are peculiar in construction. The gassified fuel passes the regulating needle into the nozzle through a series of very fine holes, and the heated constant air is supplied to the nozzle through a second series of small orifices. The nozzle is so constructed that the fuel holes intersect the constant air holes at the outlet point, a condition that insures atomization of the mixture as it enters the mixing chamber. The needle valve and the nozzle are adjustable and can be raised or lowered by

Cross Section of Knox Kerosene Carburetor, Showing the Principles of Operation and the Manner of Heating from the Exhaust.

the movement of the throttle lever. The auxiliary valve that controls the additional air supply serves as a throttle. No other control is needed.

The qualities of the carburetor, for which special claims are made by the maker, are protected by patents, and these include the method of heating the fuel, the method of increasing the speed of the gases and the method of thoroughly atomizing the mixture. The carburetor is so constructed that either gasoline or kerosene may be used, but for convenience it is built with a flushing valve and the gasoline is not passed through the carburetor. When the motor is first started the fuel is gasoline, supplied by opening the flushing valve, this valve having a needle regulation and being controlled from the dash. After the engine has been run from 15 seconds to three minutes, depending upon conditions, the flushing valve is closed and the kerosene fuel is drawn upon without change in the regulation.

The maker claims that a gain averaging seven per cent. is made in speed and power when using kerosene, as compared with gasoline, and with practically the same volume of fuel; that further, the standard automobile motors can be operated successfully with kerosene fuel, demonstration of this efficiency leading to extensive tests for some of the motor manufacturers; that when fitted to marine motors the model E carburetor is decidedly superior to the model D instrument, and that in ordinary conditions the marine motor can be started cold with kerosene by priming it well with gasoline. When used with gasoline as fuel the statement is made by the maker that the carburetor, because of its consumption and method of vaporizing, will deliver a mixture to the motor superior to that of any other carburetor, increasing the power and decreasing the fuel consumption. The saving with kerosene as fuel instead of gasoline is the difference in price. The company is now building an addition to its plant and has ordered special machinery for the manufacture of these carburetors, and will shortly produce them in standard sizes of one, 1.25 and 1.5 inches, to supply the manufacturers and the trade.

H. J. Rogaly, Port Elizabeth, South Africa, agent for Hupmobile cars made by the Hupp Motor Car Company, Detroit, recently completed his third tour of the South African Union in a machine of this make. The object of these trips

has been to bring the merits of the automobile to the direct attention of the people in sections where motor cars have not been known hitherto, and to demonstrate the ability of the Hupmobile to negotiate the prime roads of these districts.

### HUNTING BY AUTOMOBILE.

#### San Francisco Enthusiast Gets Unusual Enjoyment with His Knox Car.

An accompanying illustration shows Samuel W. Crim, San Francisco agent for Knox cars, made by the Knox Automobile Company, Springfield, Mass., and a party of friends returning from a day's hunting trip. Mr. Crim is a busy man, as are all the automobile dealers in San Francisco, but he manages to steal away

Samuel W. Crim of San Francisco and Hunting Party in Knox Car.

from business for a day of his favorite sport, once in a while. He declares it is nothing new for Californians to utilize their machines in this manner.

In fact, he maintains that the California owner of an automobile uses it constantly whether at work or at play. He considers it only natural that a car should be just as much a part of the hunting equipment as the gun. By getting an early morning start it enables him to go into the remote sections for several hours of rambling in some of nature's most glorious hunting regions, and still get back for a good night's sleep in his own bed.

"We Californians believe the automobile was made to be used", he says, "and whether it is hunting or just roaming about town, we do not intend to let the motor get rusty from lack of use".

## WITH THE CYCLECAR MANUFACTURERS.

### Detroit Cyclecar Company in Serious Trouble—Charles Merz Enters the Manufacturing Field—Details of Cricket and Latest Woods Mobilette.

**I**T IS extremely unfortunate that the remarkable interest in cyclecars has created a situation as a result of which it has been possible to work upon the speculative instinct in a manner capable of discrediting an industry of less stability than the manufacture of automobiles. This is particularly true, inasmuch as there are many in the industry who share the opinion of the public that there is a promising future for this type of machine.

The Automobile Journal has repeatedly urged caution on the part of both prospective purchaser and manufacturer, because it has appeared essential that the first machines of this new type which are put into general use shall be as nearly practical as it is possible to make them. It must be assumed that there will remain certain details of construction and application of well defined principles which must be worked out after the original designs have been tested in actual service.

It is believed that for the most part those engaged in exploiting the cyclecar are honestly endeavoring to supply a demand which appears decidedly insistent. That there are at least a few who seem to be quite as much interested in the disposal of stock as in the production of machines also is evident. Therein lies the greatest danger to the immediate success of the cyclecar.

As the result of an investigation by Irving Coffin, county detective, of Detroit, a warrant has been issued by Police Justice Matthew S. Gainer of that city, charging Phillip H. Cale, formerly second vice president and a director in the Detroit Cycle Car Company, with the disposal of 10 shares of that company's stock, although the company had not complied with the statute requiring the filing of particulars as to its assets, liabilities and plans with the state securities commission. The statute in question is the so-called "blue sky" law, passed at the last session of the Michigan legislature, and is similar in many respects to that now in force in other commonwealths.

The prosecutor has seized all the books and papers of the concern. It is stated that of the \$350,000 in capital stock, \$247,000 was assigned to Arthur B. Thomas, president of the company, in payment for two patents held by him, one for

an oiler and the other for a radiator. Thomas is said to have assigned \$25,000 of this stock to one Hall, and Cale is alleged to have disposed of this in lots of 10 shares at \$100 a share. It is expected that the defense will claim that it was not violating the statute in question because Cale was not selling stock for the company, but for Hall.

---

#### FAULTLESS FROM SAGINAW.

---

#### Valley Boat & Engine Company Is Giving First Car Its Road Test.

---

While the Valley Boat & Engine Company, Saginaw, Mich., has not yet made public the complete details concerning the cyclecar upon which it is working, it is anticipated that it will bear the same name as the Faultless power boats, in the production of which it is somewhat distinguished. The first machine is undergoing its road test, and it is stated that it has been averaging about 50 miles to the gallon over the ordinary Michigan country roads, and between 25 and 30 miles an hour on long drives. A second car is now being built, to which a body will be fitted, the test machine having been turned out with chassis only.

The car is to be equipped, according to present plans, with a two-cylinder, air-cooled V type motor, with bore of 3.375 inches and stroke of 3.875. The flywheel is located amidships and serves the purpose of the friction disc. This puts practically the whole of the driving mechanism under the seats, which will be a trifle staggered, the driver being about nine inches ahead of the passenger. The wheelbase will be 100.5 inches and the tread 36. Wire wheels will be used with 29 by 2.75-inch non-skid tires.

---

#### MERZ ENTERS THE FIELD.

---

#### Well Known Racing Driver Announces a New Friction Driven Model.

---

Charles C. Merz, well known in the industry as a driver of National and Stutz racing cars, and for many years connected with the engineering and experimental departments of the National

Motor Vehicle Company, Indianapolis, Ind., is interested in the production of the Merz cyclecar, shown in an accompanying illustration. This will be built in the two-passenger, tandem design and as a light delivery vehicle, by the Merz Cyclecar Company of Indianapolis. It is understood that this concern has acquired a concrete factory building at 1417-1421 Southeastern avenue.

Merz is said to have been experimenting with the new product for the past year, and is now convinced that the machine is capable of taking one or two persons anywhere that an automobile can go. The wheelbase is 84 inches, and the tread 40. The weight is not given, but the maker states that tests have indicated that it can be

screen to allow free air circulation, and the screen, as well as the ventilation doors on the sides of the hood, is removable to permit easy access to the motor.

#### NEW SCHEBLER CARBURETOR.

##### Modification of Motorcycle Type Designed for Use with Cyclecar Motors.

Consideration of the specifications for cyclecars now being produced by American manufacturers indicates that a large majority of them have decided upon the Schebler carburetor as standard equipment. This is the product of Wheeler & Schebler, Indianapolis, Ind., and the

Plan View of Merz Cyclecar Chassis and Front, Rear and Side Views of Completed Car, Fitted with Passenger and Delivery Bodies.

operated at an actual expense of one cent a mile for gasoline, oil and tires.

The motor is a De Luxe two-cylinder, air-cooled V type, with bore of 3.5 inches and stroke of 3.67, and the maker's rating is 9-12 horsepower. Drive is by shaft to the friction transmission, which provides four forward speeds and reverse, thence by short V belt to the rear wheels. The friction clutch is supported by a cross member about amidships. The friction wheel has a fiber surface contacting with a steel driving disc. The brake employed is a contracting band on the countershaft, and both clutch and brake are operated by pedal.

A distinctive feature of the design is the use of a single headlight in the centre of the front, and almost flush with it. This front is a wire

specially designed model H Schebler cyclecar carburetor is shown in an accompanying illustration.

It will be noted that it is in effect a modification of the well known model H, designed for motorcycle use. The chief difference is to be found in the provision of choking devices in both the primary and secondary air openings to provide for easier starting. A butterfly valve C, to which a wire is attached, provides for shutting off the primary air supply, and in order to prevent the increased suction thus produced from opening the high speed air valve B a wire is also attached to the spindle A, which when pulled outward locks air valve B by compressing a spring behind it. The result of this double choking is to insure a rich fuel mixture being drawn into

The Model H Schebler Cyclecar Carburetor.

without undue throttling of the charge by heavy spring pressure on the auxiliary air valve.

### CHANGES IN WOODS MOBILETTE.

#### Chicago Manufacturer Announces a Second Model Presenting New Features.

The Woods Mobilette Company, Chicago, Ill., which announced a friction driven cyclecar some months ago, is now making public the constructional details of the Woods Mobilette, model No. 2, in which several changes are noted. The original machine was equipped with a two-cylinder motor, but this later was replaced by a four-cylinder unit, and in this respect the model No. 2 does not differ.

The principle change is in the transmission, which is now incorporated with the rear axle, forming a single unit. This axle is of the full floating type, with full bevel gear differential. Roller and ball bearings are used in the axle, and the transmission shafts are mounted on three sets of ball bearings. The transmission is of the planetary type, affording two forward speeds and reverse. The shifting lever is located in the centre of the car, and the selective type of quadrant is used. The clutch is a multiple disc, located in the transmission case. The brakes are of the internal expanding type and operate in eight-inch drums on the rear wheels.

The front axle is tubular. The drive shaft runs in a straight line from the rear axle to the crankshaft, where it is coupled with a universal joint.

the cylinders.

Model M follows the principles of the latest Schebler carburetors for full sized cars in having an adjustable cam to raise the needle valve as the throttle opens, thus providing more gasoline at high speed

Semi-elliptic springs are used in front and cantilever in the rear. The wire wheels are of special Woods design, and are shod with 28 by 2.5-inch tires. The wheelbase is the same as the older car, 98 inches, and the tread 30. The seats are arranged in tandem.

### CRICKET IS A NOVEL DESIGN.

#### Has No Rear Axle, Drives One Wheel and Carries Motor at the Side.

A cyclecar which presents a decidedly distinctive appearance is the Cricket, to be built in Detroit by the Cricket Cyclecar Company. Its most striking feature is the location of the power plant at the side, while others include the use of a novel form of three point suspension, without a rear axle, and drive from one wheel only.

The original model is said to have been designed and built by Anthony New, a noted English automobile engineer, and to have undergone a thorough test abroad, before it was purchased, together with all patents and drawings, by a well known Detroit manufacturer, who interested a number of local capitalists in a company which will shortly place the first series in the market. It is stated that the company expects to deliver sample cars early this year.

The car has two independent side frames of tubular construction, connected by light, flexible cross members, so that the whole structure is expected to conform to road inequalities without undue strain on any part, the body moving freely through what amounts to three point suspension on the side frame. Spiral springs are used in front, this construction being similar to that of the Morgan, the English cyclecar which won the Grand Prix race in France in 1913.

Bicar Cyclecar Axles: A, Front Axle Construction; B, Rear Member.

There is one semi-elliptic spring at the rear.

The motor is a two-cylinder, air-cooled V unit, which, with the disc clutch and sliding gear transmission, is mounted in one of the side frames beside the driver, at the right. Drive is by chain from the engine to the transmission, which has two speeds forward and reverse, and by V belt to the right rear wheel. There is no rear axle, and it is stated that during the severe road trials to which the car has been subjected, the drive from a single wheel has proven eminently satisfactory, and that, owing to this feature and the independence of the rear wheels, there is no skidding, no matter what the condition of road surface.

The wheelbase is 82 inches and the tread 46. Wire wheels of the motorcycle type are used, the tires being 28 by 2.5 inches in front and 29 by 2.75 inches in the rear. The low hung body seats two passengers side by side, and provides storage space under the hood. Direct steering by means of a 15-inch hand wheel is stated to be extremely satisfactory. The weight is about 500 pounds, and it is maintained that the fuel consumption is about 40 miles to the gallon.

Tracy Lyon, formerly director of production for the General Motors Company, is manager and engineer of the company, and O. C. Hutchinson, formerly general manager of the Olds Motor Works, and before that with the Rainier company, is in charge of sales and advertising.

### LONG TRIP FOR FALCON.

#### Making Overland Journey from Cleveland to New Factory in Staunton, Va.

Bryce E. Blackley, assistant production manager for the Falcon company, maker of the Falcon cyclecar, accompanied by George F. Cox of Cleveland, left that city in one of these machines Dec. 29, en route for the new factory of the company in Staunton, Va.

From Alliance, O., under date of Jan. 2, Blackley wired that mud, snow drifts and all kinds of bad roads had been encountered, but the little machine had been able to pass two five-ton trucks and a seven-passenger, six-cylinder touring car, which had been delayed as the result of recent storms.

### MAKING BICAR AXLES.

#### Engineering Equipment Company of Indianapolis Enters New Field.

Believing that there is to be an important demand for cyclecar components, the Engineering Equipment Company, State Life building, Indianapolis, Ind., has brought out designs for front and rear cyclecar axles, the details of which are presented in an accompanying illustration. The company states that these axles are now being shipped, under the trade name of Bicar.

The forward axle is of the automobile type, with forged ends and knuckles. The standard tread is 36 inches, but it is maintained that owing to the tubular construction any width of tread can be furnished and the spring pads can be set any distance apart. These pads are designed to

Side View of Cricket Cyclecar, with Motor at the Side.

take quarter-elliptic springs. The design can be modified so that a dropped axle can be supplied to builders who desire this feature.

The rear axle is a straight tubular construction, with stubs either brazed in or electrically welded to the tube. Provision is made for the use of loop ended quarter-elliptic springs, which the company holds make for a very simple mounting. The arrangement of the radius rods is such as to give a wide range of belt adjustment.

The belt pulleys are extra deep, a feature which is expected to permit of running the belts loose without possibility of their jumping out. They are fastened to the rims by heavy pressed steel lugs. Rims can be supplied for 28 by three-inch or 28 by 2.75-inch tires, as desired.

This company also produces springs, and while it recommends the quarter-elliptic type for light car work, it will furnish any type to specifications of purchaser.

cast separately and having a bore of 4.75 inches and stroke of five. The horsepower rating according to the S. A. E. formula is 36.1. The

Fig. 2—Components Utilized in Adjusting Fore and Aft Rod Connection of Knox Cars.

piston displacement is 354.42 inches. The valves are located on the left.

Carburetion is by a model L water jacketed Schebler and the fuel feed is by gravity. The ignition system is dual, magneto and battery. Lubrication is by splash, a pump circulating the oil. Cooling is by water, the pump being driven from the end of the camshaft. The radiator is of the cellular type and the usual fan is included.

The clutch is a cone, leather faced and the gearset of the selective type, providing three forward speeds and a reverse. It is operated by a lever at the right of the driver, who is located at the right. The brakes are internal expanding and external contracting. The wheelbase is 123 inches and tires 36 by four. The front springs are semi-elliptic and the rear semi-elliptic platform. The chassis weight is 2600 pounds. The car is not being manufactured now. Parts may be obtained, however, at Orange, Mass.

#### Mitchell Six Ignition.

(1691)—What is the firing order of the 1912 six-cylinder Mitchell? Is the magneto a high-tension and how is it wired?  
La Crosse, Wis., Jan. 1.

The cylinders of the 1912 Mitchell fire in the following order: 1, 5, 3, 6, 2, 4.

The magneto employed as standard equipment is a Splitdorf, made by the Splitdorf Electrical Company, Newark, N. J., which concern will forward a booklet on request, showing its construction, operation and method of installing, etc. It is termed a high-tension magneto, in that its armature has but a single winding and a current of low potential is obtained.

The primary current is transformed into a high-tension

sion by the use of a coil having a low and high-tension winding, constructed on practically the same principle as the induction coil utilized with battery system of ignition. The transformer coil builds up the low-tension current to a sufficient value to overcome the resistance of air at the electrodes of the spark plug.

The wiring plan is shown at Fig. 3, and the primary wires are denoted by thin lines and the secondary by heavy. The ignition system is a dual one, in that either the cells or magneto may be employed, but the batteries are generally used for starting purposes only. It will be noted that the primary current is collected from the magneto, led to the coil, thence to the terminal in the centre of the distributor. It will also be seen that neither side of the batteries is grounded, both connections being made at the coil.

#### Back Pressure.

(1692)—Is it possible for the muffler to become so clogged with carbon, etc., as to prevent the starting of the car?  
I. W. K.

Boston, Jan. 3.

Such a condition might be possible, but a case has never come to the notice of the writer.

#### Periphery of Flywheel.

(1693)—I note mention made of the periphery of the flywheel in your magazine. Is it the surface of the wheel?  
NEW OWNER.

Chicago, Ill., Dec. 29.

The term as utilized refers to the surface or circumference of the flywheel.

Practically every dealer in Hartford, Conn., will be represented in the show to be held in the Casino, Feb. 21-28, according to present indications. The event is to be under the auspices of the Hartford Automobile Dealers' Association.

The Waite Auto Supply Company, Providence, R. I., is mailing to the trade an attractive loose leaf desk calendar for the year 1914.

## OFFICES:

NEW YORK, CHICAGO, DETROIT AND BOSTON

## Subscriptions:

The United States and Mexico, the year, \$1 in advance;  
Canada and Foreign Countries in Postal Union, the year,  
\$2 in advance. Ten cents the copy.

## Advertising Rates:

Information given at request. All advertising copy to  
insure publication must reach this office 10 days pre-  
ceding the date of issue.

Remittances should be made by Check, Draft, Postoffice,  
Express Money Order, or Registered Letter. Money  
enclosures must be at sender's risk.

Entered as second class matter, April 16th, 1906, at the  
Postoffice at Pawtucket, R. I., under the Act of Con-  
gress of March 3rd, 1879.

## BUSINESS CONDITIONS GOOD.

It probably will not be denied that the Chamber of Commerce of the United States of America, which was organized early in the past year, being in effect an amalgamation of the various chambers of commerce and boards of trade throughout the country and therefore in direct touch with the conditions in the various sections, is a thoroughly impartial judge as to the effect of those conditions upon business generally. Elsewhere in this issue is presented a digest of the report issued by this body at the close of the year, and no better comment could be made concerning the outlook for 1914.

The analysis is most complete in every particular, and where no reference is made to a specific industry it may be taken for granted that

the conditions are good. The map which accompanies the report is fairly representative of business conditions at any time, insofar as its general characteristics are concerned. The situation is most encouraging, and bears out the optimistic tendencies revealed by the recent investigations conducted by The Automobile Journal.

## TRAVELLING MEN'S OPINIONS.

It is somewhat surprising to note how little the magnitude of the automobile industry is appreciated by the general public. It might be assumed that as a body, travelling men were well informed as to industrial enterprises. The following quotation from The Manufacturing Jeweller is an example of the regard with which their opinion is held:

Travelling men say they cannot account for the present dullness. Some of the jewelry drummers have an idea that the purchase of so many automobiles by thousands of people throughout the country, and the necessary expense incurred in running the same, may have some effect.

A travelling man, who was engaging the attention of passengers on a train out of New York recently, with somewhat similar opinions and the further observation that within a year there would be but half a dozen automobile manufacturers in America, was asked how many he thought there were today. "Offhand, about 30", was his reply.

He was surprised to learn there were more than 200; that they had produced 450,000 cars during the past year, and had shipped nearly \$28,000,000 worth of these machines abroad. The opinion of travelling men regarding the stability of the automobile industry evidently needs decided revision.

## UNIFORM MOTORING LAWS.

At last the commissioners appointed to represent the various states in a conference for the purpose of formulating uniform motoring laws have met and organized for business. It is indeed gratifying to note the chairman's statement that those engaged in the preparation of a model statute are to be governed very largely in their deliberations by the counsel of Common Sense. This "therapeutic friend" has been overlooked too often by those who have framed motoring regulations in the past.

## PLANS COMPLETE FOR CHICAGO SHOW.

**Conservatory Settings for Coliseum and First Regiment Armory---Provisions Made for Extra Display Space---Cars and Accessories Not Seen at New York.**

**F**OR the 14th annual national automobile show in Chicago, Jan. 24-31, the Coliseum and First Regiment Armory will present conservatory settings. That is to say, the splendor with which past displays in that city have been connected in the minds of visitors will be somewhat modified. Considerable additional floor space will be afforded by the extension of the gallery in the Coliseum proper. Of course, this presages a larger show than ever before, although this is not indicated by the grand total of motor car exhibitors.

A canvass of the manufacturers in 1913 reveals the opinion that the Chicago display retains rather more of the old time national show atmosphere than is true respecting the New York exhibition. By this is meant that many dealers in the Middle West and Southwest still make it a practise to visit the Chicago show for the purpose of securing new contracts.

No automobile show ever has approached the record of the annual Boston event in number of actual sales. New York and Chicago are the only cities in the country where the annual display is dignified by the term national. A strict interpretation of this term would seem to indicate that the exhibitions in these two cities were held primarily for the purpose of interesting dealers. It may be contended that ornate decorations will have little effect upon the dealer who is interested in representing a car which will meet the demand which exists in his territory.

There are those in the industry who see in the announcement regarding a modification in the matter of decorative treatment, a strong disposition on the part of the management to make the 1914 Chicago show a general meeting place for manufacturer and dealer, although, of course, there will be no lack of opportunity to do business directly with the prospective owner. Manufacturers are ready to concede that the big retail show of the year is that held in Boston. In the Middle West, and, in fact, throughout the entire country, the so-called minor shows of other years are fast assuming major proportions in many instances. The Chicago show of 1913 was most successful in reaching the dealer, and it is anticipated that the same will be true this year.

The event will be under the auspices of the

Automobile Chamber of Commerce, as was the New York display, which just closed. The management is directly in charge of Samuel A. Miles, who has been manager of all of the Chicago displays. His intimate knowledge of the industry and its growth in the Middle West, as well as the people in that section who may be interested in an event of this character, places him in an enviable position in this regard.

Mr. Miles acquired his first motor car in March, 1900, and about the same time he became an enthusiastic member of the Chicago Automobile Club. Shortly after the first show was announced in

New York City, Mr. Miles was convinced that something of this nature would appeal to the residents of the Middle West. He enlisted the co-operation of the Chicago Automobile Club, and that the event was a success is best evidenced by the fact that when the National Association of Automobile Manufacturers was formed he was selected as general manager, a position he has held ever since, for the Automobile Chamber of Commerce is but a continuation of the National Association of Automobile Manufacturers, in amalgamation with the Automobile Board of Trade.

**Samuel A. Miles, General Manager,  
Chicago Automobile Show.**

The statement regarding the decorative treatment this year may be amplified as follows: In the Coliseum, the roof of which is domed or rounded, the conservatory design is to be begun on the ground floor and carried to the ceiling. The wall spaces will be backed by canvas painted to represent glass, and the roof will be concealed

by similar painting, in which a scroll effect will separate the various "panes".

On the ground floor, flowering vines will "take root" and "grow" upward to the ceiling. The main aisles will be marked at either end by tall, slim, poplar trees, imported from Austria, between which will be giant vases overflowing with flowers. Gold pillars, surmounted by a statue of a kneeling automobile girl, will mark the various exhibition spaces.

Practically a repetition of this scheme will be worked out, so far as possible, in the armory. The fact that a larger portion of the latter structure will be devoted to the display of accessories, etc., will necessitate alterations in the gen-

those which have been reported by the management to date. The car exhibits will be disposed as follows:

**Coliseum**—Winton, Locomobile, Paige, Jeffery, Franklin, Packard, K-R-I-T, Buick, Reo, Studebaker, Abbott-Detroit, Chalmers, Maxwell, Peerless, Hupmobile, Stevens-Duryea, Cadillac, Pierce-Arrow, Overland, Cole, Hudson, Regal, Oakland, Velle, Cartercar, Premier, Jackson, Stearns-Knight, White, Lozier, Kissel-Kar, Haynes, Marmon, Willis-Knight, National, Moon, Mitchell, Metz, Case, Imperial, Auburn, Marion, Oldsmobile, Apperson, King, Flat—all gasoline.

**First Regiment Armory**—Mercer, Henderson, Pathfinder, Moline-Knight, Norwalk, Stutz, Speedwell, Chandler, Great Western, Herreshoff, Austin, Lyons-Knight, Allen, Keeton, Davis, Lambert, McFarlan, Crow, Partin-Palmer, Palmer-Singer-Magic—gasoline. Chicago, Century, Broc, Borland, Woods, Argo, Standard, Waverley, Baker, Detroit—electric.

**Coliseum Basement**—Flyer, Vulcan, Lexington, Ohio.

Exterior of the Coliseum in Chicago, Where 14th Annual National Automobile Show Will Be Held Jan. 24-31.

eral plan. The entire effect, however, will be to provide nothing which shall detract from the exhibits themselves.

According to the latest information respecting the number of cars to be displayed, there will be 71 makes of gasoline machines, 10 of electrics and four of cyclecars. None but pleasure cars will be shown. Of the gasoline cars, the Norwalk, Austin, Lambert, McFarlan, Crow, Elkhart, Flyer, Ohio and Lexington were not seen at New York. The Chicago, Century, Broc, Borland, Woods, Argo and Standard electrics also were not exhibited at the Grand Central Palace. It is expected that additional cyclecar makers will secure space before the doors are opened to the public, but the list given includes only

McIntyre—gasoline cars. Cornellian, McCord, Lomax, Imp—cyclecars.

It will be noted that the practise, which was inaugurated last year, with respect to placing the electric machines by themselves in the centre of the First Regiment Armory, will be continued this year. The interest in such cars in the Middle West is such as to make this plan most desirable in every way. This also will have its bearing upon the decorative treatment of that building.

The list of accessory exhibitors indicates there will be no less than 165 makers of parts, supplies and fittings represented. These will be located in the Coliseum gallery, Coliseum basement, Coliseum annex and First Regiment Arm-

ory gallery. The extension of the gallery floor in the Coliseum has been with a view to placing the aisle along the railing outside the exhibition spaces, a feature which will be appreciated by visitors, since there will be no necessity for avoiding the overhead girders, as in the past.

Among the accessory exhibitors, who did not display in New York, are the following:

Fort Dearborn Mfg. Co., Chicago.  
Pierce Speed Controller Co., Anderson, Ind.  
Electric Products Co., Cleveland, O.  
Modern Auto Appliance Co., Auburn, N. Y.  
Sulzberger & Sons Co., Chicago.  
Auto Parts Co., Chicago.  
Cotta Gear Co., Rockford, Ill.  
L. P. Halladay Co., Streator, Ill.

Wm. E. Pratt Mfg. Co., Chicago.  
Morrison-Ricker Mfg. Co., Grinnell, Ia.  
Tuthill Spring Co., Chicago.  
Hess Spring & Axle Co., Carthage, O.  
Gould Storage Battery Co., New York City.  
Rutenber Motor Co., Marion, Ind.  
Baldwin Chain & Mfg. Co., Worcester, Mass.  
Continental Motor Mfg. Co., Detroit.  
Diamond Chain & Mfg. Co., Indianapolis, Ind.  
Lovell-McConnell Mfg. Co., Newark, N. J.  
Auto Parts Mfg. Co., Muncie, Ind.  
Warner Mfg. Co., Toledo, O.  
McCord Mfg. Co., Detroit.  
Imperial Brass Mfg. Co., Chicago.  
Whitney Mfg. Co., Hartford, Conn.  
Automobile Supply Mfg. Co., Brooklyn, N. Y.  
Waukesha Motor Co., Waukesha, Wis.  
Dunlop Wire Wheel Corp., New York City.  
S. Breakstone, Chicago.  
U. S. Ball Bearing Mfg. Co., Oak Park, Ill.  
Taylor Instrument Co., New York City.

## TEST ECONOMIN, A BRITISH MOTOR FUEL.

**I**N A recent issue announcement was made of a new motor fuel, which was to be marketed in Great Britain under the name of Economin. At that time little information was available as to the nature of the new product, although it was stated that it had the indorsement of a well known British automobile manufacturer. Prof. Robert W. A. Brewer, an engineer of prominence in England, states that he has had opportunity to make several tests of the new fuel in comparison with gasoline and benzol, and concerning the fuel he has the following to say:

Economin itself is one of those fuels which are physically and chemically treated in order to render them volatile, and to reduce the carbon constituent. As distinct from the Lamplough process, which is a heat treatment, and the Shonrey process, which is a chemical one, the method of production in Economin is a combined process of treating kerosene, shale oil, naphtha and other similar hydrocarbons in the following way: Eighty per cent. of the raw material is mixed with 20 per cent. of a solution of resin and certain other bodies in benzol and benzine; the mixture, after standing, is distilled up to a temperature of about 240 degrees Centigrade. About 70 to 80 per cent. of this volume of the original mixture comes over as Economin spirit, which has a water white appearance and a viscosity somewhere between gasoline and kerosene. The specific gravity of the fuel was 0.767 at 58 degrees Fahrenheit.

Prof. Brewer recently conducted 36 tests with this and other fuels during a single week, the weather being such as to give a very good indication of the behavior of the several fuels under the majority of conditions prevailing in England. Two carburetors of entirely different types were used, one with a fixed and definite jet orifice and the other with a variable one, the dimensions of which could be changed, when the motor was running, by means of a control wire. Concerning these tests he says:

One of the most interesting facts which was brought out was that, while a variation in the size of the jet from 1.25 mm to 1.15 mm improved the fuel consumption (when everything was hot) from 18.5 miles a gallon to 24.5, yet with Economin there was less than .75 miles a

gallon difference when using jets varying from 1.15 mm to 1.30. These were in tests at 30 miles an hour. The effect, however, on the motor was marked at this speed, as insufficient power was produced with the smallest jet running on Economin to drive the car up the slope of the small banking at Brooklands on top speed.

This small jet (1.15 mm), although it gave the best gasoline consumption, was too small for practical use with that fuel, as the car speed dropped by 10 miles an hour in the before mentioned locality. We may, therefore, take it that for all around work the correct size of the jet was the one used, of 1.25 mm diameter, and this jet had previously been used to a considerable extent by the writer in other tests. This jet was certainly not too large, as on the coldest days, when the temperature in the morning was from 42 to 45 degrees, some slight difficulty was experienced in starting with either gasoline or Economin, but this difficulty disappeared when a jet of 1.30 mm was fitted.

An extract from the table of results shows briefly that, with the car in question, having a weight of 30 hundredweight, a wide windshield and an engine of the T head type, 100 mm bore by 105 mm stroke (3.9 by 4.13 inches), results in the following order were obtained:

At 20 miles an hour Economin gave 27 miles a gallon as against an average of 26.6 with gasoline with one carburetor.

At 30 miles an hour, the average results with both fuels were identical—25.9 miles a gallon.

At 40 miles an hour, Economin gave 16.5 miles a gallon with one carburetor and 20.8 with the other, as against 17 on gasoline with the first mentioned carburetor.

With every fuel tried and with each carburetor the maximum speed attained was about 55 miles an hour, but the rate of acceleration varied slightly. For example, the acceleration to 30 miles an hour occupied 28 seconds in each case, except with one carburetor on gasoline, when the time noted was 21 seconds, and the speed at the end of half a mile was practically the same in each case—44 miles an hour.

Briefly, the fuel Economin is comparable with gasoline in all ordinary circumstances, but does not appear to be as susceptible to faulty adjustment of jet size on the large side.

A total of \$197,700 is offered for prizes in racing events throughout the country during 1914, divided as follows: Indianapolis 500-mile race, \$50,000; Seattle speedway, \$30,000; Sioux City, \$25,000; Vanderbilt and Grand Prize, \$16,000; Los Angeles-Sacramento, \$14,300; Corona, \$11,000; Tacoma, \$10,500; Santa Monica, \$10,000; Elgin, \$10,000; Los Angeles-Phoenix, \$9,500; El Paso-Phoenix, \$6,400; Galveston beach, \$5,000.

## MECHANICAL NOTES FOR OWNERS.

### Converting Gravity Fuel Feed to a Pressure System—Care of Tires and Rims in Cold Weather—Home Made Tonneau Windshield—Concealed Radiator Cover.

**W**INDSHIELDS are appreciated in cold weather, but with the top down the occupants of the tonneau seats experience considerable draught, largely due to the air currents set up by the windshield. The following suggestion is made by a reader for providing protection to the passengers in the tonneau, and the contributor writes that the cost of material is slight and that the work may be performed easily. As will be noted by an accompanying drawing, the rear windshield is made V shaped, and the owner states that as far as he can ascertain it has not increased the resistance; that is, has not affected the speed of the car.

I am enclosing a rough sketch of a windshield which I constructed and fitted to my machine, which has a toy tonneau. My friends complained of draughts in the rear seats and not wishing to go to the expense of purchas-

**Home Made Windshield Designed and Fitted by a Reader to Protect Occupants of Rear Seats from Draughts.**

ing a ready made tonneau windshield, I gave the problem considerable thought.

As the rear seats are rounded, I found that I could attach an iron rod, which was made flat at one end and drilled to take a number of wood screws. The upper section of the rod, which was .5-inch round stock, extended above the top of the front seats as shown in the drawing. The rod was screwed to the back of the front seats, although it could have been provided with an angle at the lower end and screwed to the floor of the tonneau, and a clamp used to support the upper end. Similar rods were made for each side of the tonneau. These were fitted on the front side of the hinges so as to permit opening and closing the doors.

The windshield proper was constructed of heavy cotton duck, two layers being employed for each wing. The celluloid I secured from an old top and this was sewed between the two layers. The centre of the shield was fitted over the front seat rod and then sewed to form a loop, which was fitted snugly. Each rear end of the wings was fitted in the same manner. After completing the work I gave the cloth a coat of oil, then painted it to match the finish of the machine.

To use the shield it is a simple matter to slip the loop sections over the rods, and in measuring for the cloth it is important that a snug fit be made so that the wings

will be stretched tight when on the rods. I found that with a loose fit—that is, a slack in the wings—they would vibrate and flap, so refitted them. Of course the car looks odd with the shield removed, as the rods are noticeable, but the shield keeps the draughts off the passengers in the rear seats. In measuring, it is advisable to make the height of the wings such that the lower edge comes inside of the body.

### INSTALLING PRESSURE FEED.

Many owners display considerable ingenuity in improving the operation of their motors and cars, and an instance was noted recently by the writer. The machine was a 1906 model, with which the owner was loath to part because the motor ran perfectly and had good power. Considerable trouble was experienced in starting, however, which was largely due to the fact that the intake pipe was very long and that the valve tappet guides were worn, admitting more or less auxiliary air. Another trouble experienced was that of dirt finding its way from the road into the carburetor, as the power plant was not protected by a pan or undershield. To construct and fit a pan would have involved considerable expense, since the carburetor was several inches below the frame. The feed was by gravity, the fuel tank being of the conventional square type and located under the seat.

After studying conditions the owner decided to replace the gravity feed with pressure and to carry the carburetor higher and in proximity to the cylinders, where their heat could be employed to raise the temperature of the fuel. The intake manifold was provided with a long elbow to which the carburetor was connected. This was discarded and the carburetor fitted to the intake pipe proper.

The fuel tank was converted into a pressure member by soldering the opening in the filler cap and carefully fitting washers to make it air tight. Pressure was supplied from the exhaust manifold, which was tapped to take a pipe provided with the usual check valve connections, and the conventional pressure gauge, hand pump, etc., were incorporated.

With the carburetor placed higher and above the frame, it was a simple matter to make and fit shields on either side of the motor and between it and the radiator. The engine was suspended at four points, the extension or arms of the upper

crankcase being bolted to the frame. By fitting a strip of heavy sheet metal and drilling holes to correspond with the crankcase bolts, one side of the pan was secured, while the other was fastened to the frame by stove bolts. A similar arrangement was employed between the front cylinder and the radiator.

The owner states that the cost of the material was not excessive and that better results are obtained from the motor, as the carburetor does not become filled with road dust and mud as formerly. It is also stated that starting is much easier and more mileage is obtained from a gallon of fuel.

### CARE OF RIMS.

Although the importance of caring for the tire rims has been pointed out in these columns, reference to the subject is especially timely at this season of the year, when the rims are exposed to moisture. The removal of a shoe is not a pleasant task in warm weather and is more difficult in the winter, as not only is the casing less pliable, but frequently the hands are too cold to operate the rim mechanism, and anything that will make for easy removal will be appreciated by the motorist.

In addition to facilitating the work of changing a tire, proper care of the rims makes for economy. When rims are neglected they become coated with rust, causing deterioration of the rubber, and sometimes the latter becomes so frozen to the rim that force is necessary to remove the casing. With the protective material removed from the casing moisture finds its way to the fabric, with the inevitable result—a blow-out.

Remove the casings from the rims at least once a month and clean the latter. This will permit of inspecting the shoes and the vulcanizing of any cuts that may exist. It will also afford an opportunity for backing up a weak place with fabric, preventing a blow-out, and obtaining additional mileage.

After cleaning the rims and removing any high spots, prepare a mixture of powdered graphite and oil, utilizing as much of the former as is necessary to make a thick paste. Smear the rims and their locking mechanism liberally with the mixture, rubbing it well into the pores of the metal. Next take a cloth and remove the superfluous material. The result will be a high polish and a surface that will resist the action of water. It is surprising how easily the tire can be removed after this treatment.

### COVERING THE RADIATOR.

The modern motor is equipped with a cooling system which makes for efficiency in warm weather, but when low temperatures prevail the fluid is apt to be too cool to obtain good results from the motor. The most common method is to fit a radiator shield at the front of the cooler, but a variation of the practise was noted recently by the writer.

The car was a 1913 model and its owner found that on cold days the water did not get warm enough, and that on mild days it became heated, owing to the large per cent. of alcohol used to prevent freezing. Instead of placing the shield at the front of the radiator, it was fitted at the rear, as shown in an accompanying illustration.

It was explained that with the cover in front, on mild days the water became too hot, as the

A Radiator Cover, the Location of Which Differs from Conventional Practise, in That It Is Located at the Rear of the Cooler.

motor was often run for long intervals, the machine being utilized in the owner's business. He claims that with the cover in back a proper working temperature is secured, as the shield restricts the air passing through the cooler to the cylinders. The proper height of the shield was determined by experimentation. The method of fastening is shown, it consisting of wires run between the fins and twisted at the front. The method has one advantage, in that the cover is concealed.

At the annual meeting of the Waterbury Automobile Club, Waterbury, Conn., the following officers were elected: President, Walter W. Holmes; vice president, Lewis A. Platt; secretary, William E. Hunt; treasurer, H. S. Seeley; board of governors, Robert A. Coe, Dr. A. A. Crane and F. W. Tate.

## IMPROVED ROADS AND MOTORING LAWS.

### Uniform Statute Commissioners Organized for Business—Nantucket Is Experiencing Novel Automobile War—Traffic Regulations in Maryland.

COMMISSIONERS representing the states of Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Delaware and Maryland, met in New York City last month for the purpose of securing uniform legislation in all states for the regulation of automobiles. S. W. Taylor of New York, chairman of the Motor Vehicle Legislation Commission's Conference, as the body evidently is to be known officially, reports that work is under way looking toward the drafting of a model bill, in which an effort will be made to cut out a mass of superfluous specifics and permit "our old therapeutic friend, Common Sense, to write into the law one of his effective prescriptions".

Before the next meeting of the conference, further efforts will have been made to have the states of Maine, New Hampshire, Vermont and Rhode Island appoint commissioners. It would seem that there ought not to be objection if other commonwealths see fit to join the conference, since the main object of the body is to prepare a bill which can be urged upon the legislatures of all states, to the end that uniform motoring regulations may be in force throughout the entire country.

#### NANTUCKET'S AUTOMOBILE WAR.

##### Mail Carrier Is Still Using His Motor Car Under Serious Difficulties.

The island of Nantucket has been successful in excluding automobiles for a number of years, but just at present it is experiencing some difficulty in forbidding the use of a machine which Clinton S. Folger purchased some weeks since for use in carrying mail and passengers between Nantucket and Siasconset. Folger has been arrested twice and fined in the local court. These cases are now pending on appeal, and the automobile is being operated under its own power on the state highway between the two towns.

As soon as the selectmen of Nantucket heard of the purchase of the machine, they called a special town meeting, at which it was decided to continue the exclusion of all such inventions. This exclusion order was approved by the Massachusetts highway commission in due form.

Then the car appeared, and was driven up in front of the postoffice. The first arrest followed. After appearing in court, pleading not guilty, and appealing his case, Folger again took up his duties as mail carrier, only to be arrested a second time, even after he had given the chief of police a ride just to show him how the machine worked.

Folger claims he has a perfect right to operate his machine on the state highway, and thus far no attempt has been made to stop him, pending the appeals. He has been warned, however, that he must not operate the car under its own power one inch over the town line. In order to avoid further trouble of this nature he has acquired the services of a horse, which draws the car into and out of town. Once over the town line the horse is unhitched and the remainder of the trip is made by gasoline propulsion.

#### FALL RIVER TAKES ACTION.

##### Board of Aldermen Orders Police to See That Law Is Not Violated.

The board of aldermen in Fall River, Mass., has called the attention of the police department in that city to the fact that chapter 803, acts of 1913, relative to the operation of traction engines, etc., is being violated and has instructed the board of police to take such steps as may be necessary to stop such violation. The chapter in question reads as follows:

Section 1—No traction engine, trailer, motor or other vehicle shall be operated upon or over a highway or bridge in any city or town in this commonwealth, nor shall any object be moved over or upon any such highway or bridge upon wheels, rollers or otherwise, in excess of a total weight of 14 tons, including vehicle, object or contrivance and load, without first obtaining the permit mentioned in section 3 of this act from the authorities therein mentioned; nor shall any vehicle be operated or contrivance moved upon or over said highways or bridges which has any flange, ribs, clamps, or other object attached to its wheels or made a part thereof, which will injure, cut into, or destroy the surface of the highway or bridge for any considerable depth; and in the towns of the commonwealth outside of the metropolitan parks or sewage districts no such engine, vehicle, object or contrivance for moving heavy loads shall be operated or moved upon or over any such highway or bridge the weight of which resting upon the surface of said highway or bridge exceeds 800 pounds upon any inch in width of the tire, roller, wheel or other object, without first obtaining said permit, unless such highway is paved with brick, block, sheet asphalt, concrete pavement or surface. The owner, driver, operator or mover of such

engine, vehicle, object or contrivance over said highway or bridge, shall, unless relieved from liability in said permit, be responsible for all damages which said highway or bridge may sustain as a result of said action on his part, and the amount thereof may be recovered in an action of tort by the authority or authorities in charge of the maintenance or care of said highway or bridge, or by the authorities of the town, Massachusetts highway commission or the county commissioners, which have charge of the highway or bridge which is injured.

Section 2—No steam traction engine, with or without trailers, and no motor truck, carrying a weight in excess of four tons, including the vehicle, shall be operated upon any highway or bridge in this commonwealth at a speed greater than 15 miles an hour; and no such vehicle carrying a weight in excess of six tons, including the vehicle, shall be operated on such highway or bridge at a speed greater than six miles an hour when such vehicle is equipped with iron or steel tires, nor greater than 12 miles an hour, when the vehicle is equipped with tires of hard rubber or other similar substance.

Section 3—The Massachusetts highway commission, county commissioners, superintendents of streets, selectmen or road authorities having charge of the repair and maintenance of any highway or bridge in any of the towns of the commonwealth are hereby authorized, upon proper application in writing, to grant permits for the moving of heavy vehicles, loads, objects or structures, in excess of a total weight of 14 tons, over said highways or bridges, and for operating or moving over any highway or bridge in any town in the commonwealth any engine, vehicle, object, or contrivance, the weight of which resting upon the surface of said highway or bridge exceeds 800 pounds upon any inch in width of tire, roller, wheel, or other object; which permits when duly granted shall authorize such movement. Said permits may be general or may limit the time and the particular roads and bridges which may be used, and may contain any special conditions or provisions which in the opinion of the authorities granting the same are necessary for the protection of said highway or bridges from injury. The authorities that have charge of any such bridge are hereby authorized to make regulations limiting the speed of any of the vehicles mentioned in this act passing over said bridge to a speed not to exceed six miles an hour, providing that notice is conspicuously posted at each end of the bridge affected by such regulation and load capacity of the bridge is stated therein.

Section 4—Any person violating the provisions of this act or regulations or permits granted under authority thereof shall be liable to a fine of not more than \$100 for each and every offense, and said fines shall be paid into the treasury of the commonwealth for use on state highways, or bridges, when state highways or bridges are injured, and into the treasury of the city, town or county when any highway or bridge is injured which is under the care of said city, town or county, for use on the highways of said city, town or county, in addition to any other moneys that may be available for that purpose.

## TWO NEW BILLS.

### Automobile Legal Association Will Ask Action by Massachusetts Legislature.

The Automobile Legal Association has given public notice that it intends to present two bills before the Massachusetts legislature for enactment at the forthcoming session. The first seeks a change in the punishment for operating recklessly or while under the influence of intoxicating liquors, from a fine or imprisonment to imprisonment only.

The second would compel drivers of horse drawn vehicles to carry lights after dark on any public highway. The present law in Massachusetts requires lights on such vehicles only

where street lamps are more than 500 feet apart, which is held to be a discrimination against the residents of rural communities.

## MARYLAND'S TRAFFIC STAND.

### Motor Truck Owners Are Assured of Fair Treatment in That Commonwealth.

Motor truck manufacturers, owners and users will be interested in the following letter received by the Automobile Chamber of Commerce from H. G. Shirley, chief engineer of the Maryland state roads commission:

We have under construction at present about 60 miles of concrete road. I believe that the concrete road is the coming county road to stand the heavy traffic of automobile trucks. We have no desire in this state to impede economical advancement of hauling with larger equipment than has heretofore been used, but the protection of life is also in our hands, and we must look out for the present structures, which are in such condition that it would be quite a waste of money to destroy them and build new ones, which would be capable of carrying the larger loads.

The bridges which we are erecting today will carry almost any load that can be hauled over a highway, as we design for a weight of 24 tons with a factor of safety of three, which would carry theoretically a 72-ton load. This, in my judgment, will be sufficiently strong. We also have many bridges which were designed for a six-ton load, which are now carrying 12, and they have been standing quite a number of years.

It is quite a difficult matter to decide just where to draw the line, but I think you will find that the officials of Maryland will always try to be reasonable, and try to draw the line where it will be fair to all concerned.

This letter has an important bearing upon the report that Maryland proposes to enact legislation this winter limiting the weight and speed of motor trucks. Governor Goldsborough has appointed a traffic commission to investigate motor trucking and other traffic conditions and to co-operate with the state roads commission in drafting a law that will be fair to all concerned. The Automobile Chamber of Commerce has called the attention of these commissions to the danger of restricting the development of economical hauling, if the limitation of weight is placed too low, and has pointed out that such restrictions may be taken advantage of by county and township road authorities to postpone the rebuilding of old, weak bridges and poor roads.

The annual show of the Washington Automobile Dealers' Association will be held in Convention hall, Washington, D. C., during the week of Jan. 19-24. The number of exhibitors who have taken space is such as to indicate that it will be the largest event of this character ever held in that city. The arrangements are in charge of a committee, of which T. Oliver Probey is chairman.

## NEW LINE OF REMY ELECTRIC MOTOR STARTERS.

**T**HE Remy Electric Company, Anderson, Ind., has announced its complete line, embracing starting motors, generators, combined motors and generators, combined generators with ignition, magnetos and ignition distributors. The company calls special attention to O. F. Conklin, who has been at the head of its engineering department for over 18 months, and who was secured for the sole purpose of adapting motors and generators to car requirements.

It is further pointed out that he is recognized as an eminent authority on lighting and motor starting systems, since he has been a designer and producer of direct current generators and motors for the past 27 years. Four years ago he gave his undivided attention to the adaption of his experience to electric motor car lighting

will be economical on account of the assortment of motors.

All armatures are standard drum wound, and rotate on high grade heavy duty ball bearings. Both the armature windings and commutator are designed with a large factor of safety to withstand heavy overloads. The brushes are special and carefully selected for this requirement. All motors are provided with inspection plates, exposing commutator and brushes for inspection. It is not necessary to explain the construction of the detailed parts, such as the manner of assembling core discs, commutator segments, placing of windings, etc., as their construction is standardized.

### Switch Types.

Either "push" or "pull" type of switches are supplied as occasion demands. From the illustrations it may be seen that both switches are plain and sturdy, with large copper current conducting parts. Model 20 is the push type and is to be mounted either on the motor side of the dash or under the floorboards, with only the push pedal protruding. The cover also forms the method for attaching the switch to the dash or floorboards. The model 22 is the pull type and is fitted with a base so that it may be conveniently placed in connection with the gear linkage.

The combination generator and starting motor is de-

**New Remy Electric Starting Motors: A, B, C and D, Models 5, 6, 4 and 9, Starting Motors; E, Model 20, Push Type Switch with Cover Removed; F, SL Combined Starting Motor and Generator; G, Model 20, Push Type Switch.**

and starting. Mr. Conklin is credited with having redesigned several of the successful systems now in use and also has acted as consulting engineer for other companies. He is well known in the wireless world, having developed considerable apparatus for both United States and Canadian companies. In designing the Remy equipment the fundamental laws of electricity have been strictly adhered to and it is stated that the designs are in no way radical or freakish, embodying principles which have been approved and are standard.

The Remy company builds four sizes of separate starting motors, designated as models 4, 5, 6 and 9. With these four motors several different windings are used, so that each car maker may be supplied with exactly the correct size starting motor his engine demands. All are efficient, six-volt, series wound, compact, ball bearing motors, developing ample power to spin engines at high rates of speed, and it is obvious that the operation

designated as model SL and is built in two sizes, with a number of different windings, as the Remy company states its policy is to carefully analyze the make of engine and then supply an instrument which will give the highest engine speed with the lowest possible current consumption.

The SL models may be termed "two-story" or "twin-cylinder" instruments, as the armature of the motor is superimposed over the generator armature, although the frame or field for both is a steel casting. It will be seen from the illustration that this unit is not composed of a motor and generator bolted together. The Remy company states that the two-armature instruments possess distinct advantages over the one-armature motor-generator, since for the most efficient and successful motor car operation the generator must be shunt wound, while the motor must be series wound and each with its own armature.

Unlike the single-armature motor-generator with its double winding and two-commutator armature, and generally two clutches, necessitating two points of attachment to the engine, the Remy company claims its two-armature instrument is less complicated, has but one over-running clutch and one point of attachment to the engine. On the SL either armature or either field might become disabled without affecting the other.

The output of the model SL generator is practically the same as the separate generator and the same third

brush regulating method is employed. The brushes of both motor and generator may be readily inspected by removing large inspection covers, which are placed in an accessible position.

#### **Employ Over-Running Clutch.**

An over-running clutch of the roller type is provided to disengage the motor armature and reduction gears, which remain idle and inoperative when the engine is once started and running under its own power, and it will be appreciated that the wear of the brushes and commutator of the motor is negligible as compared to the wear encountered on the single armature of the motor-generator, which revolves all the time the engine is running.

The generator armature is the only moving part under running conditions. Reduction gears of the spiral type are fitted to the motor armature and countershaft, to insure durability and quietness of operation. The other gears are of the spur type, and all are of hardened steel, and together with the over-running clutch are enclosed in an oil tight housing, thus affording both protection and lubrication. Provision has been made to prevent entrance of oil into the armatures or fields. An overflow is provided on the gear housing and an oil throwing device is fitted to the generator armature shaft. The gear reduction housing is supplied on either the left or right hand side as the occasion demands, and all terminals on the SL may be arranged to suit the motor car maker's requirements.

Rocking or back firing has no injurious effect on this SL apparatus, since the Remy company states that repeated tests of intentional back firing have thoroughly demonstrated that no injury can result therefrom, due to the excellence of construction, method of securing same and the low gear reduction.

The reverse current relay is placed on the dash and forms part of the simplified wiring plan. Its base is made of Bakelite and all terminals are plainly marked. Provision is made on the relay for two additional circuits, such as horn and inspection lamp, etc. The model SL proper is finished in black enamel and harmonizes in appearance with all different makes of engines.

### **ROCHESTER SHOW PLANS.**

#### **Sixth Annual Display of Dealers' Association in Exposition Park.**

The sixth annual show of the Rochester Automobile Dealers' Association will be held in the Exposition Park buildings, Rochester, N. Y., Jan. 24-31. This plan follows that which proved so successful last year, when three of the structures were placed at the disposal of the motor car and accessory exhibitors.

C. A. Simmons will again be in charge as manager, and he states that the display will be even larger than that of last year. One particular feature in the arrangement of the exhibits during the 1913 show was that of placing the accessory displays in the first building entered, so that it was necessary for each visitor to pass all of the accessory exhibits before reaching the car spaces. So satisfactory was this plan, it is anticipated it will be followed again this year.

J. P. LaVigne, formerly chief engineer for the LaVigne Gear Company, Detroit, is interested in the formation of the Advance Gear Company in that city, which will produce a new type of steering gear.

### **ENTERTAINS THE GOVERNOR.**

#### **Mr. Gray of Gray & Davis Takes Pleasure in Showing Him Over the New Plant.**

The new plant of Gray & Davis, Inc., in Cambridge, Mass., has held much of interest for the people of Massachusetts and other states, since it was opened late in 1913. Many distinguished visitors have presented themselves for a personally conducted tour of the building, to observe the modern manufacturing methods employed there and to watch the construction of the Gray & Davis starting and lighting systems, with which so many cars are now being fitted as standard equipment.

An accompanying illustration shows Eugene N. Foss, then governor of Massachusetts, and

**Former Governor Eugene Foss at Gray & Davis Factory.**

Mr. Gray of the company, upon the occasion of the former's visit to the plant during the closing days of his administration. His Excellency was much interested in the plant, which is one of Boston's largest industrial buildings, and spent a great deal of time watching each step in the manufacture of the electric equipment.

The many friends of H. R. Pickering, advertising manager for the New York & New Jersey Lubricant Company, New York City, will learn with deep regret of his death at his home in Roselle, N. J., Jan. 2. He had been in poor health for the past two years, but had been able to continue his active duties until within a very few days before the end came, and had planned to be present at the New York show.

## SUGGESTIONS FOR THE REPAIRMAN.

### Novel Method of Hot Water Jacketing the Intake Manifold by Utilizing Coil of Tubing---Inexpensive Mold for Casting Bearings.

**A** NEW YORK concern employing a fleet of commercial vehicles offered a bonus to the driver who obtained the greatest mileage on

**Novel Use of Spiral of Tubing in Intake Manifold and Using Hot Water from the Water Jacket of Cylinder.**

the lowest fuel consumption, and the prize was won through the invention and application of heat to the mixture, but in a manner differing from the usual methods. Not wishing to sacrifice the smooth running of the motor, and after trying several devices for increasing the mileage, the plan of heating the mixture within the intake manifold was tried and it is stated that excellent results were obtained.

The plan is shown in an accompanying illustration and it is very simple, although it involves a little labor. It consists of utilizing a coil of copper tubing inside of the manifold, and connecting the pipe with the water of the circulating system.

As will be noted by the drawing, one end of the tubing is tapped into the water jacket of the fourth cylinder and the other end to the pump, thereby forming a hot water circuit from the jacket, through the coil, and back to the pump. The copper tubing is bent to form a helix, and with annealed pipe it is an easy matter to obtain the required spiral on an ordinary broom handle.

Two half-inch holes are drilled in the intake manifold, through which the coil of tubing is threaded. The openings are closed by two small brass bushings, these also serving to retain the tubing in position. Auxiliary air is eliminated by sweating the tubing to the bushings. By the use of an ordinary pipe union at each end of the coil, the tubes leading to the water jacket and

pump are attached as shown in the drawing.

The driver points out that two advantages are obtained by the device. First, the incoming mixture is given a swirling motion, thereby breaking up any particles of fuel not vaporized by the carburetor; second, the heat prevents the possibility of condensation of the fuel and also makes for a more homogeneous mixture. It is stated that considerably more mileage was obtained from a gallon of gasoline and that the operation of the motor was improved.

### REBABBITTING BEARINGS.

In rebabbitting bearings it is important that the surfaces be clean in order that the anti-friction metal will adhere to the caps. The following method is suggested by the winner of the prize contest conducted by the Commercial Motor, an English print. The illustrations show the simplicity of the plan and it will be noted that a tube and portions of hacksaw blades form the core. It is pointed out that the most essential feature is the use of a .375-inch diameter Whitworth hole. This should be tapped through the centre of a small face plate to accommodate a clamping bolt.

A piece of asbestos, the overall size of which should be larger than the two halves of the bearing caps when placed together, is utilized, and a

**Easily Constructed Mold for Pouring Bearings, a Tube and Hacksaw Blades Forming the Core.**

hole drilled in its centre, slightly larger than that of the plate. The core is provided by iron piping of various diameters and according to the

size of bearings to be rebabbitted. The retaining bolt for the bearings is made from a piece of rectangular mild steel, having a .375-inch hole drilled through, and this placed across the top edge of the bearings serves as a clamp. Before tightening the brasses down, two pieces of hacksaw blades are placed between the two halves, so

as to separate the metal during the pouring.

Previous to placing the tube in position, it should be well coated with lamp black to prevent the metal sticking. The caps should be heated previous to the pouring and the caps clean. It is stated that the work results in a casting free from flaws.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**A** NEW style of universal joint termed the L has been brought out by the Blood Bros. Machine Company, Kalamazoo, Mich. The new

New Blood Universal Joint.

design is particularly adapted for use on cycle cars, and the maker states that it has been thoroughly tested. Where the angles are not over five degrees it is held that the new style is as durable and efficient as other types of joints.

As will be noted by the accompanying illustration, there are no bearings in the new joint. The two ends are connected together with heavy leather discs or rings that permit of flexibility without any lost motion or friction. Durability is emphasized in the construction. The maker states that owing to their simplicity and few parts, they can be produced at a cost considerably lower than that of the conventional types.

### MINIMAX PUMPING OUTFIT.

Herz & Co., New York City, is marketing a portable type of electric air compressor, termed the Minimax garage pumping outfit. It is a complete air compressor equipment mounted on a truck having a convenient handle for moving the unit as desired. A feature of the truck is the use of a metal tray which is sufficiently large to accommodate tools in addition to the motor, pump and tank.

The air compressor is a double-cylinder pump with cranks set at 180 degrees. The cylinders have a bore of 1.375 inches and stroke of 2.5, and the operating speed is 400 revolutions a minute. The height is 11 inches, width 3.5. The electric

motor is rated at .25 horsepower, and is supplied for direct or alternating current and different voltages. The gears driving the pump are accurately cut, of high grade material, and are enclosed by a guard.

The tank is of cast iron, and all air passing to it flows through a check valve of special design. The tank is 20 inches long and nine inside diameter. The capacity of the tank is equivalent to 5.5 gallons of water. It is tested to a safety pressure of 250 pounds. A safety valve is placed behind the manometer and may be set to a pressure up to 125 pounds, and the valve is stated to be very accurate in its action and will not require attention.

One of the qualities of the equipment is that all wires between the motor and the switch are carefully protected against damage or leakage of current. Connection to the supply of electricity is by a cord and a lamp socket. The equipment includes a starting switch and suitable length of steel covered hose to connect with the tire, etc. The maker states that the Minimax will inflate several tires from the supply in the tank and that the cost of operating is but a few cents a day. The workmanship and material are first class in every respect. Price list and complete details of the Minimax equipment will be forwarded on request.

Minimax Garage Pumping Outfit Marketed by Herz & Co.

## ACCESSORIES AT THE BOSTON SHOW.

**S**INCE it became known that the Motor & Accessory Manufacturers had declined to issue a sanction for the big Boston show this year, thus confining exhibits by the makers themselves to the national displays in New York and Chicago, there has been much interest in the result of this action. The show will be held March 7-14, and sufficient information is now at hand to make possible a definite prediction with reference to this phase of the situation.

Members of the Motor & Accessory Manufacturers will be unable to make display direct as in past years, but they will be represented by jobbers, and in many instances these jobbers have made arrangements with the factory to ship the exhibits used at New York and Chicago direct to Boston, so that, in effect, this portion of the accessory display in Boston will be exactly like that made in the national shows. In addition, many members of the association who were not represented in New York or Chicago, particular reference being made to several well known tire concerns and makers of other lines, will be represented in Boston through jobbers. This, in itself, is sufficient indication that the accessory department in Boston will be larger and more complete than elsewhere in the country, but, in addition, several concerns who are not members of the association have applied for and have received space allotment. In fact, there have been so many applications for space in this department that effort is now being made to secure additional room.

Of course, the pleasure car department will retain its position of supremacy. The Boston show has long held first place among the exhibitions in this country for number of makes on display, and in this respect there will be no change this year. During the past two years the Boston display has been remarkable from the fact that several motor car manufacturers have waited until that time before announcing new models, and there is every reason for anticipating that this plan will be followed yet once more. Applications already have been received from motor car producers who are not to be seen at either of the national shows.

Its reputation as a business producer has placed the annual Boston show in a class by itself, and, as in past years, there is considerable competition between those concerns not already represented by dealers in that city. The show is given under the auspices of the Boston Automobile Dealers' Association, and members of that

organization have first choice in the awarding of space. Those who do not have representation in New England are particularly anxious that their product shall be so placed that full opportunity may be had to make comparison, and for this reason applications are made early. This gives the show management opportunity to announce definitely that the number of makes will exceed those seen either in New York or Chicago.

The decision of the Automobile Chamber of Commerce to hold no national show of commercial vehicles this year, gives Boston still another opportunity to lay claim to premier honors. There is little doubt that the exhibition of motor trucks and business wagons, with their accessories, which will follow that of pleasure cars, March 17-21, will prove the most important event of this character during 1914. The number of actual sales which resulted during the Boston commercial vehicle displays of 1912 and 1913 has had its effect upon the dealers and manufacturers, and the advance application for space has been exceedingly large.

As stated, the pleasure vehicle show will be under the auspices of the Boston Automobile Dealers' Association, while the commercial vehicle display will be in charge of the Boston Commercial Motor Vehicle Association. Both will be held in the Mechanics' building, and both will be under the personal direction of Chester I. Campbell, who has been manager of all the automobile, motor boat and aeroplane shows held in that city.

---

Judge F. A. Geiger of the United States district court for the eastern district of Wisconsin, has issued a decree, granting a permanent injunction against the C. A. Shaler Company of Wau-pun, Wis., prohibiting the production of portable vulcanizing devices for tires containing or embodying the invention protected by the so-called Adamson patent, No. 1,057,911. The action was brought by the Adamson Manufacturing Company of East Palestine, O.

---

The annual show of the Kansas City Motor Car Dealers' Association will be held in Convention hall, Feb. 16-22, under the management of E. E. Peake, secretary of the association. Already all of the space set aside for the display of pleasure cars and trucks has been taken, and no dealers will be represented in this section except those who are members of the organization.

## GENERAL NEWS OF THE INDUSTRY.

### Hess-Bright Company Loses Suit Against the J. S. Bretz Company---Briscoe Freres Secures Factory in Jackson, Mich.---Other Changes in Production Plans.

JUDGE McPherson of the United States district court in Philadelphia has handed down a decision in the suit of the Hess-Bright Manufacturing Company of that city and the Deutsche Waffen und Munitions Fabriken of Germany, against Hedwig Fichtel and Ernst Sachs of Germany, doing business as Fichtel & Sachs, and their exclusive American representative, the J. S. Bretz Company of New York. Decision is for the defendants.

The action was brought in 1911, and the complaint alleged infringement of the so-called Conrad patents, covering, among other features, the continuous and uninterrupted race type of construction in a ball bearing. The patents are owned by the German concern first named above, the Hess-Bright company being its exclusive American licensee. The decision is of importance, as it is held to apply to the ball bearings made by a large number of concerns, including the makers of the Malliet et Blynn of France, R. I. V. of Italy, Schafer, H. C. B., Ideal and Rhineland of Germany, S. R. O. of Switzerland, and New Departure and U. S. in this country.

It is understood that the Hess-Bright interests will take an appeal and that further action will be prosecuted with vigor.

#### SINGER AGAIN PRESIDENT.

##### Replaces Clyde D. Knapp as Head of Palmer & Singer Manufacturing Company.

At a special meeting of the board of directors of the Palmer & Singer Manufacturing Company, Long Island City, N. Y., Dec. 31, Clyde D. Knapp retired from the presidency of the concern, and Charles A. Singer, Sr., was elected to fill the vacancy. Mr. Singer was for many years president of this company, previous to Aug. 27, 1913, at which time he retired and Mr. Knapp was promoted from the office of vice president.

It was announced at that time that Mr. Singer had been relieved of the duties of president in order that he might be free to devote his entire time and attention to the production of the new Palmer-Singer models, fitted with the Magic motor. It is assumed that the announcement of these new models may have had some connec-

tion with the most recent action of the board.

As an indication of the esteem in which Mr. Singer is held by his fellow associates, it may be stated that upon the occasion of his re-election the officers and employees of the company presented him with a beautifully engraved, gold inlaid, silver cigar case, with an appropriate inscription thereon.

#### BENJAMIN BRISCOE'S CAR.

##### Lewis Spring & Axle Company to Produce American Models for Briscoe Freres.

By a contract, the terms of which became known Jan. 1, the Lewis Spring & Axle Company, Jackson, Mich., becomes the American manufacturing end of Briscoe Freres of Paris, France. The company is said to be equipped with a factory and machinery valued at \$1,400,000, and to be in an excellent position to produce the new machines.

Briscoe Freres is composed of Benjamin and Frank Briscoe, who are already well known to the American automobile industry, through their connection with the old Maxwell-Briscoe Motor Company, the United States Motor Company, and a number of other concerns. The new car was first revealed at the recent Paris Salon, and is being displayed at the national shows in this country.

It is stated that for a long time the Jackson company has been making a large number of parts for automobiles, these not being confined to the items indicated by the firm name. A portion of the plant has been devoted to the manufacture of motors. Briscoe Freres believes the Lewis Company is eminently well fitted to take charge of American production of Briscoe line.

#### CONNERSVILLE CONCERNS UNITE.

##### Makers of Howard and Lexington Cars Combine Under New Charter.

A certificate of incorporation has been filed with the secretary of state in Indianapolis, Ind., for the Lexington-Howard Company of Connorsville, with capital of \$150,000. It is under-

stood that this is the result of a combination between the Howard Motor Car Company and the Lexington Motor Car Company, and that the new concern will produce both the Howard and the Lexington cars.

The directors of the new company are E. W. Ansted, J. E. Huston and F. I. Barrows. It is stated that machines will be produced on a large scale during the coming season.

### BUICK'S ANNUAL REPORT.

#### Flint Company Makes Public the Statement of Its Financial Condition.

The Buick Motor Company, Flint, Mich., has filed a statement of its financial condition, dated Dec. 9, 1913, which gives the following figures:

| Assets.                          |              |
|----------------------------------|--------------|
| Real estate .....                | \$72,284     |
| Machinery .....                  | 51,669       |
| Material, stock in process ..... | 5,638,927    |
| Furniture .....                  | 61,984       |
| Cash and debts receivable .....  | 4,453,951    |
| Investments .....                | 516,400      |
| Other assets .....               | 4,370,321    |
| Total .....                      | \$15,065,536 |
| Liabilities.                     |              |
| Capital stock .....              | \$2,500,000  |
| Accounts payable .....           | 2,189,094    |
| Floating debt .....              | 2,013,099    |
| Surplus .....                    | 8,363,343    |
| Total .....                      | \$15,065,536 |

### TO PRODUCE KEETON CARS.

#### American Voiturette Company Assumes Manufacture of Large Machine.

Announcement is made by Charles B. Shaffer, president of the American Voiturette Company, Detroit, that it has completed arrangements with the Keeton Motor Company of that city, whereby the Keeton cars will be produced by the former concern in the future. It is understood that outward appearance and name of the Keeton will remain unchanged, while the mechanical construction and details will be given every consideration consistent with sound engineering practise.

The American Voiturette Company was organized early last year for the purpose of producing the Car-Nation, in three models. This machine has been classified as a cyclecar, insofar as the two two-passenger models are concerned; but it is also produced as a touring car. Many of those interested in the manufacture of the Keeton machine were connected with the other company, although some of these withdrew from the older concern last summer.

Mr. Shaffer was a minority stockholder in the Keeton company. The other officers of the American Voiturette Company are: Vice president and general manager, W. H. Newsom; secretary and treasurer, C. B. Lewis; assistant secretary and treasurer, C. P. Jones.

It is explained by Mr. Shaffer that, owing to the fact that the field for a car of the class and type of the Keeton is somewhat limited, it has been decided best to have it made in conjunction with the Car-Nation. He adds that the company will build a limited number of the new Keetons for the 1914 season, but every one of them will be of the quality and construction that makes a car a continual source of pride and satisfaction to the owner.

### IS NOW SALES MANAGER.

#### C. F. Ames Retires from Cushion Wheel Concern to Enter Tire Field.

Cortland F. Ames, who has been located at 1241 South Michigan boulevard, Chicago, as distributor of the Sewell cushion wheels for motor trucks, has resigned all connection with that product to take the position of sales manager for the Devine Tire Company. His office is now at 2021 Michigan avenue, Chicago.

The Devine Tire Company produces the Devine indestructible fabric tire, which is said to be composed entirely of cotton duck. It is maintained that it cannot be cut, torn or chipped off, under the most severe service, and that it will give maximum traction under all conditions of road surface.

### HAVOLINE VS. VALVOLINE.

#### United States District Court Holds There Is No Unfair Competition.

Judge Mayer of the United States district court for the southern district of New York has handed down a decision in the case of the Valvoline Oil Company of New York City against the Havoline Oil Company and the Indian Refining Company, which controls the Havoline product, also of that city, in which it is held that the similarity of the names is not such as to constitute an infringement of trade mark rights. The plaintiff asked for an injunction restraining the defendants from using the name in connection with the production and marketing of automobile lubricants.

Judge Mayer finds no similarity in the con-

tainers or labels, or in their colors. In his opinion there is sufficient difference in the two names so that they do not convey the same meaning to the purchaser. The complaint is therefore dismissed.

### DIVIDES WITH EMPLOYEES.

#### Ford Motor Company to Distribute \$10,000,000 Among Its Men in 1914.

Announcement is made by James Cousens, treasurer of the Ford Motor Company, Detroit, that that concern will divide some \$10,000,000 among its workmen during 1914. The plan is outlined in the following statement:

We have estimated our earnings for the coming year at \$10,000,000, and, dividing as we go, or, in other words, as we earn it during the year, will distribute \$10,000,000 in the pay envelopes in semi-monthly payments. Our firm belief is that the division of earnings between capital and labor is not fair at present and that labor is entitled to a greater share. We desire to express our belief in this direction in some practical way and have therefore adopted this plan.

It means in substance that no man over 22 years of age will receive less than \$5 for eight hours' work. Others will be compensated in relation to their value, using \$5 per day as the minimum. We have reduced our hours from nine to eight and are running 24 hours per day. We hope to carry out this plan during 1914, and whatever future plans we make are dependent upon conditions; but we hope to be able to make a further distribution at the end of the year, after having laid aside proper amounts for dividends, extensions and the construction of assembly plants throughout the country.

The minimum wage per day, outside of the distribution in pay envelopes, is now \$2.34 for nine hours, which has now been reduced to eight hours. We believe this distribution from day to day will enable the men to improve their living conditions and to be prepared in case of sickness or other misfortunes. Men under 22 years of age will be dealt with as their individual circumstances appear best to us; it being the intention where they are industrious, honest and saving to do the same with them as with others, as soon as our investigations have been concluded. Men under 22 years of age, who are the support of their parents or younger brothers and sisters, will be promptly put on the same basis. We hope to so arrange our production that, in case it is ever necessary to shut down or to slow up, we will do so during the months of harvest, so the farmers may be supplied with men from our plant.

This may not be a plan for any other concern but ours, but we are in hopes that other employers will recognize the unequal distribution of earnings and endeavor in their own way to make a better division.

### SPARK PLUG ORGANIZATION.

#### Forty Manufacturers Meet for This Purpose During New York Show.

One of the important gatherings during the week of the New York automobile show was that of some 40 manufacturers of spark plugs, which was called at the instance of A. R. Mosler, president of A. R. Mosler & Co., Mount Vernon, N. Y. The meeting followed a banquet at the Hotel Astor, at which the guest of honor was

William A. Redding, patent attorney, and the chief topic of discussion was the recent decision respecting the so-called Canfield spark plug patent.

A second meeting will be held in the near future for the purpose of completing the organization of the spark plug manufacturers, and to this end the following committee was appointed: D. B. Mills, Rajah Supply Company; Albert Champion, Champion Ignition Company; R. A. Stronohan, Champion Spark Plug Company; David Smith, Standard Company; E. H. Schwab, Silvex Company, and Otto Heinze, Bosch Magneto Company.

It is expected that the organization will be composed of manufacturers licensed to produce spark plugs under the Canfield patent, which is owned by the Mosler company. It is stated that 23 leading manufacturers already hold such licenses.

### NEW CONTEST HEAD.

#### Kennerdell Succeeds Schimpf—Vanderbilt and Grand Prize in February.

At a meeting of the executive board of the American Autotomobile Association, held in New York City during the progress of the show, Richard Kennerdell of Franklin, Penn., was selected as chairman of the contest board, vice William Schimpf of Brooklyn, N. Y., who assumed the position upon the death of S. M. Butler, during the Glidden tour of 1911, and was re-elected for 1912 and 1913. Mr. Schimpf declined further re-election, and Mr. Kennerdell is considered an excellent choice, from the fact that he has long been interested in contest work, dating from the bicycle days, and is in a position to do considerable travelling so as to be present at various important events.

The contest board also decided upon definite dates for holding the 1914 Vanderbilt Cup and Grand Prize events. The former will be held Feb. 21 and the latter Feb. 28. Although sanctions actually have not been granted, it is expected that they will be issued early next month. The races will be held over the Santa Monica course, and the details are being arranged by Leon T. Shattler of Los Angeles, who was in New York during the show for the purpose of interesting manufacturers and others.

The national good roads board was empowered to hold a federal aid conference in Washington in connection with national roads legislation. A committee, consisting of L. R. Speare,

S. A. Miles and A. G. Batchelder, has been appointed to arrange for a midsummer meeting of the association to be held in the White Mountain region of New Hampshire.

### BRISCOE MOTOR COMPANY.

**Organization Perfected in New York with Horace DeLisser as President.**

Elsewhere in this issue appears a statement that the Lewis Spring & Axle Company, Jackson, Mich., is to produce the Briscoe car in this country for the Briscoe Freres of Paris, France. This statement is a trifle misleading, in the light of subsequent events, although it is now understood that this company will actually manufacture the machines for the Briscoe Motor Company, which was organized in New York City, Jan. 6.

**Horace DeLisser, President, Briscoe Motor Company.**

It would appear that the Briscoe Motor Company was the American representative of Briscoe Freres. At the organization meeting in New York, Horace DeLisser, formerly associated with Benjamin Briscoe, the former as vice president and the latter as president of the United States Motor Company, and now with the Ajax-Grieb Rubber Company, was elected president. It is understood that he will not sever his connection with the tire concern, at least for the present. The other officers are: Vice president, W. F. Smith; secretary and treasurer, L. E. Latta.

### NEW PUMPING OUTFIT.

**Gemmer-Detroit Starter Company Making Display at New York and Chicago.**

The Gemmer-Detroit Starter Company, 712 Ford building, Detroit, exhibited at New York,

and will display at Chicago, a new portable air storage pumping outfit. This is made in two sizes, one being intended for public garage service and the other for private and smaller public garages.

The larger outfit is equipped with a tank of sufficient capacity to fully inflate 15 34 by four-inch tires or partially inflate 30 or more. It also comprises a four-cylinder pump, with bore of 1.5 inches and stroke of 1.75. The smaller equipment has a two-cylinder pump, with bore and stroke of 1.5 inches, and a tank with sufficient capacity to fully inflate six 34 by four-inch shoes, or partially inflate 12 or more.

The pumps of both outfits are driven by standard electric motors at such speed that the smaller tank will be filled from zero to 150 pounds pressure in about 18 minutes, or replenished from 75 pounds in 10. The larger has such capacity that the tank will be filled from zero to 175 pounds in 20 minutes and replenished from 75 in about 14 minutes.

Another feature of these is held to lie in the construction of the running gear, which consists of strong metal strips welded directly to the tanks. The wheels are rubber tired and of the swivel type, which permits the outfit to be moved easily in any direction. The handle always is held in an upright position by means of a spring. Valves and pipe connections are used throughout so as to prevent leakage. The pumps have cast iron pistons and rings, special bronze connecting rods and ground crankshafts.

Louis H. Moos, trustee of the Carhartt Automobile Sales Company, has issued an announcement that assets of that company will be sold at public auction at Morgan & Bros.' storage warehouse, 232 West 47th street, New York City, Jan. 15, at 10:30 in the morning.

The 12th annual automobile show of the Cleveland dealers will be held in that city Jan. 10-17. The event is under the auspices of the Cleveland Automobile Show Company, the sanction and co-operation of the Cleveland Automobile Club, and the active management of Fred H. Caley.

The employees of the Republic Rubber Company, Youngstown, O., will hold a formal opening of their new clubhouse in that city Jan. 15. The following compose the board of governors: Chas. A. Miller, Daniel Evans, Oscar Watkins, N. W. Sayles, C. C. Porter, A. H. Harris, Jacob Dieter, J. H. Kelly and Thomas L. Robinson.

## EFFECT OF NEW TARIFF ON IMPORTS.

SOME little interest attaches to the first monthly report of the Department of Commerce since the new Underwood tariff went into effect. This applies particularly to the automobile industry, because the rate on chassis was reduced from 45 per cent. to 30 per cent. By far the larger proportion of foreign cars shipped to this country are sent in with stripped chassis, the bodies being constructed on this side. It readily will be seen that the new tariff should have an important bearing upon the number of machines imported into the United States.

At the other hand, it will be conceded that the results as indicated by the first monthly report hardly can be regarded as a criterion, since the new rate was decided upon in conference a few hours before the bill was enacted into law. It will be understood, therefore, that an intending purchaser would have little opportunity to give an order and have it filled during this first month.

The new law went into effect Oct. 4, and the report covers the month of October after that date, the entries for the first three days under the tariff law of 1909 being included in the report for September, previously presented in these columns. The report for October shows the following, as compared with the same month in the year 1912:

| Country—             | 1912 |           | 1913 |          |
|----------------------|------|-----------|------|----------|
|                      | No.  | Value     | No.  | Value    |
| France .....         | 51   | \$105,754 | 15   | \$38,961 |
| Germany .....        | 1    | 762       | 1    | 8,000    |
| Italy .....          | 7    | 13,324    | 6    | 11,455   |
| United Kingdom ..... | 8    | 24,318    | 5    | 16,691   |
| Other countries..... | 11   | 26,252    | 2    | 4,539    |
| Totals.....          | 78   | \$170,410 | 29   | \$74,646 |

It would appear from this tabulation that there had been a decided falling off in the matter of imports, even though the duty was reduced one-third. The figures are of interest as having a bearing on the subject, although they probably do not offer any conclusive evidence as to the manner in which the new tariff rate will affect the industry.

In this connection it also is of interest to note the report with reference to exports of automobiles during the same period. The following tabulation gives these figures, in comparison with those for the same month in 1912:

| Country—               | 1912 |             | 1913 |             |
|------------------------|------|-------------|------|-------------|
|                        | No.  | Value       | No.  | Value       |
| France .....           | 42   | \$24,820    | 59   | \$35,759    |
| Germany .....          | 45   | 45,432      | 32   | 27,923      |
| Italy .....            | 13   | 9,785       | 18   | 19,172      |
| United Kingdom .....   | 265  | 219,578     | 283  | 250,298     |
| Other Europe .....     | 62   | 54,103      | 82   | 91,421      |
| Canada .....           | 405  | 491,133     | 298  | 423,016     |
| Mexico .....           | 17   | 30,719      | 24   | 41,354      |
| West Indies, etc. .... | 35   | 32,418      | 35   | 36,110      |
| South America .....    | 191  | 202,610     | 182  | 181,230     |
| British Oceanica ..... | 264  | 230,665     | 356  | 310,163     |
| Asia .....             | 186  | 167,072     | 231  | 221,694     |
| Other countries .....  | 87   | 75,477      | 176  | 150,087     |
| Totals.....            | 1612 | \$1,583,812 | 1776 | \$1,788,222 |

## COMPARATIVE COMPILATION FOR FIRST 10 MONTHS.

| Exports—                | 1911   |              | 1912   |              | 1913   |              |
|-------------------------|--------|--------------|--------|--------------|--------|--------------|
|                         | No.    | Value        | No.    | Value        | No.    | Value        |
| France .....            | 336    | \$413,030    | 585    | \$439,313    | 714    | \$546,090    |
| Germany .....           | 95     | 112,121      | 392    | 316,201      | 890    | 775,466      |
| Italy .....             | 167    | 192,339      | 254    | 224,436      | 277    | 241,180      |
| United Kingdom.....     | 2,776  | 2,407,373    | 4,207  | 3,163,696    | 4,183  | 3,184,530    |
| Other Europe.....       | 685    | 635,378      | 1,340  | 1,098,761    | 1,565  | 1,355,249    |
| Canada .....            | 4,800  | 4,770,911    | 6,393  | 7,704,772    | 5,558  | 7,473,333    |
| Mexico .....            | 210    | 351,007      | 198    | 320,592      | 199    | 362,733      |
| W. Indies and Bermuda   | 236    | 270,994      | 273    | 283,116      | 405    | 397,538      |
| South America .....     | 766    | 967,358      | 1,586  | 1,817,988    | 2,271  | 2,554,210    |
| British Oceanica.....   | 1,729  | 1,602,383    | 2,849  | 2,586,185    | 2,774  | 2,585,389    |
| Asia and other Oceania. | 645    | 647,067      | 1,321  | 1,310,323    | 2,001  | 1,969,777    |
| Other countries.....    | 221    | 238,161      | 620    | 570,728      | 1,892  | 1,644,585    |
| Totals.....             | 12,196 | \$12,608,127 | 20,018 | \$19,836,111 | 22,729 | \$23,090,080 |
| Imports—                | 1911   |              | 1912   |              | 1913   |              |
|                         | No.    | Value        | No.    | Value        | No.    | Value        |
| France .....            | 262    | \$567,665    | 384    | \$914,639    | 158    | \$370,272    |
| Germany .....           | 129    | 280,385      | 45     | 105,131      | 78     | 205,931      |
| Italy .....             | 100    | 159,188      | 80     | 129,551      | 74     | 137,373      |
| United Kingdom.....     | 127    | 305,531      | 115    | 278,583      | 42     | 128,993      |
| Other countries.....    | 155    | 344,512      | 70     | 145,680      | 65     | 140,876      |
| Totals.....             | 773    | \$1,657,281  | 694    | \$1,573,584  | 417    | \$983,445    |

These two tabulations indicate that while there was a decrease in imports amounting to very nearly 57 per cent., there was a gain in exports of approximately 13 per cent. The balance of trade appears to be very greatly in favor of the United States, and this is still further indicated in the accompanying tabulation for the first 10 months of 1913.

A new ordinance has been passed by the city council in Chattanooga, Tenn., which stipulates that every motor vehicle "be equipped with a Klaxon or other signal sufficient in character and volume to give ample warning to pedestrians and drivers of vehicles". It also rules against the unnecessary use of signals by providing that they shall be used only "as a warning of danger".

## INTERESTING NEW TYPES OF MOTORS.

**Speedwell and Westinghouse Rotary Valve Models—Fischer-Magic Crescent Valve Design—Carter Piston Valve—Weidely Overhead Camshaft Distinctive.**

**W**HETHER or not the poppet valve motor is eventually to be replaced by some other type of engine, as is maintained by engineers who are working upon these new types, it is certain that there is decided interest in the subject on the part of both manufacturer and user. There are today seven American makes of automobiles fitted with four different types of non-poppet valve engines, as follows: Stearns, Lyons, Moline and Willys with the Knight; Speedwell with the Mead; Palmer-Singer with the Magic, and Great Western with the Carter.

The Knight motor is regarded as the first successful non-poppet valve engine, and its constructional features are fairly well understood, although the details have been worked out a trifle differently in the several cars employing the design, in brief, it is a sliding sleeve valve type, in which

**Sectional View of Magic Motor, Showing the Crescent Valves and Cams.**

one sleeve operates within another, and both are located within the cylinder, between the cylinder wall and piston.

### **Rotary Valve Designs.**

The engine utilized by the Speedwell was announced as optional equipment with that car during the New York show of 1913. It is now standard, but the purchaser has an option of securing the older Speedwell poppet valve motor if he so desires. In other words, the conditions are exactly the reverse of what was true a year ago. It does not seem necessary to include a description of this engine in this discussion, beyond recalling that it is a rotary valve design, in which there has been little change, except in refinement of details making for more efficient operation of the valve cylinders, which lie along the top of the motor casting at either side.

Several other rotary valve engines have made their appearance in this country in an experimental way, and a number of motor car manufacturers are known to have been very much interested in them. One of the newest is that now being considered by the Westinghouse Machine Company, Pittsburg, Penn. It is impossible to give full details concerning this motor, because the company is not yet ready to make them public. However, it may be stated that it is designed to employ but one rotary valve, that being located directly in the head.

### **Westinghouse Valve Cylinder.**

A portion of the valve cylinder, which is hollow, is cut away, or nicked, to form a means for conveying the incoming mixture and exhaust. As the valve cylinder revolves, this nicked portion registers with the intake and exhaust manifolds in turn. It will be understood that the interior of this cylinder is circular in form except at those places where the nicks contract this contour, the nicks being so disposed as to supply each cylinder in proper timing order.

The valve cylinder is cooled by the circulation of oil. A pump at the forward end of the motor forces the lubricant up a tube to the front end of the cylinder, thence through the hollow cylinder to the rear end, whence it enters another tube and lubricates gears and bearings operating other components of the engine before being filtered and utilized again. Additional information concerning the motor is not available at this time.

### **Fischer-Magic Crescent Valve.**

The motor utilized by the Palmer-Singer, although the company is still producing a car equipped with a poppet valve engine, had its origin in Switzerland, where it is known as the Fischer. In America the design has been termed the Magic, and it is so designated by the Palmer & Singer Manufacturing Company, which is a licensee of the Fischer Motor Corporation of New York City. The design is termed a crescent valve motor.

In an accompanying illustration, these crescent valves may be noted at either side of the cylinder. The inner concave surface is in contact with the piston and is flush with the cylinder walls. The outer convex surface is in contact

with the water jacket, and is ribbed to permit of efficient lubrication at that point. Each valve extends the entire length of the cylinder, and is operated by a cam at the lower end.

The mixture enters and leaves the explosion chamber through openings near the top of the valve. Both valves are held in their correct position in the walls of the cylinder by the piston rings and the so-called master ring in the cylinder head. Whenever the valve moves, as it must in order that the opening may register with the intake or exhaust manifold, as the case may be, it is with and not against the movement of the piston, thereby reducing wear to a minimum. Both valves are at rest during the explosion stroke. There are no springs, and it is maintained that the valve movement is positive, insuring full port openings and absolutely correct timing.

#### Carter Piston Valve.

The Carter motor is made by the Model Gas Engine Works, Peru, Ind., and is offered by the Great Western Automobile Company of that city as optional equipment. It is of the piston valve type, which may be taken to mean that there is a second piston working in the cylinder above the so-called working or power piston. The cylinder is bored straight through, and the upper piston carries three compression rings, practically the same as the power piston, and on the extension at the base are two expansion rings A A, which close the intake port C and the exhaust port D as the piston is moved up and down.

The piston valve is actuated by a camshaft, being fitted at the top with a standard wristpin G and a roller H, which contacts with the central cam F. The bridge I across the top of the piston contacts with the two outside cams E E at all times, and the roller H and cam F also are always in contact. The cams are so ground that each movement of the upper piston corresponds to that of the ordinary poppet valve of the standard motor, insuring positive movement of the piston valve in either direction.

In an accompanying drawing the motor is shown with the exhaust port open and the power piston on the exhaust stroke. Beginning the suction stroke, the cam F moves the upper piston down until the intake port C is open, and the exhaust port D is closed simultaneously. Near the end of the suction stroke and the beginning of the compression stroke the position of the rings A A is indicated by the dotted lines, closing both the exhaust and intake ports. Near the conclusion of the explosion stroke the piston valve again moves upward, until the exhaust port is fully open as shown in the drawing.

#### Weidely Motor Distinctive.

One of the features claimed for all non-poppet valve motors is silent operation, and it cannot be denied that the success of these engines has resulted in decided improvement in this respect in poppet valve types. Few changes have been so radical, however, as those indicated by the new Weidely motor installed in 1914 Premier cars. This

Transverse and Sectional Views of Carter Piston Valve Motor, Revealing the Pistons, Valves, Overhead Camshaft and General Details of Construction.

is a poppet valve engine of the valve-in-the-head type, but the arrangement of the components is such as to make it decidedly distinctive in design.

The six cylinders are cast in a block with the entire crankcase and intake header. The cylinder head is another unit and carries all the valves and the camshaft, while covering it is another smooth plate that makes an oil tight housing for the valve mechanism. Even the water pipes have been eliminated, the radiator being bolted to the motor itself without rubber connections.

#### How Valves Are Operated.

The valves are large, and there are no cages, the valves seating right in the head casting. Each

valve overhangs the cylinder bore slightly, and it is maintained that in the event of a stem breaking the valve could not fall into the cylinder. There are no rocker arms, the camshaft being directly above the ends of the valve stems, but between the cams and the stem ends is the end of a very light steel finger pivoted at the outer end. This carries the adjustment by which wear may be taken up and replaces the usual valve stem adjustment.

With reference to the drawing, the camshaft C is driven by means of a worm A and worm wheel B, which is connected with another worm and worm wheel assembly on the crankshaft by means of a vertical shaft. D indicates the steel finger. Lubrication of the camshaft bearings and cams is accomplished by means of a rotary sleeve on the top of the pump, which distributes oil through a pipe leading to the centre bearing. The bearing is grooved and the camshaft is drilled so

burn, Ind., in an Imp, made by the Imp Cyclecar Company of that city, accompanied by W. B. Stout of Chicago. The party left Detroit Dec. 30 and came through to New York in nine days.

The other machine was a Zip, made by the Zip Cyclecar Company, Davenport, Ia., and driven by Hugh Hughes, well known as a racing driver. He left Chicago, Christmas Day, and the trip required 14 days.

### RUDGE-WHITWORTH WHEELS.

#### Standard Roller Bearing Company Seeks Injunction Against Houk Interests.

Rudge-Whitworth, Ltd., of England, and the receivers for the Standard Roller Bearing Company, Philadelphia, have brought suit against the Houk Manufacturing Company, Buffalo, N. Y., seeking an injunction restraining the last named concern from using the name Rudge-Whitworth, and also to prevent it from manufacturing and selling wire wheels embodying the features covered by the Rudge-Whitworth patents.

It is maintained by the plaintiffs that the Standard Roller Bearing Company has the sole right in the United States to use this name, and that it is the only company in this country licensed to manufacture, or have manufactured, wire wheels embodying these patents. This is the first suit brought in America

under these patents and the outcome will be awaited with interest.

**Correction of Error**—In a recent issue attention was called to the new four-story addition occupied by the Champion Spark Plug Company, Toledo, O., in which it was stated that the building gave the company 40,000 square feet more of floor space and increased the minimum capacity to 75,000 a year. The latter figure is minus three ciphers. The capacity of the plant is 75,000,000 plugs a year, or about 25,000 a day.

The Society of Automobile Engineers has made the Institution of Automobile Engineers of Great Britain a Christmas gift of a handsomely bound book containing clippings relative to the American trip of the latter organization in 1913.

Sectional View of Weidley Engine, Also Cylinder Head Carrying Valves and Camshaft, and Cover Plate.

that the passage of lubricant to the bearings is uninterrupted. The rest of the valve mechanism is bathed with oil by streams that issue from the backs of the cams. In the centre of the cylinder head casting is a well in which the camshaft gear revolves and the oil from the camshaft bearings keeps this filled so that the worm wheel turns in a bath of oil, as does the worm on the vertical shaft, and its bearings.

### TWO CYCLECARS ARRIVE.

#### Imp and Zip Make Long Overland Trips to Attend New York Show.

During the progress of the New York show, two long distance cyclecar trips came to an end in front of the Grand Central Palace. One of these was accomplished by W. H. Smith of Au-

## ACCESSORY EXHIBITORS AT NEW YORK.

Brief Description of Displays of New and Standard Supplies, Parts and Fittings Made by Prominent Concerns in the Industry at Grand Central Palace.

**A**CCESSORIES were displayed at the New York show on the third and fourth floors of the Grand Central Palace, and while there were a number of well known concerns in this field who were not represented this year, having withdrawn from all national exhibitions, the lines were generally most complete. The most noticeable absentees were among the tire manufacturers. No attempt is made herein to give a detailed description of the various lines on display, but rather to call to mind the manner in which the most prominent exhibitors in the respective sections directed attention to their products.

### Apple Electric Company.

Dayton, O.—The well known Apico electric lighting,

Anthony hand tire pump was another feature of the display.

### Brown Company.

Syracuse, N. Y.—In addition to the line of Brown and Brown Jr. tire pumps heretofore produced by this concern, there was exhibited a new four-cylinder gear driven pump, for which entirely new constructional features are claimed. Another new accessory for this firm was a deflecting electric headlight, equipped with a movable shade that cuts out the upper rays of light, the control being by push button. Still another was a primer for Ford cars.

### Cataract Rubber Company.

Boston, Mass.—Although the number of tire exhibitors was not as large as in previous years, there were several well known concerns in this field who made display, and among these was the maker of Cataract tires. A full line of pleasure and commercial vehicle tires was shown, these including the plain tread, break-skid tread, pneumatics and Cataract gray and Invincible red tubes, etc. The product is made on the policy that quality must never be sacrificed to quantity, and the attendants at the

General View of the Accessory Display in Grand Central Palace During 14th National Automobile Show.

starting and ignition systems occupied the centre of interest at this booth. The feature of the display was the demonstration of the self-regulating dynamo and indicating automatic switch, by which it is possible at all times to note the condition of the battery without the use of the volt-ammeter. Attention also was directed to the new Golden Glow headlights with special dimming attachment to conform with city ordinances.

### John W. Blackledge Manufacturing Company.

Chicago, Ill.—Velvet shock absorbers, comprising the use of springs within a casing, were shown at this booth in six different sizes, for cars weighing from less than 2200 to more than 4800 pounds. Some of these were demonstrated, being attached to a small car riding over a mechanical contrivance to imitate road conditions.

### Braender Rubber & Tire Company.

Rutherford, N. J.—Several of the Braender tires utilized by Ralph Mulford in long distance racing events during the past year were on exhibit. The shoes went through the entire contest in each instance without change, and were the object of much interest. The company called special attention to its Bull Dog non-skid tread, and to the red and gray tubes made by it. The

booth laid special stress upon the mileage record gained by these casings and tubes.

### Coes Wrench Company.

Worcester, Mass.—Coes wrenches were first produced in 1843 and the company has been making these for automobile use since the inception of the industry. The display included all types, from the smallest to the largest, and special attention was directed to the steel handled type, some of these being shown in section to indicate the internal support of the steel shell.

### Cox Brass Manufacturing Company.

Albany, N. Y.—A demonstration was arranged to indicate the desirability of using the Coxajusto shock absorbers and Cox rebound E-zer. The former is of the coil spring design and is held to be adjustable to every load the car may carry, while the feature of the latter is the automatic friction clamps, which open when the spring compresses and grip on the rebound. The company also called attention to its combination welding and decarbonizer outfit for garages, and to its line of windshields, bumpers, etc.

### Smalley Daniels.

Detroit—Aside from the New Era vehicle springs and other lines previously displayed by this concern, two

**A Corner of the Third Floor Devoted to the Display of Accessories, Fittings and Supplies.**

entirely new products were featured. One of these is a Ford tire carrier, with combination rear number holder and lamp bracket, made in two designs, with and without the tire trunk. The other is a collapsible water bucket, operating on the same plan as the pocket collapsible drinking glass, which is supplied in a neat case and is capable of being stowed in small space. This latter equipment includes three funnels, for water, gasoline and oil.

**Dean Electric Company.**

**Elyria, O.**—The exhibit of this company was decidedly complete in every respect, including the Elyria-Dean high frequency ignition systems, Elyria-Dean II dynamo lighting system, Elyria-Dean speedometer and Elyria-Dean battery cases. Attention also was directed to the line of electric horns, with special reference to the Maxo II for motorcycles. This is similar in every respect to the original Maxo, but is sold at a much lower price.

**Jos. Dixon Crucible Company.**

**Jersey City, N. J.**—Dudley Thurston, L. H. Snyder and O. A. Light were kept busy throughout the week explaining the merits of Dixon's graphite lubricants. Demonstrations were made of Dixon's No. 677 graphite grease for transmission and differential cases. The various packages were so arranged as to make a very attractive exhibit, and one designed to catch and hold the attention.

**Edison Storage Battery Company.**

**Orange, N. J.**—The Edison nickel-iron storage battery was displayed in such manner as to call special attention to its constructional details, and every effort was made by the attendants to explain its features in a practical way. The new type A-5 vehicle battery for light car service was made a special feature of the display, which also included a full line of batteries for ignition and lighting of gasoline cars.

**Electric Storage Battery Company.**

**Philadelphia, Penn.**—The exhibition of the well known Exide line of storage batteries for various purposes was very complete, several of the batteries being shown disassembled and in part sections so as to present the method of construction. Special attention was directed to the new type X starting and lighting battery, designed particularly for this work.

**Gray & Davis.**

**Boston, Mass.**—Besides the well known Gray & Davis electric lighting and starting system, this concern presented a new non-blinding headlight, designed to conform to the ordinances prohibiting the use of glaring headlights within city limits. A large portion of the lamp is covered with ground glass, leaving a space in the centre, through which a so-called pencil ray is projected straight ahead, while the ground glass is held to diffuse the rays about the front of the car so as to make it visible at all times.

**Green & Swett Company.**

**Boston, Mass.**—This is a new concern, organized recently to produce the Tri-Phoon three-cylinder air pump.

It differs from conventional designs in that the three reciprocating pistons are driven by a high powered rotary cam, and are controlled on the cam surface by means of roller bearings. The pump was shown complete with brackets and fittings, which make installation a simple and easy matter.

**A. W. Harris Oil Company.**

**Providence, R. I.**—This company has been manufacturing lubricating oils for over 28 years, and the line exhibited included the three grades of Harris automobile oils—heavy, medium and light—and Harris trans-compound. Various grades of machinery oils also were shown. Sample of store counter displays, designed to show the purity of these oils, were a feature of the exhibit, as also were samples of road signs, window transparencies, etc.

**Geo. A. Haws.**

**New York City**—The exhibit of Panhard oils, made by this concern, was decidedly complete and instructive. Aside from the use of the checker board cans for decorative purposes, a particularly pleasing demonstration called attention to the method of refining Pennsylvania crude, and to the difference between the various crudes. The condition of Panhard oils throughout the entire process of refinement was graphically portrayed.

**Heinze Electric Company.**

**Lowell, Mass.**—The well known line of magnetos, coils, spark plugs, timers and switches bearing the Heinze name, has been augmented by the addition of an entirely new type of oscillating magneto, which is held to possess advantages not hitherto found in the models produced by this concern. While special attention was drawn to the new magneto, a feature of the exhibit was the Heco priming spark plug, which was shown for the first time last year, and which has been improved and refined to meet the varying requirements of service.

**Herz & Co.**

**New York City**—Herz magnetos and plugs, Minimax pumping outfits, B. B. power driven air compressors, Universal flywheel pumps, and other standard Herz products were displayed as usual. In addition, special attention was directed to the Herz patent automatic time adjustment for ignition apparatus, which is held to be simple and applicable to any type of magneto, and the Herz tape grip rings, for making connection between rubber hose and metal pipe.

**Holtzer-Cabot Electric Company.**

**Brookline, Mass.**—At this booth, demonstration was made of the new JS type magneto-generator and lighting system for small cars. It is maintained that this system, although designed to meet the needs of the small car owners, is equally applicable to the large car, where it is desired to have electric side and tail lamps, but gas headlights; where the car is used largely for daylight driving; where the use of headlights is prohibited, and on the earlier types of large cars without magneto ignition, to supply current for ignition, side and tail lamps, electric horn, etc. The company also displayed its Newcomb carburetor and Reacto electric horns.

**Hudson Export & Import Company.**

**New York City**—Special attention was called to the A. V. shock absorber, made in Europe. This is held to be so constructed as to take care of both light and heavy shocks by means of a combination of hydro-pneumatic cylinders supplemented by concentric spiral springs. A special feature of the display was the presentation of a new type for Ford cars.

**Indian Refining Company.**

**New York City**—That Havoline oil "makes a difference" was the slogan which attracted attention to the exhibit made by this company. The product was displayed in packages, so arranged as to cause the visitor to become familiar not only with the trade mark, but the design of the can or other receptacle. Havoline oil is made in varying densities to meet the requirements of different motors, and this factor was not forgotten by the attendants in explaining the merits of the product.

**Janney, Steinmetz & Co.**

**Philadelphia, Penn.**—This concern had a very interesting and attractive exhibit of its seamless steel tanks. Particular attention was directed to the new shapes and forms, with new attachments, including the Steinmetz reserve compartment, which is entirely contained within the tank. The line is held to cover every style of tank that is made in the cold drawn seamless process, and the display was designed to appeal both to the user and to the consulting and designing engineers of factory departments.

**J. M. Shock Absorber Company.**

**Philadelphia, Penn.**—The J. M. shock absorbers, made in France, were effectively demonstrated on a small automobile, and the attendant was kept busy explaining the merits of the product. The device is made in four models, model A being a twin-cylinder, and the others single-cylinder. These are designed for various types of cars, the model F being specially adaptable to Fords. The construction embodies the use of helical springs encased in a cylinder.

**H. W. Johns-Manville Company.**

**New York City**—This company acts as selling agent for a number of concerns who have exhibited direct at previous New York shows. Among the products listed at this stand were the following: Jones speedometer, K. P. foot rest heater, Arnold electric heating plugs, J-M Mobillette electric lamp, Arnold electric vaporizer, J-M Fyro extinguisher, J-M dry batteries, J-M (Mezger) Soot Proof spark plugs, Mobilene packing, Non-Burn brake lining, Carter carburetor, Long horn, Noark enclosed fuses and Spark-No automobile lock.

**Kemco Electric Manufacturing Company.**

**Cleveland, O.**—The Kemco fan type generator, made by this concern, was shown for the first time at a New York display. The generator furnishes current for charging the storage battery and is designed to be mounted in place of the regulation fan in front of the engine. The exhibit included both the original models suitable for

various makes of cars, and a new model with the pulley at the rear instead of in front of the fan blades.

**Atwater Kent Manufacturing Works.**

**Philadelphia, Penn.**—The main portion of the display was given over to the Atwater Kent Unispark ignition systems, first placed on the market in 1905. Particular attention was drawn to the new type K-2, which is practically the same as the older types, with the exception of the hard rubber casing and cap. This will be supplied to the manufacturer only, and has already been adopted as regular equipment on a number of cars. Another feature of the exhibit was the Monoplex horn, designed for operation on dry cells, storage battery or charging dynamo of from six to nine volts. This is made in two types, with short and long projector.

**New York Coil Company.**

**New York City**—Demonstration was made of the various Ford accessories produced by this concern, one illustrating the ease with which the Nyco accelerator and power adder is operated to enrich the supply of fuel. Other products to which special attention was directed were the Nyco two-system switch, designed to permit the operation of the Ford on the master vibrator or vibrating coils, thus furnishing two systems, and the Rhoades' unit spark system, complete with necessary fittings.

**New York & New Jersey Lubricant Company.**

**New York City**—Special attention was directed to the sprocket wheel trade mark on packages containing Non-Fluid oil made by this concern. The attendants were kept busy explaining the difference between these lubricants and other so-called non-fluid oils, and it was made clear that this company was originator of the term as applied to automobile lubricants. The packages were well arranged, and the lighting effects were such as to direct attention to the exhibit.

**Marburg Bros.**

**New York City**—The concern is an importer of the Mea magneto, S. R. O. ball bearings and other products. A distinctive feature of the Mea instrument lies in the rocking of the magnets, and there is no departure from this principle in the new water proof types, although the housing remains stationary, and the bell shaped magnets are shifted around the armature, together with the timing mechanism. The company also displayed the Lucifer motorcycle lighting outfit, brought out during the New York show in 1913.

**Chas. E. Miller.**

**New York City**—The importance of this concern as the pioneer accessory house in America is such that it handles practically every known product of merit in its 15 stores in 12 cities and nine states. As has been its custom for a number of years, handsome, large catalogues of the goods handled by it were distributed to all visitors. Special attention was directed to the Miller spark plugs, these being sold at a very low price during the show, and to Miller's Pan-American oils.

Looking Down the Centre Aisle Among the Accessory Exhibitors on the Fourth Floor.

**A. R. Mosler & Co.**

**Mount Vernon, N. Y.**—Owing to the recent decision respecting the so-called Canfield patent, attendants at this booth were prepared to explain its bearing upon the spark plug industry. The display included a very complete line of Mosler Splitfire plugs, made in different styles to meet the requirements of individual motors, Vesuvius and Superior plugs, and the new priming plug. The Mosler step mat also occupied a prominent place in the exhibit.

**Motometer Company.**

**New York City.**—The exhibit was devoted to the Boyce Motometer, a device provided with a special type of thermometer or meter in which is a red fluid. The dial is calibrated and the fluid rises and falls according to the temperature of the water in the radiator, to which the instrument is fitted. The device is made in two sizes, one of which is designed particularly for application to Ford cars.

**Perfection Spring Company.**

**Cleveland, O.**—The full line of Krupp steel vehicle springs, made by this concern for both pleasure and commercial cars, was arranged so as to display the very efficient qualities of the product. Special constructions are offered to meet the individual requirements of the manufacturer, this applying particularly to the maker of motor trucks and business wagons.

**Philadelphia Storage Battery Company.**

**Philadelphia, Penn.**—The display at this booth included specimens of completely assembled trays of cells to represent units that are installed in each of the makes of electric trucks and pleasure cars on the American market. Batteries of types designed for ignition, lighting and starting also were shown, these being arranged to indicate the method of construction. Particular attention was called to the diamond grid feature of these batteries.

**Pyrene Manufacturing Company.**

**New York City.**—Special attention was directed to the non-conductivity of Pyrene mixture used in the fire extinguishers made by this company, and therefore to the absence of danger in employing the extinguisher for fighting fires on electric vehicles or in the vicinity of electrical apparatus. The company is also producing a neat bracket for the container, so finished as to harmonize with the other fittings of the car. Another addition to the line is an emergency fire hood, designed to be slipped over the head when it becomes necessary to enter a burning building or approach closely to a fire.

**Randall-Faichney Company.**

**Boston, Mass.**—Emphasis was laid upon the construction of the Blitz spark plugs made by this concern, a large part of the display being devoted to this line. Other standard products of the company included the line of Jericho and Jubilee horns, for both automobiles and motorcycles, the B-line grease guns, etc.

**Remy Electric Company.**

**Anderson, Ind.**—The display included a full line of the well known Remy magnetos, as well as the new Remy starting and lighting equipments, described in detail elsewhere in this issue.

**Rhineland Machine Works Company.**

**New York City.**—A full line of the ball bearings made by this concern was on display, including the self-aligning bearings, and demonstrations were arranged to indicate the various uses to which they are applicable. Attention also was drawn to the A. V. shock absorber, made abroad and represented in this country by the Hudson Export & Import Company. Still another portion of the display was given over to Anchor spark plugs.

**Royal Equipment Company.**

**Bridgeport, Conn.**—A large portion of this booth was devoted to the presentation of a loom for weaving Raybestos brake lining. This proved a most interesting demonstration and one which gave the visitor a very clear idea of the manner in which the material is produced. The display also included the line of Duplex brakes made by this company, and a new Ford special brake and lining, the latter being without the use of metal.

**J. H. Sager Company.**

**Rochester, N. Y.**—Demonstration was made of the new J. H. S. shock absorbers for Ford and other cars.

The construction is a combination of a piston working within a cylinder and coiled springs, and they are made in two types, single and twin-cylinder. The older type of Sager equalizing springs also was shown, and the display included the full line of Diamond, Protection, Universal and Simplex bumpers.

**Splitdorf Electrical Company.**

**Newark, N. J.**—The new Splitdorf Ford outfit occupied the central space in the exhibit of this concern, this being designed to supply a true high-tension magneto equipment for model T Ford machines. The display also included a full line of Splitdorf magnetos, transformers, plugs, electric lighting and starting outfits, etc. Another new product is the water proof motorcycle magneto, designed for one, two and four-cylinder machines.

**Springfield Metal Body Company.**

**Springfield, Mass.**—Two of the convertible body designs made by this company were shown at this booth. One was for seven passengers, this being upholstered in light gray cloth and painted the same shade of gray. The other was a three-passenger roadster model, with collapsible rumble seat of new design. An attendant explained the features of construction, and the neat appearance of the two bodies shown met with decided approval.

**Standard Woven Fabric Company.**

**Framingham, Mass.**—The particular merits of Multi-bestos brake lining materials were called to the attention of the visitors, and a special feature of the exhibit was a testing machine, such as is utilized at the factory. This was in the form of a friction transmission, the various belts, friction facings, etc., being composed of Multi-bestos material. The object was to demonstrate the effectiveness of the product under differing conditions of service. Among the new things shown at this booth were the Ford special brake lining and a series of Multi-bestos fan belts for Ford cars and other machines.

**Stewart-Warner Speedometer Corporation.**

**Chicago, Ill.**—A full line of Stewart and Warner speedometers was supplemented this year by the addition of the Stewart one-cylinder air pump, the new Stewart motorcycle speedometer, Stewart hub odometers and other lines. Particular attention was directed to the Stewart thermo-automatic carburetor adjuster, in which the expansion and contraction of mercury in a bulb emerged in the cooling system operates an adjusting screw attached to the carburetor. Another feature of the display was the Stewart speedometer for cream separators, as indicating the influence of automobile accessories on other industries.

**Vacuum Oil Company.**

**Rochester, N. Y.**—The display made by this company was a duplicate of that made at the recent Paris Automobile Salon, the booth being reproduced exactly, except for the substitution of English for French in the signs and literature. The product of the company, Vacuum Mobiloils, is well known among motorists, and it has a wide use throughout the entire world.

**Valentine & Co.**

**New York City.**—Valentine varnishes were displayed in their original packages, and special attention was directed to Vanadium Chassis Finishing in a particularly interesting demonstration. A wheel emerged in soapy water was with six of its spokes finished in automobile varnishes made by other concerns, and six with the above named product. This was for the purpose of indicating that the latter is absolutely unharmed by the caustic action of soap.

**Veeder Manufacturing Company.**

**Hartford, Conn.**—Special attention was directed to the new form K Veeder hub odometer for motor trucks, etc. The principle does not differ from that of previous designs, but the face is provided with five dials indicating miles, and one for tenths. The instrument is somewhat more compact than its predecessors. The company also displayed its line of odometers, tachometers, mileage recorders, etc.

**Weed Chain Tire Grip Company.**

**Bridgeport, Conn.**—A noticeable feature of this exhibit was the addition of the Lyon solid tire grips for commercial vehicles, recently acquired by this concern. Of course the major portion of the display was given over to the well known Weed chain for pleasure vehicles. These are also made in similar types for motorcycle and

motor truck use. The only change in this line is in the commercial vehicle type, in which electrically welded side chains have replaced the older design.

West Side Y. M. C. A.

New York City—A special booth was placed at the disposal of this institution in order that it might call attention to the courses of instruction followed in its automobile school. Aside from the literature regarding these, cut-out motors and other mechanical constructions utilized in the school were presented to indicate

the thorough manner in which the subjects are treated.

Willard Storage Battery Company.

Cleveland, O.—The display included a full line of the well known LBA storage batteries for vehicle service, with special emphasis upon those designed for lighting and starting systems. One of the new features was the six-volt motorcycle battery of 15 ampere-hours capacity, this being produced in two types, one in a rubber case and the other in wood. Both are light and exceedingly well adapted for use on the two-wheel mount.

## ENGINEERS' MEETING.

### Annual Gathering in New York City—Election of Officers for Ensuing Year.

The annual meeting of the Society of Automobile Engineers was held at the rooms of the Automobile Club of America, New York City, Jan. 6-8, at which the following officers were elected for the ensuing year: President, Henry M. Leland, Cadillac Motor Car Company, Detroit; vice presidents, William Guy Wall, National Motor Vehicle Company, Indianapolis, Ind., and K. W. Zimmerschied, General Motors Company, Detroit; treasurer, Henry F. Cuntz, New York City; members of the council for two years, Christian Girl, Perfection Spring Company, Cleveland, O., and Henry W. Wilson.

The various sessions were devoted to the reading of papers and discussions thereon, and to reports from various committees. Among the papers read were the following: "Storage Batteries", W. H. Conant, Gould Storage Battery Company, New York City; "Necessity for More Special Data for Electric Car Designers", W. J. B. Thomas, Century Electric Car Company, Chicago; "Automobile Efficiency", David L. Gallup, Worcester Polytechnic Institute, Worcester, Mass.; "Final Drive for Motor Trucks", Arthur J. Slade, New York City; "Internal Gear", V. V. Torbensen, Newark, N. J.; "Double-Reduction Live Axle", B. B. Bachman, Philadelphia, Penn.; "Worm Gear", John Younger, Buffalo, N. Y.; "Chain", H. D. Church, Detroit; "Gasoline Locomotives for Mines", J. A. Anglada, New York City; "Development of Electric Tractor for Handling Freight Cars Over Tracks Laid on City Streets", T. V. Buckwalter, Altoona, Penn.; "Taxicab Specifications", L. P. Prossen, New York City; "Radiators", J. W. Cain, Detroit; "Workshop Organization", Charles G. Renold, and "Notes on Scientific Shop Management", Henry W. Allingham.

The annual dinner of the organization took place at the Hotel Plaza, and a large number of members and guests were present. The meetings were in charge of a committee composed of Arthur B. Cumner, E. T. Birdsall, J. G. Perkin,

Howard E. Coffin, Christian Girl and Coker F. Clarkson. The banquet committee was as follows: Howard Marmon, Arthur B. Cumner, J. A. Arnold, Allen L. McMurtry, H. M. Swetland, R. M. Lloyd and Coker F. Clarkson.

## COMING EVENTS.

### January.

Jan. 10-17—Show, Philadelphia, Penn.  
Jan. 10-21—Show, Brussels, Belgium.  
Jan. 12-17—Show, Bridgeport, Conn.  
Jan. 14-21—Maritime motor show, St. John, N. B.  
Jan. 17-24—Show, Pittsburgh, Penn.  
Jan. 17-24—Show, Detroit, Mich.  
Jan. 19-24—Show, Washington, D. C.  
Jan. 20-24—Show, Baltimore, Md.  
Jan. 24-31—Pleasure car show, Montreal, Que.  
Jan. 24-31—Show, Rochester, N. Y.  
Jan. 24-31—Pleasure car show, Coliseum, Chicago, Ill.  
Jan. 26-31—Show, Scranton, Penn.  
Jan. 31-Feb. 7—Show, Minneapolis, Minn.

### February.

Feb. 2-7—Show, Troy, N. Y.  
Feb. 2-7—Pleasure car show, Buffalo, N. Y.  
Feb. 3-7—Show, Kalamazoo, Mich.  
Feb. 3-7—Commercial car show, Montreal, Que.  
Feb. 4-7—Show, St. Joseph, Mo.  
Feb. 7-12—Show, Seattle, Wash.  
Feb. 9-14—Truck show, Buffalo, N. Y.  
Feb. 9-14—Show, Grand Rapids, Mich.  
Feb. 11-14—Show, Louisville, Ky.  
Feb. 11-14—Show, Geneva, N. Y.  
Feb. 14-21—Show, Pittsburgh, Penn.  
Feb. 16-21—Canadian national show, Toronto, Ont.  
Feb. 16-21—Show, Kansas City, Mo.  
Feb. 18-21—Show, Bloomington, Ill.  
Feb. 21—Vanderbilt Cup race, Santa Monica, Cal.  
Feb. 21-28—Show, Hartford, Conn.  
Feb. 21-28—Show, First Regiment Armory, Newark, N. J.  
Feb. 21-28—Pleasure car show, Cincinnati, O.  
Feb. 23-28—Show, Omaha, Neb.  
Feb. 24-28—Show, Syracuse, N. Y.  
Feb. 28—Grand Prize Race, Santa Monica, Cal.

### March.

March 2-4—Commercial car show, Cincinnati, O.  
March 2-6—Show, Fort Dodge, Ia.  
March 4-7—Show, Tiffin, O.  
March 7-14—Pleasure car show, Mechanics' Building, Boston, Mass.  
March 9-14—Show, Des Moines, Ia.  
March 17-21—Truck show, Mechanics' Building, Boston, Mass.

### April.

April 9-15—Show, Manchester, N. H.

### May.

May 24-25—Targa Florio race, Italy.  
May 30—500-mile race, Indianapolis, Ind.

### June.

June 9-11—Isle of Man road race.

### July.

July 3-4—Road races, Tacoma, Wash.  
July 4—Grand Prix, Lyons, France.  
July 25-29—Grand Prix race, Belgium.

### August.

Aug. 28-29—Road races, Elgin, Ill.

### September.

Sept. 9—Road race, Corona, Cal.  
Sept. 9—Grand Prix, Italy.

## IN THE REALM OF THE MOTORCYCLIST.

### Review of the Machines and Accessories Display at the New York Show--British Mounts Share Honors with Those of American Make---Results at Savannah.

**U**NDoubtedly the most interesting feature of the motorcycle section of the New York show, insofar as American machines were concerned—for this year there were two makes of foreign mounts on display—was the announcement of a complete electric lighting system by the Miami Cycle & Manufacturing Company, Middletown, O., on its seven horsepower Flying Merkel twin. It hardly was expected that innovations of this character would be presented at this exhibition, since the national motorcycle show in Chicago, in November, had been considered by the riders and dealers as the one big event of the year for that portion of the industry.

Twelve manufacturers of two-wheel mounts exhibited direct on the fourth floor of the Grand Central Palace, as against 23 at Chicago, and all of these had previously made display at the November show. However, the number of makes on display was increased to 15, if the machines exhibited at some of the accessory booths be added in the count.

#### Machines on Display.

The 12 manufacturers were: Davis Sewing Machine Company, Dayton, O., Dayton; Emblem Manufacturing Company, Angola, N. Y., Emblem; Excelsior Motor Manufacturing & Supply Company, Chicago, Ill., Excelsior; Miami Cycle & Manufacturing Company, Middletown, O., Flying Merkel; Harley-Davidson Motor Company, Milwaukee, Wis., Harley-Davidson; Henderson Motorcycle Company, Detroit, Henderson; Hendee Manufacturing Company, Springfield, Mass., Indian; Pope Manufacturing Company, Hartford, Conn., Pope; Reading-Standard

Company, Reading, Penn., R-S; Schickel Motor Company, Stamford, Conn., Schickel; Aurora Automatic Machinery Company, Chicago, Ill., Thor; Consolidated Manufacturing Company, Toledo, O., Yale. Peter A. Frasse & Co., New York City, exhibited the Rudge, and Herbert F. L. Funke & Co., New York City, the Scott, both British made machines, while the Pierce, made by the Pierce Cycle Company, Buffalo, N. Y., was shown at the booth of F. A. Baker & Co., New York City.

#### Few Changes Noted.

All of the American machines, including the Pierce, were shown at Chicago, and it may be added that those displayed in New York presented little change from the announcements made in November, with the exception of the Dayton, Pope and Flying Merkel. With the first two practically the only alteration is in the matter of fitting a two-speed gear. The Pope

General View of the Motorcycle Section of the New York Show, Flying Merkel Exhibit in the Foreground.

model was not shown during the opening days of the exhibition, but was announced and was expected to arrive before the close. The Dayton two-speed was on display. It also was announced that the maker of the Emblem had arranged to fit any of its models with either an Eclipse or Thor gear at extra cost.

#### Dayton and Pope.

The Dayton is produced in two models, both twins, one of seven horsepower and the other of nine. The two-speed gear is fitted to each. The drive is similar to the ordinary countershaft drive utilized on the regular models, and the gearcase is neatly stowed away just under the tool kit, so that the general appearance of the

machine at the first glance is unchanged.

The Pope drive is of the double-step chain type with the short chain in the usual location.

**Vesta Lighting Equipment on Flying Merkel.**

The long drive chain, however, is fitted on the right side, the sprockets being attached to both ends of the countershaft. The gearset is of the always-in-mesh type, and is fitted with large diameter gears of large pitch and exceptionally wide face. On high speed the gears carry no load, the drive being direct through the countershaft, which is carried on large annular ball bearings. The change to low speed is made by shifting a dog clutch, also of ample proportions, and the drive is either 6:1 or 7:1, at the option of the purchaser.

#### **Merkel's Lighting Generator.**

The electric lighting system supplied with the seven horsepower Flying Merkel twin of the regular type, is the Vesta, the product of the Vesta Accumulator Company, Chicago, Ill. The generator is of the shuttle armature, permanent field type, and is belt driven directly from the crankshaft of the motor through the intermediary of a pair of pulleys so related as to diameters that the armature revolves at about 2.5:1. The generator develops but two volts at ordinary speeds, and this is cited as an advantage, permitting the use of batteries of small size and weight.

The dynamo is clamped in a permanent manner to the front tube of the frame, so that it is positioned just above the magneto. The battery is carried in a small metal case on the right side of the machine immediately below the saddle, and the wires leading from the dynamo to the battery and to the head and tail lights are suitably encased against the action of the weather. The headlight is of the standard torpedo type with parabolic reflector, and the tail light is a miniature aluminum device of neat design.

#### **Two British Machines.**

Considerable interest was manifested in the two British machines, although they were not exhibited for the purpose of introducing them in the American market, but in connection, in each

instance, with a display of British made chains. The Rudge presents a very attractive appearance, but from the viewpoint of an American rider, it is plentifully supplied with controls of one kind or another, and thus conveys the impression of being complicated. The Scott is fitted with a two-cylinder, two-cycle, water-cooled, vertical motor, and was of interest because of the innovation of this combination of features.

#### **Accessory Exhibitors.**

A large number of accessory concerns laid special emphasis upon fittings designed for motorcycles, and it was noticeable that the list of motorcycle accessory jobbers was somewhat larger this year than heretofore at a New York show. Many of these devices were displayed in connection with those made by the same concern for automobile service, and as a result the visitor who was interested solely in motorcycles probably failed to grasp the opportunity for examining them.

#### **Several New Lamps.**

The tendency toward the adoption of electric lighting systems was reflected in the number of headlights displayed. Several of these were with some means for meeting the requirements of ordinances prohibiting the use of glaring lights

within the city limits. This was particularly true of the Glareless lamp, made by the Roffy-Grace Corporation, New York City; the Solar double-bulb type, made by the Badger Brass Manufacturing Company, Kenosha, Wis., and the new motorcycle lamp made by Gray & Davis, Boston, Mass. Others who displayed lamps were: Hawthorne Manufacturing Company, Bridgeport, Conn., Old Sol; H. W. Johns-Manville Company, New York City, J-M Mobilite; C. & A. Matisse, New York City, Gold Mangin, and B. & L. Auto Lamp Company, New York City.

#### Storage Batteries.

The importance of electric lighting systems for motorcycles has encouraged the production of special batteries, special reference being made herein to those shown by the Philadelphia Storage Battery Company, Philadelphia, Penn., and

One of the New LBA Motorcycle Batteries.

the Willard Storage Battery Company, Cleveland, O. The former concern is marketing two types, in one of which the two cells measure 1.75 by 4.75 by 2.25 inches. The other is a single-cell battery, measuring 1.625 by 3.375 inches and stands 8.25 inches high. The latter is designed for use in connection with a six-volt lighting system, three cells being connected in series, and has

capacity of 40 ampere-hours. The former has a voltage of two a cell and will carry its ampere load for eight hours.

The LBA motorcycle storage battery, made by the Willard Storage Battery Company, is of the six-volt type and is marketed either in a hard rubber or wood case. Both are light in weight and securely sealed against the introduction of foreign matter. The capacity is 15 ampere-hours, and it is maintained by the company that the battery has all the qualities which have made the LBA line such a distinct success in the automobile field.

#### Lucifer Lighting Equipment.

Of particular interest, in connection with electric lighting systems, was the Marburg-Lucifer equipment, shown by Marburg Bros., Inc., New

York City. This has been improved and refined, and the dynamo is held to be similar in construction to the Mea magneto imported by this concern. A bell shaped magneto is employed, the armature being mounted in the axis thereof. The generator is supported in a bracket and so mounted that it can swing into and out of engagement with the motorcycle wheel. This motion is controlled by a small set screw opposing the action of a spring. When the set screw is released the spring presses the dynamo toward the wheel so that the friction wheel on the armature shaft comes in contact with the tire. In this position the dynamo generates current for lighting the lamp when the machine is being operated. For daylight running, the dynamo is held out of contact by the set screw device. The weight is but two pounds, and it is held that the contact of the friction wheel is so nicely regulated that the tire is not in any way injured.

#### Many Carburetors Shown.

Several new carburetors were shown, the Newcomb, made by the Holtzer-Cabot Electric Company, Brookline, Mass., being particularly interesting. This has been made for some time in the automobile types, but this was its first appearance in this field. A floating cylinder, controlled by the action of the motor, serves to open the air inlet and at the same time to admit gasoline through the jet. Since the air inlet ports and the gasoline inlet valve are specially designed and are opened by the floating cylinder, it is maintained that the amount of gasoline and air admitted is always in correct proportion. The Newcomb is made of aluminum, and is provided with a special air horn for any make of machine.

Among the other makes of carburetors shown were: The Sunderman, made by the Sunderman Safety Carburetor Company, Newburg, N. Y.; the Breeze, made by the Breeze Carburetor Company, Newark, N. J., and the B. & B., an English make. The last named is typically British and is made with either one or two-lever control. In the single type, the gasoline jet aperture is automatically controlled, but in the other it is regulated by means of a second lever on the handlebar.

#### Horns and Other Lines.

Horns were displayed by a number of makers, these including: H. W. Johns-Manville Company, New York, Long; Automobile Supply Manufacturing Company, Brooklyn, N. Y., Motophone; Fitzgerald Manufacturing Company, Torrington, Conn., Clero; Electric Spark Appliance Company, Brooklyn, N. Y., Olympic; Dean Electric Company, Elyria, O., Maxo; Sireno Company,

New York City, Cyclephone; Randall-Faichney Company, Boston, Mass., Jubilee.

The Stewart-Warner Speedometer Corporation, Chicago, demonstrated its new motorcycle speedometer, and the H. W. Johns-Manville Company, the Jones, both of which have been described fully in these columns. Other exhibitors to which special attention may be called were: Braender Rubber & Tire Company, Braender tires; Brown Company, Syracuse, N. Y., pumps and lamp hoods; Eclipse Machine Company, Elmira, N. Y., Eclipse clutches and Morrow coaster brakes; Herz & Co., magnetos and ignition devices; Majestic Manufacturing Company, Worcester, Mass., Majestic sidecars; Splitdorf Electrical Company, Newark, N. J., magnetos; Weed Chain Tire Grip Company, Weed chains. Still other exhibitors showed standard lines applicable to both motorcycles and automobiles, and these are covered elsewhere in this issue.

#### Savannah Grand Prize.

Complete details concerning the running of the 300-mile Grand Prize race at Savannah, Ga., Dec. 27, show that Robert Perry of Urbana, Ill., finished in first place on an Excelsior, Maldwyn Jones of Middletown, O., was second on a Flying Merkel, and F. H. Camplejohn of Jacksonville, Fla., was third on a Thor. There were 36 starters, 18 mounted on Indians, eight on Excelsiors, five on Thors, two on Flying Merckels, two on Yales and one on a special. Six of these finished and six others were running when the race was called. The standing at the finish follows:

| Rider and Mount—                  | Time    |
|-----------------------------------|---------|
| Robert Perry, Excelsior.....      | 5:22:08 |
| Maldwyn Jones, Flying Merkel..... | 5:33:03 |
| F. H. Camplejohn, Thor.....       | 5:45:25 |
| J. Yerkes, Thor.....              | 6:08:36 |
| Harry Glynn, Indian.....          | 6:11:58 |
| Rex E. Edmunds, Indian.....       | 6:12:35 |
| Paul Warner, Indian.....          | running |
| J. W. Gregorie, Excelsior.....    | running |
| J. Wilcox, Indian.....            | running |
| Thomas W. Dedge, Indian.....      | running |
| Frank B. Hart, Indian.....        | running |
| J. U. Constant, Indian.....       | running |

#### Latest Merkel News.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Flying Merkel machines, celebrated its 20th anniversary Dec. 29. There are very few concerns in the industry that have continued in the same line of business for so long a period and the company naturally feels very proud of its birthday.

C. A. Van Doren, who handled the Flying Merkel in Atlantic City, N. J., before assuming the position of New England branch manager, has disposed of his business in that city and has assumed his new duties in Springfield, Mass. He

has closed the following agencies: Matthew Lamberg, Bridgeport, Conn.; C. P. Maley & Co., New Haven; Waterbury Cycle Works, Waterbury; United Cycle Company, Hartford; George Seavey, Haverhill, Mass.; J. E. Farland, Lawrence; J. William Newton, Fall River; F. N. Coleman, Springfield; C. S. Cobb, Plainville; William F. McCarty, Nashua, N. H., and Combination Ladder Company, Providence, R. I.

#### Bosch Also Won.

Another feature of the Savannah race lies in the fact that every machine which finished was equipped with a Bosch magneto, and this is particularly interesting to the Bosch Magneto Company, New York City. The Grand Prize was the fourth long distance event of the year in which this make of ignition equipment has figured thus prominently, the others being the Tourist Trophy race in England, the Elgin National road race and the San Diego-Phoenix road race.

#### New Members in December.

Secretary-Treasurer G. B. Gibson of the Federation of American Motorcyclists reports an addition of 158 new members during the month of December, divided according to states as follows:

California, 27; Iowa, 25; New York, 16; Ohio, 13; Illinois, 11; Georgia, seven; Florida, six; Kansas, six; Arizona, six; Massachusetts, six; Maryland, five; New Jersey, five; Pennsylvania, four; Wisconsin, four; New Hampshire, four; Virginia, two; West Virginia, two; Michigan, two; Oregon, two; Tennessee, Missouri, South Dakota, Nebraska and Utah, one each.

#### Amendment Is Carried.

Secretary Gibson also reports that 78 of the 155 members of the last national assembly of the Federation of American Motorcyclists have voted by mail in favor of the proposed amendment to the constitution, fixing the date for the annual assembly, which reads as follows:

There shall be held between June 15th and Sept. 15th of each year a national assembly of the F. A. M. at such place and time as the board of directors may decide upon; not less than 90 days' notice of such meeting and the hour and place at which it is to be held shall be given.

#### JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

#### E. M. ESTABROOK

Chairman Membership Committee Federation  
American Motorcyclists,  
BANGOR, MAINE.

Please send me the F. A. M. Booklet and all information interesting to prospective members.

## ACCESSORY MANUFACTURERS.

### Officers Elected at the Eleventh Annual Meeting in New York City.

The 11th annual meeting of the Motor & Accessory Manufacturers was held at the Waldorf-Astoria in New York City, Jan. 7, at which there was a very representative attendance of members. The following concerns were admitted to membership: Gouder, Paeschke & Frey Company, Milwaukee, Wis., maker of automobile parts; American Sheet & Tin Plate Company, Pittsburg, Penn., maker of sheet iron, tin plate, etc., and Champion Machine & Forging Company, Cleveland, O., maker of machinery and steam hammer forgings.

The following were re-elected directors for three years: J. H. Foster, Hydraulic Pressed Steel Company; H. E. Raymond, B. F. Goodrich Company; T. J. Wetzel, Spicer Manufacturing Company, and C. W. Stiger, Stromberg Motor Devices Company. The election of officers by the board of directors resulted as follows: President, J. H. Foster, Hydraulic Pressed Steel Company; first vice president, F. Hallett Lovell, Jr., Lovell-McConnell Manufacturing Company; second vice president, C. E. Whitney, Whitney Manufacturing Company; third vice president, F. C. Billings, Billings & Spencer Company; treasurer, L. M. Wainwright, Diamond Chain & Manufacturing Company; secretary and assistant treasurer, Alfred P. Sloan, Jr., Hyatt Roller Bearing Company; manager, William M. Sweet.

### PHILADELPHIA SHOW NEXT.

#### Fifty Dealers in Cars Will Make Display in New Metropolitan Building.

Following immediately upon the close of the New York show, or, to be more exact, opening some few hours before the actual close of the display in the Metropolis, the annual Philadelphia automobile show will be inaugurated Jan. 10, for one week. In contrast with the exhibitions of recent years, when it has been found necessary to utilize two buildings, this year's display will be held in the new business structure, known as the Metropolitan building, at the corner of Broad and Wallace streets.

The arrangements have been completed by a committee of the Philadelphia Automobile Trades Association, composed of Louis Block of the Ford agency, president and chairman; J. E. Gom-

ery of the Hudson, secretary and treasurer; William P. Herbert of the Chandler agency, E. C. Johnson of the Reo and Premier, and Ralph W. Cook of the Peerless. The building adjoins Philadelphia's Automobile Row, and affords some 40,000 square feet of floor space. The decorative scheme will be particularly pleasing. Those who will display cars are:

V. P. Padula, Abbott-Detroit, Havers; American Auto Company, American; C. A. Haines Company, Baker electric; Buick Motor Company, Buick; Automobile Sales Corporation, Cadillac; Cartercar Motor Company, Cartercar; Chalmers Motor Company, Chalmers; Chandler Motor Car Company, Chandler; Automobile Company of Philadelphia, Cole, Marmon; W. W. Gawthrop, Davis; J. C. Bartlett, Detroit and Argo electrics; Detroit Company of Philadelphia, Detroit; J. H. Shoemaker, Dorris; Fiat Motor Company, Fiat; Ford Motor Company, Ford; Sweeten Auto Company, Franklin; Johnson Motor Car Company, Haynes; Gomery & Schwartz Company, Hudson; Tioga Auto Company, Hupmobile; Jeffery Motor Company, Jeffery; Kissel Motor Car Company, Kissel-Kar; Krit Motor Company, K-R-I-T; Locomobile Company of America, Locomobile; Bigelow-Wiley Company, Lozier, Page; Gibbons-Wetherill Service Company, Maxwell; Mercer Automobile Company, Mercer; Fanning-Paxon Company, Mitchell; Minerva Motors Company, Minerva, Moon; Motor Sales Company, National, Henderson; Oakland Motor Company, Oakland; Seltzer-McGowan Company, Ohio electric; Oldsmobile Company, Oldsmobile; Overland-Marion Company, Overland; Packard Motor Company, Packard; Colonial Motor Company, Partin-Palmer; Peerless Motor Car Company, Peerless; Foss-Hughes Motor Company, Pierce-Arrow; E. C. Johnson Company, Reo, Premier; Regal Sales Corporation, Regal; Thornton-Fuller Company, Simplex, S. G. V.; Stanley Motor Carriage Company, Stanley steam; F. B. Stearns Company, Stearns-Knight; A. G. Spaulding, Stevens-Duryea; Studebaker Corporation, Studebaker; S. Blockson Company, Stutz; Touraine Motor Company, Touraine; Standard Motor Company, Velle; White Company, White; Garford Philadelphia Company, Willys-Knight; Winton Motor Carriage Company, Winton.

### MOTZ TIRE BOOKLET.

Contains Much Valuable Information Regarding This Company's Line.

The Motz Tire & Rubber Company, Akron, O., has issued an attractive booklet, which describes and illustrates the already well known Motz cushion tire. It is said to be one of the most elaborate works of this character ever produced, and tells many reasons why these tires are entitled to special consideration for electrics.

The Motz cushion tire has a dual tread, with perpendicular indentations on the inside of each tread, which are held to be decidedly effective as a preventative against skidding. In addition, the tire is constructed with undercut sides, forming slantwise bridges, which, it is maintained, afford resiliency practically equal to the pneumatic.

This booklet will be distributed to all who make request of the company, and it is especially desired that prospective purchasers shall be informed regarding this feature of tire equipment.

## NOBBY TREAD TIRES.

### Consistent Demand on the Part of Motorists for All the Year Service.

According to the United States Rubber Company, New York City, when the all rubber non-skid tires were first introduced, both the makers who designed them and the public that used them were under the impression that the chief demand would be either in the spring, when the roads were wet with rain, or in the winter months, when the streets and highways were slippery with sleet and snow. This condition may have held true at the time, but there has been a decided tendency toward the adoption of this type of tread for all the year service.

Officials of the company say that there has been a noticeable falling off in the demand for plain tread tires, since the the public discovered the effective anti-skidding effect of the Nobby tread tire made by it. The reason for this is held to lie in the fact that these tires not only furnish greater safety to the user but, even allowing for their higher initial cost, they are the most economical to use in constant service.

## NO LONGER A MYSTERY.

### Expert Holds There Are Over One Million Magneto in Use on Cars Today.

In the early days of motoring there were many who pronounced the magneto a mystery box, but there has been a decided change in public sentiment with respect to this type of ignition equipment. Alfred H. Bartsch of the Bosch Magneto Company, New York City, estimates that there are over 1,000,000 magneto equipped cars running in America today. He reviews the situation as follows:

Even those who have followed closely the history of the motor car do not always realize the part that the magneto has played in making the engine efficient and reliable. The progress made in speed, efficiency and economy is unthinkingly attributed to general refinement of the engine itself. Advances in refinement have been made, it is true. Much higher powers are being obtained from engines of given dimensions; much smoother running, and better pulling through a wide range of speeds; but when it comes to regularity of performance day by day and month after month, the magneto is scarcely given due credit.

Many motorists found that with a weak mixture the magneto fired regularly and well where battery systems would fail. That this was no unsubstantiated belief has long since been clearly proven. It was in 1907, so far as this country was concerned, that the critical period in magneto history occurred. It was no novelty, but the great majority of car manufacturers and motorists did not trust it fully. They admitted the magneto gave better results on the road than the battery did, but it was an absolute mystery to them, and they felt that it was an apparatus that would fail them at any time, and one they

would be utterly unable to put right, and, therefore, they used it with distrust, and, one might say, never without complete duplicate ignition in a battery system, so that if the (to them) mysterious magneto went wrong, they could come home using the auxiliary battery which they understood so much better. Of course, an entire duplicate system is the safest, but with the present day perfection of some magnetos, failure of such is rare indeed, and an independent magneto of the proper quality is all that is necessary.

In taking up the magneto as a sole method of ignition, motorcyclists were over a year in advance of motorists, and it was largely through the reliability of this form of ignition on the motorcycle, despite the fact that it was all among the mud and dust, which gave confidence to motorists. By the end of 1907 there no longer was any doubt as to the reliability of the magneto, and when the simpler forms, followed by the dual ignition combinations came into use in 1908, the magneto became almost universally used. Four or five years ago there were far more cars on the road with battery ignition than with magneto ignition; but today the position is reversed, as not only the majority have magnetos, but a very large proportion of the old cars have been fitted with them.

It may seem strange, at first thought, as the battery had such a strong hold on the field that the magneto should so quickly have ousted that type of ignition system. However, this is easily explained in three words—absence of trouble. Given a good magneto, it requires practically no attention for thousands of miles other than a drop or two of oil, and after long periods of use it will be firing the engine as well as on the day it started work.

The Albany Automobile Club, Albany, N. Y., has inaugurated a campaign to prevent reckless driving and an intelligent enforcement of the motoring laws. To this end President George G. Lempe, Secretary Roland Ford and Counsel Melvin T. Bender recently held a conference with Chief of Police James L. Hyatt, with a view to establishing an automobile squad, composed of a plain clothes man, a motorcycle policeman and a patrolman on foot, for the purpose of securing sufficient evidence against reckless drivers.

The Heinze Electric Company, Lowell, Mass., announces the opening of a New York sales office and service station at 1876 Broadway, under the management of P. G. Sedley. This branch will carry in stock a complete line of coils and coil parts for Ford cars, carburetors and spark plugs, together with a full line of ignition apparatus. In addition it will be thoroughly equipped for prompt and efficient repair work.

The Toronto automobile show, which will be in the nature of a national event this year, will be held in the Transportation and Horticultural buildings, Feb. 16-21, under the management of E. M. Wilcox, as in the past. The display of pleasure cars will be confined to the former building, while the latter will house the exhibit of motor trucks, motorcycles and accessories. It is expected that the national convention of the newly formed Canadian Automobile Federation will be held during the week of the show.

# J. H. S. SHOCK ABSORBERS

are a revelation as well as a revolution in spring suspension.

Their sensitiveness of action **AUTOMATICALLY** takes up and destroys jars and jolts, either heavy or light, and to the occupant of a car it seems like riding on air—fairly floating through space.

Vibration is eliminated, thus giving long life to tires, motor, transmission and other components. In consequence greater speed is possible, as the car does not tend to skid or roll. The mechanical principle of the J. H. S. Shock Absorber is as scientific as that of a hydro-carbon engine. A cylinder and piston are used to insure durability, there being no fragile parts to wear or easily get out of order. The piston acts in harmony with coiled springs which destroy all shocks.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## BRAKE LINING MADE OF ASBESTOS AND Brass Wires

J-M Non-Burn Brake Lining is made of the long, tough fibres of pure asbestos, reinforced with strong brass wires. Due to this construction, the intense frictional heat, produced when brakes are applied, cannot char or burn this lining.

"The action of oil, water, grit, etc., won't impair its gripping power or cause it to rot and wear out. J-M Non-Burn has proved by actual tests that it outwears *twelve* ordinary brake linings.

## J-M NON-BURN BRAKE LINING

*never fails to stop a car almost instantly in emergencies, yet you can stop gradually and smoothly when desired.*

"J-M Non-Burn" is stamped on every piece. Be sure you get the genuine. If your dealer hasn't it, send your order to our nearest Branch.

QUALITY WILL TELL

THE OIL IN THE DUCK CAN

EASY TO CARRY  
EASY TO POUR

CAN AND GALLON OF ALDING OIL

75c

DELIVERED anywhere in New England—65c at our store.

"ALDING" Oils are manufactured from Pennsylvania Crude, which by reason of its high fire test and high viscosity, low gravity and purity produces the finest lubricants known to science.

The principle of lubrication of Gas Engine Cylinders is very much the same, BUT the construction of the various types of cars and the different methods of introducing the Oil to the part requiring lubrication DIFFER, so that no one density of Oil is suitable for every make. Therefore we produce ALDING OIL in Light, Medium and Extra Medium consistency, to suit your make of car.

OUR REGULAR 75c

SPARK PLUGS

50c

To every reader of this advertisement—Just send us the coupon below and 50c—Additional Plugs at Same Rate.

Suitable For All Cars—Especially Serviceable For Fords.

ALDING PORCELAIN PLUG

Equal in service to any \$1.25 Plug on the market.

OUR GUARANTEE

ALDING Porcelains are made to our own formula from the best imported clays and are hand-turned. ALDING Porcelains are as near heat-proof as porcelain can be made. ALDING Porcelain that has been cracked by heat, will be replaced without charge. Gives results at all times and on all types of engines. Easily interchangeable parts. The most satisfactory porcelain plug ever produced. Half-inch Thread, Metric Thread, A. L. A. M. Standard Thread, Long Half-inch, Long Seven-eighth Thread. Extra porcelains, complete, ready for replacement, 25 cents each. 5,000,000 in use.

Any person purchasing an ALDING SPARK PLUG and not finding it satisfactory, can return same for replacement—MILEAGE UNLIMITED

## THE LINCOLN HIGHWAY

(Copy Contributed)

By

**ELBERT HUBBARD**

**A. R. PARDINGTON**

Vice-President and Secretary Lincoln Highway Association  
DETROIT, MICHIGAN

Dear Sir:—

I regard it as a privilege to be one of the many who will make *The Lincoln Highway* possible., and am accordingly sending along my check for Five Dollars as my subscription to this glorious cause.

Name .....

Address .....

☐ Check here if you will sell certificates to your friends

**A** DUSTLESS, mudless, skidless highway from the Atlantic to the Pacific—that's why I should cease to worry.

Behind the project are over 100 firms and corporations who do big things. Over \$5,000,000 are pledged or in hand.

Subscriptions are asked from every cheerful sport who owns an automobile and loves the smell of gasoline. And doesn't that take in pretty nearly all of us?

Any man who owns a machine and doesn't get in on this is a Piker from Pikersville.

It's a privilege to get in this glorious company, and I hope every reader will send a Fiver or more and then sell some certificates to his friends.

Enjoy the sweet satisfaction of knowing that you are in this glorious company who are making the world a fit place for gentlemen to live in.

*Good roads are the most unselfish enterprise in the whole world of human betterments.*

## America's Leading Lubricants

For over 28 years we have been making them—improving them—learning to produce oils that are *all* lubrication—no waste. We refine the best Pennsylvania Crude for which we pay a premium. All soot producing elements are eliminated. HARRIS OILS are not acid-treated. The result—smoother running motors, increased efficiency, greater economy, less wear.

That is why HARRIS OIL Dealers hold satisfied customers.

**Harris Cylinder Oil**  
 —Made in three grades, and sold in bbls., 5 gal. and 1 gal. cans.

**Harris Superheated Steam Cylinder Oil**  
 —Expressly prepared for steam driven cars.

**Harris Motor Car Soap**—An efficient soap which will not harm the finest surface.

**Harris Trans Compound**—A transmission oil reduced to the consistency of a grease.

## Winter Lubrication

If you plan to keep your car in service through the cold weather you especially need

because it is impervious to change in temperature. It lubricates as perfectly at zero as in warm weather.

If you are planning to house your car for the winter, it will pay you to clean out all the bearings and gears and repack them with NON-FLUID OIL. This lubricant does not dry or gum when the car is idle and will not cause the slightest corrosion of balls and rollers

NON-FLUID OIL excludes moisture and prevents rust.

Ask your dealer for these lubricants packed in orange-colored cans bearing the above trade-mark.

## HAVOLINE OIL

For Perfect  
Lubrication of  
Automobile

And Marine  
Gasoline Engines

This OIL is NOT AN EXPERIMENT, here today and gone tomorrow, but has for many years maintained the highest reputation as a scientifically prepared lubricant which is properly filtered, so that it burns clean, without leaving carbon deposits on plugs or cylinders.

The biggest engine manufacturers in the East and in the West recommend it; thousands use it on Touring and Racing Automobiles, and Working, Cruising and Racing Motor Boats, and all are pleased to find that

**T**HE SPLITDORF starting system and lighting generator, which have proven two of the sensations of the New York show, is an evidence of the determination of the Splitdorf Electrical Company to supply the demand for ignition units in their every phase, and supply them, too, better than the best on the market.

The SPLITDORF STARTING SYSTEM is simplicity itself thanks to an automatic clutch of ingenious construction. This SPLITDORF clutch is free—there are no gears to disengage—there is absolutely no chance of it binding or wearing when the motor is running. As the engine stops the clutch becomes automatically engaged for re-starting. The motor, a 12-volt battery, a transmission reducing gear and a switch complete the positive starting outfit.

The SPLITDORF LIGHTING SYSTEM has the cleanest possible installation and is, above all, reliable. Perfect regulation is the keynote to the whole SPLITDORF system, the controller parts incorporated in the generator answering for the output of the dynamo as well as the flow of the current to the battery at all times and under every condition.

*Full descriptive matter sent upon request.*

**SPLITDORF ELECTRICAL COMPANY**

# J. H. S. SHOCK ABSORBERS

are a revelation as well as a revolution in spring suspension.

Their sensitiveness of action **AUTOMATICALLY** takes up and destroys jars and jolts, either heavy or light, and to the occupant of a car it seems like riding on air—fairly floating through space.

Vibration is eliminated, thus giving long life to tires, motor, transmission and other components. In consequence greater speed is possible, as the car does not tend to skid or roll. The mechanical principle of the J. H. S. Shock Absorber is as scientific as that of a hydro-carbon engine. A cylinder and piston are used to insure durability, there being no fragile parts to wear or easily get out of order. The piston acts in harmony with coiled springs which destroy all shocks.

FOUR  
SPEED  
DIRECT  
DRIVE

4

## Choosing Your Car

Picking the car that will give the greatest service at the lowest possible price, both first cost and future up-keep is the problem which confronts every prospective buyer this year. It was with this idea in view that the CAMERON FOUR was designed and constructed. It possesses features that no other car does or can. Not a make-shift machine, assembled from parts gathered here and there, but a car built complete under one roof, under the careful jurisdiction of its designer, Mr. E. S. Cameron.

### FOUR SPEED DIRECT DRIVE

This patented transmission is positively the only style in existence that delivers maximum power at a minimum cost. 35 PER CENT. MORE POWER than all other types. *In other words you are enabled to get the mileage from the gasoline you use.* It is also the only type of transmission that permits of a direct drive on every speed.

### THE MOTOR

Just as distinctive as the transmission. Cast en bloc with valves in centre of combustion chamber giving highest efficiency to motor. Enclosed valve mechanism that ensures quietness and freedom from wear.

In fact the Cameron Four is the Car of Individuality built with a Principle in View Not at a Price. The car for the man who wants a moderate priced machine that will stand the wear, give the best of service under all conditions, and is economical in up-keep.

Fully equipped

with every requisite.

*Our booklet is free for the asking. May we send it to you?*

## Gearless Transmission Plus Electric Starting and Lighting

**New Model 7 Cartercar, Fully Equipped—Sells for \$1250**

There are many advantages in gearless transmission.

You best realize them when you sit behind the wheel of a Cartercar and drive and operate it under adverse conditions—in crowded traffic—over bad roads—up steep grades.

You are not limited to two or three or four speeds, but have an infinite number at your command by merely pushing one lever forward. To reverse the car you move this same lever backwards.

Then there is the extreme flexibility, a feature not found in any other four cylinder car. The enormous leverage supplied by the friction wheel rolling against the disk transmits continuous abundant power, and renders it unnecessary to utilize all the strength of the sturdy, silent, four cylinder engine.

The gearless transmission saves wear on your tires by applying the power to the rear wheels gently and smoothly—no jerking the wheels in starting.

For this same reason there are no jerks and jars which are common to gear driven cars, and so hard on passenger and car alike. The wheel and disk roll together so smoothly that the car is under motion before you realize it.

Model 7, the new model Cartercar which is attracting so much attention at all the auto shows, has all the splendid features and complete equipment of the older Cartercars. It is a strong, distinctive looking car built for hard work and long service.

You owe it to yourself to ride in a Model 7—and drive it if you wish.

### Just What We Mean When We Say Model 7 Is Completely Equipped

First of all, model 7 has a reliable electric starter and five electric lights, including two big search lights, two side and one tail lamp. Also an electric horn.

A double action rain vision wind shield. Demountable rims with one extra—silk mohair top—with dust hood—robe rail—Stewart

speedometer—gasoline gauge on tank—air pressure gauge on dash—especially complete set of tools with pump, jack and tire repair outfit—license carriers go to fill the list.

Can you get better equipment on any car at any price?

See model 7 at the nearest dealers.

The Way to Find Out All About Model 7 Is to Drive One Yourself. See Cartercar Dealer.

# AMERICAN ROAD RACE CHAMPION FOR NINETEEN THIRTEEN

THE STURDY

# STUTZ

**"Motor Age" Officially Crowns  
Earl Cooper—STUTZ  
Road Racing Champion for 1913**

**Remarkable Record for Consistency**

Mr. C. G. Sinsabaugh, in his review of 1913 Road Racing in Motor Age says:

"Cooper drove a Stutz in this campaign and naturally, therefore, the companion title—that of Champion Car for the year—belongs to the Hoosier concern manufacturing **'The car that made good in a day'—The Stutz.**

"It started fifteen times and only four times was it out of the money. In six of the fifteen starts the Stutz averaged better than 70 miles an hour, its fastest performance being 75.03 miles per hour, at Corona."

**Write for Catalog Today**

The Sturdy Stutz is a car that makes good everywhere—in speed and endurance contests and for dealers as well as users. Write quick for our Catalog A-5, Series E.

## PUBLISHERS' COMMENT.

The Big Boston Automobile Show will be held this year, March 7-14, for pleasure vehicles, and March 17-21, for commercial vehicles. The Boston truck display will be the only exhibition of this character of national importance this year. The annual pleasure car show always has been the largest in the country, and manufacturers have adopted the practise, in recent years, of reserving the announcement of new models until that time.

The Boston Show Numbers of The Automobile Journal will be issued Feb. 27, advance, and March 12, review. Inasmuch as this display comes at the opening of the active driving season and manufacturers will have completed their announcements, the buyer's references and guides prepared for these issues will present the most complete classifications covering the models offered for 1914. You cannot afford to miss these numbers. You will refer to them constantly throughout the coming season. They will contain information that could not be secured in any other manner. Order now—direct, or through your news dealer.

The Issue for Feb. 10 will contain a review of the annual national automobile show of the Middle West in Chicago. It has been the custom each year for some in the industry to reserve announcement of their new models for this display. It is anticipated that there will not be departure from this practise this year, and the forthcoming issue will present the details of these, in addition to any new accessories, supplies or fittings which may be revealed by the several concerns exhibiting at that show, who were not represented

in New York. Another feature will be the presentation of reports from the several local dealer's shows throughout the country.

The Special Department devoted to mechanical suggestions for new owners, see page 40, this issue, will be particularly valuable during 1914. The man who has acquired his first car is in need of advice and assistance, that he may be enabled to secure the utmost

from his new purchase, and it will be the aim of The Automobile Journal to supply this information in simple, non-technical language. New owners are specially invited to make full use of the correspondence columns of this magazine, when confronted by problems upon which they may need assistance. See also page 45.

Regular Readers of The Automobile Journal may keep well informed as to what is new in the accessory field by carefully following the department devoted to New Accessories for the Motorist, beginning this issue, on page 35. It is our purpose to make this one of the most newsworthy features of the magazine, and to this end manufacturers are invited to cooperate by submitting illustrations and descriptions of any new equipment which they may be placing in the market.

The Interest in Cyclecars has impelled The Automobile Journal to devote a special department to this latest type of vehicle. See page 49 of this issue.

Remember the Buyer's Guide, pages 87-96, when in need of anything new in pleasure or commercial cars, accessories, supplies and fittings. The concerns listed therein are reliable and are worthy of your patronage.

# You Must Have Reliable Light On Your Car!

## Prest-O-Lite—

Illuminates all of the road, spreads its beams to show a sudden turn, shows the path directly in front of the car, gives an even, steady, brilliant light without eye-tiring rings or deceptive shadows. As a practical road light it is far superior to electric light.

## Prest-O-Lite—

By actual test, is operated at one-fifth the cost of any electric system. In addition to the saving in cost, it means a saving in power of your engine, which gives your car added efficiency on hills and in emergencies.

## Prest-O-Lite—

Affords every "press-the-button" convenience, and every light on the car may be lit or extinguished from the seat by the use of the Prest-O-Lite. And should this convenience ever fail, you may still have all the light by the use of a match.

## Prest-O-Lite—

Means a steady, reliable, economical supply of powerful light which no electrical system can guarantee. Actual experience is proving this fact every day. The absolute proof is yours for the asking.

### The Prest-O-Lite Co., Inc.

226 Speedway, Indianapolis, Ind.

Please send information on ALL Lighting Systems to—

## Electric Lights may fail at any moment!

You may drive for months and never meet an emergency

But when the emergency comes, you place your safety—and the safety of your passengers—upon your lights.

How is your car equipped to meet YOUR emergency

Prest-O-Lite for years, on hundreds of thousands of cars has proved its dependability.

Electric lights have proved decidedly unreliable.

A short circuit, the breaking of a delicate connection, failure to meet a sudden strain, time after time, has resulted in a blinding shock to the driver by the abrupt change from a dazzling beam of light to total darkness. Even if no accident results, there is little hope for a repair—the emergency lamp is gone with the rest of the system—and the only way out is to abandon the car until the expert can get there.

## The Dealer Knows!

Dealers are aware of these facts. Many of them have sunk a large part of their profits patching up the electrical troubles of their customers. From all parts of the country dealers have told us the story of their troubles with electricity. If your dealer doesn't tell you what he really knows about electric lighting—let us send you the letters of other dealers and expert electrical repairmen. Ask us.

## DISTINCTIVE FOREIGN BODY DESIGNS.

**Sales Methods Held to Be Responsible for Greater Development in This Field—  
Examples Selected Represent Coach Makers of France, Germany, Italy,  
Belgium and Great Britain—Effect upon American Makers.**

**A** MERICAN motorists have been led to believe that the sales methods in vogue in Great Britain and on the Continent of Europe, in which the chassis and body are sold separately, has resulted in extensive development of body design. It is true, for the most part, that particular attention has been paid to the matter of coach work, as it is termed abroad. Many of those engaged in this field have gradually taken it up in addition to their former production of bodies for horse drawn vehicles, and have been in business for years.

results in keen competition between rival coach makers. The car manufacturer often considers his work finished when he has sold the chassis, although some of the makers have a body department and others have contracts with certain houses to supply their customers wherever possible. Of course, the so-called standardized body exists abroad as well as in this country, but special reference is made herein to the opportunities for the coach maker who seeks to create that which is distinctive.

**Novel Type of Berline Limousine Body on Gregoire Chassis—Enlarged Space at the Rear Provides Three Separate Storage Compartments.**

The plan to which reference has been made Accompanying illustrations indicate how well some of these coach makers have succeeded in this

**S. P. A. Torpedo Roadster—Design Originated in Italy and Is Widely Copied.**

respect. Two extremes in the large enclosed type are presented in the Gregoire berline limousine and the "Triune" limousine. The Gregoire is a French machine, and the two bodies shown were produced by Paris designers.

The first of these not only provides luxurious accommodations for the occupants, including the driver, but a particular feature of the design lies in the storage compartments at the rear. There are in reality three compartments, although the reproduction does not reveal the upper and lower except upon closer study. The middle space is for tires, or a spare wheel. There is a double horizontal door, opening from the middle, which permits easy access to the entire interior. Above this is a compartment for luggage, with sufficient room to accommodate all the equipment that is re-

quired for a long tour. Below the tire space is another for tools, etc.

The "Triune" model is decidedly pretentious. The first appearance is that of three separate coupe type bodies in one. The two at the rear comprise one compartment, which is entirely shut off from that of the driver in front, doors leading to each. Particular attention is drawn to the arrangement of the windows to carry out the artistic effect of the design. There is opportunity, at least, for a difference of opinion as to the beauty of the double trunk on top, but as to its utility in providing storage space for tools, equipment, lug-

**Benz Touring Car Body, with Compartment for Luggage Under Front Seat.**

gage, etc., there can be little room for doubt.

It might be suggested that the designer of the touring car body fitted to a Turcat-Mery chassis, shown in both front and three-quarter rear views, followed the advice of the proverb, beginning, "Go to the ant", particularly when the rear portion alone is considered. This is another attempt to provide storage space at the back of the car. The front view indicates the method utilized in deflecting air currents downward, and it also will be noted that the designer has made use of all available space for seating accommodations by eliminating the running board entirely.

Still another Turcat-Mery design is presented, this being an adaptation of a few additional

**Rear View of Turcat-Mery Touring Car—An Interesting Design.**

features to the standard touring car body produced for this concern. One of these is to be found in the fenders, which, instead of curving downward to meet the customary running board, are carried straight across from front to rear. It might almost be said that this was a result of the Turcat-Mery firm's study of aeroplane design, in that this arrangement is expected to give the car unusual speed possibilities. Another feature is the provision for protecting the occupants from inclement weather. Ordinarily the machine is of the open body type, but the top in question completely encloses both front and rear seats, the interior being lighted

**The Result of Aeroplane Production Is Reflected in This Turcat-Mery Model.**

merely a thin, straight piece of metal so arranged as to reduce wind resistance to a minimum.

The S. P. A. torpedo roadster design is of Italian origin, and has made its appearance in this country for the 1914 season. By this is meant that bodies following closely the general tendency of this type are now being offered as standard equipment by American manufacturers. In some instances there is noted a more gradual sweep of the fenders than appears in the illustration shown, but in general lines this is a design which has been widely copied both here and abroad.

**The Streamline Effect Presented by Mercedes Double Torpedo.**

only by windows located in the side and front.

Two German body installations are shown in the illustrations of the Benz and Mercedes. The former is a touring car of pleasing streamline design, not unlike some which have made their appearance as standard equipment in this country. A distinctive feature lies in the provision of a compartment underneath the front seat, with door opening at the side, for a trunk, or other touring paraphernalia.

The Mercedes body is termed a double torpedo. The streamline effect is very strongly emphasized throughout, and particularly so at the pointed rear. It will be noted that the front fenders sweep downward toward the short running board, and that the rear fenders are

Many Belgian body designs have found their way to this country, several of the coach makers in Brussels being quite as well known in America as those of Paris. A Belgian

**Elaborate "Triune" Limousine Body Fitted to Gregoire Chassis.**

**Coupe Body of Attractive Design Fitted to Mathis Chassis.**

design for a small car is presented in the illustration of the Mathis, a chassis rated at eight horsepower under the R. A. C. formula, which is the same as that known as the S. A. E. here. This undoubtedly would be termed a coupe in this country, a type that is gaining very rapidly in popularity, but it is designated an enclosed voiturette abroad.

British motoring prints lay decided stress upon the matter of body design, and any demonstration of what is considered neat and attractive by the British motoring public always is of interest. The convertible body shown fitted to a Phoenix chassis has several distinctive features. Two views are presented, but these are hardly more than a suggestion, since the possible combinations are quite numerous.

In the view at the left the car is shown completely enclosed, save for the auxiliary seat at the rear. That at the right indicates the appearance of the machine when utilized as an open roadster, with the rear seat closed. The semi-circular top is so designed that it disappears into recesses, front and rear, and it readily will be seen that either half may be in place at the option of the occupants. A ventilating windshield, or

screen as it is termed in England, is fitted to the forward portion, and this may be tilted at any angle to meet the exigencies of the occasion.

While it might be contended that the examples selected, chosen at random, were somewhat extreme, the intention has been to present some rather unusual models as indicating the manner in which European designers are seeking to satisfy a demand for something distinctive. A comparison of the standard bodies offered by motor car manufacturers in this country will suggest that they have adopted what they believe to be the most satisfactory features of the several designs presented. And it may be added that there are special body makers in America who have originated designs quite as artistic in every respect as are to be found abroad. The lines of these also have found their way into the standardized models produced by automobile manufacturers. Undoubtedly, the work of foreign

**Front View of Turcat-Mery Touring Car Shown on Page 16.**

coach makers has had an important influence on body design in this country, but many handsome designs have originated on this side of the water.

**A British Conception of the Convertible Body Type as Exemplified by the Phoenix Roadster Model.**

## BIG ATTENDANCE AND GOOD BUSINESS.

**Record Breaking Crowds and Increased Sales Figures Reported of Local Shows in Eight Widely Separated Cities—Splendid Outlook for 1914 Season.**

**I**N THE interval between the closing of the New York national automobile show, Jan. 10, and the opening of the Chicago display in the Coliseum and First Regiment armory, Jan. 24, the attention of the motor car industry has been directed toward the so-called minor show circuit. This term is fast becoming a misnomer, because of the fact that the exhibitions conducted under the auspices of the dealers in various sections of the country are gaining rapidly in importance.

The interest in automobile shows, no matter where held, this year has been increased very materially, as a result of the attempt in certain quarters to suggest that business conditions generally were having, or were to have, a somewhat depressing effect upon the sale of cars during 1914. This was amply refuted by the New York exhibition, but it might be contended that the situation revealed thereby was somewhat local in character, or, at least, sectional.

It is expected that the Chicago show will result in another splendid success, from the fact that the national display in that city has been noted for the enthusiasm created among dealers, owners and prospective owners in the section of the country for which Chicago is the metropolis. The industry will be surprised if any other condition is revealed this year.

But because of the importance of the local show as a business barometer, the industry has awaited reports from the displays held during the past two weeks with unusual interest. The results have been reassuring beyond all expecta-

tions. If there is any feeling of unrest on the part of the buying public it has yet to be revealed.

From Philadelphia, Bridgeport, Baltimore and Washington on the Atlantic Coast to Los Angeles on the Pacific, with Detroit, Pittsburg, Cleveland and Milwaukee, representing widely separated inland districts, comes information

At Left, President W. P. Herbert; at Right, Show Manager Louis Block, Philadelphia Automobile Trade Association.

that not only has the attendance been larger than ever before, but the number and value of sales have created new records as well. The following reports present a most optimistic view of the situation, and are particularly encouraging to those who have the welfare of the industry at heart, whether manufacturers, dealers or owners.

## PHILADELPHIA DEALERS OPTIMISTIC.

**D**EALERS in Philadelphia are particularly pleased because of the new record in attendance and sales which resulted from the 13th annual display of the Philadelphia Automobile Trade Association, Jan. 10-17. The only regret expressed by any member of the association has been with respect to the decision not to hold a truck show this year. Conditions are held to be such that some such stimulation would prove of decided value to those representing commercial vehicle manufacturers.

As is true of many other centres in the country, the dealers of Philadelphia have found op-

portunity during 1913 to study the conditions which must be met and to reorganize their business methods to conform to present day needs. As a result there has been such concentration of effort, particularly during the closing six months of the year, that the number of sales for 1913 was larger than ever before and the profits as well.

Members of the association were enthusiastic about the show, and much effort was expended in making it an event in the history of the automobile industry in that city. For the first time in several years opportunity was had to examine

all of the models under one roof. One hundred and fifty-nine cars, representing the product of 64 makers, were on display, indicating in no small measure the possibilities of the motor car market in that centre.

The exhibition was held in the new Metropolitan building, Broad and Wallace streets, the architecture of which enabled the committee in charge to provide a setting well worthy of the best the industry has produced. The interior was treated to represent a grand French court of the Louis XVI period. The color scheme was old rose, ivory and gold, with garlands of natural foliage artistically festooned about the many large columns.

Louis C. Block was chairman of the show committee, which also included William P. Her-

A Corner of the Metropolitan Building, Philadelphia, During the Progress of the Automobile Show, Indicating Extent of the Crowd.

bert, the new president of the association; Ralph W. Cook, the new vice president; J. E. Gomery, honorary secretary and treasurer; H. Warren Terry as secretary and E. C. Johnson. Among the exhibitors were the following:

**Gasoline Cars**—V. P. Padula Motor Company, Havers; Automobile Company of Philadelphia, Marmon, Cole; White Company, White; Tioga Automobile Company, Hupmobile; J. Henry Schumaker & Co., Dorris; Fiat Motor Company, Fiat; W. P. Lippincott, Imperial; Johnson Motor Car Company, Haynes; American Auto Company, American; Motor Sales Company, National, Henderson; Ford Motor Company, Ford; Garford-Philadelphia Company, Willys-Knight; Mercer Motor Company, Mercer; Cartercar Motor Company, Cartercar; Detroiter-Philadelphia Company, Detroiter; Overland-Marion Company, Overland; Kissel Motor Car Company, Kissel-Kar; Winton Motor Car Company, Winton; Foss-Hughes Company, Pierce-Arrow; W. W. Gawthrop, Davis; Jackson-Stutz Sales Company, Stutz; Oldsmobile Company, Oldsmobile; A. G. Spalding & Bro., Stevens-Duryea; T. B. Jeffery Company, Jeffery; F. B. Stearns Company, Stearns-Knight;

Sweeten Auto Company, Franklin; Touraine Motor Company, Touraine; Oakland Motor Company, Oakland; Locomobile Company, Locomobile; Packard Motor Car Company, Packard; Chalmers Motor Company, Chalmers; Minerva Motors Company, Minerva, Monn; Peerless Motor Car Company, Peerless; Gomery-Schwartz Motor Company, Hudson; Gibbons-Wetherill Company, Maxwell; Buick Motor Car Company, Buick; Studebaker Corporation, Studebaker; Colonial Motor Company, Partin-Palmer; E. C. Johnson Company, Reo, Premier; Thornton-Fuller Auto Company, Simplex; Standard Motor Car Company, Velle; Fanning-Paxson Company, Mitchell; Regal Sales Organization, Regal; Auto Sales Organization, Cadillac; Bigelow-Willey Motor Company, Lozier, Paige; Chandler Motor Car Company, Chandler.

**Electric Cars**—J. C. Bartlett, Detroit, Argo; Seltzer-McCowan Company, Ohio; A. G. Spalding & Bro., Waverley; C. A. Haines & Co., Baker.

**Steam Cars**—Stanley Motor Car Company, Stanley.

**Accessories**—J. Eavenson & Sons, Gibney Motor Supply Company, Keystone Lubricating Company, J. H. McCullough & Son.

At the conclusion of the show several members of the association expressed themselves very optimistically concerning the prospects for the immediate future. A few of them are quoted below:

**President William P. Herbert**—Aside from the splendid success of the show from an attendance and business standpoint, it has proven of value in creating an atmosphere of confidence and enthusiasm. The public has demonstrated its interest by attending in larger numbers than ever before. The exhibitors are filled with courage and confidence in the future, hard to estimate.

**Chairman Louis Block**—It is shortsightedness to decry the importance of the show as an institution. It brings the people to look over the year's motor car offerings as nothing else under the sun could do. They come from all walks of life—every manufacturer has his goods displayed to a splendid purchasing audience, and the tremendous value of it all from a trade standpoint is apparent on the face of it.

**Vice President Ralph W. Cook**—When the money market is affected, the handlers of the luxurious cars are first to suffer. It may go down the whole line, but the highest priced goods are the first to feel the slump, beyond a doubt. But, from our experience, and from the experience of others with whom I have talked, our show has demonstrated a wonderful revival of business. Our show crowds are catholic in taste—no one particular priced car has any advantage—it is encouraging activity all along the line. Buyers realize today they are getting more for their money than they ever did before, and everything indicates a prosperous year.

**J. E. Gomery, Hudson Distributor**—As a trade boom and an advertising medium for the industry an annual automobile show can't be beaten. If I had my way, Philadelphia would have had a truck show, too, but the majority thought otherwise. Granted that a truck exhibit does not have the advantage of the spectacular—as an educator of the possibilities of motor vehicle transportation, it would be invaluable to the industry.

**E. B. Jackson, Packard Manager**—I believe that the period of rumors about the automobile business has about passed over and that this industry has settled down to normal conditions again. The fireworks that the public were looking for did not come off, and I believe that, for the most part, they are getting tired waiting for them and are willing to accept conditions as they exist. The truck business in particular is in an active process of rejuvenation and we are looking forward to a good year's business in that field.

## SUCCESSFUL SHOW IN LOS ANGELES.

**D**URING the week in which New York City was experiencing the biggest automobile show of its history, Jan. 3-10, the first organized exhibition of motor cars in Los Angeles, Cal., in three years, was being held in the Grand avenue pavilion. Only 25 different makers were represented, but the show was a success in every respect. It may be added, in this connection, that the Los Angeles Motor Car Dealers' Association did not co-operate with the management, and only two of its members made display.

Business conditions, insofar as the automobile industry is concerned, are particularly good in southern California at this time. The registrations show that some 17,000 cars were sold in this territory during 1913. The situation is altogether unlike that which exists in practically every other section, in that the district of which

Los Angeles may be regarded as the commercial centre, is so-called virgin country. By this is meant that a great deal of development work is under way, and the people are only just beginning to become sufficiently settled in a business way to gratify their desires in many respects. The territory is rich in possibilities, and all dealers, whether they took part in the recent show or not, are decidedly optimistic as to the immediate future.

The interior of the building was made particularly attractive by the use of some 5000 square feet of mirrors, large Japanese umbrellas, dwarf trees, pagoda effects and foliage, amid which twinkled nearly 4000 electric lights. In addition to the 25 makes of cars there were about 35 accessory houses represented. The attendance was estimated at nearly 70,000.

## ONE HUNDRED SALES IN BRIDGEPORT.

**A**LTHOUGH Bridgeport, Conn., is within 75 miles of Grand Central Palace, where the most largely attended show New York City ever has known was held during the week of Jan. 3-10, it has been ably demonstrated that it is possible to attract the people of that city to a local

way were such as to inspire new confidence in the dealers of that city. Immediately after the close of the exhibition over 100 sales were reported, and the number of prospects for sales in the near future were said to be decidedly bright. The list of exhibitors included the following:

Simple and Attractive Setting in Which the Season's Models Were Displayed by the Dealers in Bridgeport, Conn.

dealer's display directly after the closing of the national exhibition. The third annual Bridgeport show was held in the state armory, Jan. 12-17, under the management of B. B. Steiber.

Not only was the attendance larger this year than ever before, but the results in a business

**Pleasure Cars**—Erwin M. Jennings Company, Hudson, Stevens-Duryea; J. L. Carpenter, Hupmobile, Baker electric; Starbuck & Mattice, Ford; Consolidated Motor Car Company, Abbott-Detroit; Arthur L. Clark, Buick, Franklin; Harry M. Ford, Oakland; George W. Wuestfelt (New Haven), Pierce-Arrow; O. H. Banks (Norwalk), Moyer; Detroit Cadillac Motor Car Company, Cadillac; Carl H. Page, Chalmers; Harry Ford, Metz, Stutz, Reo; Blue Ribbon Garage, Packard; Buckley Auto Station, Paige,

**Commercial Cars**—J. L. Carpenter, Standard, Federal; Consolidated Motor Car Company, Selden.

**Special Bodies**—Metropolitan Auto & Carriage Company, Blue Ribbon Auto & Carriage Company, R. A. Rantz.

**Cyclecars**—Clarendon Oil Company, Imp. Trumbull.

**Motorcycles**—Burroughs Company, Excelsior.

**Accessories**—Erwin M. Jennings Company, general line; Harry M. Ford, carburetors; Blue Ribbon Garage, general line; Rutherford Tire Company, tires; Clarendon Oil Company, truck tires and tire chains; Pyrene Manufacturing Company, fire extinguishers; Auto Leather Goods Company, leather goods; Standard Parts Manufacturing Company, horns; Standard Signal Light Company, Vacuum Mabiloils.

## RECORD ATTENDANCE FOR BALTIMORE.

**F**OR the eighth year the automobile dealers of Baltimore, Md., placed their wares before the people of that city and vicinity for inspection, Jan. 20-24. This year the display was made in the Fifth Regiment armory, where abundant opportunity was afforded to exhibit the various makes of cars and trucks and accessories on one floor. The event was under the auspices of the Baltimore Automobile Dealers' Association, assisted by the Automobile Club of Maryland.

Secretary H. M. Luzius of the club acted as

space was devoted to the exhibition of trucks and business wagons as to passenger machines:

**Pleasure Cars**—Colonial Motor Company, Studebaker, Stearns-Knight; Motor Car Company, Stevens-Duryea, Overland; Rice's Garage, Pathfinder; Gilbert A. Wehr, Reo; Franklin Motor Company, Franklin; Haynes Motor Sales Company, Haynes, King; Poehlmann Automobile Company, Cole, Chandler, Chevrolet; Model Auto Company, Apperson; Beehler & Ogden, K-R-I-T; Mar-Del Mobile Company, Packard; Eastwick Motor Company, Ford; Carl Spoerer's Sons Company, Spoerer; Club Garage, Mercer; Zell Motor Company, Chalmers, Rauch & Lang electric; Walter Scott, Marmon, Premier; Schell-Crouch Auto Company, Lozier, Paige; Winterson Automobile Company, Cartercar; Winton Motor Company, Win-

show manager and arranged a decorative scheme well calculated to transform the interior of the building into a proper setting for the various exhibits. The other members of the committee were: F. S. Bliven, E. R. Meyers, R. J. W. Hamil and T. W. Wilson, Jr., for the association, and Dr. H. M. Rowe, John S. Bridges and J. G. Nassauer for the club.

As was true of the Philadelphia and Washington displays, the attendance at Baltimore exceeded all previous records, and reports from that city soon after the show opened indicated a very satisfactory business. A particularly pleasing feature of the display was the interest created in commercial vehicles and it will be noted by the following list of exhibitors that almost as much

ton; Foss-Hughes Company, Pierce-Arrow; Standard Motor Company, Cadillac; Locomobile Company of America, Locomobile; Oakland Motor Company, Oakland; Cook & Fletcher, Stanley steam; White Motor Company, White; Ditch, Bowers & Taylor, Inc., Detroit electric; Auto Outing Company, Buick; Lambert Auto Company, Hudson; Mitchell Auto Company, Mitchell; F. Fulton Company, Lauth-Juergens; Foss-Hughes Company, Pierce-Arrow; Nelly & Ensor, Kelly; White Motor Company, White; International Service Company, Mack, Saurer; International Harvester Company of America, I. H. C.; Oakland Motor Company, Federal; Autocar Sales & Service Company, Autocar.

**Accessories**—Federal Tire Sales Company, tires; C. B. Pruden Company, portable garages; Auto Supply Company, general line; Reus Bros. Company, bearings, tires.

**Motorcycles**—Sandruck Motor Company, Flying Merkel.

## GREAT ENTHUSIASM IN PITTSBURG.

**P**ITTSBURG, Penn., is one of the few cities in the country which will hold two automobile shows this year. The first was held in Motor Square Garden, Jan. 17-24, under the auspices of the Pittsburg Automobile Dealers' Association, and the second will be held in Exposition hall, Feb. 14-21, under the direction of the Pittsburg Auto Show Association. If the latter meets with the same degree of success which attended the former, there will be little doubt as to the enthusiasm of the people in the district of which Pittsburg is the centre. For that matter, there is no doubt in the minds of the members of the dealers' association now.

The show just closed was unique in one respect, in that it virtually was two shows in one. The show committee, consisting of W. N. Murray, E. Kiser, Wilson McClintock, W. W. Bennett, Ray McAllister, C. E. Vestal, I. C. Meyers, W. Murray Carr and Frank D. Saupp, offered a prize for the oldest gasoline propelled vehicle still in service, and this contest resulted in one of the most interesting collections of "relics" yet assembled in this country. This portion of the display was held outside the building, as indicated by an accompanying illustration, and the vehicles offered a sharp contrast with the 1914 models in the hall proper. The car occupying a prominent place in the picture bore a placard with the following inscription:

This Oldsmobile has never had a replacement of parts. Ran by its own power from McKee's Rocks to East Liberty this morning. Has been driven 300,000 miles.

W. H. LaFountain was manager of the show, which was the eighth to be held under the aus-

pices of the dealers' association. He is particularly pleased with the results, as evidenced both by the attendance and the number of sales. The interior of the building was treated with a color scheme of apple green and white, with a touch of red in the upper canopy. The side walls were made to match the ceiling and the floor decorations were in white. The electrical display was particularly appropriate, with a profusion of large art globes of the lead or cathedral type, made in the form of tulips, roses, etc.

The list of exhibitors included the following:

**Gasoline Cars**—Averman-Lynn, Inc., Lozier; Abbott Motor Car Company, Abbott-Detroit; Bennett Motor Car Company, King, Pope-Hartford; Eddie Bald Motor Car Company, Hudson; Buick Motor Company, Buick; Ford Motor Company, Ford; Franklin Motor Car Company, Franklin; Hiland Auto Company, Peerless; G. H. Hopkins, American; Klingler Company, Imperial, Palmer-Singer; Locomobile Company, Locomobile; L. G. Martin, Jeffery; Miller Auto Company, Crawford; McAllister Bros., Cadillac; McCurdy-May Company, Pierce-Arrow; Pittsburg Chalmers Company, Chalmers, Reo; Pittsburg Mercer

Company, Mercer, Jackson, Stearns-Knight; Pittsburg Haynes Company, Haynes; Oakmont Motor Boat Company, Pathfinder, Wahl; Oakland Motor Car Company, Oakland; Packard Motor Company, Packard; Oldsmobile Company, Oldsmobile; Painter-Dunn Company, Overland; Poffinberger Motor Company, Marmon; T. M. Pepperday Company, Simplex, S. G. V.; E. J. Thompson Company, Flat; Vestal Motor Car Company, Stevens-Duryea; Winton Motor Car Company, Winton; White Company, White; Hamilton Motor Car Company, Keeton; W. C. Rea, Speedwell.

**Electric Cars**—Baker Electric Sales Company, Baker; East End Auto Company, Waverley; Klingler Company,

Ohio; R. & L. Sales Company, Rauch & Lang.

**Accessories**—Aetna Life Insurance Company, Automobile Accessories Company, Blodgett Sales Company, P. V. Blond, Chemical Rubber Company, Doubleday-Hill Electric Company, Dyke Motor Supply Company, Gasoline Supply Company, Hoover & Hurst, Keystone Lubricating Company, Keystone Shock Absorber Company, Liberty Brazing & Welding Company, Pittsburg Rubber Company, Pyrene Manufacturing Company, Pittsburg Auto Equipment Company, Pittsburg Spring Company, Alex. Peacock Company, Williams & Co., H. W. Johns-Manville Company, Joseph Woodwell Company, Jackson Motor Supply Company, Iron City Spring Company.

## TRUCKS THE FEATURE AT DETROIT.

CONSIDERING the fact that Detroit is regarded as the heart of the automobile industry, and that a large percentage of the population is connected with the industry or its allied interests in one form or another, it would hardly seem, upon first thought, that an automobile show in that city would be an attraction that would draw a large number of people. Yet for 13 consecutive years an event of this character has been held in that city—during recent years under the auspices of the Detroit Automobile Dealers' Association.

Not only has the attendance at each succeeding show been larger than at any of its predecessors, but the demand for space has grown more insistent each year. The latter factor presents a problem which those in charge of the arrangements find more and more difficult to solve. For the 1914 display, which was held Jan. 17-24, it was at first thought that it would be necessary to erect a temporary structure, but at the last moment, Henry Ford of the Ford Motor Company, placed the new assembly building of that concern at the disposal of the committee. The exhibits were staged on three floors of this structure.

The 13th annual Detroit show was particularly notable for the interest created in the commercial motor vehicle. The number of makes on display was not sufficient to excite special comment, in view of the importance of the city as an automobile centre, and this will doubtless be remembered by those manufacturers of trucks and business wagons who were not represented.

The commercial vehicle section also was of importance from the introduction of an entirely new truck, the Pull-More, made by the Pull-More Motor Truck Company, Detroit. This is a front wheel drive machine, possessing a number of novel features. The construction is termed by the maker a two-unit plan, by which is meant that the power unit, consisting of the motor and all the mechanism, is entirely apart from that carrying the load, virtually a two-wheeled tractor.

The show was under the direction of a special committee, consisting of President Joseph Schultze, Secretary Frank N. Sealand, Treasurer C. C. Starkweather and Directors W. J. Gordon and George Reason. Walter Wilmot, who has been show manager for a number of years, again held that position. The exhibitors included the following:

**Gasoline Pleasure Cars**—Buick Motor Company, Buick; Cadillac Motor Car Company, Cadillac; Standard Auto Company, Packard; Winton Motor Car Company, Winton; Oakland Motor Car Company, Oakland; Grant Bros. Auto Company, Grant, Chandler; Neuman-Lane Company, Chalmers, Pierce-Arrow; Overland Detroit Company, Overland; Cunningham Auto Company, Maxwell; M. A. Young, Reo; Ford Motor Company, Ford; Oldsmobile Company, Oldsmobile; Wetmore-Quinn Company, Lozier, Paige; Grasser Motor Company, Hupmobile; Siegel-Zackendorf Company, Cole; Keeton Motor Company, Keeton, Car-Nation; P. W. Schulte & Sons, Paterson; Jackson Automobile Company, Jackson; Cartercar Company, Cartercar; Studebaker Corporation, Studebaker; K-R-I-T Motor Sales Company, K-R-I-T; Bomd-Robinson Company, Hudson; Postal-Fair Motor Company, Peerless; Regal Motor Sales Company, Regal; Gaston-Richardson Company, Abbott-Detroit; J. P. Schnelder, Chevrolet; Havers Motor Car Company, Havers; King Motor Sales Company, King; Foster Motor Sales Company, Stevens-Duryea, Imperial; Perrett-Barber Motor Sales Company, Detroit; Thomas J. Doyle, Saxon.

**Electric Pleasure Cars**—Detroit Electric Garage, Detroit; Century Electric Car Company, Century; Grinnell Electric Car Company, Grinnell; Electric Automobile Company, Standard; Edward I. Rumsey, Ohio; Henry L. Walker Company, Woods.

**Commercial Cars**—Buick Motor Company, Buick; Standard Auto Company, Standard; Thompson Auto Company, Wagenhals, Federal, Universal; Studebaker Corporation, Studebaker; General Motors Truck Company, GMC; Star Tribune Motor Sales Company, Star, Tribune, O. K.; International Harvester Company of America, I. H. C.; Pull-More Motor Truck Company, Pull-More; Commerce Motor Car Sales Company, Commerce; Kelly Truck Company, Kelly.

**Cyclecars**—LaVigne Cyclecar Company, LaVigne; Scripps-Booth Cyclecar Company, Rocket, Packet; Mercury Cyclecar Company, Mercury; Cricket Cyclecar Company, Cricket; Hawk Motor Car Company, Hawk; Detroit Cyclecar Company, Detroit.

**Motorcycles**—W. E. Wandersee Company, Harley-Davidson.

**Accessories**—Chas. E. Miller, Armitage Leather Company, Wayne Oil Tank & Pump Company, Paragon Refining Company, Sewell Cushion Wheel Company, Sears-Cross Company, Indian Refining Company, White Star Refining Company, Automobile Supply Company, Farmer Manufacturing Company, Jackson-Church-Wilcox Company, M. & S. Gear Company, National Refining Company, Cleveland Worm & Gear Company, H. W. Johns-Manville Company, Visco Motor Oils Company, Acme Enamelling & Japanning Company, Fidelity & Casualty Company, National Can Company.

## PRESIDENT OPENS WASHINGTON DISPLAY.

**W**HEN President Wilson pressed a button at the White House at 8 in the evening of Jan. 19, a large American flag, which had been hung at the highest point of the Convention hall, in Washington, D. C., unfurled and dropped down in the centre of the hall, and the second annual automobile show of the Washington Automobile Dealers' Association was formally opened. Eighty cars and trucks, representing the product of some 30 makers, were on display, and the exhibition of accessories was most complete.

The color scheme this year was white and gold. The entire ceiling was covered with material of these colors, effectually concealing the girders, etc. The side walls were treated in a similar manner. The floor was covered with green burlap to represent a greensward, and at intervals along the main aisle, dividing the exhibition spaces, were a number of ornamental lamp posts, with side arms, still further accentuating this effect.

T. Oliver Probey was chairman of the show committee, and he was ably assisted by Charles W. Semmes, vice chairman; R. Bruce Emerson, secretary; Arthur Foraker, treasurer; F. C. Sibbald, J. H. Johnson, Jr., William P. Barnhart, T. Lamar Jackson, C. H. Warrington and Irving J. Henderson. The list of exhibitors included the following:

**Gasoline Pleasure Cars**—Automobile Sales Company, Lozier; Briscoe Motor Car Company, Briscoe; Cole Motor Sales Company, Cole; Davis Motor Car Company, Davis;

Emerson & Orme, Apperson; Henderson-Rowe Auto Company, Chevrolet; Hupp Motor Car Company, Hupmobile; Hudson Automobile Company, Hudson; William P. Barnhart & Co., King, Pullman; T. Lamar Jackson, Stevens-Duryea; Kline Motor Car Corporation, Kline-Kar; Krit-Washington Motor Car Company, K-R-I-T; Mitchell Lewis Motor Car Company, Mitchell; Potomac Motor Car Company, Marmon; Probey-Haynes Motor Company, Haynes; Regal Motor Car Company, Regal; W. L. Smith Company, Detroit; Warrington Motor Car Company, Palmer-Singer; Winton Motor Car Company, Winton.

**Electric Pleasure Cars**—Emerson & Orme, Detroit; Hudson Automobile Company, Argo; William P. Barnhart & Co., Standard; Ohio Electric Car Company, Ohio; Poto-

mac Motor Car Company, Woods.

**Commercial Cars**—Congressional Garage, Wilcox; R. E. Lankford, Indiana.

**Cyclecars**—Imp Cyclecar Company, Imp.

**Accessories**—Barber & Ross, supplies; Irvin T. Donohoe, supplies; National Electric Supply Company, electric supplies; Chesley & Herveycutter, shock absorbers and lamps; Edison Storage Battery Company, Edison batteries; A. H. Gregory, marine engines; Miller-Dudley Company, magnetos, carburetors, lighting devices; Standard Auto Top Company, one-man top; W. H. Waldron, shock absorbers.

## CLEVELAND SALES TOTAL \$1,000,000.

**S**ALES aggregating more than \$1,000,000 are reported to have resulted from the 12th annual automobile show, held in the Wigmore Coliseum, Cleveland, O., Jan. 10-17, under the auspices of the Cleveland Automobile Show Company, and the personal direction of Fred H. Caley as manager. He was assisted by the following officers: President, H. M. Adams; vice president, W. H. Barger; secretary, Fred C. Wood, and treasurer, C. M. Brockway.

In every respect the display exceeded all past records. The number of exhibitors was by far larger than at any previous exhibition, the floor space at the disposal of the management being very nearly an acre and a half. The attendance for the week was about 100,000 and the number of sales, with the sum involved, not only sets a new record for Cleveland, but for any city in that section.

There seems to be no doubt as to the imme-

diate future in the district of which Cleveland is the commercial centre. The dealers of that city sold 9000 cars during 1913, and freely predicted, previous to the opening of the show, that the number for 1914 would reach 14,000. The interest created by the exhibition is sufficient to justify a thoroughly optimistic view of the situation.

The visitors to the show entered the building through an arched pergola of columns and lattice work, profusely covered with foliage and flowers. Once inside the main hall it was found that this same treatment had been carried out to make an entirely original and pleasing setting for the cars and accessories, the exhibitors of which included the following:

**Gasoline Pleasure Cars**—Winton Motor Car Company, Winton; Peerless Motor Car Company, Peerless; White Company, White; F. B. Stearns Company, Stearns-Knight; Chandler Motor Car Company, Chandler; W. H. Barger Company, Lozier, Jeffery; Weaver-Twelve-tree Company, Pierce-Arrow, Chalmers; Richardson Motor Car Company, Cole; Auto Sales Company, Reo, Pathfinder; Ford Motor Company, Ford; Stevens-Duryea Company, Stevens-Duryea; V. R. Hall Automobile Company, Cartecar; E. C. Anderson, Grant; Oakland Motor Company, Oakland; A.

R. Davis Company, Studebaker; Ohio Buick Company, Buick; Jackson Motor Sales Company, Jackson; Hamilton Motor Car Company, Chevrolet, Allen; Lucas & Christensen, Mitchell, Paige; Neighbors Motor Company, Hupmobile; Parrish Motor Car Company, Packard; C. D. Paxson, Crescent; Velle Motor Car Company, Velle, King; Overland-Garford Sales Company, Overland, Willys-Knight; Vulcan Manufacturing Company, Vulcan; Cleveland Cadillac Company, Cadillac; M. D. Coate, Detroit; Pullman; J. H. Greenwald, Hudson.

**Electric Pleasure Cars**—Baker Electric Vehicle Company, Baker; Rauch & Lang Carriage Company, Rauch & Lang; Broc Electric Vehicle Company, Broc; Anderson Electric Car Company, Detroit; Homer Haupt, Ohio.

**Commercial Cars**—Standard Motor Truck Company, Standard; C. D. Paxson, Cleveland, Gabriele; Overland-Garford Sales Company, Garford, Willys Utility; Colonial Service Station, Menominee; Kelly-Springfield Motor Truck Company, Kelly.

**Cyclecars**—Wilkinson, the Cyclecar Man, Imp; J. H. Sizelan Company, Fidelity.

**Accessories**—Euclid Oil Company, H. W. Johns-Manville Company, Joseph Schaeffers, Auto Top Dyeing & Cleaning Company, Visco Motor Oils Company, R. C. Hull Electric Company, Electric Products Company, Universal Lubricating Company, Chas. E. Miller, Cleveland Worm & Gear Company, National Refining Company, Perfection Spring Company, Aetha Life Insurance Company, V-Ray Company, Standard Oil Company of Ohio, Wayne Oil Tank & Pump Company, MacAdams Company, Browning, King Company, City Auto Tire & Supply Company, Favorite Knitting Mills, Cleveland Prest-O-Seal Company, Cleveland Spring Company, O-Tak-A Tire Remover Company, E. H. Bryant, I. H. Silby, Casino Cycle & Supply Company, Factory Sales Company, Scarborough Company, Forest City Electric Company.

## MILWAUKEE ALSO FEATURED TRUCKS.

OF THE 79 different makes of automobiles represented by the 54 dealers in Milwaukee, Wis., 72 were displayed at the sixth annual Milwaukee automobile show in the Auditorium in that city, Jan. 10-16. Not only was this the largest exhibition of motor vehicles ever held in that centre, but the event was made even more notable from the fact that it presented the greatest number of commercial cars ever assembled under one roof in that city.

The situation in Milwaukee is somewhat distinctive, in that a majority of the dealers are state distributors, and therefore in direct touch with the conditions prevailing throughout the whole of Wisconsin. Good crops were responsible for a good year's business during 1913, the sales being decidedly in excess of those for the previous year. Another feature, and by no means the least important, lies in the fact that cash sales were much more frequent than at any time in the past. The dealers have not found it necessary to adopt stringent methods in order to bring this about, since there has been much less disposition to ask for credit.

Concerning the show it may be stated that the results were quite up to expectations. The attendance was large and representative of the entire state, the total being about 40,000, nearly half of whom were non-residents. This was due

in part to the fact that many conventions of dealers, supply men and owners were held during the week. Chairman Edwards of the show committee took full advantage of the opportunity to exploit the commercial vehicles on display, and business men were not only invited, but urged to attend and inspect the various models. Special efforts were made to reach municipal authorities, and the city officials of more than 50 towns and cities in Wisconsin were entertained by a committee created for that purpose.

The interior of the building was transformed into a Japanese garden and the cars were presented amid a veritable bower of flowers, bamboo poles and Japanese lanterns. The list of exhibitors included the following:

**Gasoline Pleasure Cars**—Frint Motor Sales Company, Chevrolet; Hoppe Hatter Motor Car Company, Chalmers; Wollaeger Sales Company, Studebaker, Peerless; Imperial Auto Sales Company, Imperial, K-R-I-T; Hickman-Lauson-Diener Company, Ford; Hughes Motor Car Company, Apperson, National; Winton Motor Car Company, Winton; McDonald Motor Car Company, Lozier; Hustis Bros., Stevens-Duryea, Premier; Sanger Auto Company, Franklin; Buick Motor Company, Buick; Schreiber-Bourse Motor Car Company, Locomobile, Hudson; Emil Estberg, Pope-Hartford; White Automobile Company, White; American Automobile Company, Pierce-Arrow; Schilol Motor Sales Company, Mercar; Cole Motor Company, Cole; Mitchell Automobile Company, Mitchell, Detroit; Creek Motor Sales Company, Oakland, King; Jesse A. Smith Automobile Company, Empire, Speedwell; Regal Auto Sales Company, Regal; Cartecar-Wisconsin Company, Cartecar; R. D. Rockstead, Paige, Chandler; Curtis Auto Company, Reo; Adams & Burg.

Auburn; J. I. Case Threshing Machine Company, Case; Jonas Automobile Company, Cadillac; Sherman Garage, Jackson; Reeke-Osmond Motor Car Company, Jeffery; KisselKar Company, KisselKar; George W. Browne, Overland, Stutz, Willys-Knight; Haynes Automobile Company, Haynes; Packard Motor Car Company, Packard; Edgar F. Sanger Company, Hupmobile, Abbott-Detroit, Stearns-Knight; Milwaukee Auto Sales Company, Maxwell; First Avenue Garage, Davis, Flyer, Metz; C. M. Thorning, Velle; W. C. Walt, Patterson, Moline-Knight.

Hadden Company, O'Neill Oil & Paint Company, Western Fixture Company, Bartles-Maguire Oil Company, Kamice Company, Christiansen Engineering Company, Wisconsin Mat Company, Robinson Auto Heater Company, Wallmann Manufacturing Company, Wadhams Oil Company, Julius Andrae & Sons Company, Racine Sales Company, Stenz Electric Company, Wisconsin Machine & Manufacturing Company, and representatives of the Boston Ford starter, Air Friction carburetor and Dayton Airless tires.

## ENTERS AUTOMOBILE FIELD.

### Wetmore-Savage Company Places C. F. Lawton in Charge as Manager.

The Wetmore-Savage Company, 76-78 Pearl street, Boston, Mass., one of the largest and most progressive electrical supply houses in that centre, has joined the ranks of the old established concerns entering the automobile field. Recently the company enlarged its automobile department, and it expects to play a prominent part in the supply business in New England.

C. F. Lawton, formerly sales manager of the Bi-Motor Equipment Company, has been placed in charge of the enlarged department as manager, and active work of covering the territory is now under way. Mr. Lawton is perhaps one of the best known and most popular automobile supply salesmen in New England, and his personal following is very large. He was for five years with the Bi-Motor company, first as travelling salesman and later as sales manager.

## KETCHUM SUCCEEDS PRUDEN.

### Former Garford Salesman Takes Charge of KisselKar New England Branch.

The motorists of New England have been somewhat interested in learning the name of the man who was to succeed H. B. Pruden, who resigned as manager of the KisselKar New England branch, Boston, a month or two ago. The Kissel Motor Car Company, Hartford, Wis., has announced the appointment of Ralph Ketchum, one of the best known and most competent salesmen in the East.

During his connection with the R. & L. Com-

pany of Boston, New England distributor for the Garford line, Mr. Ketchum has won for himself an enviable reputation both as an authority and as a salesman. He is one of the new school of executives who believe that the head of a concern should be on the floor or on the road, rather than at a desk.

He takes over the KisselKar branch with every advantage in his favor. Mr. Pruden had provided one of the most complete and attractive sales and service stations in the country on Commonwealth avenue, and a good representation of sub-agencies throughout the New England states.

## REDUCE TIRE GUARANTEE.

### Makers of Equipment for Commercial Vehicles Announce Change in Mileage.

The Goodyear Tire & Rubber Company and the B. F. Goodrich Company of Akron, O., and the United States Tire Company and the Kelly-Springfield Tire Company of New York City, have announced a reduction in the mileage guarantee heretofore supplied with the tires produced by them for use on commercial vehicles. The old guarantee will apply to all tires sold previous to Jan. 1, and allowances will be made accordingly.

The Goodyear and United States tires for gasoline cars formerly bore a guarantee of 10,000 miles service, and this has been reduced to 7000, to be used in 12 months. Electric vehicle tires made by these concerns are now guaranteed for 7000 miles in 18 months. This applies to practically all types of solid tires, although the mileage with some of these has been 7000. The Goodrich reduction is from 8000 to 7000 on both gasoline and electric.

## NATIONAL ENTERS SIX-CYLINDER FIELD.

**T**HE six-cylinder car has received the indorsement of another old established manufacturer, the National Motor Vehicle Company, Indianapolis, Ind., announcing a new chassis which differs in many respects from the well known model 40, which has so ably represented the company in track and road contests. The last named will be continued and will doubtless be the chief factor in the company's production plans for the future.

The new motor has conventional cylinder dimensions of 3.75-inch bore and 5.5-inch stroke, and like the majority of new sixes its cylinders are cast en bloc. It is of the L head type with the valves located on the right, differing from the model 40, which is a T head design with two camshafts. A radical departure from National practise is the utilization of a cantilever type of rear spring, somewhat similar to the Lanchester suspension, but differing, in that the entire end thrust of the car is taken through the springs. This is probably the first endeavor to use a cantilever spring as the propulsive member. The National cantilever springs are 53 inches long and are suspended at the front end from a double shackle.

### New Body Designs.

The body designs are innovations for the National company, being noticeable for their exceptional sweep and cleanliness. They are typical streamline, the hood tapering from the radiator back without a break, and seemingly beginning as far back as the front seat. The impression one receives is that of speed, as wind resistance is reduced to a minimum. The accompanying illus-

trations bring out these features, also the low centre of gravity.

In its selling policy, as well as mechanical features, the National company has adopted a rather unusual method. It is the belief of the general manager, George M. Dickson, that the prospective purchaser is more vitally concerned in the character of the maker and the responsibility than with many minor details; that is, it is sufficient to show the buyer that the factory has the kind of a car he wants, and the responsibility of the company and the good judgment of its engineers may be relied upon to provide the proper material and incorporate high grade workmanship in carrying out their designs. His idea is that buying a motor car is much like purchasing a high grade watch—the maker's name is sufficient guarantee of its proper material and design.

### Intake Manifold Water Jacketed.

The rating of the motor is 33.75 horsepower by the S. A. E. formula, but it is very conservative when its light weight and long stroke are taken into consideration. A feature of the design is the use of detachable intake and exhaust manifolds and intake water header. The intake water manifold is water jacketed, a distinct advantage in carburetion, and the exhaust is a square, clean casting. The power plant is noticeable for its clean appearance and compactness of design.

A number of noteworthy features are noted in the cooling system. The radiator has been improved, being made more efficient to permit of the use of a smaller design and to conform to the slope of the hood. It is mounted on trunnions on

The Body Designs Fitted to the National Six Chassis Exemplify the Streamline Effect to a Marked Degree.

**Illustrating Some of the Mechanical Features of the National Six, Including Form of Cantilever Spring, Accessible Differential, and Both Sides of Motor, Which Is Noticeable for Its Clean Appearance.**

the frame horns, to compensate for road inequalities, and cooling is aided by an adjustable ball bearing fan mounted on a standard from the engine base.

The cooling fluid is circulated by a rotary pump on a lay shaft driven from the timing gears, which are spiral cut and operate in a bath of oil. The shaft referred to carries from the front to the rear of the motor a fan belt pulley, power tire pump, water pump and magneto. The last named is driven through a leather flexible coupling.

#### **Lighting and Starting Units.**

The crankcase is divided horizontally, and a constant level of lubricant is maintained by a force feed pump, with a splash lubrication of the connecting rods and other cylinder components. The main bearings are lubricated through tubes cored in the cylinder castings, and these tubes also convey oil to the timing gears located at the front end of the motor. This arrangement provides proper lubrication of the silent chain, which drives the starting and lighting units. The last named, although separate, are mounted as a unit upon the valve side of the motor, a base plate being cast on the upper crankcase. One of the noticeable features of the design is the ease with which the dynamo and motor may be displaced if desired. The motor starter is actuated by a foot plunger.

Ignition is by a dual high-tension magneto with a storage battery supplying auxiliary current. A Rayfield carburetor and pressure feed are employed, the fuel container having a capacity of 23 gallons and being suspended at the rear of the chassis. It is well protected, has an am-

ple sized filler tube, and the usual gauge is provided. Pressure is maintained by a small piston pump operated by a cam on the camshaft.

#### **Accessible Clutch.**

One of the qualities of the National clutch is that it is removable without disturbing the balance of the transmission system. This desirable feature is obtained by one of the time tried National constructions, the use of a double universal joint in the short shaft between the clutch and the gearset. The clutch proper is an aluminum, leather faced member, spring cushioned to obtain easy and gradual engagement. Another feature is the use of an adjustable clutch pedal. Easy change of speeds is assured by the use of a clutch brake, comprising two rim bearing pads.

The gearset follows National practise, three forward speeds and a reverse being afforded, and is located amidships. An unenclosed shaft with a universal joint at either end transmits the energy of the motor to a full floating rear axle, and a large torque arm cares for any twisting stresses.

#### **Ample Sized Brakes.**

As in the past, the National braking system provides a large factor of safety. Two sets are fitted, two internal expanding on the hubs, and two external contracting on the outside of the drums, which are 11 inches in diameter and have ample face. The frame of the new chassis is unusually sturdy, having a five-inch channel section and exceptionally wide flanges. It curves up slightly over the rear axle, providing a low suspension of the body, and is offset at the front to permit of turning the machine in a small circle. It is stated that the National six can be turned around in a 39-foot circle.

The front axle is of the conventional I beam section type and supports semi-elliptic springs. The roller bearings of the front wheels are am-

**National Method of Suspending Fuel Tank and Carrying Spare Tires.**

ple in size and are of the adjustable type. Roller bearings are also employed in the rear axle. The driver is located at the left and the steering column is set at a comfortable angle, a feature of the National cars. The control levers are placed in the centre, well back toward the seat, and the gearset member is provided with the ball top, which conforms to the shape of the hand.

The wheelbase is 132 inches, and the 36 by 4.5-inch tires are fitted to Firestone demountable rims, one extra member being standard equipment. Provision is made for carrying two spares at the rear of the chassis, the holders being substantial and the design preventing chafing of the casings.

#### **Control Units Neatly Grouped.**

The control units are neatly and compactly grouped on the instrument board, all being within a metal plate. The push button operating the electric horn is located on the top of the steering column, a position making for convenience as well as quick operation. The equipment leaves nothing to be desired. The Warner speedometer is driven from a gear on the universal at the forward end of the propeller shaft, the pinion bracket being bolted to a cross member of the frame.

In carrying out the streamline body design, the side lamps have been eliminated. The headlights are provided with double bulbs, the smaller lamps being utilized for operation in cities and towns where the ordinances prohibit the use of

headlights. The top includes side curtains and boot, and the windshield is a rain vision and ventilating design.

#### **Three Body Types.**

The bodies fitted to the National six include four and five-passenger touring types and a three-passenger coupe. The last named is indicative of the streamline ideas of the National body designer, and has not only the sloping hood, but also is curved with sweeping lines at the rear and top. The mud guards are exceptionally wide, are perfectly smooth and flat and have neither doming nor beading. The new National design is fully in keeping with the high grade established by the model 40 and will appeal to those who desire a machine having ample power to meet the requirements of all conditions of service and comfortable riding qualities.

#### **PLAN TO REORGANIZE.**

#### **Stockholders of Columbus Buggy Company Hold Meeting for This Purpose.**

In a statement signed by L. M. Browne, for the automobile department of the Columbus Buggy Company, Columbus, O., it is announced that a meeting of the owners of this concern was held at the factory Jan. 16, the larger interests being particularly well represented. It was decided to incorporate, issue stock to the present owners for their respective holdings and proceed with the business.

A sub-committee was appointed to act with the creditors' committee, which has been operating the plant since June 7, to carry into effect the plans of incorporation. This committee was

**National Six Coupe, Indicating the Streamline Ideas of the Designer.**

instructed to proceed in the matter as rapidly as possible, and to hold a stockholders' meeting at an early date.

**STEWART-WARNER SERVICE.****Chicago Concern Is Well Represented in This Country and Abroad.**

Service is one of the most important factors for which makers of automobiles and accessories have to provide in order to insure success for their product. The reason for this is held to lie in the fact that the whole car and its equipment, being a collection of machinery, is subject to breakage or excessive wear through accident or improper usage. It is with the idea of still further extending its service facilities that the Stewart-Warner Speedometer Corporation of Chicago announces the establishment of seven new direct factory branches and 50 new service stations, in many parts of the United States and several foreign countries.

With the opening of the new direct factory branches, the Stewart-Warner representatives in 15 cities of the country have equipment and facilities as good as those at the main plants, for taking care of customers. These cities are New York, Boston, Buffalo, Cleveland, Detroit, Indianapolis, Chicago, San Francisco, Philadelphia, Pittsburgh, Atlanta, Los Angeles, Minneapolis, Kansas City and St. Louis. The seven last named are the new ones. The dealers' service stations, which now total 103, are located in every city of any importance as an automobile centre in the world. The United States is thickly dotted with them, and among those in foreign countries are the following: London, Montreal, Quebec, Ottawa, Paris, Sydney, Australia and the Transvaal, South Africa.

**ELIMINATES CHICAGO BRANCH.****Kissel Motor Car Company Turns Business in That Territory Over to Agency.**

Following the announcement that the Peerless Motor Car Company, Cleveland, O., had contracted with the McDuffee Automobile Company of Chicago to handle its product in the future, comes information that the Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure and commercial vehicles, has placed its business in that territory in the same hands, abandoning the Chicago branch. The change went into effect Jan. 20.

Besides these two lines the McDuffee company handles the Howard, made by the Howard Motor Car Company, Connersville, Ind., and the Rauch & Lang electric, made by the Rauch &

Lang Carriage Company, Cleveland, O. The concern is one of the most aggressive in the Middle West.

**TO MAKE QUALITY TIRES.****Akron and Canton Men Organize and Locate Factory in Hartville, O.**

The Quality Tire & Rubber Company has been organized by several men in Akron and Canton, O., and the plant will be located in Hartville, O. The company, which is capitalized for \$75,000, purposes to make tires and tubes of all kinds, and hopes to have its factory in operation next month.

The officers of the company are: President, J. C. Guthrie, Akron; vice president, E. A. Brown, Akron; secretary, E. B. Brown, Akron; treasurer, Edward L. Smith, Canton. F. H. Trump will be factory superintendent.

**CYCLECAR MAKERS WILL ORGANIZE.****Representatives of the Various Manufacturers to Meet During Chicago Show.**

During the week of the Chicago show, Jan. 24-31, there will be a meeting in that city of representatives of the various cyclecar manufacturers throughout the country for the organization of the National Cyclecar Manufacturers' Association. It is stated that invitations have been issued to some 100 concerns who are engaged in the production of the new type of vehicle and it is proposed to organize for mutual benefit.

Simultaneously with this meeting there will be held a convention of delegates representing the various cyclecar clubs, which have been formed during the past few months.

The Department of Commerce, Washington, is announcing the publication of a newspaper directory containing a list of news and trade papers in foreign countries, supplemented with such data as would interest advertisers, possible subscribers, etc. This is known as "Miscellaneous Series No. 10, Foreign Publications for Advertising American Goods, Etc.", and copies will be sold by the superintendent of documents, government printing office, Washington, D. C.

It is stated that the attempt to reorganize the Nyberg Automobile Works, Anderson, Ind., has been abandoned and the plant will now be sold.

## GENERAL NEWS OF THE INDUSTRY.

### American Electric Car Company Organizes to Market Argo, Borland and Broc Pleasure and Commercial Vehicles---Other New Concerns in the Field.

**I**NFORMATION from Chicago reveals the formation of a big electric car combination, under the terms of which the product of the Argo Electric Vehicle Company, Saginaw, Mich., the Borland-Grannis Company, Chicago, and the Broc Electric Vehicle Company, Cleveland, O., will be marketed by the American Electric Car Company of Chicago. The new concern is capitalized for \$1,500,000, and the officers are: President, F. A. Brand; vice presidents, Fred Buck, Bruce Borland and U. B. Grannis; secretary-treasurer, Theodore Huss. Each of the three constituent companies is represented on the executive board and on the board of directors.

The details of the plan have not been made public sufficiently to determine definitely whether the new concern is to take over the manufacturing of the cars heretofore produced by the makers of the Argo, Borland and Broc electric pleasure and commercial vehicles. It is stated, however, that the three names will be retained, and, presumably, the various models will be continued, at least for the present.

As announced recently, there will be three Argo pleasure car models for 1914, six Borland models and six bearing the Broc name. In addition there are two Argo commercial vehicles, and it has been rumored that there is the possibility of electric trucks being produced by the Borland concern.

#### NEW AXLE COMPANY.

#### M. L. Yuster Organizes Concern for This Purpose in Cleveland, O.

M. L. Yuster, formerly general manager of the Hess Spring Axle Company, Cincinnati, O., has been instrumental in the formation of the Yuster Axle Company in Cleveland, O., for the manufacture of axles for pleasure and commercial cars. The concern is understood to have acquired the old Royal Tourist plant, and work is said to have been begun on the installation of modern manufacturing equipment throughout.

The men who are associated with Mr. Yuster in the enterprise are the following: President, W. R. Hopkins of the Cleveland Short Line Railway Company and Cleveland Underground

Rapid Transit Railroad Company; first vice president, E. H. Parkhurst, formerly vice president of the Peerless Motor Car Company; second vice president, E. W. Farr, treasurer of the Perfection Spring Company; assistant general manager and purchasing director, E. E. Muller; engineer, R. E. Fries, formerly with the Weston-Mott Company and the Lozier Motor Company. Mr. Yuster is secretary and general manager.

#### K-R-I-T SALES COMPANY.

#### Maker of K-R-I-T to Secure Additional Working Capital by This Method.

Announcement is made from Detroit that the board of directors of the K-R-I-T Motor Car Company has considered it advisable to secure, in addition to its present quick assets in material, a working capital of \$100,000, through the formation of the K-R-I-T Sales Company. The officials of the new concern are: President, Henry W. Standard; vice president, Walter S. Russell; directors, these two and John J. Ramsey, Albert W. Russell and Frank W. Blair.

As outlined, the plan is for this new concern to purchase materials and pay for the labor entering into the construction of cars, all profits from the sale of machines to go to the K-R-I-T Motor Car Company, except for reimbursing the sales company for its capital invested with interest at six per cent. The old company is said to have contracts and specific orders for cars now in hand sufficient to tax its productive ability to the utmost capacity.

#### WIZARD COMPANY REORGANIZED.

#### Manufacturer of Motors to Produce a Line of Pleasure Cars as Well.

The Wizard Motor Company, Indianapolis, Ind., which has been engaged in the production of motors for some time, has been reorganized with capital of \$50,000, and it is stated that it will add the production of pleasure vehicles.

The principal stockholders of the new company are P. S. Florea, O. C. Forbes and E. H. Habig, who comprise the board of directors.

**POPE SALES FOR DECEMBER.****Receiver Files Report with Superior Court Showing Receipts and Expenses.**

Col. George Pope, as receiver for the Pope Manufacturing Company, Hartford, Conn., has filed with the clerk of the superior court a statement of the business done by him during the month of December. The detailed figures show the following:

|  |                  |
|--|------------------|
| Balance in bank and cash in office, Nov. 29....  | \$85,404.32      |
| <b>Cash Receipts.</b>  |                  |
| Sale of Hartford factory product....   | \$35,899.62      |
| Sale of machinery and tools.....   | 2,509.00         |
| Collections of Hartford factory, accounts and notes receivable of Pope Manufacturing Company.... | 17,178.76        |
| Deposits from customers on orders taken by receiver for automobiles                              | 400.00           |
|  | <u>55,987.38</u> |
|  | \$141,391.70     |

|   |                   |
|---|-------------------|
| <b>Cash Disbursements.</b>  |                   |
| Premiums for insurance on Hartford factory .....  | \$358.01          |
| Refunds of deposits received on undelivered orders .....  | 31.20             |
| Factory payrolls .....  | 19,337.72         |
| Office salaries .....   | 6,602.25          |
| Material, supplies and freight....  | 4,778.61          |
| Miscellaneous expense, selling and advertising .....  | 2,576.54          |
| Expert accountant, West works....   | 300.00            |
| Paid receiver on account of fees....  | 846.77            |
| Discounts made for account, Westfield factory .....   | 468.93            |
|   | <u>35,300.03</u>  |
| Balance in Phoenix National Bank, Dec. 31.....  | \$104,339.21      |
| Balance cash in office, Dec. 31.....  | 1,752.46          |
|   | <u>106,091.67</u> |
| Sales made by receiver, Oct. 28 to Dec. 31, inclusive:  |                   |
| Merchandise .....   | \$113,279.83      |
| Machinery .....   | 2,843.25          |
|   | <u>116,123.08</u> |
| Amount of notes and accounts receivable from sales made by receiver, which has not been collected ..... | 56,111.04         |
| Amount of receiver's security payable for Hartford material.....  | \$11,399.37       |
| Amount of receiver's accounts payable for Westfield material.....                                       | 3,921.41          |
|   | <u>15,320.78</u>  |

**CASE ELECTS OFFICERS.****New Names Appear in the List as Result of the Annual Meeting.**

Several changes were made in management of the J. I. Case Threshing Machine Company, Racine, Wis., as a result of the annual meeting. Warren J. Davis, president of the Manufacturers' National Bank, who was recently elected a director, was made treasurer, succeeding F. Lee Norton, who has held the position since the death of C. J. McIntosh.

The other officers elected are: President, Frank K. Bull; first vice president and general

manager, F. Lee Norton; second vice president, Frederick Robinson; secretary, Richard T. Robinson; assistant secretaries, Stephen Bull and William F. Sawyer; assistant treasurers, R. P. Howell and C. J. Fahrney.

**TO MAKE DILE CAR.****Company Organized to Produce New Machine in Factory at Reading, Penn.**

Announcement is made of the formation of the Dile Motor Car Company of Reading, Penn., with capital of \$20,000. Frank K. Dick, Margaret K. Dick and Irwin D. Lengel are named as the incorporators.

It is stated that a new factory is to be erected in Reading and that production work will be begun about March 1, giving employment to some 150 men. The Dile car is to be a two-passenger roadster, the first model of which is now being constructed, and will sell for less than \$500.

**S. & M. BECOMES BENHAM.****Former Company Retires and Cars Will Be Produced by the Latter Concern.**

Some few months ago announcement was made of the organization of the S. & M. Motor Car Company of Detroit, for the production of a new six-cylinder machine to be known as the S. & M. A dispatch from Detroit states that these cars were assembled in the factory of the Benham Manufacturing Company, which has also been engaged in the production of steering wheels and windshields for the Ford car.

It is further stated that the S. & M. company has retired from the field, and that the Benham company, as a creditor, has taken over the production end of the business. It is understood that this does not mean that the former concern has been purchased, but it is added that the S. & M. cars will continue to be produced under the name of Benham and that between 300 and 500 machines will be marketed during the coming year.

**TESTING ELECTRIC WAGON.****Wagenhals Motor Company Working on Three-Wheel Machine of This Type.**

According to a dispatch from Detroit, the Wagenhals Motor Company of that city is testing a new electric commercial vehicle, which is entirely new in its constructional details. The

company is well known as manufacturer of the Wagenhals gasoline wagon, a three-wheel machine with rated capacity of 800 pounds.

It is understood that the new car will present much the same characteristics as the gasoline vehicle. It will utilize a General Electric motor and a 24-cell Exide storage battery. The carrying capacity is to be the same as the older model, and the price about \$100 more.

### MAXWELL RE-ENTERS RACING.

#### Ray Harroun to Superintend Construction of Three Cars for Contest Work.

Ray Harroun, who won the first international sweepstakes, or 500-mile race, on the Indianapolis speedway in 1911 with a Marmon car, has been engaged by the Maxwell Motor Company, Detroit, for the construction of three cars, which will be entered in this year's 500-mile race, Memorial Day. This statement is of particular interest because of the withdrawal of Maxwell cars from racing events by the management of the old United States Motor Company early in 1912.

It is understood that the speedway cars will have four-cylinder motors with 4.2-inch bore and eight-inch stroke, giving them a piston displacement of 443.32 cubic inches. It is stated that Harroun's contract calls for a speed of 1:37 for a lap of the Indianapolis speedway, which is equivalent to a speed of 92.5 miles an hour. Harroun is to have charge of the racing team, which will take part in other events throughout the year, but will not drive.

### NEW TRADE ORGANIZATION.

#### Nine Manufacturers Form Nucleus of National Accessory Association.

During the closing hours of the New York show, nine accessory manufacturers formed the nucleus of what is hoped will be a national organization of those engaged in the automobile accessory trade, under the name of the Accessories' Co-Operative Association. Apparently, membership is to be limited to manufacturers, and the objects are to be: To promulgate plans for the betterment of trade conditions, to bring the members together, to correct abuses, to permit an interchange of ideas, etc.

The officers and directors are: President, Lewis H. Shalock, M. & S. Gear Company, Kansas City, Mo.; secretary, N. L. Shaten, Standard

Motor Parts Manufacturing Company, 1200 Chestnut street, Philadelphia; directors, John F. Renfro, Peteler Shock Absorber Company, New York City; William C. Reynolds, Para Tire Company, New York City; Perry M. Powers, Powers Shock Absorber Company, New York City; C. J. Cadwell, Master Carburetor Company, Los Angeles, Cal.; A. E. Roberts, S. & A. Manufacturing Company, Boston, Mass.; A. D. Noonan, A. S. Noonan Tool & Machine Works, Rome, N. Y.; J. W. Beers, Bridgeport, Conn.

### TAKES OVER TWO CONCERNS.

#### Standard Motor Company Completes Organization Plan in Mason City, Ia.

Although it was stated at first that the Standard Motor Company was to be organized for the purpose of taking over the assets of the Colby Motor Company of Mason City, Ia., and the Minneapolis Motor Company, Minneapolis, Minn., with location in the latter city, additional details indicate that the first named company is to be located in Mason City. It is now understood that the Standard company has taken over the Colby Motor Company and the Nevada Manufacturing Company, the latter being maker of a line of motor trucks and tractors.

The officers of the concern are: President, R. C. Plummer, vice president of the First National Bank, Forest City; vice president, George H. Fuller, president, Farmers State Bank, Rockwell; treasurer, Isaac Sweigard, vice president, Farmers National Bank, Garner; secretary, W. T. S. Rath, vice president, State Exchange Bank, Ackley; assistant secretary and treasurer, S. A. Schneider, secretary and treasurer, Mason City Loan Association.

The Invader Oil Company, New York City, through E. A. Scheu, general manager, has concluded arrangements with the James Bailey Company, Portland, Me., which will handle the products of that concern for the State of Maine on an exclusive selling basis during 1914. The company also has made similar arrangements with George Collins, 284 Columbus avenue, Boston, Mass., who will retain its old address at that place and take care of all local business in that section of New England.

The 25 automobile dealers in Waterloo, Ia., are extremely proud of the sales record made by them during 1913, when 3000 cars were delivered from the salesrooms of that city.

# NEW ACCESSORIES FOR THE MOTORIST.

## NON-BLINDING HEADLIGHT.

### New Gray & Davis Light Has Novel Features.

Gray & Davis, Inc., Boston, has brought out a non-blinding type of headlight which is held to provide a

bright beam for distance and a diffused light for the foreground. The latter quality is obtained by the use of a semi-circular, frosted front glass, which is held to be stronger than the usual construction and to diffuse a "fan ray", making the radiator and front wheels plainly visible to an approaching vehicle. With the bulbs lighted and lamps viewed from the front, they have an appearance of a frosted globe glowing with light and showing a relatively small bright spot. The last named provides a long, slender "pencil ray", which is thrown directly on the road far ahead.

## NATIONAL GENERATOR.

### Includes Timing Mechanism for Ignition Purposes.

The National Coil Company, Lansing, Mich., is manufacturing what is termed its type A generator, which is constructed to supply a large output at low motor speeds, and to carry the average lamp load at eight to 10 miles an hour. The output of the lighting dynamo is automatically regulated, and the maker states that overcharging of the battery is prevented at high speeds. One of the qualities of the National is the provision made for increasing the output in cold weather and when the machine is used in city service. Augmenting the output is rendered possible by the changing of a screw plug switch on the front plate of the generator.

Ignition is provided by the type A generator unit, a synchronized spark being developed by the use of a closed circuit transformer of compact design. The National dash unit comprises an ammeter, reverse current relay, fuse panel, ignition and lighting switches. These are compactly and neatly grouped. The usual dimming feature is included. The company states that its reverse current relay regulates very closely.

## SLY FORD TIRE HOLDER.

### A Combined Lamp, Number Plate and Shoe Support.

Smalley Daniels, Detroit, with offices at New York City and Boston, is marketing the Sly lamp, number plate and tire holder, which is designed for the model T Ford automobile. The maker states that it includes several valuable features not embodied in other designs, in that it combines a number plate holder and lamp bracket, compact tire holder and a thief proof lock.

The tire holder is attached to the rear of the chassis, is of pressed steel black enamelled, and is so formed as

to provide a snug cradle for each tire. It is stated that the design is such as to prevent chafing of the tires. Straps are also eliminated. One of the qualities of the holder is that either tire may be removed in 10 seconds without disturbing the other casing. The lock is a part of the construction. It is stated that the design can be attached in a few minutes and that it improves the appearance of the machine, in that it helps cover the open space below the body.

## POWER TIRE PUMPS.

The power tire pump promises to be the most popular new accessory for the used motor car, and already a number of moderately priced pumps have made their appearance. Several makers announce brackets, etc., for simplifying the work of installation, and in the majority of instances the service of the pump is obtained by the meshing of gears. It is only reasonable to assume that some form of cone or disc clutch will ultimately be employed to impart the motor's energy.

## J-M LOBSTER EYE.

### Adjustable Electric Headlight for Fender.

The H. W. Johns-Manville Company, New York City, is marketing the J-M lobster eyes, which are made

in two styles, these differing in the size of lamps employed. The lobster eyes consist of a lamp fitted with a stamping so that they can be attached to the top of each front fender in line with the radiator. The style C fits loosely in the stamping and can be turned in any position over an arc of 30 degrees so as to throw the light directly in front of the car or at a distance as desired. When the proper adjustment is obtained, the lamp is permanently set by means of a small screw. A six-inch reflector is utilized, and the wires are led through suitable tubing to the lobster eye. All leads are concealed.

## FORD WIRE WHEEL.

### Stanweld Design Bolts to Wheel Flange.

The Standard Welding Company, Cleveland, O., is manufacturing a neat design of wire wheels for attachment to model T Ford cars, and one of the qualities of the design is that it may be applied to both front and rear wheels by utilizing the old wooden wheel flange and bolts. The hub of the Stanweld is a steel stamping, the spokes are reinforced at both ends, and the three-cross method of lacing is employed. The finish is two coats of black enamel, baked on. Among the features emphasized in the wheels is lightness. They come complete for attachment, and their application does not involve any other work than removing the old flange and bolts, and displacing the wooden wheel. Special tools are not required.

**BROWN HEADLIGHT.****Mechanically Controls and Deflects Rays of Light.**

The Brown Company, Syracuse, maker of power tire pumps, has brought out the Brown deflecting

headlight, which, as the name implies, is a device for controlling the light rays and without the usual dimming arrangement. The control is mechanical, the movement of the shutter being obtained by the use of an individual, compact motor. The operating switch may be located as desired. A semi-dome metal deflector or shutter, the drop of which may be regulated, acts on the horizontal and upward rays to the extent of changing their course, forcing a large number of them downward and ahead. This eliminates the glaring effect without sacrificing efficiency and conforms to the ordinances prohibiting the use of blinding headlights.

**STEWART AIR PUMP.****The One-Cylinder Design Having a Clutch, Etc.**

The Stewart-Warner Speedometer Corporation, Chicago, has brought out a new type of one-cylinder pump to meet the demand for a high grade, popular priced unit. It is an air-cooled design and the fins provide ample cooling surface. The air is protected by a double ball valve, insuring operation even if one becomes clogged with dirt, etc. The bore is 1.4375 inches, stroke 2.5. The piston is extra long and is provided with oil conductors, insuring lubrication.

The pump requires no surplus oil in the crankcase, the piston being lubricated by means of a wick system, or wipe, in contact with the piston. Oil is dropped from this wick from the outside of the pump. The bottom of

the crankcase is open, so that any free oil drops out. The maker states that it is impossible for any lubricant to be carried with the air into the tires. A clutch, tire gauge and 13 feet of hose with connections are supplied with each pump.

**KELLOGG FORD STARTER.****Spins Crankshaft by Use of Compressed Air.**

The Kellogg Manufacturing Company, Rochester, N. Y., maker of power tire pumps, etc., has brought out a compressed air starting system for the model T Ford car. It comprises in combination a pump and starting mechanism, storage tank, gauge, starter button and pump control. As shown by an accompanying illustration, the installation involves the addition of a small bracket at the front of the car, which does not detract from its appearance.

The unit comprises a cylinder, the piston of which is actuated by air entering from the tank and at high speeds. A chain connected with the piston operates a drum in the housing mounted at the front of the car. This chain makes one complete turn

around the drum. The fan belt pulley is replaced with a combination pulley, sprocket for driving the pump, and a clutch which automatically engages with the motor when the starter is operated. The application of the air is gradual, but the power developed during the balance of the piston travel is such as to spin the motor. A spring returns the drum, preparing for a second application of energy.

All working parts are fully enclosed, and provision is made for inflating tires. Control of the pump for storing compressed air is by a button, and a similar member operates the starter. Several starts are held to be possible with one charging of the tank.

**GLARELESS LAMPS.**

The announcement of non-blinding lamps by several makers may be held to anticipate legislation prohibiting the use of dazzling headlights in the cities. A number of cities have passed ordinances to this effect and it is very probable that others will enact similar laws. Among the new designs are three eliminating the glare without the unusual dimming feature. One of these is operated by a tiny electric motor. Another uses lenses to control the rays.

**MAXI II HORN.****Compact and Designed Especially for Use with Motorcycles.**

The Dean Electric Company, Elyria, O., which concern markets a number of electric horns, is producing a

new type termed the Maxi II, which is designed especially for motorcycles. It is a popular priced signal; provides a sharp, abrupt, penetrating sound, and it is stated it requires but little current to operate. A special lever type push button is included in the equipment, it being mounted on the handlebar close to the grip. It is of the quick acting type and easily operated. The finish of the Maxi II is baked enamel and the switch is nickel-plated. Suitable length of flexible cord and clips accompany each horn. The company is marketing a battery case which holds two No. 1 flashlight cells, capable of operating the horn for a considerable period. The connections of the case permit of the use of one or both cells as desired.

**EXIDE TYPE X BATTERY.****New Design for Service with Motor Starters.**

The Electric Storage Battery Company, Philadelphia, is producing a new type of battery for service with electric motor starters, termed the Exide type X. It is designed to meet the exacting requirements of starting motors and lighting systems, is very compact and is constructed with the same care characteristic of the product of this concern.

Individual cells are utilized, and these are closed at the top by means of a cover having an inner sealing flange and an outer flange which encloses, supports and protects the top edge of the bar. The maker states that the covers will not catch and retain dirt or water, and that it can be cleaned easily. An important feature is the gas vent and filling aperture, which is so arranged as to limit the amount of water that can be used.

**ALDING SPARK PLUG.**

**Is High Grade, Moderately Priced and Guaranteed.**

The Alsten & Goulding Company, 36 Foster street, Worcester, Mass., is producing a high grade spark plug,

called the Alding, which is marketed at a low price and carries a liberal guarantee. While designed for service with all types of internal combustion engines, it is especially serviceable for the model T Ford motor.

The company states that any motorist purchasing an Alding plug, and not finding it satisfactory, can return same for replacement. The mileage is unlimited. The porcelains utilized in the Alding are made from a secret formula from the best imported clays, and are hand turned. They are constructed to be as nearly heat proof as possible, and any that crack with heat will be replaced free of charge. All parts are interchangeable, and the porcelains are inexpensive. The Alding is made in various threads, and the company is making a very attractive offer to readers of The Automobile Journal.

**ELYRIA-DEAN DYNAMO.**

**Lighting System Adapted to the Small Motor Car.**

The Dean Electric Company, Elyria, O., is manufacturing a dynamo lighting system especially adapted to the small car, which is termed the Elyria-Dean II. The company states that each element is made to do the work most efficiently, cutting down the weight to a minimum, and obviating complications in mounting and wiring. The system was brought out to meet the demand of owners who desire other than a standard equipment and of large output capacity.

The dynamo is very compact and has a self-contained reverse current cut-out, and the equipment includes a combined lighting switch, current indicator and connecting rack, and a 40 ampere-hour capacity storage battery. The dynamo is cut in at 700 revolutions a minute of the armature, and carries all lights dim at 1000 revolutions, and bright at 1400. The

drive ratio of the Elyria-Dean is 2:1.

The output is controlled by a special arrangement of the windings and by a particular design of the magnetic field, a construction which the company states eliminates moving and adjustable parts. The action of the dynamo, as well as the reverse current cut-out, is shown at all times by a special indicator located in the dash switch.

**ROFFY ELECTRIC LAMPS.**

**Eliminate Glare—Are Attached to Radiator.**

The Roffy-Grace Corporation, 1926 Broadway, New York City, is introducing the Roffy lamp, which presents a number of interesting features, among them being the elimination of glaring effects, the inventor stating that the non-blinding quality does not impair the efficiency of the light. The Roffy lamp is not only a neat, compact design, but its light weight permits of installation on the radiator, two .1875-inch bolts being employed. These are inserted between the fins. The company states that the method of locking prevents vibration and that the radiator cannot be damaged by the bolts which retain the lamps in place.

Glare is eliminated in the Roffy design by the use of a conically shaped achromatic light beam with sharply defined edges, so projected that the upper boundary is parallel with the ground. This light is rectified for chromatism, aberration and diffraction, producing an even field of white light. It is stated that the rays will illuminate for about 1.5 city squares, and since the upper edge of the light beam is never more than 4.5 feet from the ground, there is no glare into the eyes of persons on the highway.

The lamp itself is tubular. Located at the bottom of the tube is a mushroom shaped tungsten bulb, above the flattened portion of which is a plano convex condensing lens that collects the rays. Above this lens is a double convex lens, which converges the light beam upwards against a mirror placed at such an angle that the light beam is reflected horizontally through the projection lens.

**It is the intention of the editor of this department to present only the latest accessories. In writing, kindly mention The Automobile Journal.**

**AUTO SIGNALITE.**

**Rear Signalling Device Operated by a Lever.**

The Auto Signalite, made by the Auto Signalite Company, 735 Seventh avenue, New York City, differs from

the conventional types of signalling devices in that a small lever is utilized to operate it. The lever is operated by the driver slightly in anticipation of stopping, turning to the right or left, or continuing in the original direction.

Combined with the signal is a tail light and number plate bracket, these being compactly arranged in a cylinder having dimensions of 5.5 by 12.5 inches. The company states that the installation can be made easily and that the Auto Signalite can be attached to any part of the rear of the vehicle. An electric light illuminates the words, "Stop", "Right", "Left" and the red light.

**SPARK-NO LOCK.**

**An Ingenious Device for Locking the Ignition.**

The Spark-No automobile lock is marketed by the H. W. Johns-Manville Company, New York City, and is an ingenious device for locking the ignition of the motor car and preventing use of the machine by others than those intended. It is attached to the dash, and the hands are moved over a calibrated dial by means of two little knobs. These are used for starting for battery and running for magneto, and one of the qualities is that it is impossible for any one riding with the driver to discover the starting combination.

If anyone attempts to steal the car, not only is the ignition cut out, but an alarm is sounded by a bell. The signal is also sounded if one tampers with the lock. The action of the device is similar to a combination lock, but differs in that the combination operates a switch, and this switch cannot be closed unless the hands are properly set on the dial.

## NEW RAYFIELD HAS MANY IMPROVEMENTS.

THE Findeisen & Kropf Manufacturing Company, Chicago, maker of the well known Rayfield carburetors, has brought out a new design which differs materially from its predecessor, the model D, but the principle remains the same. The new type is known as the model A when water jacketed, and as B without water jackets. These with the dashpot model are shown in an accompanying illustration.

The most noticeable change made is in the float mechanism, a new method of float control having been designed. Instead of a weight on the needle itself in a chamber beside the float, fulcrum levers are utilized directly above the float as indicated in both sectional views. The two fulcrum levers control the needle valve, the stem of which extends through the brass float. As the last named member rises, the arms lift,

speeds, supplying air when called upon by the motor. The maker states that the Rayfield combines the advantages of the mechanical and automatic principle without the disadvantages of either.

Another new product of the company is the dashpot Rayfield, shown at the extreme right in the illustration. It combines the same principles as the other models except for the air control. It is produced in two forms, with a single and double jet, the latter being for service with six-cylinder motors. The air valve stem is integral with the piston and is in a bath of fuel as shown in the illustration. With it a quick opening of the throttle results in a rich mixture being supplied temporarily, for getting away quickly. Fluttering of the auxiliary air valve is prevented by the valve stem being immersed

Three New Models of Rayfield Carburetors, Having Fuel and Air Adjustments Marked, Improved Float Mechanism and Many Refinements Making for Efficiency and Economy—The Type at the Right Has a Dashpot.

and the fuel supply is restricted proportionately to the upward movement. This construction made necessary a change in the fuel inlet, which is now directly below the float chamber.

Another feature of the new design is the fitting of an efficient strainer trap, so constructed that the fuel connection may be turned to simplify installation. A large water and sediment pocket is provided and the conventional draining cock included. The throttle arm stop has a positive locking device, and several little refinements have been made, including the marking of the fuel and air adjustments so that the novice may determine easily the proper rotation of the screw members.

The characteristics emphasized by the Rayfield carburetors are the constant, mechanical and automatic air valves. The fixed supplies air at all speeds, the mechanical works in conjunction with the throttle, and the automatic at varying

in the fuel as has been previously explained.

The double-jet model is similar to the single with the exception of an injector, which extends from the piston chamber to the mixing chamber, and a quick air valve opening causes the piston to exert pressure against the fuel, thereby spraying additional gasoline into the mixing chamber. This condition is only temporary, for upon the air valve assuming its normal position an economical mixture is obtained. The advantage of the dashpot type is that it enables a lean running mixture, with a rich one for rapid acceleration and automatically. The dash adjustment feature, long a quality of the Rayfield, is continued with the new models.

The Austin Motor Car Company, Ltd., Northfield, Birmingham, England, is issuing a neat and attractive calendar, in the form of an Austin car of the latest type.

**ECONOMICAL IN SERVICE.****KisselKar Owner Reports to Chicago Branch After Two Years of Use.**

Prospective motorists are interested in learning the approximate expense of running a car. Recently, T. A. Wanderer of Oak Park, Ill., made report to Manager R. D. Jones of the Chicago branch of the Kissel Motor Car Company, Hartford, Wis., concerning the condition of his machine after 13,000 miles of service. The following extract from his letter also relates the result of a trip from Oak Park to Newark, N. J., and return:

We left Oak Park, a party of four grown people, the tonneau crowded with a few suit cases and a heavy trunk in the rear. The tires already had covered about 7000 miles, and our object in keeping them on was to find out how far they would go under the touring strain. At 7 that night, after retracing the road due to washouts, we arrived at Bryan, O., a distance of 230 miles. After passing Toledo the tires were giving away, and at Buffalo we were entirely reshod. The total mileage for each tire was about 7600, and this speaks very highly for the performance of the car on the tires.

When we reached the mountains in New York we wondered how the engine would perform under the reduced atmospheric pressure. We could not perceive any difference in the power that was given out by the engine, and it was equal to that to which we were accustomed in the State of Illinois. The ride through New York State was a very enjoyable one, far surpassing the comfortable ones that we have on our boulevards. It took us two hours to cross the city of New York on Broadway, and we were glad to get the ferry to New Jersey.

We stayed in Newark about three weeks, and then decided to take the southern route home. This took us through Washington, D. C.; Gettysburg, Pittsburg, Wheeling, Columbus, Indianapolis, Lafayette and Crown Point. The roads from Newark to Washington were very good and extra good scenery was to be had. Throughout Pennsylvania the roads were very poor and the car was given a good test. Mile after mile of poor road, sometimes through forests, up and down mountains, was the rule. The mountain roads had large water breaks built across them. These were worse than the "Thank-you-Marms".

The entire trip covered over 4000 miles, without a single mishap to either the car or the engine. We had just one puncture. The finish and paint stood up very well; no cracking at all. I might mention here that the daily rides, which averaged about 200 miles, were not tiresome a bit.

From the time we got home to Dec. 24, we covered an additional 3000 miles and then decided to investigate the engine. The speedometer reading showed that we had travelled 13,000 miles. We found that besides scraping the cylinders we would have to replace three piston pins and a petcock, the latter being broken in taking the engine apart. The total cost of repairs was \$4.04, the work being performed by us in our leisure time. The piston rings were in good condition.

During the Newark trip we expended \$57 for gasoline and \$10.85 for oil. The total mileage covered was 4000, the amount of gasoline 319 gallons and the speed averaged 13 miles an hour. In Chicago we made over 14 miles to a gallon of gasoline and used very little oil. The tires are of ample size and consequently we can get more mileage at a low cost.

For the first year, not counting depreciation of the car, it cost us nearly four cents a mile. This is for running the car with seven to eight passengers. This is just one-fourth as cheap as using the railroad and paying two cents a mile. Besides we get to see things and have solid comfort. The second year the cost a mile was about 3.5 cents, due to tires being cheaper. As this is our sec-

ond KisselKar, I would state here that we would not want a better car, and will always continue to use them. A good car I think is the cheapest.

**HESS-BRIGHT LITIGATION.****Case Will Be Taken to United States Circuit Court of Appeals.**

It was announced in the last issue that the action of the Hess-Bright Manufacturing Company of Philadelphia and the Deutsche Waffen und Munitions Fabriken of Germany, against Hedwig Fichtel and Ernst Sachs of Germany, doing business as Fichtel & Sachs, and their exclusive American representative, the J. S. Bretz Company of New York, had been decided in favor of the defendants by Judge McPherson in the United States district court in Philadelphia. The action has to do with the alleged infringement of the so-called Conrad patents concerning ball bearings.

In respect to this decision, the Hess-Bright company says that it in no wise affects the relation of the Conrad patent to bearings of the Hess-Bright type, and that the question has already been determined by the same court several times. It adds that the only point involved is whether or not the patent also dominates bearings having a non-full depth filling notch. "The lower court has held in the negative", it says, "but this is simply the first step to a determination by the United States circuit court of appeals, where it will be decided".

**BUSINESS IS GOOD.****Moon Motor Car Company Finds Shipments Have Increased Nearly One-Third.**

That business is good throughout the automobile industry is decidedly evident from the reports made by most of the manufacturers. One of the latest statements in this connection is that made by the Moon Motor Car Company of St. Louis, which produces the Moon cars.

According to this report the gross shipments from the factory during the months of August, September, October, November and December in 1913, amounted to \$237,478.40, as against \$312,005.14 for the same months in 1912, showing an increase of \$74,526.70, or a gain of 31.3 per cent. As these months are regarded in the industry as the dullest period of the year, the gain is substantial, and one which reflects the tendency of the times.

## HINTS FOR NEW CAR OWNERS.

### Detailed Instructions for Cleaning and Adjusting Model A Splitdorf Magnetos, Standard Equipment on Several 1914 Cars---Wiring Diagram of Ford Ignition.

**B**ROADLY speaking, there is little that the owner of a motor car is called upon to do to a magneto other than cleaning the distribu-

Fig. 1—Illustrating Anti-Clockwise and Clockwise Drive of Model A Splitdorf Magneto, and Proper Relation of Armature Core to Pole Piece When Changing Direction of Rotation: A, Anti-Clockwise; B, Removable Cam; C, Clockwise.

tor and circuit breaker, adjusting the contact points and lubricating. Even this usually is left by the new owner to the expert at the garage or service station, because the magneto is regarded more or less as a mysterious instrument. Such work as may be performed by the owner is easily accomplished, however, provided the principles of a magneto are understood; that is, the construction and operation of the distributor and the circuit breaker.

It is the intention of the writer to present in this department the leading types of magnetos utilized on 1914 models, and to show and explain the construction and operation of those components which may be cleaned and adjusted by the novice.

The model A Splitdorf magneto, made by the Splitdorf Electrical Company, Newark, N. J., which concern manufactures a number of models, including a true high-tension type, is standard equipment on a number of 1914 machines, among which may be named the model 79 Overland car.

#### Armature Winding.

This instrument is of the single-wound armature type; that is, the armature generates a low-tension current, which is transformed into a high-tension by the use of a step-up coil. The Splitdorf model A, as does several other types made by the company, provides dual ignition, and the same set of spark plugs is employed. Current is

supplied in one instance by a set of dry cells or suitable storage battery, and in the other by the instrument itself.

Longitudinal and end views of the magneto are presented at Fig. 3 with the components lettered, and a little study of the parts, as well as a brief description of their operation, will be of service in making adjustments or in the event of trouble upon the road. The writer recalls one particular instance of an owner being delayed upon the road several hours by a simple trouble which could have been remedied in a few minutes had the motorist been familiar with the construction of the circuit breaker housing. He adhered strictly to the instructions of the agent not to touch the magneto, and it required considerable persuasion upon the writer's part before he was allowed to displace the circuit breaker and remedy the trouble.

#### Collector Brush.

Briefly stated, the electricity generated by the instrument is collected by a brush in the circuit breaker cover, which may be easily recognized by the terminal or binding nut. This is denoted in the drawing by the thumb nut. The brush bears against a conducting member, and when there is not proper contact between the brush and the member, the magneto is inoperative; that is, the low-tension current generated cannot flow to the coil.

As with all forms of jump spark ignition, the primary or low-tension current must be interrupted or broken, hence the term interrupter mechanism of the magneto. The arrangement of these components is shown at Fig. 3 and these

Fig. 2—Wiring Plan of Model A Splitdorf Magneto—Note That Both Leads of Battery Are Attached to Transformer Coll, Not Grounded.

are accessible by loosening the binding nut retaining the cover spring and swinging the last named member downward and to the right. The cover with its thumb nut may be slipped off and the breaker mechanism displaced by pulling the timing lever forward. This will permit of adjusting and cleaning the points. The wire connecting the breaker arm or condenser lead should not be tampered with.

#### Interrupter Mechanism.

The break of the primary current is obtained by a pivotally mounted contact lever carrying a fixed platinum point which is normally held in contact with another platinum point by the tension of a spring. The last named platinum member screws into a block and is prevented from turning by a lock nut. This screw is made ad-

loosen the locking nut of the movable platinum point, using the wrench provided for this work, and screw in the contact screw to reduce the gap, or out to increase it. The space may be determined by the gauge accompanying each wrench. It is possible that the operation of the motor will be improved by deviating slightly from the space above stated, but .03125 inch is generally employed.

Burned or pitted points affect the efficiency of the magneto. To clean, utilize a very fine jeweller's file, and do not remove too much of the platinum. The points should contact evenly. One cannot be too careful in the matter of lubrication. The cam should be oiled sparingly, and the roller of the breaker bar is best lubricated by applying the oil with a toothpick. Lubricate

**Fig. 3—Longitudinal and End Views of Model A Splittdorf Magneto, Outlining Arrangement of Components—The View at the Left Depicts the Circuit Breaker with Cover Spring Swung Outward.**

justable so that the relation of its point with that of the fixed point may be altered to compensate for wear, etc.

The separation of the two platinum points is accomplished by a two-pointed cam secured to the armature shaft, and two breaks are obtained to one revolution of the armature shaft, which rotates at motor crankshaft speed. Consequently the armature makes two complete revolutions, four breaks are obtained and four sparks are secured with the four-cylinder engine.

#### Adjusting Break.

The proper break or distance between the platinum points when fully separated should be .03125 inch and the maximum gap of the spark plugs should be the same. To adjust the break,

once in three months with average service. The oilers proper require a few drops about every thousand miles.

#### Cleaning Distributor.

The distributor housing is displaced by removing three screws. The view at Fig. 3 shows the method of retention, collecting brush, etc., and these components must not be lubricated. If the distributor needs cleaning, use a soft camel's hair brush. Do not attempt to change the tension of the collector brush unless it fails to make contact.

The timing and wiring of a magneto are simple. Assuming that the instrument has been removed or the coupling between the driving shaft and the armature has been displaced, it is neces-

sary to know the firing order of the cylinders, direction of rotation of the armature shaft, and location of the piston of the first cylinder. The last named factor is important and differs according to the make of motor.

#### Timing Magneto.

With the model 79 Overland the flywheel is rotated until the piston of the No. 1 cylinder has completed the compression stroke and the flywheel is one inch past the dead centre mark. If the contact points are set with a break of .03125 inch, they will just begin to separate. The coupling is then replaced, and care must be taken not to rotate the armature shaft during the work. The spark lever should be fully retarded. Fig. 1 illustrates the position of the lever for both clockwise and anti-clockwise drive.

In replacing the high-tension wires—those leading from the distributor to the spark plugs—

shown at Fig. 2 and it will be noted that both leads from the battery are attached to the coil and not grounded. The wiring plan is simple and if the connections are made properly, no trouble should be experienced in rewiring the coil and magneto.

#### FORD WIRING DIAGRAM.

The Ford Times, a publication devoted to the interests of the Ford Motor Company, illustrates the wiring diagram of the ignition system of the model T car, which is reproduced herewith with changes to include the wiring of the timer, coil, etc. In the drawing the primary or low-tension wires are indicated by light lines, the high-tension or secondary by heavy lines, and the ground by dotted lines. The path of the currents is easily traced. In practise the roller of the timer rotates anti-clockwise.

Wiring Diagram of Model T Ford Ignition System, Showing the Path of the Primary and Secondary Circuits and Proper Location of Leads.

the firing order of the motor must be observed. With a four-cylinder engine it will be either 1, 3, 4, 2, or 1, 2, 4, 3, and in attaching the wires to the distributor terminals the firing order must be complied with.

#### Direction of Drive.

It is important that the direction of drive of the magneto be observed, and if the novice will remember that the distributor rotates in a direction opposite to that of the armature shaft, no trouble will be experienced. The direction of drive is noted by looking at the driving end, but it will be observed by the drawing at Fig. 3 that the circuit breaker and distributor are at the other end of the instrument. Therefore, if the magneto is driven clockwise, the distributor will rotate anti-clockwise.

The wiring plan of the model A Splitdorf is

terminal of the timer to a unit of the coil, as shown in the drawing. With the switch lever in position as indicated and with the roller between two contact blocks, the primary circuit is open. But upon contact being made between the roller and a block, the primary circuit is closed, and the vibrator is pulled down by the action of the current flowing in the primary winding of the coil. Upon the roller breaking contact, the vibrator moves upward. Continued contact of the roller and metal block results in a number of movements of the vibrator, giving forth the sound termed buzzing. The low-tension current is transformed or raised into a high by the secondary winding of the coil, and is led to the spark plug by a cable.

The proper interruption of the primary current and distribution of the secondary is obtained

by separate wires and coil units. As the Ford motor fires 1, 2, 4, 3, the primary wires are arranged in this order at the commutator, and the secondary leads in a similar manner. A little study of the wiring plan will show its simplicity. In the drawing the coil units are shown separate to illustrate the path of the primary and secondary circuits.

### TO ARRANGE FOREIGN TOURS.

#### B. F. Goodrich Company Offers Such Service to Motorists Going Abroad.

Americans planning motor tours through the chateaux district or along the Loire may appreciate the touring service rendered by the B. F. Goodrich Company, Akron, O., maker of Goodrich tires, which maintains depots throughout Europe. Many important details, such as obtaining passports, crating cars, securing licenses, following customs requirements, etc., are taken care of by this concern.

The Goodrich company also arranges, through its touring bureau, to secure membership in the Touring Club de France, the Association Generale Automobile in Paris and the Touring Club of Italy. Motorists who desire this service should get into communication with the factory in Akron, or any of the company's branches in large cities throughout the country.

### VANDERBILT AND GRAND PRIZE.

#### Manager Shettler Announces Details Concerning Santa Monica Events.

Leon T. Shettler of Los Angeles, Cal., who is looking after the details in connection with the holding of the Vanderbilt Cup and Grand Prize races at Santa Monica, Cal., next month, announces that the former event will be held Feb. 21, and the latter Feb. 23. Entries will close at the original fee, \$250 a car, Feb. 9, and at an advance to \$350, Feb. 16.

It is expected that the Vanderbilt Cup race will be for 294 miles, or 35 laps of the road course, heretofore used for the annual Santa Monica events. It will be a non-stock event, held under class E of the rules of the contest board of the American Automobile Association, and limited to cars of 600 cubic inches piston displacement. In addition to the possession of the Vanderbilt cup, the winner will receive a first prize of \$3000, and the other prizes will be as follows: Second, \$2000; third, \$1500; fourth, \$1000.

The Grand Prize race will be over the same course, but the distance will be approximately 400 or 450 miles. As in past years, it will be a free-for-all event, and the prizes will be similar in amount to those offered in the other contest.

It is announced that two Stutz cars and three Mercers may be counted upon as assured, and the list of drivers is expected to include Teddy Tetzlaff, Harry Grant, Ralph DePalma, Spencer E. Wishart, Ralph Mulford, Barney Oldfield, Gilbert Anderson and Earle Cooper.

### A PRINCELY GIFT.

#### Henry Ford Presents Thomas A. Edison with Handsome Detroit Electric.

Whether or not Thomas A. Edison and Henry Ford are collaborating on the production of a new electric car, which is to be sold at a price in

Thomas A. Edison and His New Detroit Electric, Presented by Henry Ford.

similar competition with other makes of electrics as that furnished by the Ford car in the gasoline field, it is of interest to note that Mr. Ford presented Mr. Edison with a handsome Detroit electric car on Christmas Eve. The accompanying illustration shows Mr. Edison about to enter the machine, which is fittingly described as a princely gift.

The machine is a model 47, made by the Anderson Electric Car Company, Detroit, and is mounted on the worm gear chassis. No expense was spared in preparing the interior with every luxury and modern improvement.

The Rex Ignition Manufacturing Company, New York City, maker of Rex spark plugs, has taken out a license under the so-called Canfield patent, held by the A. R. Mosler Company, Mount Vernon, N. Y.

## WARD ANNOUNCES ELECTRIC COUPE.

**C**ONSIDERABLE interest has attached to the latest product of the Ward Motor Vehicle Company, New York City, well known throughout the industry as a manufacturer of electric wagons and trucks. Some few months ago it was announced that this concern was soon to place in the market an electric pleasure vehicle, embodying some of the principles which have made its other line so satisfactory. This machine, a coupe, was shown for the first time during the recent New York show, and the complete car is presented in an illustration herewith.

The battery, consisting of 42 cells, of 11 plates, is located in front under the long, graceful hood, and the motor is so placed that attention is given through an opening in the floor, the object being to reduce the necessary work of

2.5 inches all around. Painting and upholstery are optional.

The interior fittings are held to be most complete, provision being made for a toilet case, complete with watch, memorandum book, perfume bottles, mirror, etc., and a silver mounted flower vase. The equipment also includes a speedometer, ampere-hour meter, head, side and tail lights, tool kit, oil can and jack.

### CYCLECARS FOR POLICE.

#### New Jersey Authorities Considering the Purchase of the New Type of Machine.

The Imp Cyclecar Company, Auburn, Ind., through its agent in Maplewood, N. J., H. C. Fairchild, has received letters from the Newark police, the Essex county park commissioners and several township committees seeking information relative to the possibility of securing early delivery on Imp cyclecars. It is also stated that Chairman Robert G. Shaw of the Teaneck township committee has been corresponding with Mr. Fairchild regarding the practicability of equipping the police department of that town with such machines.

It is pointed out that the difference in price between motorcycles and cyclecars is one of the factors which has interested the Teaneck officials, who have received an appropriation of \$3500 to be used for one type or the other, at their discretion. The additional advantage of transporting a prisoner or an extra officer also is having its weight in the matter, and it looks very much as if the Teaneck police force would be the first in the country to use cyclecars.

Several creditors of the Brown Commercial Car Company, Peru, Ind., against which a creditor's petition was filed recently, are interested in seeing that the present receiver, William B. McClintock, is retained as trustee. There is said to be a strong probability that the concern will be reorganized, or, at least, continued as a going concern.

New Electric Coupe Produced by Ward Motor Vehicle Company.

labor and care to a minimum. Power is transmitted from the motor to the rear axle through a single set of well proportioned bevel gears. Two sets of brakes, light and power switches within easy reach of either hand, and a long steering handle, are expected to make the operation of the car a real pleasure. The mileage is rated at from 60 to 100 on one charge of the battery, and the speed is given as from 18 to 20 miles an hour.

Four persons are accommodated, the seats being so arranged that all passengers face forward. The wheelbase is 96 inches and the tread 56. The interior of the body is 72 inches, from the front to rear glass, and is 42 inches wide. The wheels are shod with Ward cushion tires, 32 by

## CORRESPONDENCE WITH THE READER.

**Thrust of Bearings.**

(1694)—Will you explain and illustrate how the end thrust is taken care of in the Timken type of roller bearings, and how the adjustments are made to eliminate lost motion? What is end thrust?

HUPMOBILE OWNER.

St. Albans, Vt., Jan. 12.

A simple example of end thrust is obtained when a car is turning a corner. Its momentum tends to keep the machine on its original course, and the passengers feel this force pushing them outward along the seat. This force, which is met by the bearings, is called end thrust, and comes in addition to the weight on the bearings. Another example of end thrust is the transmission of the power of the motor through the shaft to the driving pinion. The torsion of this pinion causes it to attempt to climb on the teeth of the

large gear with which it meshes. The bearings are two in number. The rear one prevents the climbing referred to and the other prevents the shaft moving backward. In this instance, movement in either direction is prevented. End thrust is compensated for in the front and rear wheels, also in the gearset shafts. Figs. 1 and 3 illustrate the points discussed.

Fig. 1—How End Thrust Is Cared for in Opposite Directions.

By referring to Fig. 3, the Timken method of meeting end thrust will be noted. The arrows represent the direction in which end thrust bears upon the cup and cone, and the maker states that the tapered construction makes it impossible for the end force to push the cup and cone apart. A rib is utilized on the large edge of the cone to prevent the tapered rollers from being forced out from between the cone and the cup. The contact between the large ends of the rollers and this rib tends, in a very slight degree, to retard the large end of each roller. Another rib on the other end of the cone, against which a flange on the small end of the roller presses, prevents any tendency to twist the roller out of its alignment on the cone.

In a wheel bearing the load is borne by those rollers which are below the centre of the spindle. There is a slight play, almost imperceptible, in the parts of the bearing above the centre of the spindle. The purpose of the cage is to guide those rollers, which are above the centre in their proper positions, during their idle period, and correctly align them as they enter their working zone.

Fig. 2—Adjustment of Timken Roller Bearing.

If wear occurs, leaving a slight space between the cup and the roller, adjustment can be made by moving the cup or cone in the direction of the arrows shown in the drawing at Fig. 2. As 1-2 and 3-4 always remain exactly parallel, the adjustments bring the different surfaces into line contact without impairing the efficiency of the bearing. A discussion of bearings will be found elsewhere in this issue.

**Setting Model B Splittorf Magneto.**

(1695)—Having an opportunity to purchase a good second hand model B Splittorf magneto, and wishing to install it on my car, I would appreciate it if you would inform me how to change the magneto so that I can drive it left handed when looking at its driving end. It is now fixed to run in the opposite direction. The owner says that it can be done, but cannot explain, and a repairman advises me to let him do it. Would you advise trying it or let the repairman change it over? How is a four-cylinder magneto wired?

ADVICE.

Lynn, Mass., Jan. 14.

The magneto referred to can be driven in either direction, it being so constructed that it is a simple matter to make the change. The repairman's advice on magnetos should be heeded as a rule, but in this instance the change could be made by exercising caution in the work and by understanding the operation of the circuit breaking mechanism.

At Fig. 4 are presented two views of the circuit breaker mechanism, also a part sectional view of the distributor, which will be useful in setting the instrument. That at A depicts the setting when the magneto is driven in a right hand direction, looking at the driving end, while that at C shows the instrument operated in the opposite direction.

Fig. 3—Indicating End Thrust.

It will be seen that the break of the primary circuit, or the separation of the platinum contact

points, is accomplished by a pivotally mounted breaker bar which is actuated by a two-point cam. Upon a cam coming in contact with the breaker bar, the latter is raised. Normally the platinum points are contacted by the tension of a spring.

To change the direction of rotation of the magneto, remove the spring retaining the circuit breaker cover, and hold the driven end of the armature shaft firmly with a pair of pliers and displace the little nut. The cam referred to is retained by a Woodruff key. Remove the cam, turn it over and replace it on the shaft with a prick punch so that it will not jar off.

Next displace the distributor block by removing the screws retaining it, and take out the screws from the lettered ring. Remove the brass protecting cup on the distributor bearings, which

over the electrical types, but find them too expensive. I would like to know what other types there are in the market besides electric, either mechanical or any other forms. I noted in the Dec. 25 issue that certain persons are interested in forming a club or society to teach young men the automobile business. Kindly inform me where I can obtain information regarding the society.

WILLIAM HERZOG, JR.

Garfield, N. J., Jan. 12.

If the celluloid has become discolored throughout, its whiteness cannot be restored, but if superficially discolored, its condition may be considerably improved by wiping with a woollen rag moistened with absolute alcohol and ether mixed in equal proportions. This dissolves and removes a minute superficial layer and presents a new surface. To restore the polish, rub briskly, first with a woollen cloth and finish with silk or fine chamois. A little jeweller's rouge or Putz pomade will greatly facilitate work of renovation.

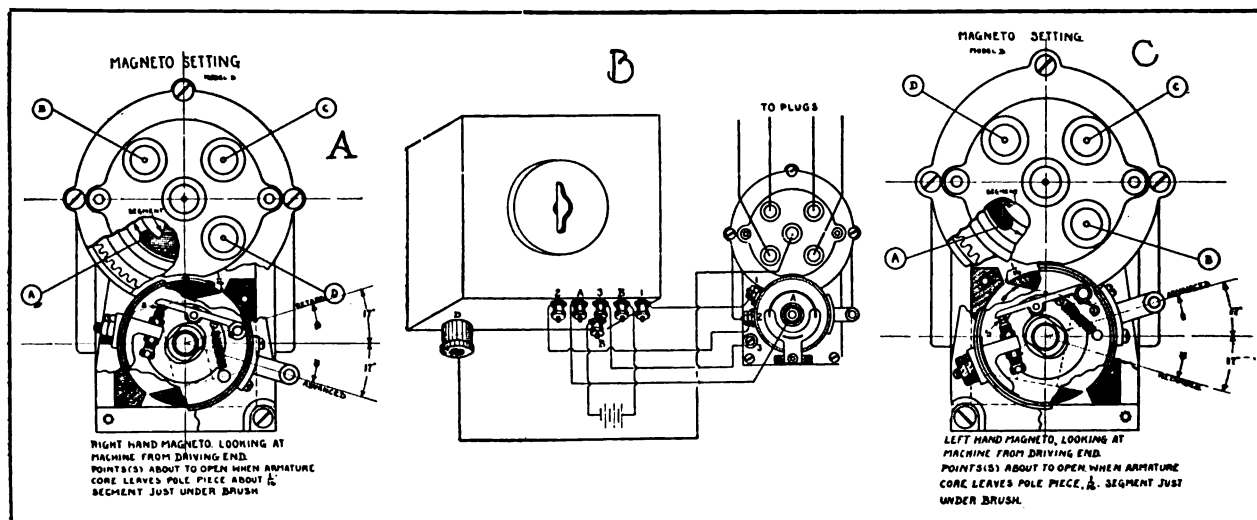

Fig. 4—Wiring Diagram of Model B Splitdorf Magneto and Proper Position of Armature for Setting for Both Right and Left Hand Drive, Viewing the Instrument from Its Driving End.

will be found inside the inverted U formed by the magnets, and displace the top screw located underneath the centre of the distributor shaft. The distributor and its gear can then be pulled forward out of mesh.

In replacing the distributor gear remesh the teeth of the driving and driven members so that the segment will agree with the drawing shown at C. With the contact points adjusted to have a break of .03125 inch, the points should begin to separate when the armature core leaves the pole, as shown in the illustration.

The Splitdorf Electrical Company maintains a branch at 182 Massachusetts avenue, Boston, where the change in the drive could be made at a nominal cost.

#### Wishes Motor Starter.

(1696)—How can I clean my celluloid windshield? I wish to install a motor starter on my car. I have looked

There are other forms of motor starters than the electrical, among which may be named compressed air, mechanical and acetylene. The first named comprises a power pump, which maintains the desired pressure in a tank, a distributor for timing the flow of air to the cylinders, control valves, etc.

Formerly there was listed a large number of makes of mechanical motor starters, but the very general adoption of electric systems has resulted in the majority of makers discontinuing the manufacture of mechanical types.

Another form is the acetylene starter. This comprises a valve for reducing the pressure of the Prest-O-Lite tank, a valve for mixing proper proportions of acetylene and air, and generally a distributor. The mixture is exploded in the cylinder by a spark. Some forms of acetylene starters provide for drawing in the mixture to the cyl-

inders by the suction of the piston, the mixture being led to the intake manifold by suitable piping.

The article appearing in the Dec. 25 issue of The Automobile Journal briefly outlined the plan formulated by the Metropolitan section of the Society of Automobile Engineers, New York City, to give a series of talks before the engineering societies of various colleges. The address of the Society of Automobile Engineers is 1790 Broadway, New York City. Complete information may be obtained from the secretary.

#### **Napier Specifications.**

(1697)—I have a four-cylinder Napier motor. Will you please inform me where it is built, and what the horsepower specifications are? F. W. A.  
Taunton, Mass., Jan. 10.

It is not possible to give the information desired as the model of car is not mentioned, or the bore and stroke given. While it would be a simple matter to ascertain the stroke by passing a wire through the opening of a petcock, and noting top and bottom dead centres, the measurement of the bore would involve the removal of a cylinder or the lower half of the crankcase.

The Napier machine is manufactured by D. Napier & Son, Ltd., with factory at Acton, London, England, and office at 14, New Burlington street, London, W. This concern should be able to supply complete details of the motor and car.

#### **Revolving Motor.**

(1698)—Will you please state in the columns of The Automobile Journal if there are any reasons why a revolving type of motor, such as employed with aeroplanes, cannot be used in an automobile? What is the proper dimension of a combustion chamber of a cylinder, the bore of which is three inches and the stroke five, four-cycle, and not having any side pockets or valve pockets in the head?

CONSTANT READER.

Mansfield, Mass., Jan. 11.

The revolving type of motor is not utilized in motor cars, because it is more complicated than the designs employed. One concern, however, made a car which was fitted with a five-cylinder revolving motor, but it is understood that the company has not manufactured the machine within the past year.

The area or capacity of a cylinder is generally between 20 to 25 per cent. and taking 23 per cent. as the average or mean, the dimension referred to would be approximately 1.15625 inch.

#### **Motor Back Fires.**

(1699)—What causes my motor to backfire when I start it on a cold morning? After it has run a few minutes the backfiring stops. SUBSCRIBER.  
Kenyon, R. I., Jan. 16.

The backfiring is due to the cold. At low temperatures the fuel does not vaporize as read-

ily as it does upon the motor becoming warm, and this results in too small a proportion of gasoline to the air, or a lean mixture. It can be remedied by adjusting the needle valve to supply more fuel, or decreasing the amount of air. Such an adjustment will, as a rule, provide a rich mixture when the motor is warm. If the adjustment of the carburetor is productive of satisfactory operation, it would be better to restrict the air openings until the motor becomes warm.

#### **EXCEEDS BURMAN'S RECORD.**

**Duray in 300 Horsepower Fiat Travels at Rate of 142.9 Miles an Hour.**

In the spring of 1911, Robert Burman drove the Blitzen Benz at a speed of 141.73 miles an hour on Ormond beach, Florida, thereby creating a world's speed record, which has remained until now. Recently, Arthur Duray, at the wheel of a 300 horsepower Fiat machine at Ostend, Belgium, drove a kilometer at the rate of 142.9 miles an hour. The mark cannot be accepted as a world's record, however, for the reason that European records are accepted only when the distance is covered in both directions, and then only the mean time is permitted to stand.

The attempt at the world's record was made on the shore road at Ostend, and conditions were considered ideal. In one direction Duray had a run of 2000 yards before striking the measured kilometer, and in the other 1600 yards. The best officially timed run in one direction was at the rate of 139.8 miles an hour. Another run in the same direction showed 142.9 miles, but the electric timing machine recorded only a streak.

Another attempt will be made by Duray with this machine in April, when it is expected that conditions will be even more favorable. At or about that time, it is anticipated that Chassagne will make a similar attempt on French roads with the 12-cylinder Sunbeam machine recently contracted for by Louis Coatalin of England.

Through the courtesy of the Automobile Club of America the use of the assembly room in the clubhouse, 247 West 54th street, New York City, has been made available for the January meeting of the Metropolitan section, Society of Automobile Engineers. This will be held Jan. 29 and the subject will be "The Gyroscope". E. P. Hopkins will read a paper explaining the application of gyroscopic influence to his mono-railway system, and Edward Durant will introduce a general discussion on gyroscopic action.

 gress of March 3rd, 1879.

**SHOWS A BUSINESS BAROMETER.**

If any further evidence were needed that the opportunity for making automobile sales was to be exceptionally bright during 1914, it is supplied by the record of attendance at the various shows now being held throughout the country. This was particularly true of the New York display, the attendance at which a year ago was exceptionally low. This year the number of paid admissions was larger each day than for any corresponding day during any previous show in that city.

The general public does not pay good money to visit an exhibition of goods of any character, which it is asked to purchase, without it is interested in the article on display. People must be interested in the purchase of automobiles, else it could not be expected that they would

visit the shows in such increasing numbers.

It is also of interest to note that business conditions generally have been looking much brighter since the opening of the New Year, and, in fact, since the middle of December. Financial papers state that merchants are beginning to stock up their shelves, and manufacturers to lay in a supply of material, anticipating a rush of orders in the near future. It looks very much as if the automobile shows were proving a decidedly dependable business barometer, and that conditions are improving rapidly.

**MOLINE-KNIGHT TEST.**

Automobile engineers and others, who have had certain misgivings concerning the practicability of the non-poppet valve type of motor in long continued service, will find much of interest in the results of the recent test of the Moline-Knight engine at the laboratory of the Automobile Club of America. Elaborate precautions were taken to have this test conducted by an absolutely impartial party, and the results thus obtained must receive general acceptance.

With respect to the questions involved, and entirely apart from the relative merits of this type of motor in comparison with any other type now in the market, the report indicates that the Moline-Knight engine fulfilled every claim made for it by the inventor and the manufacturer. While certain differences of opinion have been held, which permitted long discussion without satisfactory decision, this record breaking run has established definite facts beyond possibility of dispute, and the result must be very gratifying, not only to the Moline Automobile Company, but to other manufacturers using the Knight motor.

The announcement that one of the concerns in the automobile industry is to divide \$10,000,000 among its employees during 1914 has occasioned widespread discussion, pro and con, and it is somewhat amusing to note the difference of opinion which has resulted. Some suggest that the welfare of the industry may be involved. Others maintain that the plan adopted will have an injurious effect upon other concerns. Dealers and prospective purchasers contend that the surplus might have been so proportioned as to result in better profit to the former and a still further reduced first cost to the latter.

## WITH THE CYCLECAR MANUFACTURERS.

**Still Trying to Secure a Suitable Definition---Two Long Distance Trips Demonstrate Practibility Under Adverse Road Conditions---New Models Announced.**

**W**HEN is a cyclecar not a cyclecar? During the progress of the New York show, which was the first time the new type of machine has played an important part in direct competition with the so-called small car, several manufacturers sought to adopt a rigid rule by which it would prove possible to determine the line of demarcation. The result does not appear to have been in any way decisive, and it is doubtful if any general agreement can be reached at present.

The definition, "A cyclecar is an automobile built on the simplest possible lines", is held by some manufacturers to be altogether too general. For the most part, those who object to this wording are engaged in the production of a small car, which they maintain is as simple as a practical automobile can be built, yet they feel their product should not be classified as a cyclecar.

These men suggest the following: A cyclecar is (1) a motor vehicle with tread of less width than standard, (2) a motor vehicle weighing less than 1000 pounds, (3) a four-wheeled motor vehicle that does not follow the generally accepted automobile design with respect to the use of parts of standard type and construction, and with respect to the seating arrangement.

Concerning these proposed definitions: The first would rule out the Chautauqua, Cornelian and Downing, each of these machines, which in all other respects appear to meet the generally accepted idea of a cyclecar, having tread of 56 inches. The second would exclude the two two-passenger Car-Nation models, one of which weighs 1050 pounds and the other 1150. By common consent, the Car-Nation touring car, seating four passengers, has not been included in the cyclecar class from the beginning, but other cyclecar manufacturers are said to be considering the production of a touring model, seating four, which they desire to have termed a cyclecar.

The third definition appears to be the result of an attempt to avoid calling the cyclecar an automobile, and really complicates matters still further. Under its terms, a four-wheel motor vehicle seating two persons side by side and utilizing a four-cylinder motor, selective type transmission and floating rear axle with differential, would become an automobile, but the same car seating its two passengers tandem would be a cyclecar.

It is very obvious that the time will come when something definite will have to be decided upon, and perhaps, when that time comes, it will be found desirable to include the differences mentioned in all three suggestions, classifying a machine as a cyclecar in the event it fails in any one particular to reach the standard set for automobiles.

### THREE SEATS WITH LINCOLN.

**American Motorette Company of Detroit Changes Name of Concern and Car.**

Some of the foreign cyclecars have seating accommodations for three persons. One of these was shown at the Importers' Automobile Salon

**The New Lincoln Highway Roadster Model.**

in New York City the first of the month. The Lincoln highway roadster, formerly the American motorette, made by the Lincoln Motor Car Company, Detroit, formerly the American Motorette Company, provides for three persons, but there is a vast difference between the design of this machine and the three-seaters from abroad. In fact, there is bound to be some question as to whether this machine should be listed as a cyclecar.

It weighs 950 pounds. Its wheelbase is 100 inches. The maker has not seen fit to make public the tread measurement. Ordinarily, it seats two persons, side by side, but is provided with an auxiliary seat, which may be folded and removed from the car, or folded against the side, as desired. The driver is placed at the left.

with central position of the control levers.

The motor is a four-cylinder, four-cycle, water-cooled unit, cast en bloc, with bore of 2.81 inches and stroke of four inches, rated by the maker at 20 horsepower. The upper half of the crankcase is cast integral with the cylinders and carries all of the working parts of the motor. The lower half is one piece of strong stamped steel construction, and forms an oil well. This motor is placed under a hood of the so-called foreign type, with the radiator in the dash. Ignition is by Splitdorf high-tension magneto, and all wiring is carried in the channel of the frame, being protected from grease, etc. The carburetor is a Mayer. Lubrication is by a combination force feed and splash system.

The clutch is of the cone type, housed with the flywheel. The transmission is of the progressive type, affording two forward speeds and re-

toric in a measure. By no means the least interesting of these was the 1000-mile trip from Detroit to New York City, made by W. H. Smith of Auburn, Ind., in an Imp, produced by the Imp Cyclecar Company of Auburn.

Smith left Detroit Dec. 30 and arrived in front of the Grand Central Palace on Jan. 8, despite heavy snow storms and badly drifted roads encountered. Aside from the breaking of one pulley carrying the belt drive, necessitating driving some 38 miles with one belt, and the freezing of the lubricating pipes, because of the intense cold, the Imp suffered no mechanical troubles.

As originally planned, the Imp was to have been one of a half dozen cyclecars to leave Detroit, Dec. 28. After waiting two whole days for the other contestants to arrive, the plans were changed, and Smith finally left Detroit accompanied by W. B. Stout of Chicago to serve as the official observer.

The 60 miles between Detroit and Toledo were covered in six hours. The roads were in very bad condition, due to a heavy thaw which preceded a fall of snow. Several drifts were encountered between Toledo and Cleveland, and the belt pulley cracked a short distance beyond Elyria. The remaining 38 miles was made on one belt, through eight inches of snow.

The party waited at Cleveland a day and a half for baggage to arrive, and the drive from that city to Erie was made in blizzard weather, intense cold, deep snow and steep hills forming a combination

which made forward progress decidedly difficult at times. Stout retired as observer at this point, and Smith continued, after some delay in Erie, utilizing railroad and trolley tracks, where the drifts proved too deep in the road. His arrival in New York was one of the surprises of show week.

Concerning that portion of the trip in which he was a participant, Stout is quoted as follows:

This trip has proved a number of things. It has proved that 36-inch tread is applicable to American roads. It has proved the reliability of friction and belt drive, and that the belts will run in wet, in snow, in mud, and, if long, on small pulleys. It has shown an advantage of many gear ratios with an air-cooled motor, and has proved that the cyclecar is a real vehicle capable of great reliability. It has shown also the great advantage of tandem seating for touring work and comfort, for we carried a top and windshield and all directly against the driving blizzard in six to 11 inches of snow, and often on high gear at that. By letting the heat from the motor back into the car we were warm at all times.

The Imp Cyclecar Which Made the Trip from Detroit to New York in Nine Days.

verse, with direct drive on the high. Final drive is by shaft to a semi-floating rear axle. The service brake is located on the propeller shaft back of the transmission, and the emergency brakes are internal expanding on the rear wheels. Springs are semi-elliptic in front and full elliptic in the rear. Wire wheels are regular equipment, although an option of wood members is permitted. The tires are 30 by three inches.

### DETROIT-NEW YORK TRIP.

#### Imp Covers Practically 1000 Miles in Nine Days Despite Heavy Snow.

The New York automobile show was made the occasion of a number of cross country cyclecar runs, each of which may be regarded as his-

**GADABOUT HAS NOVEL LINES.****Car with Wicker Basket Body Built in Detroit  
by New York Concern.**

A short time ago announcement was made of the incorporation of the Gadabout Motor Corporation in New York City, with the following officers: President, Robin A. Lau; first vice president and general sales manager, Charles Vail; second vice president and New York sales manager, J. Dean Grandin; third vice president, A. Vernon Clarke; secretary, Edward M. Simpson; treasurer and general manager, Philip Heseltine; consulting engineer, Walter A. Gruenberg. At that time there was little to indicate that this concern was to engage in the production of a cyclecar. Such, however, appears to be the plan, and it is stated that the car will be produced in Detroit. The main office of the company is at 29 Broadway, New York City.

It is stated that the new machine will have a number of distinguishing characteristics, chief among which is the wicker basket body, seating two persons side by side. The wheelbase is 86 inches; tread, 46, and road clearance, nine.

The motor is a four-cylinder, four-cycle, water-cooled unit, cast en bloc, with bore of 2.5 inches and stroke of 3.5, being rated by maker at 12 horsepower. Lubrication is by a sight feed splash system. Carburetion is by a Schebler. Ignition is by magneto. Drive is by shaft, with a transmission gearset affording two speeds forward and reverse. The driver is located at the left. Wheels are of wood, fitted with 28 by three-inch tires.

**FALCON'S LONG JOURNEY.****Makes the Trip Over the Mountains from  
Cleveland to Staunton, Va.**

The Falcon cyclecar, which left Cleveland, O., Dec. 29, arrived at the new factory of the Falcon Cyclecar Company in Staunton, Va., Jan. 9, after a most strenuous trip over the mountains of Pennsylvania. The machine drove up in front of the Hotel Virginia at 7 in the evening, and it and the driver were the centre of interest for a large crowd until 4 the next morning.

When the machine left Cleveland it was in charge of Bryce E. Blackley, assistant production manager for the company, accompanied by George F. Cox. They bore letters from Mayor Newton D. Baker of Cleveland and from the Cleveland Automobile Club to Mayor Hampton

Wayt and the city council of Staunton.

Soon after the start the party experienced one of the worst snow storms which has swept the southern Ohio and Pittsburg district in the past few years. The machine was snow bound near Columbiana, O., for three days, after which the trip was resumed to Pittsburg, through deep snow practically all of the way.

Blackley became ill at Pittsburg, but continued at the wheel until the party reached Meyersdale, Penn., where he finally collapsed. He was relieved by F. R. Hoyt, designer of the Falcon, who drove into Hagerstown, Md., after an all night run from Cumberland. The following day the party went down the Valley national pike to Staunton.

Within 25 miles of the destination, on a perfect road, after the snow bound ways had been passed, the only serious mishap of the trip oc-

**Bryce E. Blackley Leaving Cleveland, O., for Staunton, Va., in Falcon Cyclecar.**

curred to the machine. While travelling at high speed the little car hit a sunken railroad crossing just outside of Harrisonburg, Va., breaking a front spindle, reported to have been due to a blowhole in the metal. The car went into the ditch, but did not upset and neither occupant was injured.

President M. W. Mercereau of the Falcon Cyclecar Company has the following to say regarding the trip:

This is the first severe test which the cyclecar has received since its introduction in this country, and the success of this trip indicates that, in spite of the views of foreign makers, an American cyclecar will endure the worst of road conditions in the country. Nothing, since the famous tour of the Mud Larks, has equalled this trip for adverse conditions, and the little Falcon has come through where few, if any, big cars could drive. We believe that this demonstration will greatly benefit the cyclecar movement as a whole, and show more clearly than ever the tremendous field which exists for this type of vehicle.

### FOUR LAVIGNE MODELS.

#### Detroit Manufacturer First to Announce an Enclosed Body Design.

One of the selling arguments employed by dealers in seeking to interest the motorcycle enthusiast in the cyclecar is based upon the equipment of the latter with a top, affording shelter from the elements. In this respect, at least, the cyclecar offers the same protection as the average automobile. And there certainly seems no good reason why this feature should not be carried one step further, with the presentation of the enclosed body type.

So far as is known, however, the LaVigne Cyclecar Company, Detroit, is the first manufacturer in this country to announce a body of this type. The LaVigne cyclecar is the design

Three-Quarters View of the New LaVigne Cyclecar, Which Is Produced in Four Body Designs.

of J. P. LaVigne, and to this chassis are to be fitted four body styles, a two-passenger roadster, cabriolet and coupe, and a parcel delivery wagon. Each of the pleasure vehicles is arranged to seat the passengers side by side. The roadster design was the only one displayed at the recent New York show. The wheelbase of the chassis is 96 inches and the tread 50. The weight ranges from 650 pounds for the roadster to 800 pounds for the delivery wagon.

The motor is a four-cylinder, air-cooled unit, the cylinders being cast en bloc, with bore of 2.375 inches and stroke of four. The horsepower rating is given by maker as 15. The motor is located under a pointed hood, and the fan which assists in cooling is at the right of the motor. Lubrication is by constant level splash, with pump circulation from an oil tank of three quarts ca-

capacity. The five-gallon gasoline tank in the dash feeds by gravity to the Schebler carburetor, and ignition is by either Bosch or Mea magneto, at the option of the purchaser.

Power is transmitted by shaft direct from the motor to the worm gear on the rear axle, through a multiple disc clutch, Raybestos lined, and a transmission gearset affording two forward speeds and one in reverse. The service brake is of the expanding type on the rear wheels, and the emergency brake contracts on the universal joint. The rear axle is of the semi-floating type, with worm drive and differential. Springs are semi-elliptic, 32 inches in front and 36 in the rear. The wheel bearings are fitted with balls in the front and Hyatt roller in the rear. Wire wheels are fitted, these being shod with Goodyear 30 by three-inch tires.

The frame is of pressed steel channel section, and is a pronounced underslung type, with road clearance of 10 inches. The equipment for the roadster includes the top and windshield, and provision may be made for fitting the Kemco fan type electric lighting system. The car is said to have demonstrated its flexibility in speeds varying from three to 50 miles an hour on experimental trips over rough roads in Michigan, and a fuel consumption of from 40 to 50 miles to the gallon.

Production work already has been begun on the two upper floors of the factory occupied by the LaVigne Manufacturing Company. The offices of the

LaVigne Cyclecar Company are at 521 Lincoln avenue, Detroit.

### ANNOUNCES CHAUTAUQUA MODEL.

#### H. J. Newman to Produce Cyclecars of Conventional Design at Jamestown, N. Y.

H. J. Newman, who has been connected with the automobile industry for a number of years, is interested in the formation of the Chautauqua Cyclecar Company, with headquarters and factory at Jamestown, N. Y. The Chautauqua model is stated to be conventional in design, with seats arranged side by side. The wheelbase is 102 inches and tread 56. Thus it becomes one of the few machines made in this country with a standard automobile tread.

The motor is a 12 horsepower, twin-cylinder, air-cooled unit, utilizing a Schebler carburetor and magneto ignition. The car employs a friction transmission, with final drive by V belt. Three speeds forward and reverse are permitted. Two brakes of the contracting type operate on the jackshaft, and emergency brakes of the expanding type are fitted to the rear wheels. The wire wheels carry 28 by 2.75-inch tires. The weight is 600 pounds.

### FLAGLER FROM CHICAGO.

#### Another Friction Driven Model with Factory Located on Michigan Avenue.

The Flagler Cyclecar Company, 1334 Michigan avenue, Chicago, is announcing a friction driven model with seats arranged side by side, for which exceptionally light weight is claimed. The chassis has a wheelbase of 90 inches and tread of 42, and the first complete car is said to have tipped the scales at 450 pounds. Tests of this machine on the road are stated to have resulted in a speed of 40 miles an hour and a fuel consumption of 54 miles to the gallon.

The motor is a two-cylinder, four-cycle unit, rated by the maker at 10-12 horsepower, with piston displacement of 69.7 inches. Lubrication is automatic with valveless pump on the motor, and a two-gallon supply is carried in a tank under the hood. The fuel tank, also under the hood, carries five gallons. Drive from the friction transmission is by 1.25-inch V belt. The change speed lever at the right side gives three speeds forward and reverse. The equipment includes two electric side and a tail lamp, current being supplied from a storage battery.

### GENERAL CYCLECAR NEWS.

#### Other New Models Announced in Brief—New York Club Organized.

The Robie cyclecar is announced from Chicago, fitted with a two-cylinder, air-cooled motor of 3.5-inch bore and 4.09-inch stroke, friction transmission under the hood, drive by single side chain to live rear axle, without differential. The wheelbase is 108 inches, tread 36. The two passengers are seated tandem. A distinctive feature is found in the use of sheet metal disc wheels.

The American Cyclecar Company, Seattle, Wash., has been incorporated by Daniel Murray, George L. Grant and others, and has purchased a factory site on 12th avenue, between Union and

Pike streets. The announcement further states that the car will utilize a three-cylinder, two-cycle motor, developing about 12 horsepower; friction transmission and chain drive to the front axle. It will weigh about 650 pounds and will seat two passengers side by side. The wheelbase is to be 96 inches and the tread 40.

The Gramm Motor Truck Company, Walkerville, Ont., across the river from Detroit, is said to have produced the first Canadian cyclecar. It is equipped with a twin-cylinder, air-cooled motor, and seats its passengers tandem.

Three cyclecars, a Dayton, a Puritan and a Frederickson, participated in the first American cyclecar run, under the auspices of the Chicago Cyclecar Club, New Year's Day, going over the Chicago-Elgin route. Although the speed limit was set at 17 miles an hour, it is stated that some of the machines made better than 20.

The Cyclecar Club of New York has been organized in that city, with the following temporary officers: President, Joseph A. Anglada; secretary-treasurer, R. F. Kelsey. It is planned to hold meetings monthly on the second Tuesday.

### FIVE ENTRIES NOW.

#### Beaver Bullet Makes Fifth in List of Competitors for Speedway Honors.

Five entries have been enrolled for the fourth annual international sweepstakes, or 500-mile race, on the Indianapolis motor speedway, Memorial Day. The fifth was filed by the Beaver Automobile Company, Beaver Falls, Penn., which enters the Beaver Bullet, driver not named. The concern is a new one, and it is stated that it is seeking an opportunity to "make good in a day", as was true of the Stutz entrant in the first 500-mile race in 1911.

The other entrants are two Stutz machines, an Anel and a Gray Fox. Unofficial announcement has been made that Robert Burman will be at the wheel of the Anel. Additional entries are expected from the Maxwell and Mercer factories in this country, Sunbeam and Vauxhall in England, and Peugeot and Delage in France. Harry Grant is said to have purchased two Sunbeams for this event, one of which probably will be driven by himself and the other by Chasagne, the world's hour record holder. Goux and Boillot are expected to be at the wheels of two Peugeots, and Guyot, who drove a Sunbeam in last year's race, undoubtedly will drive a Delage. It is possible that one or two Mercedes machines will be added to the list shortly.

## WITH THE MOTORING INTERESTS ABROAD.

### British Motorists Much Concerned Respecting Sale of Gasoline in Bulk---Constructional Details of Marshall Arter Cyclecar--News Notes from Foreign Lands.

**B**RITISH motorists are very much disturbed just at present because certain dealers in petrol or motor spirit—that is, gasoline—have adopted the plan of selling this fuel in bulk. Heretofore, it has been the practise in England, when the car owner demanded 10 gallons of gasoline, for instance, to unseal five two-gallon tins and pour the contents in the fuel tank of the machine. Also, the owner might purchase as many of these two-gallon tins as he desired and store them on his own premises.

The new plan is not thoroughly established as yet. One portion of the British motoring public objects to the innovation on the ground that it no longer will be possible for the purchaser to feel reasonably assured that he is receiving the

termed in England, which is soon to be introduced in this country, James M. Carples of 1784 Broadway, New York City, having secured the manufacturing rights for the United States. One of these machines is said to have covered 10,000 miles over English roads at a cost of .59 pence a mile, or a little more than one cent in American money. This figure included gasoline at 39 cents a gallon and the government tax of \$16 a year.

As produced in England, this machine seats two persons side by side. The wheelbase is 105 inches, tread 43 inches and extreme width 52. The motor is a four-cylinder, water-cooled unit, cast en bloc, with bore of 60 mm and stroke of 110 (2.36 by 4.33 inches). The maker's rating is 12-14 horsepower. Lubrication is by pump, cooling by thermo-syphon, carburetion by a Zenith and ignition by a Bosch high-tension magneto.

The clutch is a leather faced cone and the transmission of the power is by enclosed shaft to selective transmission, which with the differential is embodied in the rear axle. The reverse gear is brought into action by means of a separate lever, but it is held to be impossible to engage this when either the two forward speeds are in use, automatic stops being provided. Quarter-elliptic springs are utilized, front and rear.

The body design is somewhat typical of the British cyclecar, and is termed a standard torpedo model with side door. The driver is located at the right. The equipment includes a top, windshield, side and tail lamps, horn and set of tools.

#### WAGE EARNER OR DOMESTIC.

#### Chauffeur Question Now Before Industrial Court in New South Wales.

Some time since it was pointed out in these columns that the question as to whether a chauffeur was a domestic servant or a wage earner was causing some little trouble for employers of

Marshall Arter and James M. Carples in Marshall Arter Cyclecar Before House of Lords in London, England.

grade of fuel for which he is paying. Others hold that substitution is possible, even with the sealed tins, since the purchaser rarely inspects the seals, relying solely upon the honesty of the dealer. Those who take the latter view believe that, by constructing a private storage tank, the motorist can save money by purchasing fuel in quantity.

#### MARSHALL ARTER LIGHT CAR.

#### Constructional Details of British Cyclecar Soon to Be Produced Here.

An accompanying illustration presents the Marshall Arter cyclecar, or light car, as it is

Great Britain. The scene has now shifted to New South Wales, where the chauffeurs recently formed a union and are seeking to be placed under the jurisdiction of the wages board, which has the power, under the arbitration act, to fix minimum wages, conditions of employment, etc.

The matter was brought to the attention of the industrial court, before which the Automobile Club of Australia appeared to contend that a chauffeur was a domestic servant, and as such did not come under the provisions of the act. The club maintained that a domestic servant, such as a coachman who learned to drive his master's car, did not by that act cease to be a domestic servant. The union, on the other hand, urged that the mechanical skill required to drive a car placed the chauffeur in the class of a skilled craftsman. The court left matters very much as they were, by referring the question to the wages board, which already had the power to determine whether or not chauffeurs came under its jurisdiction.

Incidentally, it may be stated that the chauffeur's union asks for a wage of £3 15s (\$18.25) a week, and if more than one car is kept 10 shillings a week extra. If an employer provides board and residence, the driver is to pay for these at cost price, with the option of boarding elsewhere if he so desires. A day's work is to be nine hours, work between 7 in the morning and 5 in the afternoon, or 8 in the morning and 6 in the evening, with an hour off for lunch. Overtime must be paid for at time and a half, with double pay between midnight and 4.

Both the Motor Traders' Association of New South Wales and the Automobile Club of Australia have representation on the wages board, and it is expected that the fight will be continued in that body. It is interesting to note in this connection that the wages boards of Victoria and Queensland have granted the men employed in private service £2 10s (\$12.25) a week.

### TRIAL FOR CYCLECARS.

#### Scottish Automobile Club Is Considering Plans for Competition in June.

The secretary of the Scottish Automobile Club is issuing a circular letter to manufacturers

of cyclecars, or light cars as they are now more generally termed in Great Britain, calling attention to the plans of the club for a reliability trial during the third or fourth week in June. The letter states that the trials and competitions committee has been asked by several prospective purchasers to conduct an event of this character, and before proceeding further with the details, it is the desire of the club to learn whether or not makers will enter machines in sufficient number to make the contest a success.

It is proposed that the distance shall be between 700 and 750 miles over Scottish roads, and that the event shall include a number of hill climbing tests. The entries are to be confined to machines of not less than 800 nor more than 2000 cc in engine volume (40-122 cubic inches), and weighing not more than 800 pounds, complete with body. The contest is to be divided

Party of Tourists in Louser Car at Robert Burns' Birthplace in Scotland.

into classes, in which price will be the controlling factor.

### GENERAL NEWS FROM ABROAD.

The annual Swedish winter reliability trials for the Gothenburg and Winter trophies will be held between Stockholm and Gothenburg and return, Feb. 8-11. A hill climbing test and fuel consumption trial will be included in the event.

It is reported from Stuttgart, Germany, that a Grand Prix race will be organized in that country for next September. It is proposed to limit the event to cars with maximum cylinder capacity of 4000 cc (244 cubic inches). The distance will be about 430 miles.

The death of Leon Bollee is reported from France. Mr. Bollee was one of the pioneer manufacturers in the industry, and as early as 1896 he took one of his tandem motor tricycles across the channel to England, where it created a decided sensation. The machine was fitted with a single-cylinder horizontal motor, three-speed sliding gearset, and final belt drive to the single wheel in the rear. Later, after making a decided mark for himself in the automobile field, he took up aviation and was well known as the manufacturer of aeroplanes and aerial engines.

## REGARDING TIRE SIZES.

## Goodyear Company Reports the Result of Recent Detailed Investigation.

The standardization of everything pertaining to an automobile is proceeding steadily. Recently, the Society of Automobile Engineers took up the matter of tire sizes, and an effort is being made to reduce the total to about 12. In this connection, it is of interest to note that the Goodyear Tire & Rubber Company, Akron, O., has completed a detailed investigation of this subject and reports the result as follows:

In cross section there is a steadily greater demand for larger tires. There is a reason for this. Of tires returned to the manufacturers it was found for instance, that five times as many 34 by four-inch tires were damaged in the fabric as the 35 by 4.5-inch size. Six times as many 32 by 2.5-inch tires had fabric breaks as 32

Mr. and Mrs. W. J. Brewster, Detroit, Mich., En Route to Detroit, Fla.

by four, and the same comparison applies to 36 by four and 37 by 4.5, and to 34 by 3.5 and 35 by four.

In other words, where larger alternative tires are used, fabric damage is largely eliminated. What little does occur in the larger sizes results directly from under inflation or accident. Tire companies are naturally advocating the use of larger tires wherever possible, as a protection not only to themselves, but to car owners as well. The result is already seen in lower mileage costs.

## ANNUAL EXIDE DINNER.

## Will Be One of the Features of the Week in Which Chicago Show Is Held.

For the past six years one of the social features of the Chicago automobile show week has been the annual Exide dinner, given by the Electric Storage Battery Company of Philadelphia to the electric vehicle manufacturers, their agents and the Exide battery distributors throughout the country. This dinner will be held

this year Wednesday, Jan. 28, at the rooms of the Mid Day Club.

Invitations will be eagerly sought after. The dinner was a brilliant success last year, and it is hoped that this year's menu and entertainment will equal if not surpass the record set at that time.

## FROM DETROIT TO DETROIT.

## Long Distance Trip Demonstrates Value of Harris Oil and Ford Car Combination.

W. J. Brewster of Detroit, Mich., evidently believes in combining business with pleasure, and he also has great faith in Harris oils, made by the A. W. Harris Oil Company, Providence, R. I. He recently completed an automobile trip from Detroit, Mich., to Detroit, Fla., the latter being a small town just below Miami, and probably not known to the average reader.

Mr. Brewster was accompanied by his wife, in a Ford car, as shown in an accompanying illustration, which also indicates, in a measure, the important part which Harris oils played on the journey. It is not just clear, from the illustration, whether the trip was for pleasure or profit, but, judging from the inscription on the forward door, it would appear that Harris oils were dispensed en route.

Mr. Brewster reports that he went through with practically no trouble at all, and he attributes the absolute lack of engine or transmission trouble to the use of this brand of oils. He found the roads for the most part in excellent condition and that the journey, while long, proved interesting at every stage.

The second annual meeting of the Chamber of Commerce of the United States will be held in Washington, D. C., Feb. 11-13. This organization now comprises 488 chambers of commerce, boards of trade and similar bodies throughout the country. The annual banquet will be held on the anniversary of Lincoln's birth, and during the session of the first day Secretary Wilson of the Department of Labor will address the members on the subject, "The Relation of the Department of Labor to Industry and Commerce".

## IN THE COMMERCIAL VEHICLE FIELD.

### Constructional Details of Model B Two-Ton Wichita Truck—Features of Tilling-Stevens Gasoline-Electric Chassis—Machines in Varying Service.

**A**BOUT two years ago, the Wichita Falls Motor Company, Wichita Falls, Tex., was organized to produce the Wichita truck, and the first models displayed at the automobile shows in the Southwest were of such character as to meet instant approval. Since that time the sales of Wichita trucks in the Southwest have increased very rapidly, and the company is now extending its agencies into the South and Middle West. An accompanying illustration presents the model B, which differs from model A only in the frame and other proportions, the power plant being the same.

The motor is a four-cylinder, water-cooled unit of the L head type, with cylinders cast en bloc. The bore is 3.25 inches and the stroke five, giving a horsepower rating of 16.7 under the S. A. E. formula, although the maker states that it will develop 25. The crankcase is of the barrel type with large bolted-on plates carrying the end main bearings, and with a base that forms the oil reservoir. By removal of the base and end plates, and after loosening the connecting rod big ends, the crankshaft may be withdrawn without difficulty. The timing gears are forward of the front end plate and are housed in a separate case, which has independent means of lubrication.

Cooling is by the thermo-syphon system, and lubrication is by combined force feed and splash, the oil circulating through a glass indicating gauge on the dash. Ignition is by either Bosch or Eisemann magneto at the option of the purchaser. The carburetor is of the automatic float feed type.

The clutch is a leather faced cone of ample proportions, and the transmission is of the selective sliding gear type, affording three forward speeds and reverse. Final drive is by jackshaft

and side chains. The frame is of pressed steel channel section, and is carried on semi-elliptic springs, the rear suspension being with outside brackets. The front axle is an I section, and the rear a rectangular section, both drop forged from high grade steel. The service brake is expanding, operating on the jackshaft, and the emergency members are also expanding in rear wheel drums. The wheels are 34 inches in diameter, and are shod with 3.5-inch shoes in front and three-inch dual in the rear, both fitted with demountable rims.

The driver is placed at the right, with centre control. The wheelbase is 118 inches and the tread 56. The chassis has rated capacity of two tons, and is supplied with varying body equip-

Model B Two-Ton Wichita Truck, Made by Wichita Falls Motor Company.

ment to meet the requirements of the purchaser. The company also is prepared to furnish bodies suited for fire department service.

As a result of a novel competition, in which 20 representatives of as many leading makes of commercial motor vehicles submitted their product for examination and test, H. Paulman & Co., agent for Pierce-Arrow trucks, recently was the successful bidder for four machines to be supplied to the city of Chicago. The machines first underwent a 54-mile run, a portion of which was over muddy ground, and then were submitted to technical examination conducted by the bureau of engineering.

## TILLING-STEVENS OMNIBUS CHASSIS.

CONSIDERABLE interest attaches to the Tilling-Stevens gasoline-electric chassis utilized by Thomas Tilling, Ltd., in omnibus

carburetor is a Solex, made in Great Britain.

The electrical portion of the equipment consists of a generator, a series wound electric motor and the controller box, the last named carrying a reversing switch and a shunt resistance for the generator fields. The dynamo is connected direct to the gasoline engine by means of a flat leaf spring, no friction clutch being used. The generator, which is capable of an output varying from one to 20 kilowatts at speeds varying from 350 to 1400 revolutions a

**Tilling-Stevens Omnibus Chassis with Hood Removed, Showing Gasoline Motor.**

minute at a voltage varying from 0 to 300, has been designed so that any increase in the demand for current when the engine is fully loaded is accompanied by a corresponding reduction in voltage.

The output in kilowatts at any speed is proportional to the power exerted by the engine, but the volts and amperes may vary over a large range according to the gradient, speed or degree of acceleration required. The amperes required by the series wound motor are nearly proportional to the voltages of supply. It follows that when the vehicle is running on the level road the demand for amperes will be small, but on gradients it will considerably increase, with a corresponding decrease in voltage, resulting in a slower speed with increased torque, and this

service in London, England. Accompanying illustrations present the chassis details, and make possible study of the design. The particular feature, to which special attention is drawn, is the elimination of the usual clutch and gearbox and the substitution therefor of a flexible electrical transmission between the gasoline engine and the driving wheels, which is held to give, among other results, remarkably easy starting and control, and silent running.

It may be stated that the gasoline engine has four cylinders, with bore of 105 mm and stroke of 125 mm (4.13 by 4.82 inches), giving a rating of 27.25 horsepower under the R. A. C. formula, which is the same as the S. A. E. in this country. The cylinders are cast in pairs. Cooling is by water, and further assisted by a disc fan carried on the rear of the dynamo shaft, the motor and dynamo being of the semi-enclosed type. This shaft, as well as the motor shaft, is mounted on ball bearings. Lubrication of the motor is by a splash system. Ignition is by Bosch high-tension magneto, and the

**Plan View of Tilling-Stevens Chassis, Indicating Location of Electric Dynamo.**

change is said to take place automatically.

On level roads and ordinary gradients the whole of the control is effected by the gas throttle pedal. On steep gradients the shunt resistance must be employed to permit increased engine speed. The control has three positions—forward, neutral and reverse—the whole of the speed regulation being effected with the one po-

sition of the controller. As the generator ceases to excite at 300 revolutions a minute of the engine, it is not necessary to break the circuit between the dynamo and motor, upon stopping in traffic, for instance, as by the release of the throttle pedal and the consequent slowing down of the engine no power is transmitted to the driving shaft. In other respects, design is standard.

### PARCEL POST SERVICE.

#### Special Body Equipment on Commercial Wagon Utilized in Jacksonville, Fla.

The demand of the parcel post service, which was inaugurated by the Postoffice Department a year ago in January, was expected to make itself felt in the use of commercial motor vehicles, and, while the government has purchased but comparatively few machines, many are in use in various sections of the country. With the increase in weight of the parcels which may now be shipped by parcel post, it is anticipated that even more attention will be given to this subject.

Several manufacturers have considered the desirability of special body equipment, the controlling factors being those of securing the advantage of all available space and providing protection against the weather. In connection with the first it must be remembered that all classes of merchandise may be sent through the mails, and that it is necessary to prevent the possibility of crushing or damaging the contents of the packages.

An accompanying illustration presents an example of body construction on a Commerce light delivery wagon, made by the Commerce Motor Car Company, Detroit, and utilized in the collection and distribution of parcel post packages in Jacksonville, Fla. This is an express flareboard type, with stanchions supporting a standing roof that is carried forward above the seat to the dash, vertical stay rods strengthening it. Side, rear

and front curtains afford protection in the event of storm. The construction is light and enduring, and well adapted for the handling of the load from the sides or end.

### AN AMERICAN CHAR-A-BANC.

#### GMC Chassis Fitted with Sightseeing Body in Service in California.

Within the past year decided interest has been awakened in Great Britain and European coun-

Commerce Delivery Wagon with Special Parcel Post Body in Florida Service.

tries in the availability of the so-called char-a-banc in developing tourist business for hotels and others. In America there also has been a tendency toward the utilization of motor truck chassis for similar purposes.

An interesting example is that supplied by the Pacific Sightseeing Company of Pasadena, which employs a GMC two-ton truck chassis, made by the General Motor Truck Company, Pontiac, Mich., and equipped with a special body installation, as indicated by the accompanying illustration. The city is located in the centre of a very beautiful section, and this machine is oper-

**GMC Chassis Equipped as Sightseeing Wagon in Service in Pasadena, Cal.**

ated on a schedule, which permits opportunity to enjoy two trips a day, one of 40 miles and the other of 12.

The body is of such width that wheel housings are provided for the rear wheels. Six transverse seats provide capacity for 30 persons, and above these, supported by steel stanchions, is the roof. Provision also is made for completely enclosing the body during storm by means of side curtains, fitted with celluloid windows.

#### **OPERATING IN A BLIZZARD.**

##### **Practicability of Pierce-Arrow Worm Driven Truck Tested in Severe Service.**

There is some little contrast between the balmy, summer setting of the upper picture on this page and that of the Pierce-Arrow five-ton, worm driven truck working in blizzard weather in the lower, but the two photographs demonstrate the wide range of possibilities in motor truck haulage. The lower picture was taken during the very severe snow storm which blockaded the streets of Cleveland, O., for several days recently. The average depth of the snow was 22 inches, and in places

this was drifted to five and six feet.

The Zittlemeyer Coal Company tried to use four and six-horse teams in the delivery of fuel, which was urgently needed in many sections of the city. At last it called upon the Cleveland agent for Pierce-Arrow trucks, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., who placed the machine shown at its disposal.

The truck was loaded to capacity and was kept at work from Monday until Wednesday afternoon, with a stop from 3 to 5 Tuesday morning and another from 3 to 7 Wednesday morning. It was a standard five-ton model, fitted with an hydraulic hoist and dumping body. The motor was running continuously during the time the machine was in service, and the difficulty of securing traction may be judged from the fact that more than 60 feet of tire chains were used during the three days, the links breaking and necessitating renewal at frequent intervals.

Chin Gow, a Chinese vegetable gardener in Portland, Ore., recently purchased a 1500-pound truck, with which he is able to rush vegetables to market in rapid time in comparison with the methods employed by his competing countrymen.

**Five-Ton Pierce-Arrow Worm Driven Truck Working During Blizzard in Cleveland.**

# STEWART AUTOMATIC CARBURETER ADJUSTER.

**I**T IS estimated by an authority on carburetion that the majority of owners operate their cars on too rich a mixture to make for efficiency

**Fig. 1—Stewart Thermo-Adjuster, Which Automatically Regulates the Air or Fuel by a Novel Use of Mercury.**

and economy. This is particularly true in cold weather when the fuel vaporizes less readily than in the summer, and when starting is more difficult. While it is true that the carburetor manufacturer has made progress in overcoming troubles experienced with the present grade of fuel, his suggestions for economical operation are frequently disregarded in an endeavor to obtain easy starting. In other words, the fuel supply is increased to eliminate starting troubles.

A rich mixture has its disadvantages. It is wasteful of fuel, creates sooty deposits, and the motor does not develop its maximum output because of the improper proportions of fuel and air. While it appears to the novice that the motor operates smoothly after being started from cold with a rich mixture, he does not take into consideration the fact that upon the cylinders attaining an operating temperature of, say, from 170 to 180 degrees, the flow of fuel or its emergence from the jet is considerably faster than at starting. One authority holds that there is a difference of 39 per cent. from the same sized opening in a change of 15 degrees.

While it is possible to adjust the carburetor with a rich mixture for starting, and to change it back to the original setting, it requires a knowledge of the carburetor, as well as frequent alteration, and a large number of owners prefer the easy starting mixture to a lean, economical one. The last named in low temperatures is productive of back firing when a cold motor is started. Changes in temperature have their effect upon carburetion, and to offset these variations dash or steering post control has been adopted

by the majority of carburetor manufacturers.

The Stewart-Warner Speedometer Corporation, Chicago, exhibited at the New York show a thermo-automatic carburetor adjuster, which is designed to automatically regulate the operation of the carburetor by temperature. It is the invention of a racing driver who made an exhaustive study of carburetion, and any change in temperature is compensated for by a novel, yet simple, use of the sensitiveness of mercury.

The Stewart thermo-automatic carburetor adjuster is composed of a metal bulb, connection tubing and a Bardon coil enclosed in a metal box, from which protrudes a plunger or pushrod as shown at Fig. 1. The bulb is tapped into the water circulation system, in the outlet water manifold, for example, as shown at Fig. 2, and the adjuster proper is attached to the carburetor in such manner as to permit the pushrod or plunger to actuate the air valve or needle valve of the carburetor. The movements of this rod are indicated by the dotted lines at Fig. 1.

The temperature of the fluid in which the bulb is immersed causes the mercury to contract or expand, as the case may be, and the pushrod is actuated accordingly. It is claimed by the inventor that the thermostat will operate within one degree of the indicated temperature, and that the maximum valve movement is .3125 inch.

With the Stewart, the carburetor is adjusted as nearly correct as possible, but the adjustment of the device is so made as to have no effect except when the temperature of the water jacket falls below 180 degrees Fahrenheit. At this point, and to 40 degrees, it is held that the Stew-

**Fig. 2—Showing the Stewart Device Installed on a Rayfield Carburetor—The Bulb Is Located in the Outlet Water Manifold.**

art will automatically regulate the mixture.

The qualities claimed for the invention are: It increases the density of the mixture for starting

when the cylinders are cold, automatically proportions the fuel in accordance with the temperature of the combustion, preventing waste of fuel, and obtains maximum efficiency from the motor by reason of a perfect mixture throughout the entire range of adjustment on any carburetor.

The chart at Fig. 3 brings out the points emphasized in the Stewart device. AB represents the entire range of adjustment on any carburetor; A being the point where back firing occurs. C indicates the 180-degree point, held to be the most efficient and economical. D is the 90-degree point, where it is claimed that the majority of carburetors are adjusted so as to obtain easy starting. E is the 40-degree point, where it is stated the Stewart device provides the richest mixture possible.

The intersecting line C denotes the ideal adjustment, where the most economical and most efficient proportions of fuel and air are obtained when the motor is operating under perfect conditions and the temperature of the water is 180 degrees. With the lowering of the temperature the conditions represented by A will be experi-

Fig. 3—Chart Showing Various Carburetor Adjustments.

enced. With the adjustment as indicated by D the easy starting is offset by too rich a mixture, upon the cylinders attaining their working temperature. E indicates the 40-degree point, where it is pointed out that the Stewart device provides a rich mixture; that is, under conditions requiring more fuel or less air, as in starting in low temperatures.

With the Rayfield carburetor, as shown at Fig. 2, the Stewart operates on the air valve, a loose sliding collar being employed. At low temperatures the pushrod increases the tension of the spring controlling the air valve, decreasing the supply of air and enriching the mixture to meet conditions. Under ideal operating conditions the Stewart is inactive. Changes in temperature, however, are automatically compensated for as previously explained.

The Stewart thermo-automatic adjuster is designed for service with all types of carburetors and eliminates changing the proportions of fuel and air. It is the intention of the company to manufacture the Stewart adjuster for application to the exterior of the circulating system, elimin-

ating the tapping of the water pipes or manifolds.

### ILLINOIS GARAGE ASSOCIATION.

#### Members Will Hold Their Annual Convention During Progress of Chicago Show.

The Illinois Garage Association, composed of representatives from local associations throughout the state, will hold its first annual convention at the Lexington hotel, Chicago, during the progress of the annual national automobile show in that city, Jan. 27-28. It is probable that a permanent organization will be brought about at that time.

The object of the association is stated to be: To establish a friendly relation between the members and promote their general welfare by elevating the standard of efficiency for garage employees, by standardizing and improving the service to be rendered by garages and by co-operating in the enactment, or repeal, of laws and ordinances relative to garages and the operation of automobiles, also to encourage touring.

It is expected that some 400 delegates will be present, and these will be entertained at the show the evening of Jan. 27, and the following evening by the Chicago Garage Owners' Association. The organization committee is composed of the following:

John W. Morsbach, Chicago, chairman; E. J. McGuirk, Chicago, temporary secretary; William L. Rudd and Frank H. T. Potter, Chicago; Robert Bland, Evanston; W. C. Bode, Oak Park; Charles L. Turner and Fred Poshard, Peoria; M. Fry, Champaign; Basil W. Ogg, Springfield; A. C. Berthold, Aurora; Faust H. Boyd, Ashton; W. E. Keck and G. H. Steineck, La Grange.

President George A. Kissel of the Kissel Motor Car Company, Hartford, Wis., states that never before has a national automobile show witnessed so many actual sales as were recorded during the progress of the New York show just closed, while the record breaking attendance indicated unmistakably a lively spring market. No less pleasing to him are the results in Philadelphia, Los Angeles and Milwaukee, where the dealers' shows, held the week following the New York display, set new marks for those cities.

The following officers have been elected by the Bay State Automobile Association, Boston, Mass.: President, W. H. Stevens; vice president, J. J. McNamara; secretary and treasurer, E. K. Sweet; directors, E. A. Gilmore, Chase Langmaid, Joseph Donovan, R. R. Ross and Dr. H. D. Boyd.

## IMPROVED ROADS AND MOTORING LAWS.

### Michigan Court Asked to Declare New Statute Unconstitutional—Ohio's Governor Calls Special Session to Amend Warnes Law—Good Roads News.

**A**TTORNEYS representing citizens of Detroit appeared before the supreme court of Michigan, Jan. 7, to argue against the constitutionality of the so-called Bricker-Smith law, passed at the last session of the legislature. The action was brought into court under mandamus proceedings to compel the secretary of state to accept a straight \$3 license fee, as provided under the old law, in lieu of 50 cents a horsepower, demanded under the provisions of the new law.

The Detroit attorneys maintained that the new law was absurd, because the steam and electric vehicles were accepted at the manufacturer's rating, which was held to be without uniformity or reliability. It also was contended that some automobiles selling at \$300 have horsepower equal to others selling at \$3000. The law was further held to be discriminating in character, in that manufacturers and dealers were permitted to pay a tax of \$50 for the first five machines operated by them and \$10 for each additional car, regardless of horsepower.

Attorney-General Fellows, representing the state, contended that the commonwealth had a right to exact a toll from users of the highways. He asserted that no discrimination had been shown by arbitrary classification, as uniformity could not prevail. He declared that the automobile license law was purely a police regulation.

#### TO AMEND WARNES LAW.

#### Governor of Ohio Calls Special Session of the Legislature for This Purpose.

Governor Cox of Ohio has called a special session of the state legislature for the purpose of amending the so-called Warnes law, which was declared unconstitutional by the courts of that commonwealth recently. He thinks he has found a way to impose the increased registration fees and so word the law that it will meet with the approval of the courts.

The original law provided that the entire surplus, over and above the cost of administering the law, should go into the general fund. Governor Cox asks the legislators to consider an amendment providing that this surplus shall be diverted to the good roads funds. While there

was a time when automobile owners were inclined to accept such provisions, the motorists of Ohio object strenuously to paying the excessive fees created by this law and are much opposed to the amendment.

#### SAND-CLAY ROADS.

#### United States Government Offers Advice as to Construction and Maintenance.

There are at present about 35,000 miles of sand-clay roads in the United States, mainly in the southern states, according to the office of public roads, Department of Agriculture, which authority states that the time to work such roads is in the spring. It is further pointed out that the type is cheap, comparatively firm and durable, and easy to construct and repair. The office of public roads offers the following suggestions:

The sand-clay road is made by mixing the sand and clay in such manner that the grains of sand touch each other, the spaces between the grains being filled with clay, which acts as a binder. The approximate mixture of sand and clay may be determined by filling a vessel with a sample of the sand to be used, and another vessel of the same size with water. The water is poured carefully into the sand until it reaches the point of overflowing. The volume of water removed from the second vessel represents approximately the proportion of clay needed.

If the road to be treated is sandy, the surface is first levelled off and crowned with a road machine, the crown being about .5 inch to the foot from the centre to the sides. The clay is then dumped on the surface and carefully spread, so that it will be from six to eight inches in depth in the centre, and gradually decreasing in depth toward the sides. A layer of clean sand is then added, which is thoroughly mixed with the clay, either by traffic or by means of plows and disc or tooth harrows.

If the road to be treated is composed of clay, it should first be brought to a rough grade with a road machine. The surface should then be plowed and thoroughly pulverized by harrowing to a depth of about four inches, after which it is given a crown or slope of about .5 inch to the foot from the centre to the sides. It is then covered with six to eight inches of clean, sharp sand, which is spread thicker in the centre than at the sides. The materials should then be mixed with plows and harrows while they are comparatively dry, after which they are finally puddled with a harrow during wet weather. If clay works to the surface and the road becomes sticky, more sand should be added.

After the clay on sand, or sand on clay, road is completed it should be carefully maintained until the surface becomes firm and smooth. The construction of this type of road is by no means a quick operation. If soft, sticky places appear, more sand should be added, and if loose, sandy places are found, more clay is needed. It is just as important to attend to these small details as to any other part of the work, for, if they are neglected, the road is liable to fail.

It requires approximately one cubic yard of clay to surface 1.5 running yards of road 12 feet in width, or about 1175 cubic yards to the mile. From .75 to one

cubic yard will make a load for two horses on a dry clay road. The cost of the road will therefore depend largely upon the distance the material is hauled, the average being from \$500 to \$1000 a mile. A road built under the direction of the office of public roads at Gainesville, Fla., one mile long, 14 feet wide, and having nine inches of sand-clay surface, cost \$881 a mile, or 10 cents a square yard. Another sand-clay road built by this office at Tallahassee, Fla., 16 feet wide and seven inches thick, cost \$470 a mile, or about five cents a square yard.

### ATLANTA SECURES CONVENTION.

#### American Highway Association Will Meet in That City Next October.

As a result of the contests among 10 of the leading cities in the United States for the honor of entertaining the 1914 American road congress, under which title the American Highway Association and the American Automobile Association hold their annual road conventions, Atlanta, Ga., is announced as the winner. The decision was made by the directors of the American Highway Association at a meeting held in New York City this month. The convention will be held Oct 19-26.

At this meeting, also, Fairfax Harrison, who succeeded the late W. W. Finley as president of the Southern Railway Company, was elected a vice president to succeed Mr. Finley, and it is understood that he will be selected as chairman of the executive committee. In accepting the position, Mr. Harrison stated that he intended to carry on the work of improved highways in the South.

### CONVICT LABOR ON ROADS.

#### Much Interest Being Developed as Result of Pending Legislation.

The National Committee on Prison Labor, which is very much interested in convict road work, believes that the development of such plans in every state of the Union will be the natural outcome of the passage of the Boeher-Hughes bill, now pending in Congress. This bill seeks to limit interstate commerce in convict made goods, by subjecting such goods to the laws of the state into which they come. Inasmuch as this is expected to destroy the present contract system, other means will necessarily have to be found to keep the prisoners busy, and the committee feels that this will be road work.

The movement was given additional impetus last month, when the constitutional amendment was adopted in Kentucky, permitting the use of prisoners on public highways in that state. Plans for drafting the necessary legislation are well

under way, the chairman of the legislative council of the Kentucky Federation of Labor being particularly active in this direction.

Twenty-five governors have placed themselves on record as favoring the working of convicts in the construction and repair of highways, and have laid the matter before the legislatures in their respective states.

### A PRACTICAL DEMONSTRATION.

#### Maintenance Experiment Covering 700 Miles of Highway in the South.

The American Highway Association has arranged, in co-operation with the federal office of public roads, with the road officials in Virginia, North Carolina, South Carolina and Georgia to conduct an ambitious maintenance experiment on the road from Washington, D. C., to Atlanta, Ga. Over 700 miles of highway are expected to be improved and kept in condition as a result of this test.

The association will enlist the support of the counties and districts traversed by the road, and, wherever possible, induce local authorities to place the highway under the supervision of government engineers who will be detailed from the office of public roads for that purpose. The object of the scheme is to prevent the improved portions from deteriorating for lack of suitable care, and to make the unimproved portions as comfortable for travel as possible with the money available. In addition, of course, it is expected to result in a continuous maintenance object lesson that will be a stimulus to other sections of the country.

The American Highway Association has undertaken to raise the money for the travelling expenses of the engineers who will supervise the work. Leonard Tufts is chairman of the committee having the plan in charge.

### LINCOLN HIGHWAY BRIEFS.

De Kalb, Ill., claims the honor of being the first city in the United States on the route of the Lincoln highway to officially change the name of its principal thoroughfare, Main street, to Lincoln highway. This action was taken at a special meeting of the city council.

Citizens of Massillon, O., have placed the official marker of the association on the boulevard lights which line the route through that city.

At a meeting in Upper Sandusky, O., attended by 400 business men and farmers, a committee was appointed to interview every resident and obtain contributions.

The Glidden Highway Association of Glidden, Ia., has posted eight miles of the Lincoln highway through that town with the official emblem of the association.

Clarkson Dye, representing the Chinese Chamber of Commerce and Chinese Native Sons of the Golden Gate, San Francisco, Cal., has written E. P. Bringer, California state consul for the association, offering the generous support of the Chinese in the work in that state.

# ANALYZES ROLLER BEARINGS.

Professor Goodman of Leeds University, England, Discusses Various Types and Gives Results Obtained in a Series of Experiments and Practical Tests.

PROFESSOR Goodman of the Leeds University recently gave a lecture before the Institution of Automobile Engineers, London, Eng-

Fig. 1—Showing Frictional Resistance of Elastic Roller on Elastic Bed.

land, on ball and roller bearings, a report of which is given here-with. He was a railway engineer before he became a university professor, and for many years, in addition to the work incident to a professor of engineering, devoted himself to a persistent series of experiments with roller and ball bearings. He is recognized as an authority upon the subject throughout the world.

In opening, he said that, although it had been known 4000 or 5000 years that the resistance of a body sliding on a flat plane was from 30 to 50 times as great as that of a body on a rolling plane, it was only within the last few years that rollers had been successfully applied to bearings. The reason why they had not been successfully applied was one of the points he hoped to bring out in the course of his lecture. He proposed to deal simply with general principles, and could not profess to touch on the application of bearings to automobile work. There were many others who knew far more about that aspect of the subject than he did, and he hoped they would be induced to deal with it. Prof. Goodman then proceeded to deal with the subject of his lecture, illustrating his remarks by means of lantern slides.

## Frictional Resistance.

The first diagram, Fig. 1, by Prof. O. Reynold, illustrated frictional resistance of an elastic roller on an elastic bed, showing how this was entirely different from friction of a cart wheel over a muddy road. Prof. Reynold showed that if circumference of a roller were marked off in equal parts, and the bed were also marked off in equal parts, prior to application of roller, when the roller was placed on the bed and commenced to roll in one direction, portions of the bed spread on both sides of the roller and formed a hollow in the middle and a hill formed at either side in front and behind the roller. There was no slipping at all between the roller and the bed. The slipping occurred in one direction in the bed, while the movement of the roller was in the other direction. The friction between the roller and its bed, due to its expansion, was against the direction of rolling, so that the friction at one point hindered the roller from working over the path. Similarly, as the roller left any point the bed contracted, and, again, the friction on that portion tended to hinder the rolling of the roller on the path. That was the base of the action of a roller on an elastic path. Suppose a lubricant, such as oil or graphite, was interposed, the friction would be diminished at two points, but, owing to the fact that the width was increased over which slipping occurred, the friction would be increased at other points. The two actions almost counteracted one another, with the result that in general there was practically no difference in the rolling resistance of a roller when the surfaces were lubricated and when they were perfectly dry. With a perfect roller or

ball bearing exactly the same action was present. The resistance of the bearing, and therefore the friction produced was independent of the lubricant.

## Slip of Rollers.

There was also another very important point. Owing to the stretch of the bed upon which it worked, the roller moved less than its geometrical distance, because the length of the path became stretched, and if one very accurately measured the distance that the roller moved and compared it with the circumference of the roller, one would find that it was always short of its true distance. That was when one had a hard roller on a soft bed. A very beautiful experiment was shown by Dr. Hele-Shaw in one of the Cantor lectures which he delivered some five or six years ago, showing exactly how the slip occurred, the nature of the slip, and the nature of the surfaces. Prof. Reynold was unable to detect any difference in length between the circumference of a cast iron roller and the path it traversed. The amount of slip which occurred was very small. In a roller or ball bearing it was very easily measured and it played a very important part. There was always slip whenever an elastic roller rolled on an elastic bed. His (Prof. Goodman's) own tests showed that the amount of slip depended very largely on the load. There was a very small amount of slip with a light load and light pressure, and a very large—extremely large—amount of slip when the pressure became large.

## Early Types of Bearings.

He threw on the screen a slide of an ordinary type of roller bearing which he had chosen as one of the best of the old type, to show in this particular case the effect of a hardened steel sleeve and a hardened steel liner. These rollers were beautifully fitted in, ground, finished and hardened, and they were kept in position in a gun metal cage. This gave some idea of the ordinary type of roller bearing. In another example he showed a lighter type of roller cage. There was always end thrust on the rollers, they bore hard on the ends of the cage and pushed it up against the flange of the casing, thus causing a very serious amount of friction to occur. There were also other troubles, which were not at all easy to overcome. The next slide, Fig. 2, showed one of the very earliest roller bearings known—the earliest he had been able to find. It was shown at the Institution of Civil Engineers, and a description of it appeared in the proceedings of that body. It was intended to be used for the axle of a railway train. The inventor pointed out that from the first he had the greatest possible trouble with it, due to end thrust on the rollers. He investigated the matter carefully and found out exactly the cause of the end thrust, and he then endeavored to get over it by the very amateurish method of putting India rubber bands on the rollers. He was very sanguine of success at first, but if one looked at the proceedings of the civil engineers some three or four volumes further on one would find another short paper, in which he stated that he had abandoned this type of roller bearing.

Dealing with the end thrust trouble, Prof. Goodman said if the rollers were not absolutely parallel with the shaft, or if the rollers were the least bit taper, or if the shaft or sleeve on which it rolled was taper, the rollers tended to roll in a helical path on the shaft as it rotated. But the rollers could not actually roll in a helical path continuously, for the simple reason that the cage or ends of the casing prevented them doing so.

Fig. 2—Early Type of Roller Bearing.

Hence the rollers did not grip endwise until they pressed hard on the end of the cage and on the flange of the casing; then when the end pressure became sufficiently great the rollers slipped and started afresh to roll in a helical path and slipped back. By a very simple arrangement of his

Fig. 3—Combined Ball and Roller Design.

testing machine he (the lecturer) was able to show that the movement of the rollers was in a helical path; that the rollers moved a certain distance, and then slipped back, over and over again. The amount of the end thrust depended very largely upon the load on the bearings. As far as he was able to detect it, it did not vary at all with the amount that they were out of truth. This end thrust caused very serious trouble. First of all, the rollers wore right through the end of the cage—drilled holes right through the casing. He had seen many instances of this. It was an action that caused very serious rumbling—a vibrating action which enormously increased the friction of the bearing. If one could get a pure rolling motion of the rollers without end thrust the coefficient of friction would be somewhere in the neighborhood of one in 1000, whereas with end thrust it might easily be one in 200 or 300; and the end thrust itself was very serious, as it might easily amount to from a quarter to one-third of the total load on the bearing. When one came to think of it, it would be seen how very serious it was. With a 10-ton load on a bearing one might get from 2.5 to three tons end pressure on the rollers and end pressure on the shaft tending either to the right or to the left. The direction of the end thrust always reversed when the direction of rotation on the shaft was reversed, but in certain cases it was very erratic. Sometimes the end thrust would be easier for a few minutes, then get up to its maximum, and then reverse its direction. It was almost impossible to say beforehand in which direction the end thrust would occur, or what the amount of it would be.

#### Anti-Friction Rollers.

The next slide showed another early type of roller bearing, known as the anti-friction rollers. They were largely used in the early days, and even to the present day they were occasionally used in certain cases.

It was quite impossible to do anything with them for big loads. The end thrust of the shaft was very serious, and when testing it in the testing machine he was obliged to put a ball thrust bearing on in order to prevent the shaft from moving endwise. As the shaft rotated it would press endwise, and when reversed it would go in the other direction, and there was no option but to fit a ball bearing for thrust. A somewhat similar bearing had been recently applied to railway vehicles, but instead of two rollers it had a single roller with the shaft immediately above the main axle and guides to keep it in a vertical position. One railway company had had 10,000 or 12,000 wagons fitted with these bearings. He was walking over that particular line recently with the engineer, and asked him how they were doing. The engineer said they were doing very well indeed, giving no trouble at all. They came to a siding a short time afterwards, where there were some of these wagons, and he (Prof. Goodman) said, "You have one of those roller bearings there; I will have a look at it". There were 40 or 50 wagons standing idle, every one of them out of use because of the almost utter impossibility of keeping the main axle dead true with the other axle, the result being that there was a very serious amount of end thrust, and in some instances it had worn right through the casing. He did not deny but what some of them had worked successfully, but a great many had not.

#### Overcoming End Thrust.

Among the early tests that he made in order to overcome end thrust was one, Fig. 3, in which the ends of the roller were turned down and continued into the cage, and a ball inserted to provide the point against which the end of the roller could act. He used a ball because it was more convenient than to put a lathe centre. He had been adversely criticised for putting a ball there in that way, and had been told that he knew

nothing about friction, but as a matter of fact a ball like that would stand a very big load. He had found instances of vertical shafts carrying loads up to two tons without anything except an inch ball in the middle running on a plain piece of hardened steel. They had run for years and had given no trouble. Personally, he very much doubted it when he was told of it at first, but he had seen a great many instances of the same thing being done, and could vouch for the accuracy of the statement he made. With a small amount of pressure it answered admirably to take the end thrust. Two hardened rings and a cage were introduced. The arrangement was used mainly for experimental purposes, and a series of tests were carried out with the bearing without the ball and with it. The friction was carefully measured, and all the other particulars of the end thrusts were also carefully measured, and it was found that when the balls were interposed they reduced the friction by 30 per cent. or more, showing that a large amount of the total friction of the bearing was due to the friction between the end of the cage and the flange of the casing. That, of course, could be used in practise, but it was certainly inadvisable. They could get ball bearings and other types of roller bearings very much cheaper and better than that. It was simply done for an experiment, and answered the purpose as far as it went, in showing that end thrust was the cause of a good deal of trouble.

#### Ball and Roller Combined.

He then showed a roller bearing in which a ball bearing in a cage was put in to take the end thrust, and it answered fairly well, but he was not sure whether it was used at the present time. It added a little to the expense, and was not altogether satisfactory. It would be seen that even makers of roller bearings had been obliged to use some such method as that which he had described to take up the end thrust of rollers and on the shaft itself.

The next slide was a very cheap form of roller bearing (the Koppel), such as was used on small trucks for light railway purposes. No cage was used, and it was the very cheapest form of roller bearing that it was possible to get.

Very early in the history of this work, in making tests, he (the lecturer) found that much of the trouble with regard to end thrust was due to imperfect workmanship. He went to a firm who had a reputation for turning out the very best workmanship, and he asked them to make two roller bearings absolutely perfect, or as nearly perfect as they could, working to the ten-thousandth part of an inch in accuracy in all important points. They made two bearings, which were tested in the most accurate manner possible, and were found to be without fault; they cost their weight in silver. What he was then trying to find out was whether troubles due to end thrust could be avoided by accurate workmanship, because if accurate workmanship could get over the trouble it was simply a matter of making automatic machinery to produce bearings that were absolutely accurate. Unfortunately, these bearings gave no better results than the very cheapest bearings on the market. That at once conclusively proved that it was not a bit of good to talk about accuracy of workmanship, and that the ordinary type of roller bearing was hopeless.

#### Utilization of Short Rollers.

The next attempt was to use short rollers. It was thought that possibly long rollers bent to a certain extent under load, and that if short rollers were used makers might succeed in distributing the end thrust, some of it going to the left and some to the right, and so to a large extent overcoming the troubles. The results were better certainly. There was less end thrust and rather less friction with the short rollers than with the long ones, but it was by no means an unqualified success.

Another type of roller bearing which had been used to a large extent was the Hyatt roller bearing. In this

Fig. 4—Tapered Roller Bearing. Eliminating End Thrust.

case the rollers were made like helical springs, in some cases hardened and in some cases not; in some cases they were fitted on a steel liner on the shaft, and in others they worked directly on the shaft. These helical rollers were made, one with a left handed helix and the other with a right handed helix, in the hope that the one roller would tend to traverse to the left and the other to the right, and so overcome the thrust on the end of the bearing. To a large extent it was so, and for light loads these bearings had been a great success when used for line shafting. The loads they carried were very, very small for a bearing of one square inch section as compared with high class roller bearings or a ball bearing. That was one of the difficulties connected with them, although for ordinary purposes—such as shafting—they were quite satisfactory.

When in America a few years ago he was on the lookout for some of the American roller bearings. He bought one from a firm who guaranteed that it produced no end thrust whatever. Personally, he was a little bit doubtful, and when he came to test it in the testing machine it smashed the end thrust gear altogether. He had it strengthened, and it smashed it a second time. He took it out then, and thought that this firm had really overcome the trouble, but that idea proved to be incorrect.

#### **Tests of Timken Bearings.**

There was another roller bearing recently put on the market, in which the length of the roller is equal to its diameter; it ran in a hardened steel, beautifully ground sleeve, and had a hardened steel liner. The rollers also were hardened and ground up to the same degree of accuracy as balls were in ball bearings. It was the only one he had known that was anything like satisfactory. The end thrust was very small. The one he tested had a little end thrust at first, but after a few weeks the end thrust disappeared entirely. He kept on running it for over a year, and ultimately managed to make it fail, but at a very much higher load than a ball bearing of the same size. If they came to examine carefully into the movement of this tapered roller, Fig. 4, in regard to its sleeve, they would be able to understand why there was no end thrust. The motion of the sleeve and roller tended to crack the sleeve. It was the only case in which a roller bearing was practically free from end thrust. This particular bearing—the Timken—was interesting to the automobile industry. He carried out some tests some years ago, and they worked out extremely well. He was told that in actual practise on automobiles it did extremely well, but he had not had any experience of it in that connection.

#### **Disadvantages of Conical Rollers.**

He next showed a thrust roller bearing with conical rollers. The rollers were far, far too small. As he would be able to show, the safe load on which bearings would run depends as much on the speed of the shaft as upon the speed of the rollers. He had one of these bearings sent him to test, and was told that it was going to be put into a pleasure yacht, but that the owner wished it to be tested before having it fitted. He (the lecturer) was instructed to put a certain load on it at a certain speed, but he knew it would not carry the load at the speed required unless all his formulae were wrong. He put it in on half the specified load, and it gave rise to an interesting pyrotechnic display for a few minutes—after the manner of a Catherine wheel—but as that was not the purpose for which it was intended it was never put into the yacht. Other bearings of this type and size had been used, but the outward thrust of the rollers tended to burst the cage and ring.

To sum up the end thrust troubles: (1) the pressure on the bearings was enormously increased, due to end thrust; (2) the wear was very serious—he could give many instances of the large amount of wear that occurred with bearings having a large amount of end thrust; (3) there was a large amount of rumbling vibration—some years ago he put roller bearings in a factory in Leeds in which there was some chemical works carried on in the upper story, and after the bearings had been installed a few months very serious complaints were made with regard to the shafting. The complaints were that the vibration was so great that the bottles used to get shaken off the shelves in the chemical department above, and they were obliged to take out the roller bearings and substitute ordinary bearings for them, which effectually put an end to the trouble.

With some types of roller bearings only there was considerable end thrust. With a properly designed roller

bearing, in which there was no end thrust, the friction was to all intents and purposes independent of lubrication, but when there was a large amount of end thrust then lubrication made a great difference, for the simple reason that when there was no end thrust there was a pure rolling action, but when there was end thrust there was a large amount of friction between the ends of the cage and the flange of the casing. Then lubrication did good. With a roller bearing of nearly pure rolling action lubrication was practically of no effect. Then the friction was almost independent of speed in good roller bearings, but it decreased somewhat with the speed when there was end thrust. In all roller bearings, bad and good, the starting effort was very little greater than the running effort, which was a very great point in their favor, especially for certain types of machinery where they were constantly stopping and starting, and in general, even with the worst roller bearings, the friction was lower than in ordinary bearings in which there was bearing lubrication, but running them in a bath of oil effects a considerable improvement.

#### **(To Be Continued.)**

Ed. Note—The next installment will contain the report of Prof. Goodman's lecture on ball bearings, etc.

## **CONDITIONS NEVER BETTER.**

### **President of Premier Company Is Decidedly Optimistic as to the Future.**

That there never was a time when the automobile business promised a more healthful future than now, is the opinion of H. O. Smith, president of the Premier Motor Manufacturing Company, Indianapolis, Ind. He feels that the development period through which the industry has passed was costly, a great deal of ground having been covered in a few years. Concerning this phase of the subject, he has the following to say:

The automobile of today would not have been a possibility, and the automobile business could not be where it is today if this industry had fallen into the hands of pessimists. It required an optimist, one who could see visions of the future. It has attracted the most alert and skilled engineers of the world, as is amply verified by the great accomplishment in the developments over a brief 10 years.

A review of what has been done, the various ideas which have been taken up and exploited, will reveal the fact that less than five per cent. of the ideas introduced into the several makes of cars at various times, has survived in any form, and, on the other hand, it is startling to note how many of the features which characterize the most up-to-date cars made their appearance in the early stages of the development of the industry. This cannot be attributed to intuition or luck, especially where practical engineers had foreseen and carefully worked out these ideas.

A healthy future can safely be predicted for the automobile business, as it has finally found its place among the large and important industries of the period. The experimental or development stage has been passed, with its extraordinary expenses, and for the future we can only foresee such changes in the fundamentals of motor car design as tend toward further refinements and economies. The business may be said to be safer because of the fact that its gross margins have been reduced to normal, and it no longer attracts the "get rich quick".

The licensees of the A. R. Mosler Company, Mount Vernon, N. Y., under the Canfield patent, will complete the organization of spark plug manufacturers at a meeting in Chicago, Jan. 29.

## MECHANICAL NOTES FOR OWNERS.

### Practical Jack Block, Permanently Attached to Rear Spring, for Preventing Slipping When Jacking Up Wheel---Novel Valve Stem Adjustment---Heating the Fuel.

WITH some types of rear axle, especially when a transverse tie or strut rod is utilized, difficulty is experienced in locating the head of the jack so that it will not slip when a wheel is being raised from the ground, etc. It is not good practise to place the head of the jack under the rod or the spring. In the first named instance, the rod is likely to become damaged, as it is not designed to carry heavy loads. With the jack placed under the springs, there is always more or less chance of the jack slipping, and if a wheel has been removed, considerable damage would be likely to result if the spring slipped off the jack.

An English accessory maker has brought out what he terms a jack block, which is shown at Fig. 1, and the design is so simple that it would be an easy matter to construct one on similar

Fig. 1—Jack Block for Attachment to Rear Springs, to Prevent Head of Jack from Slipping When Raising Wheel, Etc.

lines and at a slight cost. It is depicted at C, and consists of a flat metal plate having a slot, also two holes to register with the spring clips of the car. One end of the plate is upturned to carry a wedge shaped wooden block, made to conform to the pitch of the spring. The block is secured to the plate by means of screws.

To fit the jack block, it is slipped under the spring clip as shown at A, and the nuts tightened. The piece of wood, by reason of its shape, fits snugly against the under curvature of the leaf spring, while the metal plate provides a flat, horizontal surface against which the head of the jack can be placed. The jack block is, of course, a permanent attachment. The central slot is provided to clear the web, which is cast with the spring pad. The jack block with jack is shown at B,

and it is obvious that the device eliminates opportunity for slipping.

#### ADJUSTABLE VALVE STEMS.

The owner who desires to obtain maximum mileage from his fuel should give a number of components of the chassis attention and eliminate causes making for inefficiency. Improper valve timing, that is, too much space between the valve stem and tappet, means a waste of fuel because of too late openings. The modern motor is provided with means for compensating for wear, the tappet or pushrod generally being made adjustable, so that it can be lengthened or shortened as best meets operating conditions.

There are, however, a number of early models, the pushrods of which are non-adjustable, and some of these have guides which do not permit of alteration to fit adjustable means. The following method of providing the adjustable feature is contributed by a reader and is interesting in that the valve stem provides the adjustable feature, not the tappet:

I am enclosing a rough sketch of a plan I adopted for making the valve of my motor adjustable. There was considerable space between the valve stem and the pushrod, resulting in the valves opening too late and the motor lost so much power that many hills formerly taken on the high called for a drop to the second gear.

The bushings or guides were too high on the pushrod to permit of fitting adjustable bolts and nuts, and as the bearing was small at the best, I did not deem it advisable to reduce it. There was a fairly good amount of space under the retaining valve spring collar or washer, and as the valve springs had been in service for several years I believed that they had lost much of their efficiency.

To obtain room for the adjustable mechanism (shown at B, Fig. 2) I removed the valves and springs and cut off a spiral of the spring. This necessitated cutting a new slot for the key, and I also drew the temper of the end of the valve to permit of cutting a thread.

The sketch at B will explain how the adjusting mechanism was obtained. The part that comes in contact with the pushrod was made of a piece of steel and hardened. The length of thread on the valve stem is exaggerated to show the idea. The locking nut was made fairly thin, and when the parts were assembled it was an easy matter to make the required adjustments.

#### HEATING THE FUEL.

In these days of the high cost of fuel considerable attention is being given to the development of devices which will raise the temperature of the gasoline. A large number of car manufacturers utilize the heat of the exhaust, conveying

it through flexible metallic tubing to the air intake of the carburetor, to heat its jackets. A reader contributes the drawing shown at Fig. 3, and the application of the heat of the exhaust is novel, to say the least.

Fig. 2—Fitting Adjustable Means to Valve Stems.

Noting a method of using the heat of the water jackets by means of a pipe run through the intake manifold of the motor in a recent issue of your magazine, I conceived the idea of employing the heat of the exhaust, but in a different manner, as will be noted by the drawing I am sending you.

I believe that if the exhaust can be used for the air of the carburetor, beneficial results can be secured by having the fuel

sufficiently warm. It is well known that in summer no trouble is experienced with the gasoline but when it is cold it does not vaporize readily. Hence the use of water jackets, heat, mixing devices, etc. Heating the fuel in the float chamber is held to be good practice, but why not go a step further and heat the gasoline before it enters the carburetor as well?

In putting my theory into practice, I used .375-inch annealed copper tubing, tapping two places in the exhaust pipe, as shown in the sketch. The pipe was fitted by means of threaded bushings. Although considerable trouble was experienced in bending the tubing, the work was finally accomplished by beginning with a few turns about the carburetor, then using a rod for the fuel pipe.

I believe that I obtain much better results, as the fuel pipe is kept warm, raising the temperature of the gasoline before entering the float chamber, as well as that in the carburetor.

The practicability of the plan suggested would depend upon how much heat could be obtained through a .375-inch tubing, and especially where a number of coils are employed and the pipe is of such length. It would appear that the better method would be to utilize the hot water from the water jackets, connecting the pipe in such manner that the fluid would be circulated by the pump. Raising the temperature of the fuel before reaching the carburetor is a point worth considering. Perhaps some of the readers of this department have some suggestions to offer as to improving vaporization of the fuel.

### TIRE INFLATION.

The value of keeping the tires inflated to predetermined pressures, those recommended by the maker, is acknowledged by the experienced motorist. Heretofore the various manufacturers have practically agreed upon the pressure for a certain size casing, but several changes are noted in the announcement made by the Goodyear Tire & Rubber Company, Akron, O., maker of the

well known Goodyear tires and inner tubes.

The company recommends that its 1914 six-inch casings be inflated to 100 pounds instead of 120, the 5.5 to 100, and the five-inch to 90. "Considerable scientific testing preceded this apparent concession to lower inflation and easier riding", states the company.

Tire makers recognize that the destruction of an under-inflated shoe is brought about by an excess of flexing or bending. A soft casing has its side walls contracted and expanded each time a complete revolution of the car wheel is made, a condition generating heat and resulting in breaking the fabric. A tire properly inflated is not subjected to as much destructive flexing in a year as one not properly inflated in a week, claims the Goodyear company, which points out that an under-inflated shoe, striking a stone or car rail, may have its top and bottom brought together in a blow hard enough to crush or break the fabric at once. The smaller the casing, the sharper the flexing angle and the shorter the distance between the top and bottom when impact occurs.

Careful investigation has led the Goodyear company to conclude that in a five-inch casing the angle of flexing under ordinary inflation is small enough to allow a lower proportionate air pressure than recommended with small tires, and the new figures are included in the company's latest tables of tire pressures.

An experiment to illustrate the principle involved is suggested by the Goodyear company. Take a small wire three inches long and another six long. Bend each in the middle to the same angle. Then bring the ends of each wire an inch closer together than at first and compare the sharpness of the angles at the centre. Consider

Fig. 3—Suggestion of Reader for Utilizing Heat of Exhaust for Raising Temperature of Fuel Before and After Entering the Carburetor.

that the three-inch wire is a three-inch side wall, and the six-inch wire a six-inch side wall, and the reason why under-inflation destroys tires is made clear.

## ANALYSIS OF MOLINE-KNIGHT TEST.

**T**HE full importance of the 337-hour test, to which the Moline-Knight motor, made by the Moline Automobile Company, East Moline, Ill., was subjected recently in the laboratory of the Automobile Club of America, New York City, is not indicated by the official report of the engineers in charge of the test, which was presented in the issue of The Automobile Journal for Jan. 10. Accompanying illustrations set forth details which were only partially touched upon by the report.

The test virtually was divided into three parts, the main portion, and that which constitutes a record, being the 336-hour continuous run from Dec. 19 to Jan. 2. Short runs were held before and after this period to determine other essential factors respecting the motor. The work

mediately after the completion of the test, and set forth in a decidedly comprehensive manner the effect of this strenuous trial upon those components which were expected to reveal the greatest amount of wear, etc.

It may be well to interpolate at this point that the Moline-Knight motor is a four-cylinder unit, with cylinders cast en bloc. It has bore of four inches and stroke of six, giving it a horsepower rating of 29.16 under the S. A. E. formula. The two sliding sleeve valves, one of which is within the other and both between the cylinder wall and piston, have inlet and exhaust ports, or slots, on opposite sides. The sleeves are actuated by short connecting rods, operated from a common eccentric shaft, and have a travel of 1.125 inches. The eccentric shaft and magneto are driven by silent chain from the camshaft. The weight of the complete motor and parts, as given by the engineers conducting the test, is as follows:

|  | Pounds       |
|--|--------------|
| Four pairs connecting rods, including gas tank pressure pump .....   | 10.6         |
| Four inner sleeves and pins.....   | 36.5         |
| Four outer sleeves and pins.....   | 30.4         |
| Four pistons with wristpins and rings.....   | 15.8         |
| Four connecting rods, complete with bolts and nuts .....   | 22.7         |
| Four cylinder heads.....   | 27.3         |
| One cylinder casting, with studs and nuts.....   | 130.4        |
| One cover for cylinder, four syphon tubes, four fibre insulating tubes and four lock nuts and washers .....  | 7.8          |
| One carburetor .....   | 6.0          |
| Four spark plugs and gaskets.....  | 1.1          |
| One fan with support and breather pipe.....  | 7.9          |
| One flywheel .....   | 116.6        |
| Intake water manifold .....  | 4.5          |
| Lower half of crankcase, bolts and nuts.....   | 31.0         |
| Chain case cover, oil pumps and pipes.....   | 9.6          |
| Top half of crankcase, including extension over clutch and transmission, crankshaft, magneto, magneto wires, air pump for gas tank, oil pipes, chain, sprockets, bearings, studs and nuts..... | 232.5        |
| <b>Total weight.....</b>   | <b>690.7</b> |

The cooling system also is of interest. The cylinder heads are covered by a removable plate over the four cylinders, providing ample water space between the cover and head. Circulation is by thermo-syphon. An equal flow of cooled fluid from the radiator is assured by the use of an intake manifold having two branches, one leading to the forward end and the other to the rear end of the lower edge of the cylinder block. The cooled fluid passes upward along the cylinder barrel, then around the intake and exhaust manifold, thence to the cylinder head and through the upper manifold or cover plate.

The motor is lubricated by a pressure feed system, which operates as follows: Oil is drawn from the sump by a gear pump driven off the

Showing the Condition of the Intake Ports of Four Sleeves After Two Weeks' Running.

done during the two weeks was equivalent to driving a fully equipped Moline-Knight car at a constant rate of 45 miles an hour on a level for 14,700 miles, or a steady climb up an eight per cent. grade at a constant speed of 27 miles an hour for 10,000 miles. The former distance is equal to 14 trips between New York City and Chicago, or five complete transcontinental tours from the Atlantic to the Pacific, or a journey entirely around the world on a line parallel with Edinburgh, Scotland. These facts should be borne in mind when considering the results obtained with respect to the conditions of the various parts of the motor at the conclusion of the test.

The average motorist is unable to gain practical information from tabulations and charts exclusively. These have value for the engineer and enable him to judge accurately concerning the performance of the motor under test. The photographs reproduced herewith were taken im-

end of the eccentric shaft, and is delivered to the three main bearings and the magneto shaft bearing under pressure determined by the settings of

**Connecting Rods, Presenting Excellent Condition of Grooveless Bearings at End of Test.**

a spring controlled by-pass valve, through which the excess oil is delivered. This excess oil is led to the chain driving the eccentric shaft and magneto, and flows thence to a trough and through a screen to the sump. Part of the oil delivered to the main bearings passes through holes in the crankshaft web to the crankpins and thence through the tubular connecting rod to the hollow piston pins. From the two ends of the latter it flows to the sleeves and is distributed through holes and oil grooves in these over their circumference and the cylinder walls. All parts requiring lubrication not mentioned above are oiled by splash from the crankshaft and connecting rods.

The flow of oil delivered under pressure is determined by a valve which is so connected as to open and close with the throttle. This valve was wide open in all of the tests under discussion. There are no oil grooves in any of the crankshaft bearings. The entire bottom of the crankcase is covered by a screen, through which the oil returns to the sump. On this screen, and in that of the trough mentioned above, there was some carbon and dirt, strained from the oil, at the close of the test. A similar deposit was found on the chain case cover under the point where the combined breather and filler are located. The accumulation had evidently not interfered with the lubrication in any way during the test.

As stated in the report, the various parts of the motor, without exception, were found to be in

excellent condition at the completion of the test. Herbert Chase, laboratory engineer for the Automobile Club of America, who was in charge of the test after the motor was delivered to the club by the Moline Automobile Company, stated to the writer that there was absolutely no sign of undue wear at any point. The report says that there was no perceptible wear on the bearings, sleeves or other parts. The slight irregularities in the sleeves were found to have been built up with carbon to form a close fitting, glossy surface. The ports in the sleeves were not burnt, and there was only a very slight deposit of carbon on the port edges. The cylinder heads and the tops of the pistons showed only a very thin coating of carbon, and only small quantities of carbon were to be found elsewhere. No shake could be felt in any bearing, and there was every indication of perfect lubrication. There was not a single ring in either piston or cylinder head which was not perfectly free. The running of the motor with respect to noise and vibration was not appreciably different at the end of the test from that at the start and early hours.

Incidentally, of course, this test was of importance in demonstrating the reliability and efficiency of the accessory equipment, including carburetor, magneto and spark plugs. The carburetor was a Schebler, made by Wheeler & Schebler, Indianapolis, Ind. The ignition was by a Bosch DU model 4A duplex magneto and four Bosch plugs, made by the Bosch Magneto Company, New York City. The plugs were with heavy three-point electrodes, and concerning these the report states none was taken out of the

**Crankcase, Crankshaft and Bearings as They Appeared After Endurance Test—All in Excellent Condition.**

cylinder or otherwise disturbed until after the endurance test was completed. The electrodes were partly burned away, so that the gap was in-

creased, but the regularity of the firing was notable throughout.

It will not prove amiss in this connection to suggest that the advertising and publicity men connected with the industry must possess more than the average ability to secure for the product which they represent the attention they desire in the daily press. This test was a remarkable example of the ability to discern what the public wants in this regard, and full credit for arranging and carrying out the plans incident to what was destined to be the most strenuous and exhaustive demonstration, as well as the longest in point of time, to which any motor, regardless of type, ever has been subjected, must be accorded to Leon M. Bradley, advertising and publicity director for the Moline Automobile Company. Although Mr. Bradley is one of the youngest advertising men in the industry, he has been connected with it from its inception, and he is to be congratulated

Indicating the Slight Deposit of Carbon on Exhaust Port of Sleeve at Conclusion of Test.

upon achieving results which are eagerly sought by all men in his position. So pronounced was the success in a publicity way that Mr. Bradley was asked to summarize the results from this viewpoint. He said:

Modern methods and the present day knowledge of the motor car among owners and the trade permit the general prints to use but a limited amount of even good publicity. To secure effective and lasting advertising through the editorial columns, it behooves the publicity man to go to extremes in building up ideas. It is not general or ordinary industrial news, or what the ordinary car will accomplish, which will permit the advertising man to supply the class of information that will be sought by editors. In short, my plans are to supply to the press, both trade and daily, information which will contain 100 per cent. news value, and that which is unquestionably of general interest to every thinking man. Furthermore, I so planned this test that I did not have to seek publication, with the result that in two weeks' time we were able to demonstrate that the Moline-Knight engine had every advantage claimed for it, and that any car equipped with this type of power plant was standard. We feel that we have done every interest in the industry a wonderfully good turn, and only wish that we could receive from the test and promotion work of others the benefit we have accorded them.

It may be added that the Moline Automobile Company, through Mr. Bradley, has posted \$10,000, in a challenge to all makers of poppet valve motors, regardless of price, piston displacement, horsepower or number of cylinders (sixes preferred) to place their engines in the laboratory of the Automobile Club of America and duplicate the world's record made by the Moline-Knight engine, under the same conditions.

### NOVEL OIL CONTAINER.

#### Invader Oil Company Offers Compact, Sealed and Leak Proof Cylindrical Can.

The experienced motorist insists on the same brand and grade of cylinder oil in purchasing when away from his garage, and many owners make it a practise to carry a reserve supply of lubricant in the car. It may be that the oil will not be used for some time, and with the usual containers there is more or less opportunity of leakage, a condition that soils the tool box and its contents.

The Invader Oil Company, 80 Broad street, New York City, is marketing its product in a novel container, which resembles a flat nosed six-pound shell, or a thermos bottle. The bullet like tin is sealed by a soft soldered cap, such as is utilized on various kinds of tins holding fluids and solids. To use the contents the soldered cap is pulled off.

Each container holds a quart of the high grade oil marketed by this concern, and the grade of lubricant is marked on each can. The design not only makes for convenience in storing in the car, and cleanliness, but it insures the purchaser against receiving other than the lubricant called for.

The company states that it is the first time that cylinder oil has been put up for safety and convenience in transportation and application, in a neat, attractive appearing, lithographed, safe container, in just the bulk generally used. The slight additional cost is a negligible factor when the convenience and economy are considered. The new container should appeal to those who carry a small line of automobile supplies, as well as to the garage and service station.

The Schenectady Automobile Club, Schenectady, N. Y., has elected the following officers: President, William Demming; vice president, W. W. Wemple; secretary-treasurer, Roland Ford; governors, the officers and Albert G. Davis and J. R. Magarvey.

## REMAGNETIZING MAGNETO MAGNETS.

THE remagnetizing of magneto magnets is generally left to the maker of the instrument, and that is, perhaps, the best plan, as the manufacturer has special equipment for the work. A method of remagnetizing is given in the Commercial Motor, and the repairman contributing the suggestion was awarded first prize by the publication. The apparatus and wiring diagram are shown in an accompanying illustration, and it will be noted that two storage batteries are utilized, also two bulbs.

To make the apparatus two pieces of soft iron are employed, about six inches long and about 1.25 inches in diameter. These are used for the cores. The base is constructed of a piece of mild steel plate in which are tapped two .5-inch holes and these are threaded to take one end of the iron core.

Before screwing the core pieces in position, they are wound with an equal number of turns of No. 22 gauge insulated copper wire, the ends being left free. To these are attached four terminals. The wires are connected up to a pair of storage batteries as shown, and the latter are so wired that the polarity of the soft iron cores, indicated by the compass needle, is north and south respectively.

The inventor of the apparatus states that should the coils show signs of overheating, one or more lamps should be placed in each circuit to introduce resistance. Before beginning the work it is essential to ascertain the polarity, and this is accomplished by the aid of a compass needle. The magneto magnets must next be marked north and south, respectively, before there is any opportunity of reversing the process by confusing the poles.

To use the apparatus it is stated that it is only necessary to place the magnets with their opposite poles in contact with the cores, until they have absorbed sufficient magnetism to enable them to sustain a weight of 10 pounds, after which they are ready to be replaced on the magneto. In the drawing the magnet to be treated is the inner member.

### STARTING SEIZED PISTONS.

The following suggestion for starting seized pistons is made by a repairman: Place about a pint of kerosene in each cylinder, then jack one of the front wheels so that it clears the ground by at least two inches. Next place a jack under the

starting handle with the clutch section engaging with the crankshaft. Lower the jack under the wheel until the jack under the handle carries the weight of the machine. It is stated that this method will start the most obstinate piston.

### DETROIT ENFORCING LAW.

#### Thirty Complaints Filed in One Day Against Truck Drivers and Owners.

Although the provisions of the so-called fender ordinance in Detroit were held in abeyance until after the first of the year, because those upon whom the duty of enforcing the law fell felt that a suitable type of fender for commercial vehicles had not yet been placed upon the market, there is evidence that the authorities have now decided to enforce the ordinance literally.

Remagnetizing Magneto Magnets by Apparatus Designed by a Repairman.

In one day, during the week of Jan. 5, 30 complaints were filed against drivers and owners of trucks not equipped with fenders. So far as is known none of these cases has been prosecuted as yet, but it is expected that the defendants will maintain that they are unable to comply with the provisions of the law, and that it works an undue hardship upon them.

The Utica Automobile Club, Utica, N. Y., has elected the following officers for the ensuing year: President, Edgar B. Odell; first vice president, F. William Bensberg; second vice president, Charles Miller; secretary, John M. Rose; assistant secretary, George C. Donahue; treasurer, W. J. Childs.

Delegates representing 175 California automobile dealers met recently in Fresno for the purpose of organizing the California Automobile Dealers' Association.

## GEMMER STARTER, A MOTOR-COMPRESSOR.

**T**HE Gemmer Starter Company, 112 Ford building, Detroit, has brought out a new air motor starting system for both new and used

**Crankshaft, Connecting Rods and Pistons of Gemmer Air Motor Starter.**

cars, and the design presents interesting features, among which is the elimination of the distributor and piping to the cylinders, a construction generally employed with starting systems utilizing compressed air. It is the invention of G. A. Gemmer, formerly of the Gemmer Manufacturing Company, who conducted a series of experiments to obtain a compressed air motor starter which could be utilized without a distributor valve, tubing, etc.

The Gemmer air starter shown herewith, resembles the electric motor starter in appearance and some idea of its compactness may be obtained from the dimensions, which are given as eight inches long, eight high and four wide. One of the qualities of the Gemmer unit is that it may be utilized as a compressor for storing a tank or as an air motor to spin the crankshaft of a gasoline engine.

These qualities are obtained by driving the Gemmer through a suitable train of gears as a compressor, energy being supplied by the motor car's engine, and by reversing the operation the unit may be utilized to rotate the crankshaft of the motor. When used as a compressor the Gemmer may be driven at from 100 to 1600 revolutions a minute as desired, but when reversed, the ratio of drive is about 7:1, spinning the crankshaft at a speed of 150 to 225 revolutions a minute.

The operation of the combined unit is very simple. Depressing a button by the foot engages a clutch and gearing, setting the compressor into motion and charging a tank. When the

dash gauge indicates the desired pressure, say 200 pounds, the clutch is released and the unit is inoperative until replenishing the supply of air in the tank is required or the unit is utilized for starting.

For starting, a button is depressed, permitting air to flow from the tank to the unit, and it continues to spin the crankshaft of the motor until the engine starts under its own power, whereupon disengagement is made automatically. The unit is stated to be very efficient as a compressor, the maker claiming it will replenish the supply of air in the tank in five minutes. There is but one controlling valve, that located on the dash, and it is held to be positively leak proof. The piping plan is very simple, one pipe leading from the unit to the valve and from the latter to the tank. Particular attention has been paid to connections, etc., and it is stated that the pressure in the tank is maintained under all conditions.

The motor-compressor is constructed of high grade material and on principles indorsed by sound engineering practise. The pistons, rings, etc., are ground accurately to size, and the crankshaft is a drop forging of ample dimensions. All working parts are fully enclosed and dust proof. The mechanism is lubricated automatically from the crankcase.

The net weight of the Gemmer air starting system is about 55 pounds, and the inventor

**Gemmer Air Motor Starter, Which Operates as a Compressor and Is Reversed to Spin Crankshaft of Gasoline Engine.**

states that it is very economical of air, and that a large number of starts are possible with the tank filled. The design includes hose, etc.

### STARR OVAL CUTTER.

Cutting circular gaskets, etc., is a simple matter compared to oval members, and generally considerable time is required with the latter in order to obtain perfect work. The Shawver Company, Springfield, O., is marketing a practical device, for cutting ovals, termed the Starr-Springfield cutter, which is shown herewith. The No. 1 tool will cut any size circle up to 15 inches, and oval up to 15 by 22 inches. The No. 2 cuts circles up to 22 inches and ovals to 22 by 34 inches.

The bars are graduated by inches and fractions of fourths, permitting the operator to set the machine instantly to cut the size of opening previously determined. The machine is equipped with an automatic stop, limiting the downward movement of the knife, making it impossible to cut into the table top. The four corners have adjustments for raising or lowering, so that the

Starr-Springfield Oval Cutter, Which Will Also Cut Circles Up to 15 Inches.

machine may be levelled to conform to the table surface.

A quick acting clamp is provided for holding any thickness mat board up to .25 inch, and is quickly adjusted to any size opening. When the machine is not at work the clamp and its components rise from the table, a feature the maker states is not found in any other oval cutter. The complete equipment includes a cutting board, one wheel glass cutter, one embossing wheel, one knife for cutting 23-degree bevel edge, one knife for cutting a square edge, one stub knife for cutting long, narrow ovals, and a wrench.

### HAUCK KEROSENE TORCH.

The Hauck Manufacturing Company, 140 Livingston street, Brooklyn, N. Y., is marketing the Hauck patent kerosene torch, which is designed for general shop work and is held to be more efficient and economical than a gasoline unit. The

Hauck Kerosene Torch and Furnace.

maker states that the cost of operation is very low; that considerably more heat is obtained with kerosene than gasoline, and that the fuel is not only cheaper, but it is readily obtained. Another advantage in kerosene is held to be that it may be stored without restriction and is safer to use than gasoline.

The company states that its No. 14 torch will melt a piece of copper .5 by .25 inch, in three minutes, or a one-inch brass rod in two minutes. It is utilized in conjunction with a heating furnace, as shown in the accompanying illustration, providing a combination especially adapted for tool dressing, tempering, annealing and other heating operations. The furnace is 10 inches long, 10 wide and six high; made of cast iron and lined with a high grade fire brick. The company states its torches have been adopted by the United States government.

### SPARTON HAMMER.

The Drop Forging Company, Jersey City, N. J., is manufacturing the Sparton hammer, shown in an accompanying illustration, and the maker calls attention to the design, stating that it is particularly adapted to motor car work where a hammer, screw driver and tire iron are constantly required. It is also claimed that it has the essential qualities of a general utility tool.

Sparton Hammer, Combining Screw Driver, Tire Iron, Etc.

The Sparton is a one-piece drop forging of tool steel, properly hardened and tempered, and the metal is so distributed as to provide a good balance. The hammer head is so shaped that it gives an easy and positive grip when the tool is

being used as a screw driver or as a tire iron. The manufacturer claims a scientifically developed design of strength and durability, and the workmanship and material are guaranteed. The Sparton combination tool is moderately priced.

## NEW EMPIRE ROADSTER HAS ATTRACTIVE BODY.

**A**MONG the new attractive body designs displayed at the New York show was the streamline body fitted to the standard model 31 Empire chassis, made by the Empire Automobile Company, Indianapolis, Ind. The car attracted considerable attention, as it embodied features found on strictly high priced machines.

The streamline design begins with the hood, which in a graceful curve slopes to join flush with the sweeping deep cowl, under which is located the fuel tank. A one-piece windshield of ingenious design is fitted to the cowl. It is quickly converted into a rain or clear vision type, or may be tilted to cool the driver's compartment. The latter has a low, wide seat, and the uphol-

be displaced readily without dismantling the engine, etc. The headlights are provided with a dimming feature, and the tail light is a combination unit, oil and electric.

### TO HOLD FIELD DAY.

#### Maine Automobile Association Invites National Body for Summer Meeting.

At the annual meeting of the Maine Automobile Association, held in Portland, Jan. 15, it was decided to invite the American Automobile Association to hold a joint field day, probably at Poland Spring, some time during the coming summer. It also was voted to assist the Maine state highway commission in any manner which the commission might suggest in furthering the success of a big roads meeting to be held at some point in the state, probably in April.

A committee was appointed to investigate the plan of working prisoners on the highways, and its members will take up the matter with the various county commissioners and ascertain the number of prisoners that would be available for

road work. The committee is composed of the following: A. Q. Miller, Auburn; Charles E. Hill, Belgrade Lakes; William N. Taylor, Portland. The following officers were elected:

President, Walter B. Parker, Portland; first vice president, Philip J. Deering, Portland; second vice president, Charles H. Fogg, Houlton; third vice president, E. J. Peacock, Lubec; fourth vice president, W. A. Hennessy, Bangor; fifth vice president, Forest H. Colby, Bingham; sixth vice president, John W. Hyde, Bath; secretary and treasurer, John Clark Scates, Westbrook.

Committee Chairmen—Good roads, Prof. George T. Files, Brunswick; touring information, publicity and contests, Daniel W. Hoegg, Jr., Portland; membership, J. J. Pooler, Portland; legislative, Charles E. Hills, Belgrade Lakes.

Directors—Hiram W. Ricker, Poland Spring; E. A. Doten, Portland; Charles E. Hill, Belgrade Lakes; W. N. Taylor, Portland; Silas B. Adams, Portland; Stanley Bisbee, Rumford Falls; Dr. Charles M. Sleeper, South Berwick; Charles S. Hichborn, Augusta; Leith S. Black, Houlton; Prof. George T. Files, Brunswick; David Talbot, Rockland; A. Q. Miller, Auburn.

**New Empire Streamline Roadster Shown for the First Time at the New York Display.**

stery is in keeping with the high grade material and workmanship characteristic of the product of the Empire company. The cushions are deep and comfortable.

At the rear is a commodious deck enclosed baggage compartment, providing ample space for baggage, supplies, etc., when touring, and for commercial purposes. At the rear of the compartment and opening upward is a wide door. The equipment of the new design is most complete, being identical with that of the touring car. An electric lighting and motor starting system is listed as extra.

The Remy equipment is utilized, it comprising a generator and motor combined in one housing. The installation is such that the unit may

## COPING WITH NEW YORK CONDITIONS.

SOMETHING of the work accomplished by the Manhattan Automobile Club, New York City, which was organized to cope with certain well defined conditions confronting the motorists of the Metropolis, is revealed in the address delivered recently before that body by Carl H. Page, one of the best known men connected with the distribution of cars in that centre. Extracts from the address are presented herewith for the double purpose of indicating, in a measure, some of the conditions which exist and the manner in which the club is adding to the industry by meeting them. Mr. Page said in part:

Conditions which have arisen in New York appear to me, and to some others of us who have made a careful study of them, to have become so general as to affect vitally the trade and the future of the automobile business, for the simple reason we have not had foresight enough to protect the owner in his investment in his motor car and provide for the proper protection of his pleasure, comfort and convenience in the possession and use of the same years ago. We have created a demand and have not had foresight to remove the difficulties which will some day stagnate the demand.

### Restricting Progress.

Now, therefore, let us for a moment study what these restrictions are and what causes these restrictions and how they may be removed, then put our shoulders to the wheel and remove them and in that way allow a demand to develop, which naturally will develop and did develop in seven years from nothing to the third largest industry in the world.

The Manhattan Automobile Club in a comparatively short life has already liberally demonstrated what a few people, interested in the common cause of making the automobile business better, can do. With very little money, provided by a few dealers and friends of the business eight months ago, and the abiding confidence in the future of the automobile business possessed by E. E. Schwarzkopf, to whom there is hardly one in the room who doesn't owe some obligation for the personal service he has rendered, as well as his determination to make some of us see to where we were drifting, this club came into existence with 50 or so members.

We have acted with the authorities in the study of the proper regulation of traffic conditions. We have curbed many instances of garage irresponsibility. We have studied the chauffeur problem and have a real plan to submit which will go a long way toward eliminating this most serious and hurtful condition. We have influenced highway officials to properly light and protect certain dangerous places (Columbus Circle). Have given study to upkeep expense and how it may be reduced, by demonstrating to the owner how he may cut out waste and wasteful methods. We have improved conditions on ferries. Have gathered touring information. Have laid out new ideal routes for next year to develop territories where cars now infrequently go, believing that the development of new territories will do for the automobile what the development of new territories has done for railroads, trolleys and other lines of business.

In fine, we have, with the co-operation of the best brains available on our committees, studied first, what the present owner needs to make his car more desirable to him, then what the non-owner needs to make him want a car, and have then made plans to fulfill each and all of their requirements.

### A Specific Instance.

Two instances will suffice to show the need of one owner and the need of one non-owner. The owner, the vice president of a big railroad, had in his family seven cars. His chauffeur ran into another car, killed a man and wife and permanently injured a little girl. The

owner was sued and lost a verdict of thousands. He was disgusted with automobiles, gave up his cars and his sons and daughters planned to give up theirs. In all, some 21 cars were affected and were to be put out of commission, all through the act of one chauffeur.

A member of the club heard of it, put him in touch with the club, and Mr. Schwarzkopf went to see him, convinced him that there was a body of men personally interested in his continued use of cars and could and would get him a good chauffeur—his dealer hadn't done so—if he was unable to get a good one for himself. In short, the man has bought one car and has ordered another and probably at least 10, if not more, cars are in commission today that would otherwise have been on the market for sale, and one big railroad vice president would be out telling all of his big friends that he was through with automobiles and advising them to be too.

### Another Illustration.

The other instance—a non-owner, went out to ride with a friend on a Sunday, with their wives, to see his friend's car and with the idea of buying one this week. A policeman stopped them on the Pelham parkway, asked the owner, who was driving, for his license. The owner told him he didn't have a license. The "Cop", to further humiliate him, said: "Don't kid me, you're a chauffeur and I know it—now I will add that to the charge", and he did. Monday, the owner and his friend, the non-owner, went to court. He was put in line with negroes, thieves and worse. When his turn came the judge called him a speed maniac, fined him \$50, saying "It is \$50 today, tell your friends it will be five days tomorrow".

This owner is a retired business man some 60 years old and has dignified the entire community by a life time of big business and high reputation. The owner and his friend, the non-owner, left the court together; the owner determining to sell his car at once, the non-owner giving thanks that he didn't yet own one.

### Club Fills in the Gap.

They went to a barber shop and happened to tell the barber. The barber told Mr. Schwarzkopf, and he got in touch with the owner, told him of the Manhattan Automobile Club, what we are doing and that we needed him and other owners to join us to protect him and correct such annoyances. He joined the club and is going to keep his car. Mr. Schwarzkopf got in touch with the non-owner, explained to him the movement we have started, reassured him as to what he might expect would be accomplished to avoid such experiences in the future and he will probably buy a car this week. One owner saved to the present business, and one prospect saved to the future business.

Now that the individual automobile owner is interested, let us put before him in a business like, systematic way what we have already accomplished and what we may accomplish in the future.

### Need for Co-Operation.

The private owner needs the same privilege to enjoy his car without the danger of wholesale arrests, etc., as the man who used to drive his carriage. The truck owner needs the proper regulation of traffic and other conditions so that he may use trucks successfully just as the owner of a horse truck has needed and had proper help in using his truck for years. The salesman needs more prospects to sell cars to; the dealers need more sales to make profits on. We all need these things. Not one of us can accomplish anything alone—but we can together. The salesman can find more prospects and the dealer more profits if we join together to give the man what he needs.

Let us open the door of this club to the automobile owner and bid him enter. The owner is the man who provides the money to buy our cars. Let us influence the owner to come here and meet with us just as you and I meet together. The owner can't accomplish anything as an individual—he doesn't know how to accomplish—what he needs is a club. But we do, and can, and will. Let us write him to join us because we can, and want to help him. It will, at the same time, be helping ourselves. And if we didn't years ago, when we were young in experience, when the industry was young in development and knowledge of the present need of the owner and the present conditions of the business was beyond us, have the foresight to do the things which now must be done, let us have the aftersight and do them now.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor vehicles, accessories, etc.:

**Dinsham Engine Tester Corporation**, New York City; \$50,000; to manufacture automobile engine tester; D. P. Gahabiall, Judson P. Welsh, P. M. Richards.

**Flyer Motor Car Company**, Minneapolis, Minn.; \$100,000; to build cyclecars; H. C. Campbell, G. C. Milne, Thomas Howard, A. A. Gloetzner.

**Roberts Gas and Gasoline Engine and Car Company**, Nashville, Tenn.; \$50,000; to manufacture engines.

**Iowa Cyclecar Company**, Des Moines, Ia.; \$10,000; Earl L. Lum and others.

**Resilient Auto Wheels Company**, Duluth, Minn.; \$50,000; to make automobile wheels; Arthur Jutila, Helmer Johnson, Osmond Thompson, A. W. Younkivist, B. E. Wellberg.

**Butler Auto Steel Wheel Company**, Butler, Penn.; to manufacture wheels for automobiles and trucks.

**Shaw Motor Company**, Chicago, Ill., Delaware corporation; \$1,000,000; to manufacture and deal in motors of all kinds; James W. Shaw, August Picking, Arno Meyer.

**M. Richard Automobile Company**, Cleveland, O.; \$250,000; to manufacture passenger automobiles.

**Klingelsmith Electric Truck Company**, Chicago, Ill.; \$350,000; to manufacture and deal in electrical vehicles; J. M. Klingelsmith, M. F. Cure, E. E. Tilley.

**Vaughan-Harris Company**, Vermillion, S. D.; \$25,000; to manufacture radius truss rods for automobiles; M. A. Vaughan, R. E. Vaughan, George O. Harris.

**Corsair Motor Company**, Dover, Del.; \$25,000; to manufacture and deal in trucks; J. M. Sattersfield, W. P. Carrow, M. M. Hiron and others.

**W. S. Truck Company**, Birmingham, Mich.; \$30,000; to build motor trucks; J. J. Welser, E. R. Smith.

**C. J. Cross Front Drive Tractor Company**, Newark, N. J.; \$100,000; C. J. Cross, J. W. Powelson, W. E. Holmwood.

**Washington Auto Parts Company**, New York City; \$1500; to deal in automobile parts; Joseph Dunn, Max Rosensky, Adolph Sachnoff.

**Cycle Car Company**, Wilmington, Del.; to manufacture cyclecars.

**Multi-Signal Company**, Kittery, Me.; \$100,000; to manufacture electric signals; H. Mitchell, H. A. Paul.

**J K Siphon Ventilator Company**, Little Rock, Ark.; \$100,000; to manufacture siphon ventilators.

**Kleiber & Co.**, San Francisco, Cal.; \$250,000; to manufacture motor trucks; Paul Kleiber and others.

**Signal Motor Truck Company**, Detroit, Mich.; \$60,000; to manufacture trucks; A. C. Burch, John Squires, R. Murray Wendell.

**Connecticut Aeroplane Company**, New Haven, Conn.; \$400,000; to build aeroplanes, etc.; E. A. Mulliken, Paul Webb, Ralph H. Clark.

**Haney Rescue Apparatus Company**, Tampa, Fla.; \$2,000,000; to manufacture automobiles, etc.

**Lexington-Howard Company**, Connersville, Ind.; \$150,000; to manufacture automobiles; E. W. Ansted.

**Pneumatic Devices Company**, St. Louis, Mo.; \$50,000; to manufacture door opening and closing devices; Nelson S. Gottshall, Henry B. Graham, John F. Bishop.

**American Electric Car Company**, Portland, Me.; \$1,500,000; to manufacture and deal in electrical and mechanical devices of all kinds and to deal in automobiles and parts thereof; A. F. Jones, T. L. Croteau.

**Tacoma Transit Company**, Tacoma, Wash.; \$30,000; to conduct a motor passenger service.

**Peoples Omnibus Company**, Atlantic City, N. J.; \$500,000; to operate omnibuses; N. G. Holmes, T. H. Smith, R. Harcourt.

**La Crosse Motor Company**, La Crosse, Wis.; \$10,000; to establish a transfer and drayage system; F. J. Nootzel, Herbert Lewis, W. H. Ristow.

**Automobile Sales Underwriting Company**, Petaluma, Cal.; \$100,000; to finance automobile dealers; Charles L. Clise and others.

**Motor Storage Company**, St. Louis, Mo.; \$250,000; storage of motor cars; H. B. Graham, H. S. Gotshall, W. J. Holbrook.

**Monarch Pattern Works**, Detroit; \$100,000; to manufacture wood and metal patterns and automobile ac-

cessories; John P. Park, Edward J. Swink, Herbert J. Chandler.

**Vaught Inspection and Service Bureau**, St. Louis, Mo. to inspect automobiles and trucks; C. C. Vaught, E. J. Dykstra, W. F. Horsting.

**Three Kays Company**, St. Louis, Mo.; \$2000; to manufacture carbon cleaning compounds; Rosie Olin, Edward Mendelsohn.

**Simplex Specialties Company**, Detroit; \$15,000; to manufacture and deal in automobile lifters, robe rails, accessories and parts.

**Clarke-Lorentowicz Company**, Newark, N. J.; \$100,000; to manufacture centrifugal pumps; J. Lorentowicz, G. H. Clarke, L. Lorentowicz.

**Reichenbach Patent Company**, Yonkers, N. Y.; \$250,000; to manufacture combustion motors; A. Schwartz, Thelma Joffe, Abram Breiband.

**Standard Mercantile Company**, Wessing Springs, S. D.; \$50,000; automobile and real estate business; L. F. Russell, W. T. McConnell, L. F. Aucman and others.

**Lucas Electrical Devices Company**, Chicago, Ill.; \$10,000; to manufacture electrical machinery and appliances.

**Teetor-Hartley Motor Company**, Hagerstown, Ind.; \$10,000; to conduct a general motor vehicle business; J. H. Teetor, C. N. Teetor, Joseph Teetor and others.

**Tanner-Howe Manufacturing Company**, Akron, O.; \$50,000; to manufacture gasoline gauges.

## GARAGE AND DEALER.

**The Rodney K. Haines Company**, New York City, will locate in its new and enlarged quarters at 1757-65 Broadway.

**The Folles Garage**, De Kalb, Ill., is now open to the public on South First street, where it has a new garage and machine shop, also sales and showrooms, 90x120 feet, two stories.

**The Capitol City Auto Company**, Hartford, Conn., has had its building remodelled. The company handles the Lozier and Mitchell cars.

**S. A. Foster**, Hartford, Conn., agent for White and Jeffery cars, has moved to 343 Trumbull street.

**The M-B-M Motor Company**, Boston, Mass., has moved to 41 Monroe street.

**Frederick W. Drostem**, St. Louis, Mo., has purchased the building at the corner of 12th and Locust streets and will remodel it for automobile purposes, at a cost of \$40,000.

**The Pathfinder Motor Car Company**, Minneapolis, Minn., northwestern distributor of the Pathfinder line of cars, has removed its quarters from 723 Third avenue, South, to 307 Sixth street, South.

**The Harter Automobile Company**, Sac City, Ia., has completed its large graage on North Fifth street, Marshalltown.

**The Knudson-Lurdblade Company**, Eureka, Cal., is planning to remove its Overland garage to the quarters of the Eureka Garage Company, having purchased the entire stock of the latter concern.

**The Kloeppel Motor Car Company**, Jacksonville, Fla., which handles the Reo and Lozier lines in that territory, has moved into larger quarters at 800 Main street. The new location affords ample room for a complete service station and supply warehouse.

**The George W. Browne Automobile Company**, Milwaukee, Wis., has moved into its new building at the corner of Broadway and Biddle street, where Overland, Stutz and Garford cars will be handled.

**E. B. Leverenz**, Milwaukee, Wis., has disposed of his garage and agency to Joseph Thor, who will continue the business in the same city.

**The Northwest Chevrolet Motor Car Company**, Portland, Ore., has taken quarters in the new Keats building. A. L. Smith is manager of the concern.

**The Detroit Slip Cover Company**, Detroit, Mich., has moved into its new salesrooms at 22 Hendrie avenue.

**The Knight Tire Company**, Chicago, Ill., is now located at 2112 Michigan avenue.

**C. V. Cairns**, Kansas City, Mo., has moved from 1304 McGee street, where K-R-I-T cars henceforth will be shown by the Motor Sales & Service Company.

**The Inter-State Automobile Company**, Kansas City, Mo., is now located at 1625 Grand avenue.

**The F. B. Stearns Company**, St. Louis, Mo., has leased

the two-story building at 3030 Locust street for a term of years and is now located at that address.

**J. W. Shelor and W. W. Morris, Jr.,** Dallas, Tex., have opened salesrooms at 2219 Commerce street for the purpose of showing Velle cars and trucks.

**The Western Minnesota Auto Company,** Roscoe, Minn., has moved to St. Cloud, Minn.

**George J. Bohem,** Sacramento, Cal., has opened offices and a service station at 1308 K street.

**The Kissel-Kar Branch,** San Francisco, Cal., has removed to the spacious new building on Van Ness avenue and Geary street. Kissel-Kar pleasure and commercial cars, Federal trucks and Ford cars will each receive the attention of a special department.

**The Oswald Auto Company,** Jackson, Mich., is now preparing to take possession of the new Oswald garage and salesrooms at 111-113 North Walnut street, where it will handle Imperial cars, to be distributed to north-western parts of the state.

**Charles F. Knuth,** Palmyra, N. Y., has opened a garage and repair shop at 10 Broad street.

**The F. B. Stearns Company,** Philadelphia, Penn., is now located at 247 North Broad street. The service department is in the same building.

**Thelma Motor Company,** Detroit, Mich., incorporated under the name of Rex Motor Company, will move its factory from 1200 Junction avenue to West Jefferson avenue, near River Rouge.

**Carl Lambert,** Ukiah, Cal., has opened a garage and machine shop at the corner of Stanley and Dora streets.

#### WITH THE MANUFACTURERS.

**The Pennsylvania Rubber Company,** Jeannette, Penn., has opened its new eastern branch at 1889 Broadway, New York City. The building provides 6000 square feet of floor space and extends from Broadway to Columbus avenue. The basement is to be used for shipping and adjustments. C. C. McCullough is manager.

**The Dominion Tire Company,** Berlin, Ont., has opened its new factory, constructed of reinforced concrete, one of the largest buildings of its character in Canada. The directors of the company are: D. Lorne McGibbon, Col. S. P. Colt, Victor E. Mitchell, Elsha S. Williams, A. J. Kimel, Homer E. Sawyer and T. H. Reider.

**The Puritan Machine Company,** Detroit, Mich., has opened a department for furnishing repair parts for the Michigan car, made by the Michigan Motor Car Company before its suspension. E. D. Edwards, formerly purchasing agent of the Michigan company, has been placed in charge.

**The Dean Auto Devices Company,** 120 South Sangamon street, Chicago, Ill., announces that in the future it will authorize every dealer handling Dean battery horns to replace any such horn which has become inoperative or imperfect in operation at any time within five years from date of purchase, upon the return of the original, accompanied by the exchange certificate.

**The Hood Rubber Company,** Boston, Mass., has sold the entire \$500,000 of preferred stock issued by directors, without any commission or underwriting, netting the company par.

**The Gallagher Carburetor Company, Inc.,** 1876 Broadway, New York City, has purchased the Edwards & Smith Company's foundries at Easton, Penn., and will operate under the name of the Lehigh Valley Foundries & Manufacturing Company, with head office in Easton.

**The Standard Welding Company,** Cleveland, O., has taken up the manufacture of wire wheels for automobiles in addition to the production of rims for motor-driven vehicles.

**The H. W. Johns-Manville Company,** New York City, has taken over the sales rights for the Arnold electric vaporizer and heating plugs, manufactured by the Arnold Electric Company, and the Long horn, manufactured by the G. Piel Company, Long Island City, N. Y. With respect to the last named accessory, the company announces a retail price reduction on the J-S model to \$10.

**The Hartford Suspension Company,** Jersey City, N. J., has taken the new building at 425 North Capitol boulevard as a new location for its Indianapolis branch, the former quarters having been at 448-50 North Capitol boulevard. The new place was built especially for the Truffault-Hartford concern, whose Indianapolis interests are cared for by S. C. Bohannon.

**The Richmond Forgings Corporation,** Richmond, Va., has opened a permanent office in the Dime Bank building at Detroit, Mich., which will be in charge of the

sales manager, L. C. Wellford. This company has also arranged with A. O. Knudson, Boston, Mass., to look after its large New England trade.

**The Lee Tire and Rubber Company,** Conshohocken, Penn., reports that the sale of its tires has quadrupled during the last nine months and an increase in the other departments of the business of more than 50 per cent. A new 600 horsepower addition to the boiler house is to be completed and a new calender and several 60-inch mills are on the ground ready for erection. Three new tire making machines and several hundred cores and side rings for the manufacture of pneumatic automobile tires are in transit. The total new equipment involves an expenditure of between \$50,000 and \$75,000.

**The Goodyear Tire and Rubber Company of Canada, Ltd.,** Bowmansville, Ont., has just announced several important changes in the personnel of the sales department. P. D. Saylor, vice president and sales manager of the Canada company, has been made president and managing director of the Goodyear Tire and Rubber Company of Great Britain, Ltd. R. P. D. Graham, secretary and manager of the tire department, has been promoted to the position of sales director, succeeding Mr. Saylor.

**The Factory Sales Company,** 716 Williamson building, Cleveland, O., is placing on the market a new keyless lock which operates like that of the combination safe, to prevent the theft of automobiles.

**The Republic Rubber Company's** clubhouse for employees at Youngstown, O., was formally opened Jan. 15. It is located on the east side of Albert street, directly opposite the general offices, and is 60 by 130 feet, three stories high. The first floor contains bowling alleys, pool tables, reading and lounging rooms and shower baths; the second provides a large dining room to accommodate

Clubhouse Recently Opened for Employees of Republic Rubber Company, Youngstown, O.

1200 persons, and a hall for lectures, dances, etc., and the third floor has a kitchen, a dining room for officers and office employees, living apartment for steward and rooms for the company's fire force.

**The F. S. Carr Company,** Boston, Mass., manufacturer of water proof automobile and carriage fabrics, has moved into the Francis building, 31 Beach street, where the general offices will be located.

**The S. & M. Tire Company,** Coshocton, O., expects to have its new plant in operation in a few weeks.

**The Lion Liner Company** of Appleton, Wis., has moved its factory and general office to Sheboygan, Wis.

**The Akron Tire Company,** Akron, O., has purchased land in Long Island City, N. Y., and will erect a branch factory there.

**The Nu Fen Manufacturing Company,** Indianapolis, Ind., has taken offices in the Hume-Mansur building. It is producing a new paint for automobile hoods, etc., which it is claimed will dry overnight.

**Dodge Bros.,** Detroit, has completed plans for a light four-cylinder machine. It will sell between \$690 and \$750 and production will begin next summer, after the Dodge plant concludes its existing contract with the Ford Motor Company for supplying gears and some detail parts for the Ford cars.

**The Swearington Tire Company,** Jacksonville, Fla., has taken over the good will and stock of R. W. Swearington and will manufacture tires, etc.

**The Cole Motor Car Company,** Indianapolis, Ind., has erected a large addition to its plant at a cost of \$200,000.

## RECENT PATENTS.

**Motor**, Harry W. Bolens, Port Washington, Wis.; No. 1,081,946. Filed May 26, 1911.

**Carbon Removing Process**, Harley M. Eller, Wollaston, Mass., assignor to Norfolk Manufacturing Company, Boston, Mass.; No. 1,081,950. Filed Jan. 27, 1913.

**Means for Reversing Motor**, Alan Ernest Leofric Chorlton, Manchester, England; No. 1,082,068. Filed March 18, 1913.

**Lamp Bracket**, Henry Alexander Goff, Englefield, England, assignor to John Drake, Egham, England; No. 1,082,079. Filed Jan. 23, 1912.

**Resilient Tread**, Philip W. Pratt, Boston, Mass.; No. 1,082,096. Filed March 23, 1912.

**Motor**, Malcolm W. Quiggle, Brooklyn, N. Y.; No. 1,082,138. Filed Feb. 17, 1912.

**Device for Preventing Excessive Pressure in Pneumatic Tires**, Walter H. Van Winkle, Newark, N. J.; No. 1,082,182. Filed July 15, 1911.

**Spring**, Adolphe Vermersch, Lille, France; No. 1,082,217. Filed Sept. 16, 1912.

**Stretcher or Bed for Automobiles**, Ralph Leonard Bradley, Stellacoom, Wash.; No. 1,082,223. Filed May 9, 1913.

**Cooling Apparatus**, Edgar de Normanville, Bayswater, England; No. 1,082,233. Filed April 28, 1913.

**Motor**, Enoch Prouty, Chicago, Ill.; No. 1,082,237. Filed Jan. 9, 1908.

**Demountable Rim**, Robert W. Ashley and Frank Oberkirch, New York City; No. 1,082,299. Filed Feb. 19, 1912.

**Enclosure for Motor Car Body**, August and Conrad Geissel, Philadelphia, Penn.; No. 1,082,316. Filed April 5, 1913.

**Spring Wheel**, Edmond R. White, Plattsburg, N. Y.; No. 1,082,380. Filed March 26, 1913.

**Two-Cycle Motor**, James Leonard Campbell, Barryton, Mich.; No. 1,082,402. Filed July 10, 1912.

**Lifting Jack**, Samuel Craig, Decatur, Ill.; No. 1,082,412. Filed Nov. 19, 1912.

**Fender**, Julius Didschuneit, Camden, S. C., assignor of one-fourth to Leguel A. Wittkowsky, same city; No. 1,082,415. Filed Sept. 10, 1913.

**Motor Ploov**, Orville E. Pattison, Winamac, Ind.; No. 1,082,440. Filed July 6, 1910.

**Automobile Skid**, Forrest G. Smith, Fitchburg, Mass.; No. 1,082,449. Filed Nov. 30, 1912.

**Resilient Tire**, Charles F. Strohn, Carthage, Mo.; No. 1,082,453. Filed Oct. 21, 1911.

**Folding Top**, Arthur Nolan Chenoweth, Waterbury, Conn., assignor of one-half to W. Richard Upson, same city; No. 1,083,273. Filed Aug. 27, 1912.

**Windshield**, Frank J. Falter, Norwalk, O.; No. 1,083,276. Filed Dec. 7, 1911.

**Auto Sled**, Michael Weldner, Lake Henry, Minn.; No. 1,083,312. Filed Oct. 2, 1912.

**Spring Wheel**, Lawrence W. Brown, Clinton, Mo.; No. 1,083,316. Filed May 11, 1912.

**Detachable Rim**, Arthur Frederick Gunstone, Bath, England, assignor to Captain Motor Wheel Company, Ltd., Bristol, England; No. 1,083,321. Filed April 14, 1910.

**Lubrication Mechanism for Combustion Engines**, Vincenzo Lancia, Turin, Italy; No. 1,083,329. Filed March 23, 1911.

**Lubricating System**, Harvey F. Maranville, Akron, O., assignor to Perfection Spring Company, Cleveland, O.; No. 1,083,332. Filed June 29, 1910.

**Detachable Wheel**, Leon Montupet, Paris, France, assignor to La Societe Montupet & Cie., Nogent-les-Vierges, Olse, France; No. 1,083,334. Filed Aug. 2, 1912.

**Resilient Wheel**, William A. Genringer, Allentown, Penn.; No. 1,083,396. Filed March 10, 1913.

**Steering Wheel Mechanism**, James E. Hanger, Jr., Atlanta, Ga., assignor of one-half to James H. Fenner, Jamestown, N. Y.; No. 1,083,399. Filed Dec. 4, 1909.

**Gasoline Tank**, William H. Smith, St. Paul, Minn.; No. 1,083,413. Filed Aug. 5, 1912.

**Motor**, Mark B. Crist, Pittsburg, Penn., assignor, by mesne assignments, to Colonial Trust Company, trustee, same city; No. 1,083,433. Filed April 20, 1910.

**Tire Inflation Apparatus**, Otto Ebert, Ironton, O.; No. 1,083,440. Filed Sept. 23, 1912.

**Starting Device**, Charles L. Montroy, Coahoma, Miss.; No. 1,083,457. Filed Sept. 27, 1912.

**Wheel**, Charles F. Womeldorf, Washington, D. C., assignor of one-half to William H. Rickard, Harrisonburg, Va.; No. 1,083,513. Filed May 19, 1913.

**Speed Controlling Device**, Sanford Keith Evans, Elmsford, N. Y.; No. 1,083,525. Filed March 26, 1913.

**Electric Searchlight**, Jean Gallay, Geneva, Switzerland; No. 1,083,530. Filed Jan. 6, 1913.

**Air Tube for Pneumatic Tires**, William R. Blowers, Toronto, Ont.; No. 1,083,584. Filed July 5, 1913.

**Turntable**, Joseph J. Grammes, Lakewood, O.; No. 1,083,609. Filed Aug. 4, 1913.

**Tire**, Paul Richter, Berlin, Germany; No. 1,083,632. Filed Feb. 8, 1912.

**Non-Skidding Device**, William Wenom, Kirkwood, Mo.; No. 1,083,644. Filed April 30, 1913.

**Resilient Tire**, Darwin H. Donachy, Williamsport, Penn., assignor of forty-nine one-hundredths to D. Tuttle Mahaffey, same place; No. 1,083,670. Filed Dec. 14, 1912.

**Motor**, Russell Scott Ellis, Philadelphia, Penn.; No. 1,083,673. Filed March 12, 1913.

**Speed Controlling Device**, Willis J. Perkins, Grand Rapids, Mich.; No. 1,083,701. Filed July 12, 1911.

**Wheel**, Gerome F. Tadini, New York City; No. 1,083,709. Filed Jan. 20, 1913.

**Control Lever Locking Device**, James W. Boulton, Spokane, Wash.; No. 1,083,793. Filed Aug. 8, 1912.

**Tire**, Carter J. Butts, Boston, Mass.; No. 1,083,798. Filed May 25, 1911.

### PRIZE FOR NEW TIRE.

#### Austrian Ministry of War Offers \$10,000 for a Substitute for Rubber.

The ministry of war in Vienna, Austria, has offered a prize of \$10,000, to be awarded to the person who will, with adherence to certain prescribed conditions, construct an elastic tire of new material for motor freight wagons. Besides the specific attributes of pure rubber, such as elasticity and adhesiveness, the new material must possess essentially greater durability, or with equal durability, the attribute of essentially smaller cost of construction than the rubber tires, thereby reducing the expense of operating commercial vehicles. Its weight must not exceed that of pure rubber tires.

Competitors should hand in a model of the

Company, Springfield, Mass., and were built upon special order for Dr. Walter R. Weiser of that city. They consist of a special runabout, on the left, built with an extra wide seat to accommodate three people side by side, and a new type of berline limousine.

The runabout is to be utilized as a business vehicle, in that the doctor will use it in making professional calls about the city and vicinity. On the rear is fitted a trunk, affording sufficient space for storing a complete set of surgical instruments, uniforms, etc. The seating arrangement is with a view to carrying a nurse, in addition to the chauffeur, whenever this becomes necessary, or the doctor may drive himself and take a convalescent patient and nurse on an outing.

The limousine body is designed for extreme comfort. Extra wide doors permit free access

Two Handsome Body Designs Recently Produced for Springfield Man by Knox Automobile Company of That City.

fabric in natural or reduced size, together with drawings and description, at the latest by June 30, 1914, to the Automobil-Versuchsabteilung (Automobile Trial Division), VI, Gumpendorferstrasse 1, Vienna. Further details may be found in the Militarosche Rundschau, published at I Graben 23, Vienna, and to be had also on application in German of the K. K. Kriegsministerium, Vienna.

### TWO ATTRACTIVE BODIES.

#### Result of a Special Order Filled Recently by Knox Automobile Company.

The accompanying illustration presents two cars of somewhat unusual utility and beauty. These are the product of the Knox Automobile

Company, Springfield, Mass., and were built upon special order for Dr. Walter R. Weiser of that city. They consist of a special runabout, on the left, built with an extra wide seat to accommodate three people side by side, and a new type of berline limousine. The runabout is to be utilized as a business vehicle, in that the doctor will use it in making professional calls about the city and vicinity. On the rear is fitted a trunk, affording sufficient space for storing a complete set of surgical instruments, uniforms, etc. The seating arrangement is with a view to carrying a nurse, in addition to the chauffeur, whenever this becomes necessary, or the doctor may drive himself and take a convalescent patient and nurse on an outing. The limousine body is designed for extreme comfort. Extra wide doors permit free access

to either the front or rear compartment, and more than the ordinary space is provided for the driver. When the windows in the forward compartment are dropped, the car has all the appearance of an open front limousine. Great care in the arrangement and selection of the lighting has been taken in order that it should harmonize well with the general design, and the windows are of such size as to afford very free vision from any seat in the car. Because of greatly increased business during the past three months, the Pyrene Manufacturing Company, New York City, maker of Pyrene fire extinguishers, has increased its quarterly dividend, which was one per cent., Nov. 1, to 1.5 per cent. This will be paid Feb. 1, to stockholders of record Jan. 30.

## PHILADELPHIA'S AUTOMOBILE CLUBS.

**T**HE importance of Philadelphia as a motoring centre is evidenced by the number of motoring organizations in that city. Some of these have national prominence, and have had almost since the inception of the industry in America, at least on a commercial basis. Others may not be so well known, but they have numbered within their membership men who have had large influence in the industry. In one particular, at least, Philadelphia is somewhat distinctive in possessing two strong motoring organizations, the membership in which is limited to women. Brief mention of the various clubs and their activities is presented below:

### **Automobile Club of Philadelphia.**

The largest motoring organization in the state is the Automobile Club of Philadelphia, which compares very favorably in its importance and the scope of its work with the Automobile Club of America in New York City. It was organized in 1900 and headquarters were established at Broad and Locust streets, where the club remained until the completion of its handsome new building at 23rd street, south of Market, about a year ago. This building is patterned largely after the clubhouse of the Automobile Club of America, and provides practically the same facilities for its members. It provides storage space for 300 cars and it is proposed to add other floors to be available for automobile show purposes.

From the very first this organization has taken an active interest in everything that would add to the enjoyment of motoring. It claims to be the first club in the country to establish a touring information bureau, and it spent large sums in securing data, erecting road signs, etc., before other similar bodies took up this work.

The officers of the Automobile Club of Philadelphia are: President, Stedman Bent; vice president, Howard Longstreth; secretary-treasurer, S. Boyer Davis; directors, Powell Evans, S. Boyer Davis, Henry P. Bally, Jacob J. Seeds, Stedman Bent, Winfred J. Foss, Howard Longstreth, Robert P. Hooper, W. O. Griffith, Henry Souther, W. W. Atterbury, Charles Pickering.

### **Quaker City Motor Club.**

The Quaker City Motor Club is quite as well known as the older organization, through its interest in contest work. It was organized Feb. 21, 1907, and held its first successful race meet that fall and its first endurance run to Harrisburg on the following New Year's Day. Foremost among its achievements was the series of Fairmount Park races. The proceeds from its vari-

ous undertakings have been devoted to charity.

The clubrooms are in the Hotel Walton, and the officers are: President, Paul B. Huyette; first vice president, G. Douglass Bartlett; second vice president, B. H. Kirkbride; treasurer, Ralph L. Murray; secretary, A. E. Adams; board of governors, L. D. Berger, P. D. Powell, F. C. Dunlap, Ralph D. Earle, I. T. Shoemaker, Dr. S. Leon Gans, G. Hilton Gantert, George M. Graham and George E. Potts.

### **Automobile Club of Germantown.**

The Automobile Club of Germantown was chartered under the laws of Pennsylvania Jan. 28, 1904, with 23 members. It has worked in a quiet way for the benefit of owners in Philadelphia and elsewhere throughout the state, and was one of the three clubs which formed the Pennsylvania Motor Federation, the others being the Automobile Club of Philadelphia and the Automobile Club of Pittsburg. It owns its own home, valued at \$40,000, at Emlen and Carpenter streets.

The officers are: President, William H. Kingsley; vice president, William R. Harper; secretary, William T. Betts; treasurer, E. J. Hasse; board of governors, the officers and William D. Edson, William P. M. Braun, George H. Evans, Jonathan Jenks, B. F. Betts, Edward S. Jackson and William H. Lincoln.

### **Physicians' Motor Club.**

In some respects the Physicians' Motor Club of Philadelphia is entirely distinctive. As its name implies, none but physicians are eligible for membership. The club was organized in 1909 with 15 members, and the total is now about 450. The organization has no clubrooms, and its objects are not so much to encourage the use of automobiles for social enjoyment, as to co-operate with the police in a proper enforcement of the traffic regulations and motoring laws of the state and city.

The officers are: President, Dr. S. Leon Gans; first vice president, Dr. John J. Robrecht; second vice president, Dr. Charles A. E. Codman; third vice president, Dr. Landreth W. Thompson; secretary, Dr. Howard Sutton; treasurer, Dr. Louis H. Adler; directors, Drs. T. J. Ellinger, E. S. Saylor, Charles R. Haig, Elwood R. Kirby, Sylvester J. Deelan, H. Augustus Wilson, Ernest W. Kelsey and Francis J. Kelly.

### **Lu Lu Temple Auto Club.**

Organized June 14, 1911, the Lu Lu Temple Automobile Club is the youngest of the Philadelphia motoring organizations. It is composed

entirely of members of the Masonic fraternity, and was formed by the Shriners. So popular was the innovation that it has been necessary to raise the membership limitation twice, and the list now numbers some 350.

The objects are to assist the Potentate of the Mystic Shrine in entertaining visiting delegations of Masons, to aid charity and to hold social events in which members and their families may meet for general enjoyment. The rooms are at the Lu Lu Temple, and the officers are: Honorary president, Potentate W. Freeland Kendrick; president, Joseph Way; vice president, Charles L. Martin; treasurer, William G. Burk; secretary, Fred L. Bingham; board of governors, the officers and William Holt, George F. Pawling, Thomas R. Roberts, A. T. James, Walter Scholes, Max Laupheimer and John Fits.

#### **Quaker City Ladies' Motor Club.**

Philadelphia claims the distinction of having the first exclusive woman's motoring organization in the country, in the Quaker City Ladies' Motor Club, which was organized in 1907. It began with 13 members and now has 108. Its activities are largely in interesting women in motoring and driving their own cars, and assisting in securing better roads and more equitable motoring laws.

The clubrooms are at the St. James, and the officers are: President, Mrs. Richard Y. Filbert; first vice president, Mrs. Otto W. Schaum; second vice president, Mrs. Frank B. Stockley; secretary-treasurer, Mrs. Edward Beecher Finck; board of directors, Mrs. J. J. Martin, Sr., Mrs. George C. J. Finck, Mrs. Charles D. Pretzman, Mrs. Guy Gundaker, Mrs. Sarah Babcock, Mrs. W. Lewis Cave, Mrs. J. Willard Reading, Mrs. John H. Coates, Mrs. Thomas F. Durham and Mrs. Harry Douglas Stewart.

#### **La Moviganta Klubo.**

The second woman's automobile club is La Moviganta Klubo. While this is essentially a motor club, its membership includes practically every woman of social distinction in Philadelphia, and its real mission is social, rather than promotive of motoring activities. It is affiliated with the Royal Automobile Club of Great Britain.

The club was organized in 1907, and owns its own clubhouse and grounds at Mt. Pleasant, otherwise known by Philadelphians as the Benedict Arnold mansion, situated on the east side of the Schuylkill river, not far north of the Girard avenue bridge. The officers are: President, Miss Margaret L. Corlies; vice president, Miss Frances C. Griscom; treasurer, Mrs. John P.

Hollingsworth; secretary, Mrs. William J. Clothier; directors, Mrs. John Barnes Townsend, Miss Margaret C. Houston and Mrs. J. Kearsley Mitchell.

#### **WINTER MOTORING POPULAR.**

##### **Goodrich Company Finds Owners Are No Longer Storing Their Cars.**

That motorists are fast breaking away from the former custom of storing their cars during the winter months is the opinion of E. C. Tibbitts of the B. F. Goodrich Company, Akron, O., maker of Goodrich tires. This opinion is, of course, based upon the increase in the sale of tires during this period. Concerning the matter Mr. Tibbitts says:

This year will mark a tremendous increase in the number who will keep their cars in continuous service the entire year. This demonstrates that automobilists are educating themselves to a realization of the fact that motor cars are not alone a fair weather enjoyment and convenience, but a decided asset under severest conditions as well.

One of the chief objections, hitherto, to winter motoring has been the dangerous conditions of travel occasioned by bad roads, necessitating the use of chains, which often have a costly effect on tire maintenance. But with the safety tread tires now sold at prices less than previously asked for smooth treads, motorists are enabled to equip their cars with tires that are not only economical in first cost and in mileage rendered, but which assure the cars a safe foothold on the road bed, no matter how slippery, slushy or icy.

The "Safety First" movement, which we have fathered in its application to all-season motoring, has encouraged motorists to take no chances, yet has afforded them the opportunity to do so at low expense. His four wheels shod with safety tread tires, the motorist is ready for safe travel over any road, and the extra tread thickness means increased mileage and greater wearing strength, which more than compensate for the slight additional charge over the cost of smooth treads.

Robert J. Collier, the well known editor, has purchased a Sloane hydroaeroplane, made by the Sloane Aeroplane Company, New York City. The machine was designed by John E. Sloane, with the assistance of Frank Coffyn, and seats six persons. It is propelled by a 20-cylinder air-cooled motor, driving a 12-foot diameter propeller.

Judge Hand of the United States district court, in the southern district of New York, has handed down a decision in favor of the plaintiff in the action of the Allen Auto Specialty Company of that city, against the Niagara Auto Cover Company, alleging infringement of patents covering the Allen tire covers.

C. H. Dunlap, export manager of the Hupp Motor Car Company, Detroit, sailed Jan. 24 for South Africa.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## THE LINCOLN HIGHWAY

(Copy Contributed)

By

**ELBERT HUBBARD**

**A. R. PARDINGTON**

Vice-President and Secretary Lincoln Highway Association  
DETROIT, MICHIGAN

Dear Sir:—

I regard it as a privilege to be one of the many who will make *The Lincoln Highway* possible, and am accordingly sending along my check for Five Dollars as my subscription to this glorious cause.

Name .....

Address .....

☐

Check here if you will sell certificates to your friends

**A** DUSTLESS, mudless, skidless highway from the Atlantic to the Pacific—that's why I should cease to worry.

Behind the project are over 100 firms and corporations who do big things. Over \$5,000,000 are pledged or in hand.

Subscriptions are asked from every cheerful sport who owns an automobile and loves the smell of gasoline. And doesn't that take in pretty nearly all of us?

Any man who owns a machine and doesn't get in on this is a Piker from Pikersville.

It's a privilege to get in this glorious company, and I hope every reader will send a Fiver or more and then sell some certificates to his friends.

Enjoy the sweet satisfaction of knowing that you are in this glorious company who are making the world a fit place for gentlemen to live in.

*Good roads are the most unselfish enterprise in the whole world of human betterments.*

Main Office and Factory RUTHERFORD, N. J.

# BUYING AND SELLING MADE EASY

15,000 Trade Interests

READ THE  
**Accessory and Garage Journal**  
EACH MONTH

You can secure your monthly audience with all buying and selling heads in all concerns in every branch of the automobile industry through the Accessory and Garage Journal. Such interests must know what you have to offer. All are logical prospective purchasers. They constitute your market and are always looking for lines of merit.

In this magazine the large and small manufacturer has equal opportunity to reach the whole trade and can secure a service equal to that of a trade mailing list and better than can be secured through any other medium.

100 Per Cent. Quantity—100 Per Cent. Quality—Circulation Value.

Every order carries with it a positive guarantee of service stated, and this in any form requested.

Ask how we give concern and product listing under proper classification in Buyers' Guides that have a distribution of more than 1,100,000 copies yearly. This service is free. Our trade mailing list is 100 per cent. active—Do you need it? Details gladly furnished on request.

Next issue Feb. 15th.

When Writing to Advertisers, Please Mention The Automobile Journal.

# **Unity of Interest**

**The owners, the board of directors and the executive officers of the Pierce-Arrow Motor Car Company are one and the same group of men.**

**This means that the  
PIERCE-ARROW**

**organization is one of united individuality, hampered by no outside interference or syndicated control. It means that the Pierce-Arrow directors are free to utilize their full resources of capital, brains and energy to the attainment of their ideal—the successful building and marketing of the best possible motor trucks and pleasure cars.**

**Every individual directly interested in Pierce-Arrow financial success is a working unit in the Pierce-Arrow organization.**

**The Pierce-Arrow Motor Car Company of Buffalo, N. Y.**

# PAIGE "36"

## The car that is selling by the trainload

This is literally true. We are now shipping the first of several trainload orders. This first order goes to the Payne Motor Car Company, Des Moines, Iowa. It consists of thirty solid carloads of Glenwood models.

This gives us the distinction of shipping the first trainload order that has ever gone into the state of Iowa.

The tremendous popularity of Paige cars is due to the fact that they are the greatest extra value motor cars ever produced.

Prove this for yourself at the Shows.

Paige "36" Glenwood—\$1275 completely equipped, including electric lighting and starting
